- **South Waterfront –** The South Waterfront area of Portland's Central City offers significant opportunity for new affordable and market-rate housing together with job growth via the Oregon Health & Science University 20-Year Facilities Plan. Private and public investments in SW Bond Avenue, South Portal, the greenway, and open space will be critical to delivering on new development and serving current and new residents in the district.

DLCD Category: Zoning and Code **Priority**: High **Lead**: Prosper, PHB, BPS

Partners: PP&D, City bureaus, Albina Vision Trust, Go Lloyd, Property owners, Developers, Portland Public Schools (PPS), Metro, Multnomah County

Project Start: 2024 **Adoption:** 2025 **Implementation:** 2030

2. Increase Housing Capacity in Inner Centers & Corridors

As identified in the BPS Strategic Plan, the City will increase housing capacity in high-opportunity neighborhoods to promote fair housing, address racial segregation, and expand affordable housing options. These changes may involve increasing and expanding commercial mixed-use and multi-dwelling zoning in centers and corridors in the inner neighborhoods.

- Conduct Infrastructure Capacity Analysis, funded in part by a DLCD grant, to determine the extent to which the existing infrastructure can support increased housing densities and identify investments needed to support increased capacity.
- Initiate an area plan project to increase mixed use and multi-dwelling zoning based on the results of the infrastructure capacity analysis.

Impact

Affordability: All
Tenure: Rent
Populations Served: Low-income communities; Communities of Color, Older adults, People with disabilities
Magnitude: High

DLCD Category: Zoning and Code

Priority: High

Lead: BPS

Partners: PP&D, Infrastructure bureaus

Project Start: July 2024 **Adoption:** July 2028 **Implementation:** August 2028

3. Revise Zoning Bonuses and Incentives

This strategy aims to address the wide range of floor area ratio (FAR) density and building height bonuses in the zoning code. The goal is to restructure the development incentives to support needed housing types, such as larger units, accessible units and affordable housing to serve all household types, incomes and needs.

- Funded in part by a DLCD grant, this code project will audit Portland's mixed use and multi-dwelling zoning regulations to identify barriers to housing production. These zones have 60% of Portland's residential growth capacity. The project will analyze FAR, maximum building height and bonuses to further increase capacity and facilitate production.

Impact

Affordability: All
Tenure: Both
Populations Served: General
Magnitude: Medium

DLCD Category: Zoning and Code

Priority: High

Lead: BPS

Partners: PHB, PP&D

Project Start: September 2024 **Adoption:** June 2025 **Implementation:** March 2026

4. Kickstart Housing Demand in Central City

This strategy aims to encourage housing production in the Central City by improving the livability of the area and making it an attractive place for developers to invest and residents to live. Like all other major cities on the West Coast, Portland is responding to issues of houselessness, lack of affordability, and behavioral health crises. Economic activity and vibrancy across Central City's ten neighborhoods has weakened, despite many having higher access to services, transit options and density. The Central City Task Force and Prosper Portland's Advance Portland strategic action plan include actions for the City to retain and recruit businesses and investment; to support office to residential conversions; and to activate and enhance the Central City so that community members once again view it as a safe and attractive place to live, work, and play:

- Establish and expand incentives for office-to-residential conversion, including direct financial incentives such as tax increment financing or other new financial tools, together with regulatory streamlining.
- Activate public rights-of-way in partnership with business and community partners, including maintaining opportunities for outdoor dining; expanding the public street plaza program; and investing in the programming of pedestrian plaza spaces held by the City or other public partners to serve residents and visitors.
- Enhance the Central City as a regional gathering spot by investing in renovation and activation of public open spaces and anchors to make them active and desirable places to attract additional investment in new residential development, and to enliven adjacent districts.
- Encourage temporary and permanent tenanting of vacant ground floor commercial spaces into active uses that supports local community and adjacent resident needs.

Impact

Affordability: All

Tenure: Both

Populations Served: General

Magnitude: low

DLCD Category: Stabilization

Priority: High

Lead: Prosper, BPS, PP&D

Partners: PBOT, PPR, PHB

Project Start: April 2023

Adoption: April 2023

Implementation: Ongoing through 2028

5. Increase Housing Capacity in the Central City

While Central City covers only three percent of the land base in Portland, it allows for the densest development in the region. But given the dire need for more housing in Portland, BPS and partner bureaus will explore ways the City can do more to create more housing in the city core.

BPS will update Central City zoning regulations to remove barriers to housing production, such as analyzing current densities (FAR) and heights and current utilization of allowable densities and heights.

Impact
Affordability: All
Tenure: Both
Populations Served: General
Magnitude: Medium

DLCD Category: Zoning and Code
Priority: High
Lead: BPS
Partners: PHB, PP&D
Project Start: October 2024
Adoption: July 2026
Implementation: October 2026

6. Identify Housing Opportunity Along 82nd Avenue

In conjunction with the 82nd Avenue Transit Project, the City will evaluate housing opportunities along 82nd Avenue, which includes:

- Analyze development feasibility along different segments of the corridor to identify gaps between development costs and achievable rents/prices;
- Identify developable sites per the Buildable Lands Inventory that can be developed in the near term as development interest and funding opportunities align;-and
- Consider zoning bonuses and incentives to encourage needed housing types, such as affordable housing, larger units, and accessible units.

Impact
Affordability: All
Tenure: Both
Populations Served: Low-income communities; older adults, People with disabilities
Magnitude: low

DLCD Category: Zoning and Code
Priority: Medium
Lead: BPS
Partners: PBOT, PHB, PP&D, Prosper
Project Start: August 2024
Adoption: December 2025
Implementation: March 2026

7. Promote Increased Transit Service

Access to transit service has been identified as a key factor in housing choice. The City will work with TriMet and Metro to promote increased transit service and improved transit speed and reliability in centers and corridors with higher levels of existing housing units and future development capacity. Actions include:

- Work with TriMet to implement its Forward Together 1.0 bus service concept to increase and expand bus and light rail service, including several bus service improvements in East Portland. Work with TriMet to develop Forward Together 2.0, a long-range service concept plan.
- Work with Metro and TriMet's Better Bus program and other programs to implement transit priority projects to improve transit speed and reliability, especially along the City's Rose Lane Transit Network.
- Work with Metro, TriMet and other partner agencies to plan, fund and build the 82nd Ave Transit Project, to implement the next Frequent Express (FX) bus line in Portland.
- Work with TriMet on the development of their Frequent Express (FX) System Plan, including seeking additional funding and federal matching funds to implement additional FX bus lines and other regional High-Capacity Transit lines in Portland.

Impact

Affordability: All
Tenure: Both
Populations Served: Low-income communities; older adults, People with disabilities
Magnitude: low

DLCD Category: Infrastructure
Priority: Medium
Lead: PBOT
Partners: BPS, TriMet, Metro, Streetcar
Project Start: August 2024
Adoption: August 2025
Implementation: December 2030

8. Incorporate Affirmatively Furthering Fair Housing

Fair housing means ensuring distribution of housing at all affordability levels in all neighborhoods in the city. Fair housing does not concentrate poverty in a single area, neighborhood, or geography. Fair housing is addressed by Comprehensive Plan Goal 5.B: Equitable access to housing; stating that Portland ensures equitable access to housing, making a special effort to remove disparities in housing access for people with disabilities, people of color, low-income households, diverse household types, and older adults.

The City will further explore how to incorporate an analysis and strategy for addressing fair housing in Zoning Map, Comprehensive Plan Map and City Code changes. The strategy has two parts:

- PHB will conduct a fair housing analysis of zoning and housing codes as part of federally required analysis for Consolidated Plan and Affirmatively Furthering Fair Housing reports.
- PHB will prepare a map where affordable housing currently exists and identify communities where affordable housing is not available and develop plans or code changes to encourage affordable housing development.
- BPS will explore enhanced fair housing requirements that are consistent with Statewide Land Use Planning Goals. For example, as part of voluntary quasi-judicial map amendments, developers could be required to have a fair housing strategy.

Impact

Affordability: All

Tenure: Both

Populations Served: Low-income communities; Communities of color; Older adults, People with disabilities

Magnitude: Low

DLCD Category: Zoning and Code

Priority: Low

Lead: BPS, PHB

Partners: PP&D

Project Start: July 2028

Adoption: June 2029

Implementation: July 2030

D. Reduce Barriers to Development and Improve Processes

The City has been actively adopting solutions for known regulatory impediments identified through the Permit Improvement Task Force, the housing production survey conducted by Commissioner Rubio's office, developer interviews and engagement with stakeholders such as Housing Oregon, Oregon Smart Growth and the Homebuilders Association.

These actions and programs are ones that the City has implemented or will implement. These proposed strategies aim to review and revise city services, development code regulations and the way the City processes development permits.

While many of these strategies are crucial for housing production, it's important to recognize that they may primarily benefit market-rate development and may not necessarily incentivize other types of needed housing. Implementing additional strategies to incentivize the production of housing that serves the specific needs of underserved populations in tandem with actions that reduce barriers to development is necessary.

Figure 6**. Existing/Ongoing Programs and Actions that Reduce Barriers and Improve Processes**

Existing and Ongoing Programs Reducing Barriers and Improving Processes	
Permit Improvement Task Force	Early Assistance Options for Middle Housing Pilot
Residential Permitting Single Point of Contact	Team Business Process Analysis Review
Multi-Dwelling Housing Pilot	Local Transportation Infrastructure Charge Exemption
Regulatory Work Group	Temporary Early Assistance Fee Reduction
Unification of Development Review Teams	Historic Resources Code Project
Housing Regulatory Relief Project	Parking Compliance Amendments Project
RICAP 10	Prosper Portland Construction Business And Workforce Equity
System Development Charges • Exemption • Freeze • Deferral Sanitary and Stormwater Rate Updates	Pre-approved Detached ADU Plans

NEW STRATEGIES

1. Implement Regulatory Reform Project

This project aims to establish a new code and policy process that streamlines when code and fee changes are brought to Council. The new process aims to enhance collaboration among bureaus responsible for implementing development regulations (BES, PBOT, PWB, PP&D, PPR/Urban Forestry), ensure cross-code regulatory alignment, establish frequent updates with City Council, reduce code conflicts, identify development impacts, establish a feedback loop with both customers and staff to inform code revisions, and document barriers identified by review teams and customer-facing staff to be considered for review.

Impact

Affordability: All

Tenure: Both

Populations Served: General

Magnitude: Medium

DLCD Category: Regulation and Process

Priority: High

Lead: Portland Permitting & Development

Partners: BPS, BES, PBOT, PWB, PPR/Urban Forestry

Project Start: February 2022

Adoption: January 2024

Implementation: July 2024

2. Improve User Experience within Permitting Systems

These projects aim to make the permitting process more user-friendly by streamlining and simplifying the process, removing any inefficiencies that unnecessarily slow down projects and contribute to increased development costs.

A. Implement Portland Permitting & Development- Improve permitting process through a single permitting authority structure.

B. Set up Public Infrastructure Prescreen - Include infrastructure teams in the permit prescreen process.

C. Standardize Data and Reporting - Provide timely data on permitting, providing managers with early alerts regarding timeline problems.

D. Create a Customer Focused Website - Redesign permitting websites to better align content and improve customer wayfinding.

E. Establish Intake Success: New Single-Family Residence (NSFR) -Create digital conditional logic to guide the customer through the application process, resulting in more accurate and efficient NSFR permit applications.

F. Create A More Accurate Pre-Issuance List - The new report will provide transparency to both customers and Permitting Services on the pre-issuance permitting queue.

G. Establish Single Point of Contact - Each project is assigned one person to work with as evaluation occurs. This will be expanded to all building types.

H. Continue annual customer survey to gather feedback and determine what improvements are effective and where additional improvements are needed.

I. Build and implement a streamlined and transparent Public Works Permit review solution, including metrics to assist with the management and resolution of future inefficiencies.

Impact

DLCD Category: Regulation and Process

Priority: High

Lead: CAO, PP&D, BTS

Partners: BES, PBOT, PWB, PPR/Urban Forestry

Project Start: 2021

Adoption: July 2022

Implementation: July 2025

3. Reform Development Services Funding Model

The funding and staffing model for development permitting needs to be reformed to build a mechanism that is not completely reliant on fees and can provide sustained funding. Best practices from other jurisdictions point to a need for funding that avoids the vulnerability of development cycles, which creates volatile staffing model and makes retaining/recruiting a skilled and technical workforce difficult.

Impact

Affordability: All
Tenure: Both
Populations Served: General
Magnitude: Medium

DLCD Category: Regulation and Process

Priority: High

Lead: PP&D

Partners: BES, PBOT, PWB, PPR/Urban Forestry

Project Start: August 2024

Adoption: June 2025

Implementation: July 2025

4. Explore Infrastructure Investments and Strategies

The City will ensure that capital improvement plans, public facility plans, transportation plans, and other infrastructure plans are up-to-date and prioritize areas that need investment. In order to coordinate housing development and infrastructure improvements, the City will integrate growth management, asset management and capital improvement planning to prevent infrastructure deficiencies from hindering housing development.

Also, the City will explore strategies that enhance infrastructure investment to support housing production:

- Significant Catalytic Sites – Provide funding, including through tax increment financing, System Development Charges or another dedicated fund, to unlock significant housing production on large scale sites lacking existing transportation and utility infrastructure.
- Publicly Funded Infrastructure Improvements – Create a fund to quickly deploy resources to help fund off-site improvements triggered by individual developments.

Impact

Affordability: All

Tenure: Both

Populations Served: General

Magnitude: Medium

DLCD Category: Land and Infrastructure

Priority: Low

Lead: Prosper, BPS

Partners: PBOT, BES, PWB

Project Start: July 2028

Adoption: June 2029

Implementation: July 2029

5. Revise System Development Charges (SDC)

The City will comprehensively study how SDCs, and other fees affect development feasibility, and adjust accordingly to find the right balance between adequately serving new growth and minimizing adverse impacts on housing feasibility. Recent studies and engagement show that SDCs may impact the feasibility of certain types of development. However, SDCs are crucial for meeting infrastructure needs. The City has a complex fee structure across multiple bureaus with differing timelines. Upcoming studies and revisions include:

- BES will implement rule changes related to the user, development, and connection charges study in FY 24-25.
- PPR will review and update their methodology in 2026.
- PBOT will study fees and charges and their impact on development by 2027. PBOT currently scales its SDCs by dwelling size, with two single dwelling size categories and one for multi-dwelling projects. As part of the next program update in 2027, PBOT may further stratify the residential dwelling size categories to match those used in the Parks SDC program.
- During these revision periods, bureaus will evaluate SDC fee structures and exemptions to incentivize development types, affordability levels and locations that better serve housing needs and equity goals.

Impact

Affordability: All

Tenure: Both

Project Start: 2022

Adoption: July 2024

Implementation: July 2027

E. Stabilize Current and Future Households

The HNA identified an underproduction of units in Portland over the last ten years, particularly for units affordable to households earning less than 80 percent AMI, adding pressure to the existing affordable housing. With more than a third of Portland households spend more than 30 percent of their income on housing costs, and around 50 percent of renters in the city are cost burdened, housing costs continue to increase at a rate that is hard for incomes to keep up with. Throughout engagement, we heard from households and advocates the continuing need to preserve programs that help to stabilize households, including utility and financial assistance for Portland's current households.

Advocates across the city, through community meetings, public comment and at the BIPOC focus groups/community meetings indicated the increasing need for stabilized housing, through strategies such as acquisition, funding, and easing access to existing affordable housing. Increasing housing costs in Portland are imposing significant financial strain on residents, particularly those already on the verge of housing instability. Finding ways to help vulnerable households remain in their homes and communities is fundamental to their stability and well-being as well as the City's goals around equitable access to quality and affordable housing.

As noted in the assessment of Areas of Economic Vulnerability, about 35 percent of Portland's households reside in areas of economic vulnerability. These areas also have over 50 percent of regulated affordable housing units with a roughly proportional share of the development capacity and new housing demand. While the City continues to invest in and incentivize the development of housing across the City, these households in particular will benefit from stabilizing measures that help mitigate the involuntary displacement of vulnerable households and preserve affordability.

The City continues to invest in ongoing and existing policies and programs that provide funding or manage programs that aid households in maintaining their housing (Figure 7). New strategies focus on building out policy and programs that will preserve the supply of regulated and unregulated affordable housing units and help ensure equitable access to housing. These strategies support the stabilization of current and future households, to prevent houselessness, and reduce housing insecurity.

The City will continue to work with nonprofit agencies and developers in conjunction with the Continuum of Care to identify additional resources that the City may be able to provide support for, such as supportive housing, services to people experiencing houselessness and houselessness prevention. While the City works with partners at JOHS, Multnomah County, Metro and with community partners to implement the Homelessness Response Action Plan, this initiative, in combination with initiative A. Promote Affordable Housing (0-80% AMI), aims to reduce risk of displacement, support vulnerable community members and extremely low-income households who may be at risk of becoming houseless.

Figure 7. Existing and Ongoing Programs Addressing Stabilization, Anti-Displacement and More

Existing and Ongoing Stabilization and Anti-Displacement Programs	
Joint Office of Homeless Services Programs	0% Home Repair Loans

Landlord-Tenant Mediation Pilot Program	Short Term Rental Ordinance
Rental Services Office (RSO)	Fair Access in Renting (FAIR)
Eviction Legal Support	

NEW STRATEGIES

1. Preserve Existing Affordable Housing

The City will preserve affordable housing through the following actions

A. Develop a preservation portfolio by preparing an inventory of regulated and unregulated affordable housing to support proactive policies to preserve the affordable housing stock.

B. Acquire properties using low-interest loans/revolving loan fund for preservation.

C. Coordinate with Portland Clean Energy Fund on energy efficiency improvements to work in conjunction with the rehabilitation of affordable housing.

D. Identify unreinforced masonry buildings and seismic retrofit funding and code changes to stabilize existing affordable housing.

E. Working with the State/OHCS to identify dedicated funding and explore legislative or programmatic updates to foster preservation, including potential changes to state statute for property tax exemptions.

F. Include preservation as an allowed use for all new affordable housing funding streams within all potential new TIF districts and housing bonds.

G. Support loan restructures and modifications for existing regulated projects to ensure they can continue to be operated as affordable housing.

H. Coordinate with Joint Office of Homeless Services and OHCS to ensure Permanent Supportive Housing (PSH) units have adequate funding. Align funding sources with actual costs for property management, service delivery, and other operating needs.

Adoption: July 2024

Implementation: July 2028

2. Launch Affordable Housing Listing Service

In partnership with local housing providers and other jurisdictions, the City will establish an affordable housing listing service to help low-income households better access affordable housing opportunities. The City will be conducting a request for professional services for an affordable housing listing service to kick-off these efforts. The service would allow households to search for opportunities by geography and accessibility needs.

Impact

Affordability: 0-30%

Tenure: Both

Populations Served: Low-income communities

Magnitude: low

DLCD Category: Stabilization and Other

Priority: Medium

Lead: PHB

Partners: Home Forward, Metro, local providers of affordable housing.

Project Start: Summer 2024

Adoption: December 2025

Implementation: July 2027

F. Promote Age and Disability Friendly Housing

Approximately a quarter of all households in Portland have at least one family member with a disability and over 13 percent of the population is over the age of 65, and these numbers are forecast to increase. Because of the ageing population and the acute need to meet the needs of community members living with disabilities, BPS conducted extensive engagement for the Age- and Disability-Inclusive Neighborhood action plan, which has been incorporated into these strategies.

The HPS community engagement also identified a need for specific actions such as updating incentives in the zoning code and developing a comprehensive source of information for developing housing that allows ageing households to age in community. Some recommendations from advocates and community members are beyond the scope of local regulation and are therefore included in other initiatives.

These strategies promote age and disability friendly housing and increase Portland's ability to ensure equitable access to housing, making a special effort to remove disparities in housing access for people with disabilities and older adults. These strategies build on the recommendations in the draft action plan for Age- & Disability-Inclusive Neighborhoods (ADIN).

These strategies will require staff time to revise the regulatory barriers and incentives to help produce more accessible units as well as create programs specifically focused on supporting the development of accessible units.

Figure 8. Existing and Ongoing Policies Addressing Age and Disability Friendly Housing

Existing and Ongoing Programs Addressing Age and Disability Friendly Housing	
Action Plan for An Age-Friendly Portland (2014)	Fair Access in Renting (FAIR)
Visitable Units Bonus	Empowered Neighborhood Program
Age- & Disability-Inclusive Neighborhoods (ADIN) Action Plan (2023)	

NEW STRATEGIES

1. Implement Accessible Housing Production Strategies

The City aims to reduce the financial, regulatory, and institutional barriers to developing needed accessible housing in the aging city.

- Review and revise Chapter 33.229 Elderly and Disabled High Density Housing to consider relevancy and use as well as the opportunity to target middle housing.
- Revise visitable units bonus (33.120.211.C.4) to incentivize the increased development of visitable and accessible units that meet Universal Design, Oregon Lifelong Housing Certification, and other similar standards.
- Create an accessible housing inventory – BPS, PHB and PP&D will work together to identify opportunities to fund and support the work of creating an accessible housing inventory in order to better understand the gap in accessible housing. The City will explore programmatic opportunities to connect households to units (D3).

Impact

Affordability: All

Tenure: Both

Populations Served: Low-income communities; Older adults, People with disabilities

Magnitude: Low

DLCD Category: Zoning and Code

Priority: Medium

Lead: BPS, PHB

Partners: PP&D, Multnomah County; DLCD, BCD, OHCS, SPD, ADVSD, Developers

Project start: July 2027

Adoption: June 2028

Implementation: Oct. 2028

2. Educate on Opportunities for Aging in Place & Community

Provide technical assistance on incremental housing development guidelines to enhance aging in place/community (e.g., zero-step entrances, universal design, adaptable housing, affordable neighborhood-based housing models). Create programs to support two types of development:

- Retrofits to allow households to age in community/place.
- Middle housing opportunities for aging in community

Impact

Affordability: All

Adoption: June 2029

Implementation: July 2029

G. Promote Climate Friendly and Healthy Homes

These strategies promote the development of climate friendly and healthy homes so that people of all abilities and income levels have access to high-performance and climate resilient housing. A critical connection exists between the quality of the housing unit and the health of its occupants. Access to open spaces, opportunities for social interactions, green features, low-carbon building and adaptability also influence the health of a community.

New housing production will result in development that lasts for generations, and therein lies the opportunity to ensure the provision of affordable, quality housing that prioritizes equitable access to safe and healthy living environments and supports community resiliency. In community engagement we heard residents support policies that address not only net housing production but housing that will be resilient to the changing climate. The analysis shows that close to half of all regulated affordable units are situated in Portland's hottest neighborhoods, along with 39 percent of new demand and 38 percent of current housing capacity.

These strategies focus on building and maintaining Portland's housing stock in ways that foster environmental and community health and builds on actions in the Climate Emergency Work Plan and the Climate Investment Plan. Eliminating and reducing carbon from buildings, vehicles, and businesses is one part of addressing the climate emergency. The other part is helping residents become resilient to day-to-day impacts of climate change like excessive heat, wildfire smoke, power outages, flooding and more.

Figure 9. Existing and Ongoing Policies Addressing Climate Friendly and Healthy Homes

Existing and Ongoing Programs

Empowered Neighborhood Program	Excess to Access
Portland Clean Energy Fund (PCEF)	EV Ready Requirement
SDC Waiver for Office to Residential Conversion	

NEW STRATEGIES

1. Support Mass Timber and Modular Innovations

As modular and mass timber innovations and developments increase in Portland, the City can support these innovations by updating zoning and development codes to facilitate the construction of mass timber and modular housing. The widespread use of modular construction not only lowers construction costs and timelines, but it also aligns with the goals outlined in Advance Portland and promotes Portland's emergence as an innovator in the housing market.

- In addition, the City will study the economic opportunity to invest in the necessary infrastructure and workforce development to support the growth of modular and mass timber construction.

Impact

Affordability: All

Tenure: Both

Populations Served: General

DLCD Category: Zoning and Code

Priority: Medium

Lead: BPS, Prosper

Partners: Port, PP&D, PHB, Mass Timber Coalition

Project start: July 2028

Adoption: June 2029

Implementation: July 2029

2. Develop Low Carbon Building Policies

The City will continue to develop policies that reduce both operational and embodied carbon, as well as the carbon content of building materials and construction emissions. Carbon can be lowered in development through project design, engineering, and material selection before construction. Embodied carbon can be reduced through the use of low-carbon alternatives, adaptive reuse and whole-building life-cycle assessments, etc. Operational carbon reduction strategies include onsite and community-owned solar, renewable electric grid, electric new construction homes, advanced building energy codes, and electric vehicle (EV) readiness.

The Portland Clean Energy Community Benefits Fund (PCEF) invests in community-led and informed projects to reduce carbon emissions and make Portland more resilient. PCEF's Climate Investment Plan (CIP) for 2023-28 identifies key programs that will reduce carbon emissions and address the needs of Portland residents most impacted by a rapidly changing climate. The CIP will invest over $300 million in energy efficiency and renewable energy programs to support housing that will be built to high-efficiency, low-carbon, resilient standards. PCEF will also invest over $100 million in planting and maintaining Portland's urban tree canopy and $41 million in workforce and contractor development. Specifically, these

Impact

Affordability: All

Tenure: Both

Populations Served: General

Magnitude: Low

collective investments will support clean energy upgrades in over 5,000 affordable multifamily units and over 3,000 moderate- and low- income single family homes; and planting and establishment of over 15,000 street trees, and maintaining over 240,000 street trees.

DLCD Category: Stabilization and Other

Priority: Low

Lead: BPS

Partners: DEQ, PP&D, Prosper, Metro, Mass Timber Coalition

Project start: July 2026

Adoption: June 2029

Implementation: July 2029

3. Promote Commercial to Residential Conversion / Adaptive Reuse

As cities face the reality of vacant commercial buildings in a changing economy, there is an opportunity to repurpose these buildings into much needed housing. The City will explore additional policies to support adaptive reuse:

A. Identify high opportunity underutilized assets in centers and corridors for conversion.

B. Establish financial and regulatory tools to incentivize office-to-residential conversion; including use of direct financial incentives (tax increment financing, expanded system development charge waivers, and tax abatement) and regulatory streamlining.

C. Review existing codes and zoning policies and establish ones that encourage the reuse of existing buildings.

D. Expand historic resource incentives to allow a wider variety of uses not otherwise allowed.

E. Evaluate code flexibility for adaptation and efficient energy systems for livability and affordability.

Partners: Port, PHB

Project start: 2023

Adoption: ongoing

Implementation: ongoing

4. Implement Heat Adaptation Recommendations

Given the rising urban heat risks associated with increased density, growth and the changing climate, BPS has developed recommendations for addressing urban heat, including nature based, engineered, and policy solutions. Adopting these solutions will ensure healthy and safe housing Portlanders. The recommendations most pertinent to housing development include:

- Cool Roof Regulations – Explore adopting cool roof regulations for new multi-dwelling buildings and retrofits. Cool roof requirements lower local outside air temperature which decreases the urban heat island effect, slow smog formation, reduce energy demand, decrease roof temperature, help older inefficient air conditioners provide sufficient cooling and improve indoor comfort and safety for spaces that are not air conditioned, reducing preventable heat-related illness and death.
- Other heat adaptation recommendations related to new development include shade tree planting and built shade structures in common outdoor areas, Cool Corridors Planning, planting manual updates and Environmental Justice Spatial analysis and mapping.

Implementation: 2029

H. Advocate at the State and Federal Level

The City faces limitations in its role at the local level. Through the engagement done with community coalitions, the survey and public comment received, it was clear that many changes that would promote housing production, and the type of housing needed in communities in Portland, require the City to advocate for funding and policy changes at the State and Federal level. The following strategies identify state and federal action that would advance Portland's housing production strategies and goals. This list is meant to highlight various advocacy efforts that would help the City overcome some of the financial and regulatory barriers to housing production.

1. Advocate for Funding for Production and Preservation

The state legislature has recently recognized the importance of helping cities with funding for housing production. Continued state funding for affordable housing is critical to meeting our targets for lower income households. There is a need for additional funding to preserve existing affordable housing, especially those units with expiring 10-year agreements. Expanded support for middle income housing for households making between 60-120% AMI. Recently, the state legislature provided funding for public infrastructure projects that support housing. More investments like those are needed to support infrastructure for individual developments and larger catalytic projects.

Impact

Affordability: All

DLCD Category: Stabilization and Other

Priority: Low

Lead: OGR, PHB

Partners: PP&D, Prosper, BPS

Project Start: 2024

Adoption: 2025

Implementation: 2025

2. Advocate for Regulatory and Code Changes to Meet Housing Need

Many state policy changes could be made at both the statutory and regulatory level to accelerate housing production including updating condominium laws; increasing visitability and accessible units; allowing for midsize multi-dwelling buildings with a single (staircase) exit; and reducing burdens on affordable housing. Other ideas include changing the Low-Income Housing Tax Credit program to focus on affordable housing; creating a State Rehabilitation Tax Credit to support seismic upgrades, energy retrofits, and conversion of non-residential buildings to housing; reforming the Mortgage Interest Deduction to generate revenue for affordable housing funding and creating pilot projects using a limited profit, non-market, or other alternative housing development models.

Adoption: 2025

Implementation: 2025

---

3. Advocate for Policy that Supports the Building of Resilient Homes

As the City of Portland continues to work to produce more resilient and environmentally friendly homes, there are opportunities for the state and federal governments to do more to reduce embodied carbon in construction and incentivize shifts to all-electric standards.

Impact

Affordability: All

Implementation: 2025

Monitoring Progress

As Portland's first Housing Production Strategy, the City is establishing performance measures to track strategy implementation and progress. In three years (2027), the City will submit to the State a progress report that reports on actual housing production as well as a summary of the actions taken by the City to implement the strategies and an assessment of the circumstances or factors that posed a barrier to implementation with a plan for addressing the identified need that the strategy addressed. The City must also include a reflection of the relative efficacy of implemented strategies. In addition to the annual monitoring the City does on the total number of units produced and units produced by type the performance metrics for monitoring progress are:

Figure 10. Proposed Metrics for Monitoring Progress

A. Promote Affordable Housing (0-80% AMI)	B. Increase Middle Income Housing and Homeownership
• # of units by affordability (ACS/PUMS) • # of affordable units (0-80% AMI) produced • Average $ investment per rental housing unit • Average $ State and Federal funds invested per local $	• Change in # of ownership units (ACS) • # of ownership units built using TIF • Amount of $ awarded for Middle-Income development • $ used for homeownership programs
C. Increase Access To Opportunity / G. Promote Climate Friendly and Healthy Homes	**D. Reduce Barriers to Development and Improve Processes**
• % of new housing in complete neighborhoods • % of new housing in high opportunity areas • # of units produced within RCAA/RECAP • # of units produced within centers and corridors • % of new housing in low carbon neighborhoods	• # of days from application submittal to approved to issue • # of review cycles • Increased customer satisfaction via survey • % of teams meeting 1st and 2nd review goals
E. Stabilize Current and Future Households	**F. Promote Age and Disability Friendly Housing**
• # of PSH units built • # of HHs provided legal services for housing access and stabilization • # of HHs supported in HH level programs • % of BIPOC HHs provided legal services • $ Amount of supportive services funding aligned with actual costs for property management, service delivery, and other operating needs • $ Amount of funding for preservation and rehabilitation • # and distribution of severely cost burdened households • # of units produced within economically vulnerable tracts • # of regulated affordable units preserved through rehabilitation and/or new regulatory agreements	• # of accessible units permitted and produced • # of middle housing units permitted and produced

Engagement Summary

The Housing Production Strategy involved stakeholder engagement through a number of different avenues, including relying on the engagement of several projects that took place in recent years, including the Portland Insights Survey, Housing Regulatory Relief Project, 2045 Housing Needs Analysis and the Age and Disability Inclusive Neighborhood Discussion draft, all of which are described in more detail in Summary of Engagement from Recent Projects at the end of this report. These engagement efforts resulted in a revised draft of the Housing Production Strategy.

Broad and targeted engagement included outreach with both residents and developers of housing including discussions with individuals, coalitions, community groups and developers as well opportunities for general public comments via the web. This resulted in the following engagement, which is outlined and summarized in more detail in Appendix C. Engagement Plan and Activities:

- 256 individuals while at 25 organization/coalition meetings and open houses
- 66 individuals at six Black, Indigenous and People of Color (BIPOC) specific focus groups
- 42 individuals at in-person East Portland BIPOC community meeting
- 350 individuals via Citywide Housing Needs Survey
- 107 comments on the Discussion Draft of the HPS Action Plan
- 16 developers/producers of housing interviewed
- 4 Cross-Jurisdictional Technical Advisory Committee Meetings
- 28 Multi-Bureau Internal Working Group Meetings

Residents

Across focus groups, community and stakeholder meetings, a citywide survey and public comment opportunities, the key issues identified by Portland residents included:

- **Affordability.** The greatest need identified was for more affordable housing, especially for lower-income households, including renters who are concerned about rent increases and people experiencing houselessness. Even with restricted rent, some housing is still out of reach and multiple types of services need to be stacked. There was a greater desire to better understand how to get on lists for access to affordable housing that comes online. Advocates suggested a more targeted focus on lower affordability levels for both rent and own strategies (<50 percent Area Median Income (AMI)) and at the 0-30 percent level there is a need for permanent supportive housing and rental assistance in addition to an affordable unit.

- **Access to opportunity.** Infrastructure and the expansion of transit opportunities were identified as key investments needed to support the construction of housing and to provide mobility and access to key services, such as grocery stores in neighborhoods.
- **Access to outdoor or green space.** Households value housing that has access to green space on the property but also within their neighborhoods.
- **Access to programs to gain or maintain homeownership.** Greater access to homeownership is desired (esp. for lower-income households). Greater access to stabilization or repair programs for middle-income households.
    - Targeting lower income levels of affordability for ownership is more likely to uplift BIPOC households given the current disparities in wealth and income distribution in Portland.
- **Safety.** Safe neighborhoods are desirable but feel unaffordable, some multi-dwelling properties themselves feel unsafe despite the presence of property management.
- **Accessibility.** The most critically needed specific needs housing types were identified as housing for households experiencing houselessness, mental health support, aging individuals and households, and persons with disabilities.
- **Commitment to action.** Advocates expressed a desire for bureaus to articulate a higher level of commitment to action within the strategies (i.e., "study" vs "do").
- **Community Education.** Educate to increase access to opportunity for BIPOC homeowners specifically and homeowners generally, promote education on how to better utilize properties – around using code and doing small-scale development for middle housing and additional ownership opportunity
- **Adaptive reuse**. Residents are concerned with underutilization of existing commercial and residential buildings and the impacts of new development on old stock and on climate.
- **Increased housing preservation and production advocacy.** Staff heard a variety of items that should be supported in the City's legislative work; consideration of single stair building, embodied carbon strategies for new housing, all electric housing production, additional infrastructure resources, educed burdens on affordable housing, Mortgage Interest Deduction Reform, and for a one-to-four-unit residential building code.

Developers

City staff presented to and interviewed many different housing developers and coalitions, including Housing Oregon, Oregon Smart Growth, Portland Homebuilders Association, and individual market-rate, affordable, and middle housing developers. Summaries of each engagement effort are provided in the following sections.

Some of the primary feedback on barriers to development included:

- **High financing and development costs.** Material costs have stabilized but high interest rates have increased borrowing costs, constrained the debt market, and increased project costs. Additional high costs include labor as well as city requirements for system development charges. Smaller and affordable housing developers are especially impacted.
- **Permitting and inspection delays and uncertainty.** Uncertainty around the permitting and inspection process and timeline add cost and risk to development projects and can lead to developer hesitation to embark on new projects.
- **Land supply issues**. It is difficult to find sites appropriately zoned, especially for higher density affordable development. Affordable housing providers are unable to compete with market-rate developers because of the longer timelines associated with public financing. Many sites have stormwater, sewer, and transportation infrastructure limitations, which adds significant cost.
- **Low rent growth.** Rent growth has slowed down but costs (and capital) have continued to increase. Rent is too low in East Portland for market-rate projects to financially feasible.
- **Challenging regulatory environment.** There is a perception of large sections of outdated, irrelevant, or complicated code, especially for multi-dwelling developments.

Some of the primary feedback on draft production strategies included:

- **Be aggressive with meaningful incentives.** Remove or increase height and FAR limits, simplify the Zoning Code, and revise SDCs.
- **Simplify and improve the permitting process.** Streamline permitting for previously approved plans; improve transparency, predictability, and timing; identify and eliminate unnecessary steps and common issues in adjustments; improve inter-bureau coordination.
- **Advocate for State legislative changes**. Allow single-staircase buildings and use of the single-dwelling residential code for middle housing (up to four units).
- **Explore financial opportunities to support housing development.** Utilize state revolving loan funds; expand incentives for affordable housing to 100-120 percent AMI; and explore opportunities to support private development.
- **Explore ways to support housing innovation.** Expand the use of mass timber, modular, and adaptive re-use/conversions.
- **Explore opportunities for development partnerships.**
- **Create a specific East Portland production strategy.** Increase density in areas where there is existing or future planning and investments, e.g., Powell, 82nd, 122nd, and TIF districts.

Assessment of Engagement

Even though this project implemented a robust engagement effort starting in January 2024, there are opportunities for improvement in future engagement practices including:

- Time engagement to align with advocates availability. Because this project engagement took place before, during and shortly after the State legislative session we acknowledge that some organizations and community groups were not able to fully engage with the initial review of the draft strategies.
- Continue to improve relations with community organizations in ways that are more culturally responsive, trauma informed and respect the time, resources and capacity of communities without tokenization.
- Consider the impacts of hosting events during major religious holidays, e.g., Ramadan.
- Reflect on the languages that materials are shared in by default. Materials were translated into Spanish, Vietnamese, Chinese and Russian, however it was noted through engagement that translating into French might increase engagement with African communities in Portland.
- When attending community events, staff brought information on how to connect to current programs and resources. However, while the focus of the project is long-range, given the immediacy and sensitive nature of some individual household needs when engaging on the topic of housing, additional staff or partners who are experts in navigating these resources or who are able to directly connect community members to resources should participate in the meetings.

Achieving Fair and Equitable Housing Outcomes

The City acknowledges land use and other policy has impacted fair and equitable housing outcomes in the Historical Context of Racist Planning: A History Of How Planning Segregated Portland report and Anti-Displacement Action Plan; Foundation Report and A Dream Rezoned: Navigating Possibilities within Portland's Long History of Racist Planning. Additionally, through the Consolidated Plan/Action Plan, Consolidated Annual Performance and Evaluation Report (CAPER) and Analysis Of Impediments To Fair Housing Choice, the City conducts audits and analyses of existing policies to identify potentially discriminatory effects and opportunities to affirmatively further fair housing.

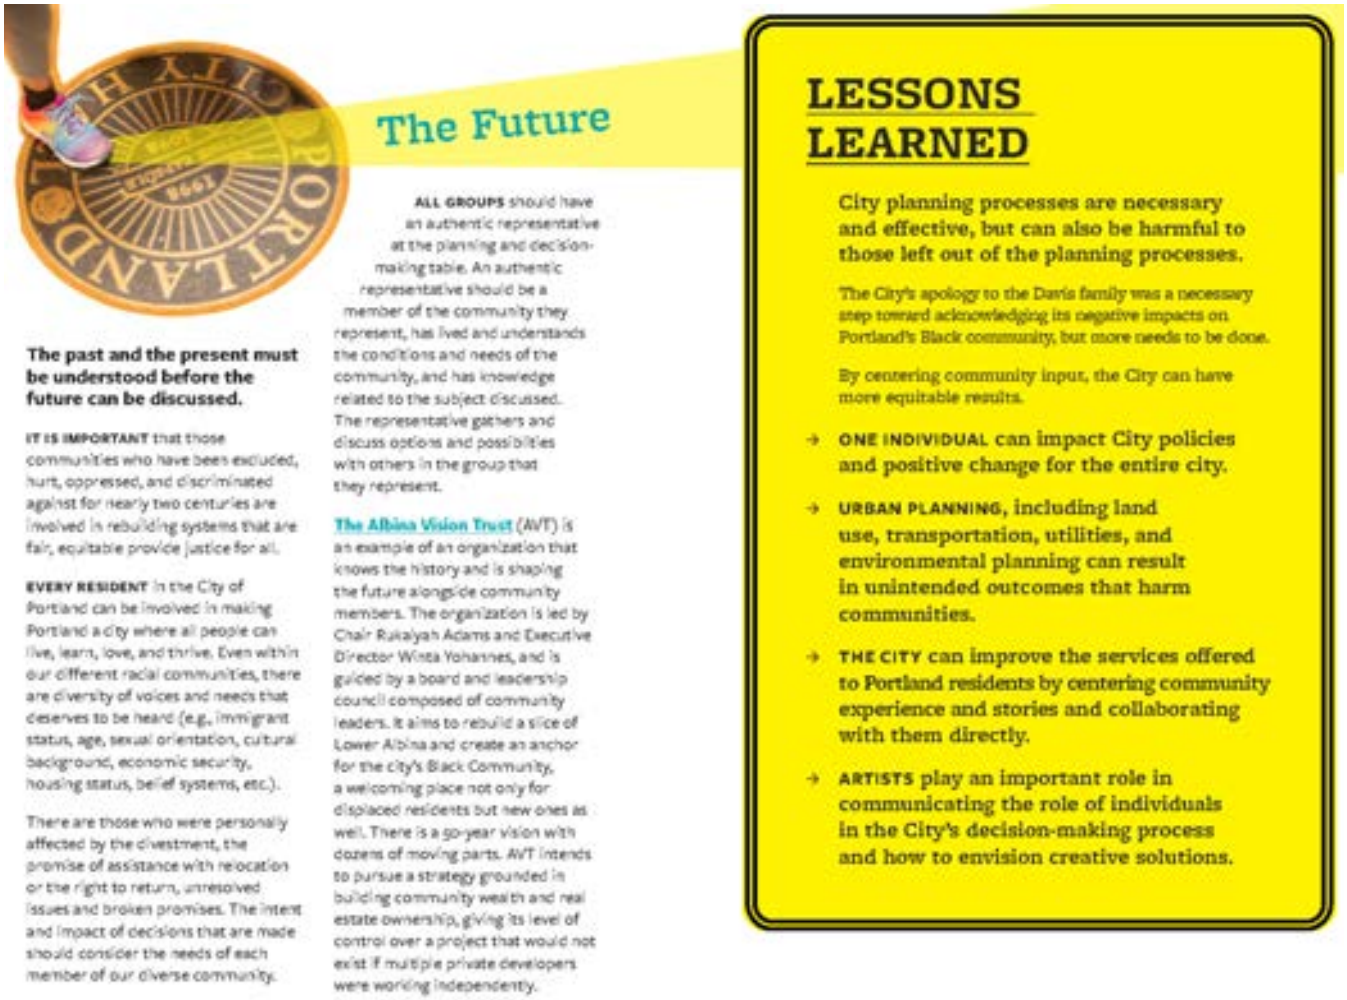
The City of Portland has a responsibility to affirmatively further fair housing by changing policies that have disparate impacts and instead intentionally create equitable outcomes. Federal protected classes are race, color, national origin, religion, gender, familial status, and disability. Oregon's additional protected classes are marital status, source of income, sexual orientation, gender identity, and status as a domestic violence survivor. In addition, Portland and Multnomah County's protected classes include occupation and age, if over 18. Under Fair Housing laws, it is illegal to deny access to housing in based on the characteristics of people within these protected classes.

The actions included in Portland's Housing Production Strategy aim to work together to achieve equitable outcomes for all residents. This evaluation summarizes the HPS strategies, in combination with other city actions, will achieve equitable outcomes. This is not intended to be an exhaustive evaluation of how each action addresses these outcomes but a high-level overview of the HPS as a whole. As outlined in OAR 660-008-0050 the factors the City must consider are:

- **Location of Housing in Compact, Mixed-Use Neighborhoods**. Is the City creating compact, mixed-use neighborhoods available to all people who belong to protected classes?
- **Fair Housing**. Is the City affirmatively furthering fair housing for all protected classes?
- **Housing Choice for Protected Classes**. Is the City facilitating access to housing choice for communities of color, low- income communities, people with disabilities, and other protected classes?
- **Housing Options for People Experiencing Houselessness**. Is the City enabling housing options for residents experiencing houselessness and promoting services that are needed to create permanent supportive housing and other options?
- **Affordable Homeownership and Affordable Rental Housing**. Is the City supporting and creating opportunities to encourage the production of affordable rental housing and the opportunity for wealth creation via homeownership?

- **Gentrification, Displacement, and Housing Stability**. Is the City increasing housing stability and mitigating the impacts of gentrification, as well as the economic and physical displacement of residents resulting from investment or redevelopment?

Figure 11. The Future: A Dream Rezoned



The Future

The past and the present must be understood before the future can be discussed.

IT IS IMPORTANT that those communities who have been excluded, hurt, oppressed, and discriminated against for nearly two centuries are involved in rebuilding systems that are fair, equitable provide justice for all.

EVERY RESIDENT in the City of Portland can be involved in making Portland a city where all people can live, learn, love, and thrive. Even within our different racial communities, there are diversity of voices and needs that deserves to be heard (e.g., immigrant status, age, sexual orientation, cultural background, economic security, housing status, belief systems, etc.).

There are those who were personally affected by the divestment, the promise of assistance with relocation or the right to return, unresolved issues and broken promises. The intent and impact of decisions that are made should consider the needs of each member of our diverse community.

ALL GROUPS should have an authentic representative at the planning and decision-making table. An authentic representative should be a member of the community they represent, has lived and understands the conditions and needs of the community, and has knowledge related to the subject discussed. The representative gathers and discuss options and possibilities with others in the group that they represent.

The Albina Vision Trust (AVT) is an example of an organization that knows the history and is shaping the future alongside community members. The organization is led by Chair Rukaiyah Adams and Executive Director Winta Yohannes, and is guided by a board and leadership council composed of community leaders. It aims to rebuild a slice of Lower Albina and create an anchor for the city's Black Community, a welcoming place not only for displaced residents but new ones as well. There is a 50-year vision with dozens of moving parts. AVT intends to pursue a strategy grounded in building community wealth and real estate ownership, giving its level of control over a project that would not exist if multiple private developers were working independently.

LESSONS LEARNED

City planning processes are necessary and effective, but can also be harmful to those left out of the planning processes.

The City's apology to the Davis family was a necessary step toward acknowledging its negative impacts on Portland's Black community, but more needs to be done.

By centering community input, the City can have more equitable results.

- → **ONE INDIVIDUAL** can impact City policies and positive change for the entire city.
- → **URBAN PLANNING**, including land use, transportation, utilities, and environmental planning can result in unintended outcomes that harm communities.
- → **THE CITY** can improve the services offered to Portland residents by centering community experience and stories and collaborating with them directly.
- → **ARTISTS** play an important role in communicating the role of individuals in the City's decision-making process and how to envision creative solutions.

Location of Housing in Compact, Mixed-Use Neighborhoods

These actions and strategies illustrate how the City is striving to meet statewide greenhouse gas emission reduction goals by creating compact, mixed-use neighborhoods available to people who are members of protected classes. Within Metro, cities subject to this rule shall describe actions taken by the City to promote housing within Region 2040 centers and climate-friendly areas, the production of regulated affordable and accessible dwelling units; to mitigate or avoid the displacement of; and to remove barriers and increase housing choice for members of protected classes.[7]

Existing Actions

The City has adopted actions that aim to allow for higher density housing in residential and mixed-use areas that are located near transit and that are within walking/rolling distance of a variety of services and amenities. This is a particular benefit to low-income households, older adults and people with disabilities, who may rely on transit and other modes to get around. These actions are further detailed in Housing Policy in Portland.

- **Mixed Use Zoning**. Developed new mixed-use planning and zoning designations to implement the "Centers and Corridors" concepts.
- **Central City 2035.** Increased capacity for high-density, mixed-use and multi-dwelling housing, streamlined bonus and transfer system, increased FAR/density and height and minimum density.
- **Better Housing by Design (BHD).** Re-wrote the Multi-Dwelling Residential Zones Chapter (33.120) to better implement policies for increased opportunities around centers and corridors.
- **Residential Infill Project (RIP)**. Added flexibility to the R2.5, R5, R7, R10 and R20 zones to allow for middle housing types, which will increase the number of units and allowable configurations; and removal of minimum off-street parking requirement.
- **Historic Resource Code Project (HRCP)**. Allowed small detached ADUs in historic districts without a land use review, removed minimum off-street parking for historic landmarks and districts, some density limits, and enabled two ADUs to be built with a house, duplex to fourplex or multi-dwelling.
- **Parking Compliance Amendments Project (PCAP).** Removed minimum parking requirements and other adjustments to standards to align with CFEC rulemaking.
- **West Portland Town Center Plan.** included incentives and regulations to prioritize housing affordability and community benefits and proposed Zoning Map changes.

[7] Executive Order No. 20-04, ORS 456.586(1)(b); OAR 660-012-0310(2)

- **Lower SE Rising Area Plan**. addresses land use and transportation challenges faced in the Brentwood-Darlington neighborhood and nearby areas.
- **EV Ready Requirement.** requires 50% of parking in new buildings with five+ units, to include EV-ready infrastructure, when more than six spaces are provided; or 100% when six or fewer provided.
- **Inclusionary Housing (IH) Program.** requires new medium and large (20 or more units) market-rate multi-dwelling development to provide affordable housing.
- **Tax Increment Financing (TIF).** An updated Affordable Housing Set-Aside Policy requires that forty five percent of TIF funding across urban renewal areas to go to affordable housing.
- **Portland Clean Energy Community Benefits Fund (PCEF)**. Invest in energy efficiency and renewable energy upgrades in housing for low-income households.
- **Affordable Housing Green Building Policy.** Ensures construction funded by PHB advances environmental, social, and economic goals.
- **Portland Housing Bureau Investment Framework.** Guides how PHB identifies, purchases, builds and renovates homes. Priority areas with little or no affordable housing, at high risk of gentrification, with concentrations of communities of color, are in consideration of infrastructure projects and have access to education, transportation, services, economic opportunities and green spaces.
- **PBOT Transportation Wallet.** Three programs are available for new movers into some new multi-dwelling buildings, those living or working in Northwest and Central Eastside Parking Districts, and people living on low incomes; provides discounts on transportation services.

New Strategies

In addition to existing actions, several strategies within the HPS encourage housing in compact, mixed-use neighborhoods, thereby encouraging reduced greenhouse gas emissions and creating more opportunities to live within climate-friendly areas:

- Review and Update Inclusionary Housing (IH) Program
- Create New Tax Increment Financing Districts
- Rezone Sites For Affordable Housing
- Incorporate Affirmatively Furthering Fair Housing Into City Code
- Establish a Comprehensive Citywide Land Banking Strategy
- Update Land Division Code
- Improve Middle Housing Permit Process
- Increase Housing Capacity in Inner Centers & Corridors

- Kickstart Housing Demand in Central City
- Increase Housing Capacity in the Central City
- Identify Housing Opportunity Along 82nd Avenue
- Promote Increased Transit Service
- Preserve Existing Affordable Housing
- Implement Accessible Housing Production Strategies
- Educate on Opportunities for Aging in Place & Community
- Develop Low Carbon Building Policies
- Promote Commercial to Residential Conversion / Adaptive Reuse
- Advocate for Funding for Production and Preservation
- Advocate for Regulatory and Code Changes to Meet Housing Need
- Advocate for Policy that Supports the Building of Resilient Homes

Fair Housing

Fair housing is embedded in the Comprehensive Plan with Goal 5.B: Equitable access to housing. Stating that Portland ensures equitable access to housing, making a special effort to remove disparities in housing access for people with disabilities, people of color, low-income households, diverse household types, and older adults. This goal is directly implemented through the following policies:

- Policy 5.10 Coordinate with fair housing programs. Foster inclusive communities, overcome disparities in access to community assets, and enhance housing choice for people in protected classes throughout the city by coordinating plans and investments to affirmatively further fair housing.
- Policy 5.11 Remove barriers. Remove potential regulatory barriers to housing choice for people in protected classes to ensure freedom of choice in housing type, tenure, and location.
- Policy 5.12 Impact analysis. Evaluate plans and investments, significant new infrastructure, and significant new development to identify potential disparate impacts on housing choice, access, and affordability for protected classes and low-income households. Identify and implement strategies to mitigate the anticipated impacts.

In addition to these policies, the following actions and strategies illustrate how the how the City is affirmatively furthering fair housing for all protected classes.

Existing Actions

These actions are further detailed in Appendix B. Housing Policy in Portland.

- **Fair Housing Policy Audits.** Through the Consolidated Plan/Action Plan, Consolidated Annual Performance and Evaluation Report (CAPER) and Analysis Of Impediments To Fair Housing Choice, the City conducts audits and analysis of existing policies to identify potentially discriminatory effects and opportunities to affirmatively further fair housing.
- **Fair Housing Testing.** City conducts fair housing testing to determine whether discriminatory patterns and practices pertaining to renting a place to live likely exist, the form that they take, and which protected class groups are most likely to experience them.
- **Affirmative Marketing For City Incentives.** As a requirement of City funding, via PHB, for affordable housing projects, the developer/owner must complete and submit an affirmative marketing plan before PHB will submit financial close.
- **Landlord-Tenant Mediation Pilot Program.** In partnership with Resolutions Northwest, provides free mediation services to landlords and tenants with rental housing disputes.
- **Rental Services Office (RSO)**. A helpline for technical assistance and information on landlord-tenant laws and policy as well as provides trainings for landlords. RSO staff can provide referrals and information, they cannot offer legal advice.
- **Fair Access in Renting (FAIR).** City adopted policy that regulates security deposits, move in fees, and screening criteria that may be used to select tenants.
- **Eviction Legal Support.** Tenants can seek these free legal services as soon as they receive a Notice of Termination and do not need to wait until an eviction case is filed.
- **Oregon Worker Relief. Household Relief and Legal Defense.** Oregon Worker Relief and its partners support immigrant and refugee Portlanders with help to keep small businesses open, stay stably housed, and navigate the immigration legal system.

New Strategies

Several of the strategies further fair housing goals by addressing disparities in housing needs and increasing housing opportunity in areas of high opportunity, and by creating housing opportunities in racially and ethnically concentrated areas of poverty. Strategies that further fair housing goals include:

- Review and Update Inclusionary Housing (IH) Program
- Rezone Sites for Affordable Housing
- Incorporate Affirmatively Furthering Fair Housing into City Code
- Develop A Comprehensive Citywide Land Banking Practice

- Preserve Existing Affordable Housing
- Launch Affordable Housing Listing Service
- Implement Accessible Housing Production Strategies
- Educate on Opportunities for Aging in Place & Community
- Advocate for Funding for Production and Preservation
- Advocate for Regulatory and Code Changes to Meet Housing Need
- Advocate for Policy that Supports the Building of Resilient Homes

Housing Choice for Protected Classes

These actions and strategies illustrate how the City is facilitating access to housing choice for communities of color, low- income communities, people with disabilities, and other protected classes.

Existing actions

These actions are further detailed in Housing Policy in Portland. Actions described in the above categories are kept by name here for brevity.

- **Land Banking for Affordable Housing.**
- **Action Plan for An Age-Friendly Portland.** The action steps comprising the 2013 plan intend to move Portland toward future development and activities that foster not only physical environments but also social and service environments that meet these criteria, making Portland a community for all ages. Several actions in the plan relate directly to housing.
- **Age- and Disability-Inclusive Neighborhood Project (ADIN)**. Members of a working group focused on advancing neighborhood "centers" by building on polices in Portland's 2035 Comprehensive Plan and the Action Plan for an Age-friendly Portland.
- **North/Northeast Preference Policy and Housing Strategy.** The N/NE Preference Policy waitlist for rental/homeownership housing is open on a rolling basis. Priority status is given to applicants, and/or their descendants, who previously owned property that was taken by the Portland City government through eminent domain.
- **Visitable Unit Bonus.** zoning code changes to create a floor area bonus for visitable units. It provides bonus FAR allowed up to the maximum with visitable units' bonus when at least 25 percent of all the dwelling units on the site meet the visitability standards.

New strategies

The following strategies are intended to facilitate access to housing choice for communities of color, low-income communities, people with disabilities, and other state and federal protected classes:

- Review and Update Inclusionary Housing (IH) Program
- Rezone Sites For Affordable Housing
- Incorporate Affirmatively Furthering Fair Housing Into City Code
- Establish a Comprehensive Citywide Land Banking Strategy
- Expand Homeownership Programs
- Increase Housing Capacity in Inner Centers & Corridors
- Revise Zoning Bonuses and Incentives
- Preserve Existing Affordable Housing
- Implement Accessible Housing Production Strategies
- Educate on Opportunities for Aging in Place & Community
- Advocate for Funding for Production and Preservation
- Advocate for Regulatory and Code Changes to Meet Housing Need
- Advocate for Policy that Supports the Building of Resilient Homes

Housing Options for People Experiencing Houselessness

These actions and strategies illustrate how the City is advocating for and enabling the provision of housing options for residents experiencing houselessness and how the City is partnering with other organizations to promote services that are needed to create permanent supportive housing and other options for residents experiencing houselessness.

Existing actions

These actions are further detailed in Housing Policy in Portland. Actions described in the above categories are kept by name here for brevity.

- **Joint Office of Houseless Services (JOHS)**. Services funded include rapid rehousing, permanent supportive housing, outreach/navigation, shelter/survival support, hygiene, and employment. The Houselessness Response Action Plan outlines actions and outcomes that the City and County are aiming to produce.
- **Safe Rest Villages**. The City's Safe Rest Village team is adding to the mix of alternative shelters throughout Portland. The project team manages the largest portion of the City grant funds from ARPA, which includes the seven designated Safe Rest Villages, as well as two alternative shelters.

- **Shelter 2 Housing Continuum (S2HC).** Adopted code to expand housing and shelter options; made it easier to site shelters, increased range of group living, including single room occupancy (SRO); and allows a recreational vehicle or tiny house on wheels on a residential property.
- **Short-Term Rental Lodging Tax and Fee.** A nightly fee on short-term rentals is due from short-term rental hosts. This fee is in addition to the Transient Lodgings Tax. The funds generated from this fee are used to fund affordable housing and houselessness.
- **Metro Supportive Housing Services (SHS) Fund.** These fund supportive services required for PSH under the Portland and Metro Housing Bonds as well as housing that becomes supportive housing. Funds have been used to provide Regional Long-term Rent Assistance (RLRA) to support houseless households or those at risk of becoming houseless.

New strategies

The City can also prioritize extremely low-income households who may be at risk of becoming houseless by targeting its affordable housing strategies to those populations. Supporting housing with deep affordability and wraparound services requires additional resources and partnerships with organizations that specialize in that form of housing. The City can make that a priority for HPS implementation.

These strategies are about increasing resources for prevention of houselessness. Part of decreasing houselessness will be preservation of existing housing, rehabilitation of housing, development of more affordable ownership and rental housing, and increasing housing stability to prevent houselessness.

- Rezone Sites For Affordable Housing
- Incorporate Affirmatively Furthering Fair Housing Into City Code
- Establish a Comprehensive Citywide Land Banking Strategy
- Update Short Term Rental Nightly Fee
- Launch Affordable Housing Listing Service
- Preserve Existing Affordable Housing
- Explore Accessible Housing Production Strategies
- Educate on Opportunities for Aging in Place & Community
- Advocate for Funding for Production and Preservation
- Advocate for Regulatory and Code Changes to Meet Housing Need

Affordable Homeownership and Affordable Rental Housing

These actions and strategies illustrate how the City is supporting and creating opportunities to encourage the production of affordable rental housing and the opportunity for wealth creation via homeownership, primarily for state and federal protected classes that have been disproportionately impacted by past housing policies.

Existing actions

These actions are further detailed in Housing Policy in Portland. Actions described in above categories are kept by name here for brevity.

- **N/NE Housing Strategy and Preference Policy.**
- **Fair Access in Renting (FAIR).**
- **Metro Supportive Housing Services (SHS) Fund.**
- **Regulated Affordable Rental Housing.** Regulated rental housing is provided for households earning 80 percent AMI and below**,** largely funded multi-dwelling, regulated rental housing through the Tax Increment Financing Set Aside resources.
- **Acquisition and Rehabilitation of Existing Properties.** Tax Increment Financing (TIF) supports programs that purchase existing market-rate housing and/or sites, to convert into regulated, multi-dwelling affordable housing. PHB has used this to acquire properties for future redevelopment, to protect residents from displacement and/or secure affordable homes.
- **0% Home Repair Loans**. offers no-interest loan up to $40,000 to fund repairs to residents earning up to 120 percent of AMI in the Interstate Corridor Urban Renewal Area (ICURA).
- **Down Payment Assistance Loan Program.** A second mortgage loan funded by PHB, and it is used in conjunction with a first mortgage loan from a participating lender. DPAL is designed with favorable terms to help first-time homebuyers purchase a home within the city limits of Portland.
- **Expanding Opportunities for Affordable Housing.** Changes to zoning code that streamlined affordable housing in residential zones review process for community and faith-based organizations. Allowed them to develop affordable housing on their land without a conditional use (CU) review if at least 50 percent are affordable, Repurpose up to 50 percent of parking for affordable project and Add up to 2,000 sq ft of nonresidential use without CU review.
- **Multiple-Unit Limited Tax Exemption (MULTE).** A ten-year property tax exemption supports the creation of affordable housing units through the Inclusionary Housing Program; leverages market activities to advance prosperity goals by aligning activities with Portland Plan and PHB's Strategic Plan; and provide transparent and accountable stewardship of public investments.

    - **MULTE Extension Down Payment Assistance Loan Program.** Updates rules to allow projects with expiring MULTE units an opportunity to extend tax exemption for a limited amount of time in order to extend the affordability of the MULTE units.

- **Homebuyer Opportunity Limited Tax Exemption (HOLTE).** single-unit homes receive a ten-year property tax exemption on structural improvements to the home as long as the property and owner remain eligible per program requirements. The property is reassessed when the exemption is terminated or expires after the ten years, and owners begin paying full taxes.
- **Manufactured Dwelling Parks (MDP) Zoning.** established a new residential multi-dwelling base zone specifically for manufactured dwelling parks with a density of up to 29 units per acre. It has an affordable housing bonus option in which the maximum density can be increased up to 43 units per acre when at 50 percent of all the dwelling units on the site are affordable to those earning up to 60 percent area median family income.
- **Construction Excise Tax**. For residential improvements, 15 percent of net revenue remitted to OHCS; 50 percent transferred to Inclusionary Housing Fund to fund finance-based incentives for programs that require affordable housing; and 35 percent to the Inclusionary Housing Fund for production and preservation of affordable housing units below 60 percent median family income.
- **Portland Housing Bond**. To implement this Measure, PHB wove in rental support in the form of Project Based Section 8 vouchers from the housing authority of Multnomah County, Home Forward, and supportive services funding from JOHS. The Bond has exceeded all goals and committed all funds to 15 projects throughout the City in high opportunity location, representing 1,859 affordable units, a 43 percent increase over the goal, to provide homes to over 4,000 low-income Portlanders.
- **Metro Housing Bond.** Using funds from this bond, PHB has committed approximately $160 million to fund over 1700 units throughout the City in high opportunity area in over 20 projects, that are open or in development, to house another 4,000+ low-income Portlanders.

New Strategies

Several of the strategies included in the HPS support production of affordable rental housing and the opportunity for wealth creation via homeownership. By benefitting low-income households more broadly, these strategies are anticipated to benefit populations with lower median household incomes than Portland as a whole—including certain racial and ethnic groups. Strategies that address these needs (in addition to the City's existing measures) include:

- Review and Update Inclusionary Housing (IH) Program
- Create New Tax Increment Financing Districts
- Explore Replacing Housing Bonds Revenue Source
- Rezone Sites For Affordable Housing

- Update Short Term Rental Nightly Fee
- Incorporate Affirmatively Furthering Fair Housing Into City Code
- Establish a Comprehensive Citywide Land Banking Strategy
- Create New Middle-Income Financial Incentives
- Update Land Division Code
- Expand Homeownership Programs
- Increase Housing Capacity in Inner Centers & Corridors
- Revise Zoning Bonuses and Incentives
- Kickstart Housing Demand in Central City
- Increase Housing Capacity in the Central City
- Identify Housing Opportunity Along 82nd Avenue
- Revise System Development Charges (SDC)
- Preserve Existing Affordable Housing
- Implement Accessible Housing Production Strategies
- Promote Commercial to Residential Conversion / Adaptive Reuse
- Advocate for Funding for Production and Preservation
- Advocate for Regulatory and Code Changes to Meet Housing Need
- Advocate for Policy that Supports the Building of Resilient Homes

Gentrification, Displacement, and Housing Stability

In addition to many of the actions in prior sections, these actions and strategies illustrate how the City is increasing housing stability for residents and mitigating the impacts of gentrification, as well as the economic and physical displacement of existing residents resulting from investment or redevelopment.

Existing Actions

These actions are further detailed in Housing Policy in Portland. Some actions are described in above categories and are kept by name here for brevity.

- **Rental Services Office (RSO)**
- **Fair Access in Renting (FAIR)**

- **North/Northeast Preference Policy**
- **Landlord-Tenant Mediation Pilot Program**
- **N/NE Neighborhood Housing Strategy**
- **Eviction Legal Support**
- **Mandatory Relocation Assistance**
- **0% Home Repair Loans**
- **Rehabilitation and Preservation of Existing Regulated Housing**
- **Acquisition and Rehabilitation of Existing Market-Rate Housing**
- **RV Pollution Prevention Program.** Portland residents living in recreational vehicles (RVs) parked on the street are eligible for the pump out program.
- **Regulated Affordable Multifamily Assistance Program (RAMP).** provides a discount to Nonprofit Low-Income Housing Limited Tax Exemption (NPLTE) properties, will reach 12 percent of units, or 15,000 households annually, an estimated average benefit of $325 per unit.
- **Homeowner Foreclosure Prevention.** works through partner organizations to provide foreclosure prevention counseling and, where needed, financial assistance to homeowners facing foreclosure.
- **Utility Assistance Programs.** Bureau of Environmental Services and Water Bureau Financial Assistance programs including, Safety Net Low Income Loans, Bill discount, Crisis voucher and Water Leak Repair Assistance.
- **Empowered Neighborhood Program**. assists vulnerable residents from communities of color and/or those with disabilities, who have code enforcement issues.
- **Lead Hazard Control Grant Program.** provides lead-based paint hazards evaluation and financial assistance to reduce hazards in pre-1978 housing occupied by qualified households.
- **N/NE Community Development Initiative Action Plan.** guides the $32 million TIF investment and is focused on 5 goals: property ownership, business ownership, home ownership, community livability and cultural hubs.
- **American Rescue Plan Act Funds.** Funding has or had supported the following projects, some of which have contributed to the stabilization of households, while others have directly worked to house households, in temporary shelter such as safe rest villages, or in permanent housing:
    - Safe Rest Villages
    - COVID-19 Houseless Services
    - Flexible household assistance
    - Rapid Workforce Training & Employment
    - JOHS Motel Shelter Strategy
    - Affordable Housing Preservation

    - Afloat: Utility Debt Relief
- Eviction Legal Defense
- Homeowner Foreclosure Prevention
- Housing Stabilization Contingency
- Household Relief and Legal Defense
- RV Pollution Prevention Program
- Match2: Utility Debt Relief
- 82nd Avenue Anti-Displacement Housing Stabilization

New Strategies

Several strategies included in the HPS aim to increase housing stability for residents and mitigate the impacts of gentrification. Strategies that address these needs (in addition to the City's existing measures) include:

- Review and Update Inclusionary Housing (IH) Program
- Create New Tax Increment Financing Districts
- Update Short Term Rental Nightly Fee
- Leverage Other State and Federal Funding Sources
- Promote Commercial to Residential Conversion / Adaptive Reuse
- Preserve Existing Affordable Housing
- Educate on Opportunities for Aging in Place & Community
- Advocate for Funding for Production and Preservation

Assessment of Benefits and Burdens

The City is required to consider the anticipated benefit and burden from each action for the following groups of people who have been historically marginalized: low-income communities, communities of color, people with disabilities, and other state and federal protected classes.

Figure 12. Assessment of Benefits and Burdens by Strategy

Strategy	Benefit	Burden
A1. Replace Housing Bonds Revenue Source	• Will benefit extremely low, very low, low, and middle-income households, depending on how the City prioritizes funding • The groups more likely to benefit from this action are disproportionately marginalized communities, including communities of color, people with disabilities, and older adults	• Unlikely to increase burdens
A2. Create New Tax Increment Financing (TIF) Districts	• Will benefit extremely low, very low, low, and middle-income households, depending on how the City prioritizes funding • The groups more likely to benefit from this action are disproportionately marginalized communities, including communities of color, people with disabilities, and older adults	• As property values increase, there is a potential for displacing existing residents. The City sets aside at least 45 percent of new TIF revenue for affordable housing to mitigate this risk • Could have less positive impact for communities of color, people with disabilities, or older adults if these communities are not recruited for participation in the planning and resulting development
A3. Leverage Other State and Federal Funding Sources	• Depending on the funding priorities, will benefit extremely-low, very-low, low-, middle- and high-income residents and communities of color, and all local, state and federal protected classes	• Unlikely to increase burdens
A4. Establish a Comprehensive Citywide Land Banking Strategy	• Planning for areas of public investment with land banking can support affordable housing development. In already developed, exclusive areas, using public land may be the only cost-effective strategy for building new affordable units	• Unlikely to increase burdens

Strategy	Benefit	Burden
	• Will benefit households at extremely low income, very low-income, low-income, and limited moderate-income households • The groups more likely to benefit from this action are disproportionately marginalized communities, including communities of color, people with disabilities, and older adults • To increase benefits to people in local, state and federal protected classes, the City may want to consider focus on working with organizations that prioritize working with these groups of people.	
A5. Rezone Sites For Affordable Housing	• Depending on the structure, will benefit extremely-low, very-low, low-, middle- and high-income residents and communities of color, and all protected classes • To increase benefits to people in local, state and federal protected classes, the City may want to consider focus on working with organizations that prioritize working with these groups of people.	• Unlikely to increase burdens
A6. Review and Update Inclusionary Housing (IH) Program	• Will benefit extremely low, very low-, and low-income households. • The groups more likely to benefit from this action are disproportionately marginalized communities, including communities of color, people with disabilities, and older adults	• Unlikely to increase burdens
A7. Update Short Term Rental Nightly Fee	• Depending on the funding priorities, will benefit extremely-low, very-low, low-, middle- and high-income residents and communities of	• Unlikely to increase burdens

Strategy	Benefit	Burden
	color, and all local, state and federal protected classes	
B1. Create New Middle-Income Financial Incentives	• Will benefit middle-income households.	• Unlikely to increase burdens
B2. Update Land Division Code	• Will benefit middle-income households.	• Unlikely to increase burdens
B3. Expand Homeownership Programs	• Will benefit middle-income households.	• Unlikely to increase burdens unless funding is diverted from other affordable housing programs to support homeownership for higher-income households.
B4. Improve Middle Housing Permit Process	• Will benefit households at all income levels.	• Unlikely to increase burdens
C1. Implement and Support Catalytic Investments	• Will benefit households at all income levels. Could benefit lower income households by increasing housing opportunities in high opportunity neighborhoods • Could benefit lower income households, communities of color, people with disabilities, and older adults by incentivizing specific types of housing that meet their needs	• Unlikely to increase burdens
C2. Increase Housing Capacity in Inner Centers & Corridors	• Will benefit households at all income levels. Could benefit lower income households by increasing housing opportunities in high opportunity neighborhoods	• Unlikely to increase burdens on communities of color, people with disabilities, and older adults
C3. Revise Zoning Bonuses and Incentives	• Will benefit households at all income levels. Could benefit lower income households, communities of color, people with disabilities, and older adults by incentivizing specific types of housing that meet their needs	• Unlikely to increase burdens
C4. Kickstart Housing Demand in Central City	• Will benefit households at all income levels.	• If property values increase as a result of investment, there is a potential for displacing existing residents. The City could incorporate anti-displacement strategies into the investment framework.

Strategy	Benefit	Burden
C5. Increase Housing Capacity in the Central City	• Will benefit households at all income levels	• Unlikely to increase burdens
C6. Identify Housing Opportunity Along 82nd Avenue	• The groups more likely to be impacted by this action are disproportionately marginalized communities, including communities of color, people with disabilities, and older adults	• If property values increase as a result of investment, there is a potential for displacing existing residents. The City could incorporate anti-displacement strategies into the investment framework or plan to mitigate this risk
C7. Promote Increased Transit Service	• Will benefit these households. The City may want to incorporate specific criteria into its policies to ensure that the policies benefit these groups	• If property values increase as a result of investment, there is a potential for displacing existing residents. The City could incorporate anti-displacement strategies into the investment framework or plan to mitigate this risk
C8. Incorporate Affirmatively Furthering Fair Housing	• Will benefit extremely low, very-low, low-, middle- and high-income residents and communities of color, and all local, state and federal protected classes	• Unlikely to increase burdens
D1. Implement Regulatory Reform Project	• Will benefit all households by reducing development costs due to increased process efficiencies	• Unlikely to increase burdens
D2. Improve User Experience within Permitting Systems	• Will benefit all households by reducing development costs due to increased process efficiencies	• Unlikely to increase burdens
D3. Reform Development Services Funding Model	• No direct impact on these communities	• Unlikely to increase burdens
D4. Explore Infrastructure Investments and Strategies	• Will benefit all households by reducing development costs due to increased process efficiencies	• If property values increase as a result of investment, there is a potential for displacing existing residents. The City could incorporate anti-displacement strategies into the investment framework or plan to mitigate this risk. • Could have less positive impact for communities of color, people with disabilities, or older adults if these communities do not directly benefit from the infrastructure development

Strategy	Benefit	Burden
D5. Revise System Development Charges (SDC)	• Will benefit all households by reducing development costs • Could benefit lower income households, with continued waivers. • The City may want to incorporate specific criteria into its policies about reducing SDCs or planning fees to ensure that the policies benefit these groups.	• Unlikely to increase burdens
E1. Preserve Existing Affordable Housing	• These actions will protect affordable housing, especially for communities of color and other protected class communities. They have strong impacts for anti-displacement that can be seen in the short-term. • Will benefit lower income households • The groups more likely to have incomes impacted by this action are disproportionately communities of color, people with disabilities, and older adults • The City may want to incorporate specific criteria into its policies to ensure that the policies benefit these groups	• Unlikely to increase burdens
E2. Launch Affordable Housing Listing Service	• Will benefit people with disabilities, older adults, lower income households and communities of color • To maximize benefit, these communities should be consulted in the development and implementation of the listing service	• Unlikely to increase burdens
F1. Implement Accessible Housing Production Strategies	• Will support older adults and lower income households aging in place	• Unlikely to increase burdens
F2. Educate on Opportunities for Aging in Place & Community	• Will support older adults and lower income households aging in place	• Unlikely to increase burdens

Strategy	Benefit	Burden
G1. Support Mass Timber and Modular Innovations	• Could benefit all households by reducing development costs • The City may want to incorporate specific criteria into its policies to ensure that the policies benefit these groups.	• Unlikely to increase burdens
G2. Develop Low Carbon Building Policies	• The City may want to incorporate specific criteria into its policies to ensure that the policies benefit these groups.	• Unlikely to increase burdens
G3. Promote Commercial to Residential Conversion / Adaptive Reuse	• The City may want to incorporate specific criteria into its policies to ensure that the policies benefit these groups.	• Unlikely to increase burdens
G4. Implement Heat Adaptation Recommendations	• The City may want to incorporate specific criteria into its policies to ensure that the policies benefit these groups.	• Unlikely to increase burdens
H1. Advocate for Funding for Production and Preservation	• Will benefit extremely low, very low-, and low-income households. • The groups more likely to benefit from this action are disproportionately marginalized communities, including communities of color, people with disabilities, and older adults • Depending on the funding priorities, will benefit extremely-low, very-low, low-, middle- income residents and communities of color, and all local, state and federal protected classes	• Unlikely to increase burdens
H2. Advocate for Regulatory and Code Changes to Meet Housing Need	• Could benefit all households by reducing development barriers for needed housing	• Unlikely to increase burdens
H3. Advocate for Policy that Supports the Building of Resilient Homes	• Could benefit all households	• Unlikely to increase burdens

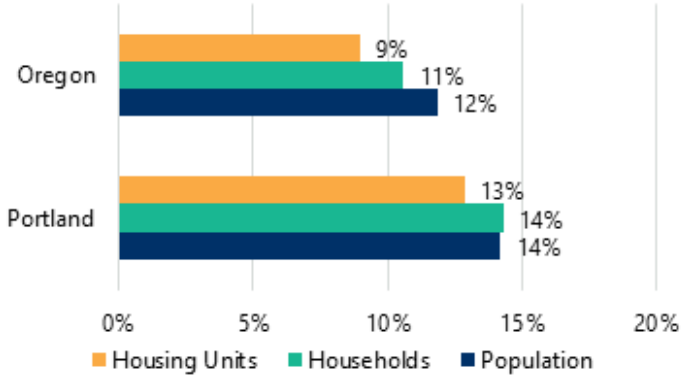
Appendix A. Additional Housing Need Context

Population and Household Characteristics

Population Change

The number of people in the city has been steadily increasing since 2000, making Portland the 24th largest city in the nation. However, over the last decade, there has been an expected slowing down in population and household growth across the Metro.[8] Estimates, including from the PSU Population Forecast Center, have estimated a slower year-over-year growth, or decline since the beginning of the COVID-19 pandemic (-0.7 percent decline in estimates from 2020 to 2022).[9] The Metro 2045 forecast still maintains that the city will see growth, albeit slower than it has been historically.[10]

Figure 13. Change in Population, Households and Housing units, Portland and Oregon, 2010 to 2021



Source: ACS 2010 and 2021 5-year estimates, DP03, DP02

Racial and Ethnic Diversity

The largest racial group in Portland is white, non-Latine or Hispanic, accounting for 69 percent of total residents.[11] Overall, the proportion of Black, Indigenous, and People of Color (BIPOC) residents in the city continues to increase over time. The population identifying as Latine and Hispanic (of any race) makes up the next largest group at 11 percent, eight percent of residents identify as Asian, and six percent identify as Black or African American.

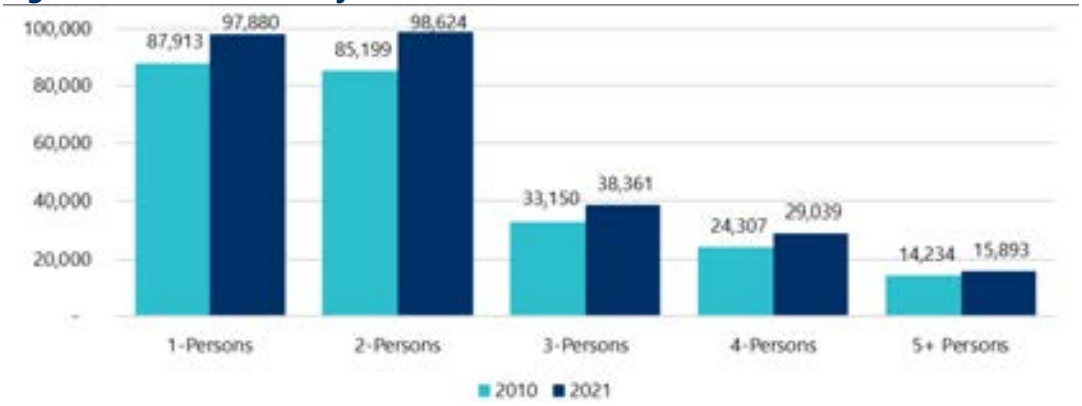
[11] Latine is the gender-neutral noun or adjective for a person who is from or whose family origins are from a Latin American country.

Household Composition

One- and two-person households represent 70 percent of the city's households. Households with three or more persons represent 30 percent of all households. (ACS 2010 and 2021, Table S1101, B11016). The average household size in Portland is 2.26 persons in 2021, comparable to the household size in 2010 (2.25). The city has seen a greater increase in the number of one and two person households than households with three or more persons between that time period. Still, the number of larger households has continued to increase as well.

Figure 15. Households by Household Size, 2010 and 2021



Source: ACS 2010 and 2021, Table B11016

The proportion of households with children declined slightly from 2010 to 2021. In 2021, 77 percent of households did not have children, a slight increase from 2010 when 75 percent of households did not have children (ACS 2010 and 2021, Table B11005). About seven percent of all households were single parent households in 2021, or about 31 percent of all households with children – a decrease from 2010.

Family households make up half of all households, a slightly decreasing share of all total households from 2010 in the 2021 survey period. The share of nonfamily households not living alone (living with roommates) increased by 11,340 households.

Figure 16. Household Composition, Family and Non-Family, 2010 to 2021

	2010		2021		Change	
	#	Share	#	Share	#	Share
Family Households:	125,703	51%	139,390	50%	13,687	11%
Married-Couple Family	90,660	37%	105,455	38%	14,795	16%

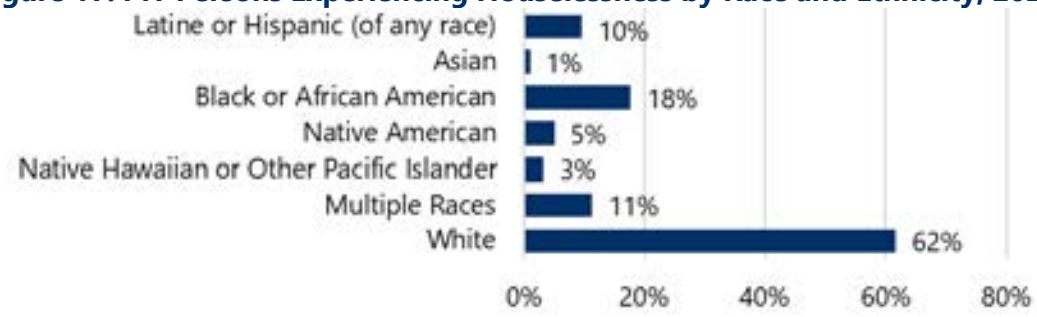
Historically Underserved Communities

People Experiencing Houselessness

Beyond immediate needs for safe shelter options, people who are unhoused or precariously housed need access to transitional housing, supportive services, and deeply affordable housing in the long term In 2023, 6,297 people were counted as experiencing both sheltered and unsheltered houselessness—a 27 percent increase since 2022, with unsheltered houselessness seeing the highest increase. In 2023, several racial groups were disproportionately experiencing houselessness in Portland.

Black or African American residents were over-represented in the houseless population compared to the overall population (18 percent compared to seven percent), American Indian or Alaska Native (five percent compared to three percent), Native Hawaiian or Other Pacific Islander (three percent compared to one percent), and Multiple Races (11 percent compared to less than three percent).

Figure 17. PIT Persons Experiencing Houselessness by Race and Ethnicity, 2023, Multnomah



Source: Multnomah County PIT, 2023

The facilities available to houseless persons and households in Multnomah County range from seasonal emergency housing to permanent supportive housing. In 2023, the number of year-round beds increased to 11,863, an increase of 1,732 permanent and 544 emergency beds from 2022.

Figure 18. Facilities and Housing for Households Experiencing Houselessness, Multnomah County

Housing Type	Family Units	Beds				Bed Subset		
		Family	Adult Only	Child Only	Year-Round	Chronic	Veteran	Youth
Emergency, Safe Haven & Transitional	138	411	2,228	9	2,648	-	255	54
Permanent	1,300	4,234	4,981	-	3,655	1,342	1,120	300
Grand Total	1,438	4,645	7,209	9	6,303	1,342	1,375	354

From the 2021-2022 school year to the 2022-2023 school year, the number of students who were in shelters, doubled up, in motels/hotels, and unsheltered increased by 43 percent (550 students) to 1,819 students, and 286 were unaccompanied in Parkrose, Portland and David Douglas Districts.

Figure 19. PK – 12 Students Experiencing Houselessness by Living Situation, 2018 and 2021

Source: McKinney Vento, Student Data, *Parkrose, Portland and David Douglas Districts

Older Adults

Since 2000, the share of Portland residents who are older adults (65+) has increased from around 12 percent to 13 percent of the population. In the greater Portland region, this population has increased to almost 15 percent. Metro population forecasts estimate that this trend will continue to increase, in keeping with state and national trends. In 2021, the highest share of the population over the age of 65 lived in Gateway (10 percent of all Portlander's aged 65+), Central City (seven percent), and Hollywood, Interstate Corridor, Lents-Foster and Montavilla (each six percent respectively) (ACS 2021, B101001).

People Living with Disabilities

It is estimated that 12 percent of Portland's noninstitutionalized population has a disability (ACS 2021, Table S1810). Fourteen percent of the over 18 population is estimated to have a disability, using local estimates from 2014-2016, the estimate increases to nearly 24 percent.[12] Overall, 22 percent of all households in Portland have at least one household member with disabilities (CHAS 2019), though less detail is provided in the ACS, the estimate increases to nearly 27 percent.

- Of those who reported a disability, three percent live with a hearing difficulty, two percent with a vision difficulty, six percent with cognitive difficulty, five percent with an ambulatory difficulty, two percent with a self-care difficulty, and five percent with an independent living difficulty.
- People over 65 years old are more likely to report a disability, and in Portland, 33 percent of people over 65 reports having at least one disability.
- Households earning less than 50 percent AMI are more likely to have members with disabilities.
- Adults with disabilities are more likely to rely on supplemental security income (SSI) as a source of income, which would be insufficient to meet most basic needs, including housing costs.[13]

[12] https://www.oregon.gov/oha/PH/BIRTHDEATHCERTIFICATES/SURVEYS/ADULTBEHAVIORRISK/COUNTY/Documents/1417/DisabilityLact_1417.pdf

[13] The Technical Assistance Collaborative's 2022 Priced Out

- Nationally, disability continues to be the top basis of alleged discrimination under the Fair Housing Act, with 4,791 complaints filed in FY 2021, 57 percent of all complaints.[14]

Students

Portland has over a dozen public and private colleges and universities, including two public institutions, Portland Community College (PCC) and Portland State University (PSU). Enrollment for both peaked in the '17-18 academic year and has since declined by 24 percent and 28 percent respectively. Presently, there are an estimated 6,218 student units in the City of Portland. For 2021, PSU reported that 50 percent of first year students and just nine percent of undergraduates live in college-owned, operated, or affiliated housing. According to the Urban Land Institute's (ULI) 2023 Emerging Trends report, new student housing production has significantly decreased since the start of the COVID-19 pandemic.

Housing Tenure

Although the share of owner-occupied units declined (Figure 20), the number of owner-occupied units increased by 14,165 from 2010 to 2021 and the number of renter-occupied housing units increased by 20,829. Since 2010, homeownership rates have decreased overall, which is largely due to most new housing development in multi-dwelling buildings, which are mostly rental units. Despite those trends, Native Hawaiian, Native American, and Black or African American householders have experienced an increase in ownership rates across the city. Only householders who identified as some other race (or another race) saw a decrease in both the rate and number of owner-occupied households.

Figure 20. Change in Tenure from 2010 to 2021, Portland

Source: ACS 2010 and 2021 5 Year Table B25003

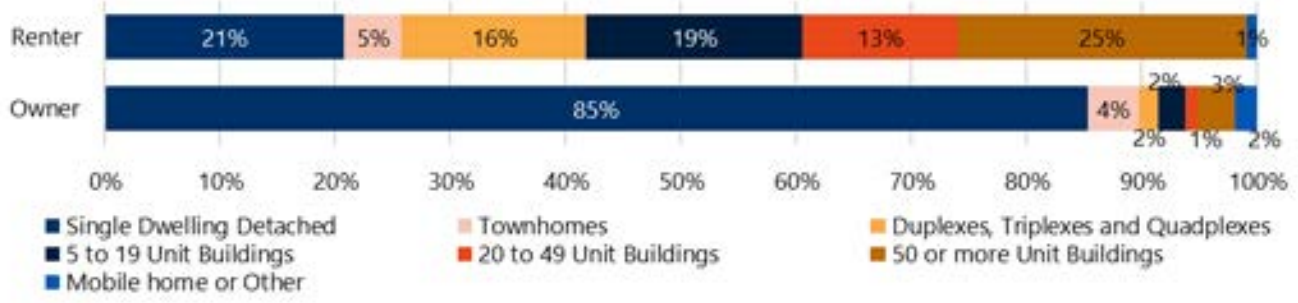
Most of Portland's homeowners (85 percent) lived in single-dwelling detached housing (Figure 21). In comparison, only 21 percent of Portland's households that rent lived in single-dwelling detached housing. Twenty-one percent of renters lived in a middle housing unit (townhome, duplex, triplex, or quadplex housing), and about a quarter of renters lived in large multi-dwelling buildings (50+ units).

Seventy percent of householders over 65 own their home, compared to just fifty-three percent of all Portland householders. Most homeowners over 65 own a single-dwelling unit home, detached, or

[14] https://www.hud.gov/sites/dfiles/FHEO/documents/FHEO Annual Report FY 2021.pdf

attached. Just 14 percent live in other types of housing structures. Elder householders who rent, are more likely to live in multi-unit structures with 50 or more units (over 43 percent).

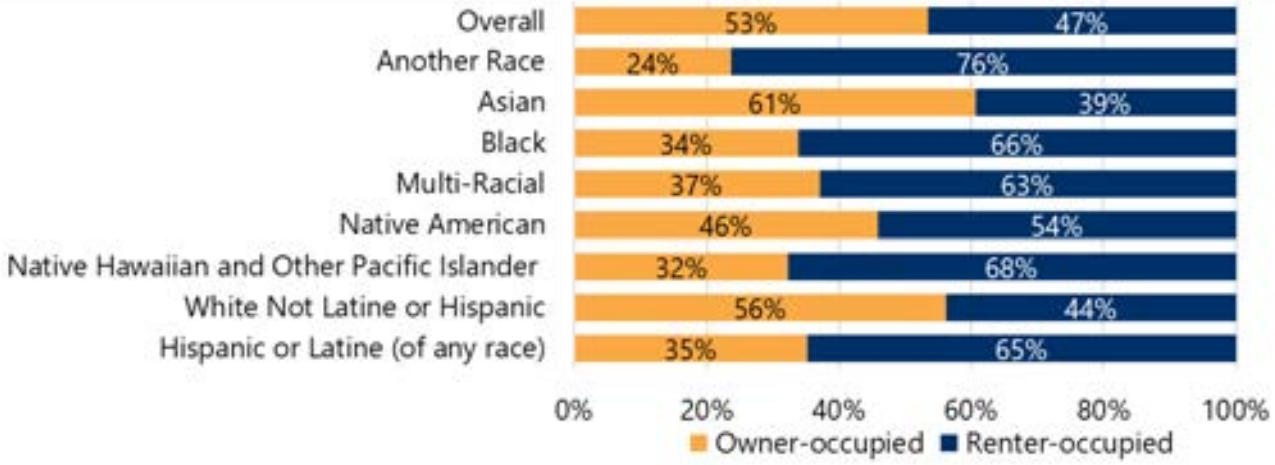
Figure 21. Tenure By Housing Type 2021, Portland



Source: ACS 2010 and 2021 5 Year Table B25032

White and Asian households have the highest rate of homeownership (56 and 61 percent, respectively). Native Hawaiian and Other Pacific Islander (32 percent) and Black or African American (34 percent) households, and households identifying as another race (24 percent), have the lowest ownership rates (Figure 22).

Figure 22. Tenure by Race and Ethnicity, Portland, 2021



Source: 2021 ACS 5-year Table B25003

Income and Affordability

Housing preference is usually shaped by the size and needs of a household. However, the actual choice and eventual place of residence for a household are significantly influenced by household income. While data shows that Portland is becoming a wealthier city overall, with 39 percent of households making $100,000 or more annually in 2021 (ACS), about 13 percent of the city's residents are experiencing poverty, compared to 12 percent statewide (ACS). Families who own the homes they live in only account for three percent of households below the federal poverty level, and 16 percent of all renter families are under the poverty level (ACS 2021, S1702). About 10 percent of householders making less than 50 percent of the poverty level identify as having a disability (ACS 2021, S1703).

The area median income (AMI) determines the amount of rent that can be charged to households making below a certain income level living in deed-restricted affordable units. Households making below 80 percent AMI also may be eligible to live in regulated affordable units or apply for specific programs such as down payment assistance loans or rental assistance programs.

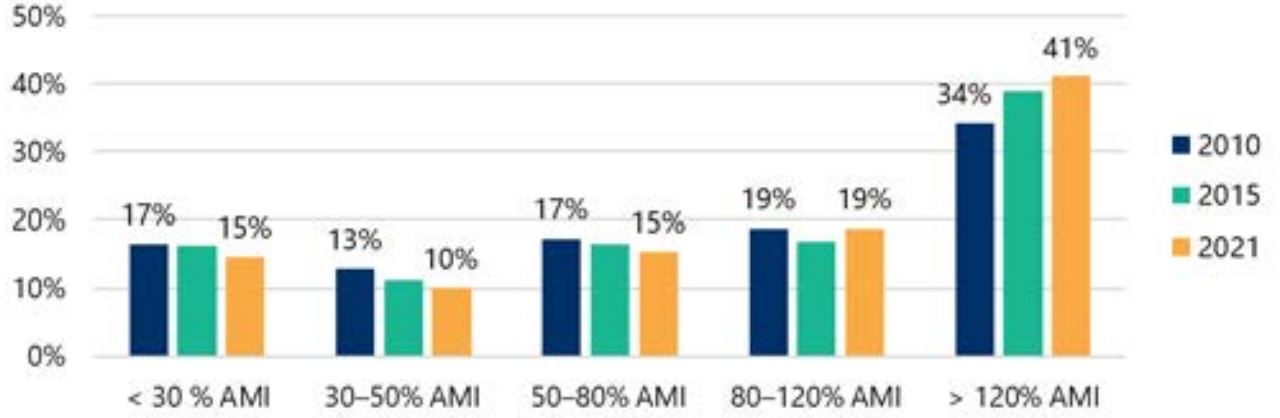
Figure 23. 2023 Area Median Income (AMI) by Household Size, and Affordable Monthly Cost at 30% of Monthly Income, Portland Metro Region

AMI %		Household Size				
		1-Person	2-People	4-People	6-People	8-People
30%	Income	$23,700	$27,100	$33,850	$40,280	$50,560
	Affordable Monthly Housing Cost	$658	$753	$940	$1,119	$1,404
60%	Income	$48,048	$54,912	$68,640	$79,622	$90,605
	Affordable Monthly Housing Cost	$1,335	$1,525	$1,907	$2,212	$2,517
80%	Income	$63,150	$72,200	$90,200	$104,650	$119,100
	Affordable Monthly Housing Cost	$1,754	$2,006	$2,506	$2,907	$3,308
100%	Income	$80,080	$91,520	**$114,400**	$132,704	$151,008
	Affordable Monthly Housing Cost	$2,224	$2,542	**$3,178**	$3,686	$4,195

Source: HUD, 2023

The proportion of households making less than 80 percent of the area median income (AMI) has been decreasing since 2010, from 47 percent of households to 40 percent in 2021. Similarly, the total number of households decreased slightly from 93,000 in 2010 to 91,000 in 2021. The 2023 AMI for a household of four in the Portland metropolitan area is $114,400.

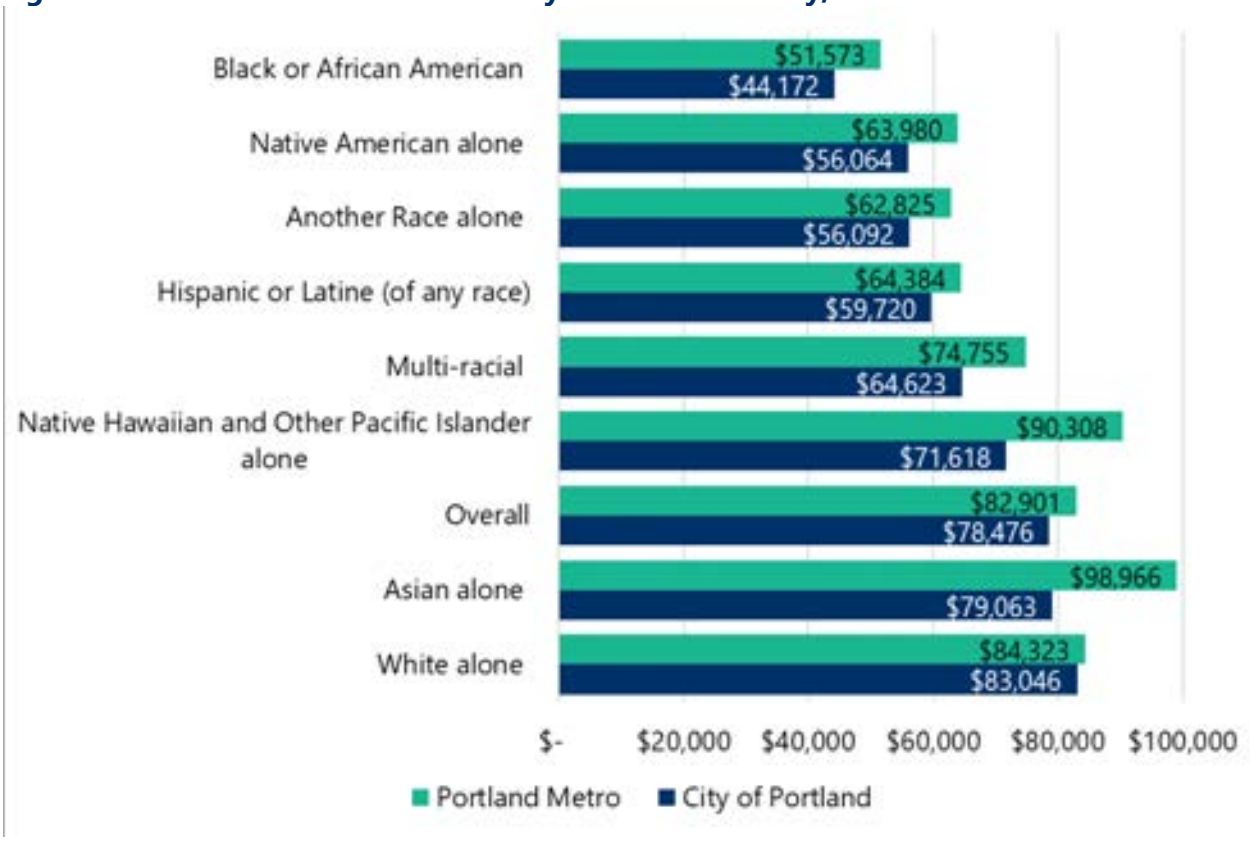
Figure 24. Percentage of Households by Area Median Income Levels, 2010-2021



Source: PUMS, 5-year, 2010, 2015 and 2021

Despite Portland becoming a wealthier city overall, there are large disparities in income among racial groups (Figure 25). Median household income for Black or African American households in Portland was the lowest out of all the race/ethnicity categories in Portland and the region ($44,172 and $51,573, respectively). Native American households had the second lowest median income in Portland ($56,064). White households had the highest median income in Portland ($83,046), and Asian households had the highest median income for the region ($98,966).

Figure 25. Median Household Income by Race and Ethnicity, 2021

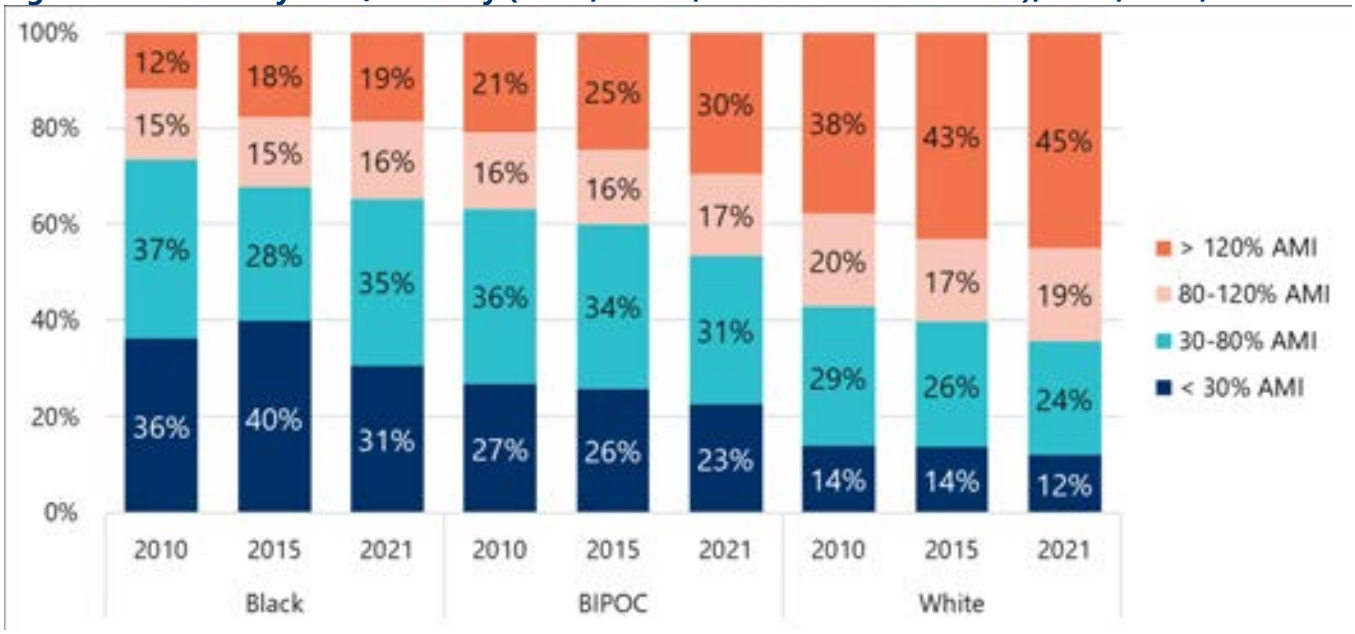


Source: ACS 5-year, 2021, Table B19013A-I

As a share of the overall median income, just Asian alone households and White alone households are earning higher than the median, at 101 percent and 106 percent respectively. In general, incomes increased for all racial and ethnic groups from 2010 to 2021, with household income levels rising most significantly for BIPOC households (Figure 26). The percentage of head of households identifying as Black, Indigenous, or people of color and making more than 120 percent AMI increased by nine percent since 2010 but totaled only 30 percent of BIPOC households combined. When disaggregated by race, the proportion of Black heads of households making more than 120 percent AMI increased by seven percent, totaling 19 percent of Black households.

In a challenging housing market, income disparities further impede the opportunity for households to enter the market, build wealth through ownership, and further burdens renters. Because of this, the impacts of a constrained supply are more starkly felt by BIPOC households. In 2021, 19 percent of all Black householders earned greater than 120 percent AMI, compared to 45 percent of white householders and 30 percent of BIPOC households overall.

Figure 26. Income by Race/Ethnicity (Black, BIPOC, and White Households), 2010, 2015, and 2021



Source: PUMS, 5-year, 2010, 2015 and 2021

In 2021, 13 percent of the overall population was below the poverty level. This includes 28 percent of the city's Black or African American population, 22 percent of the Native American population, 19 percent of the population identifying as "some other race," and 18 percent of Latine or Hispanic populations of any race (ACS 2021 S1701).

Over time, renters and owners in Portland have become wealthier, however, a higher proportion of owners (greater than 54 percent) earn over $100,000.

Figure 27. Tenure by Income, 2010 and 2021

Source: 2010 and 2021 5-year ACS Table B25118

Cost Burden

Overall, more than a third of Portland households spend more than 30 percent of their income on housing costs, which means that they are cost burdened. About 50 percent of renters in the city are cost burdened. As housing costs continue to increase at a rate that is hard for incomes to keep up with, more and more households become cost-burdened and may have to potentially move to more affordable areas or even out of state.

Rental costs have increased at roughly the same rate as renter income but have remained above 30 percent of renter-occupied household income for more than a decade. Meanwhile, ownership costs have remained below 30 percent of the average owner-occupied household income and continued to decline through 2021. Average costs for renters have increased at a faster rate than owners with a mortgage, largely because renters are more likely to be subject to annual rent increases whereas mortgages tend to be fixed. However, the attainability of homes – particularly for prospective first-time homebuyers – is at an all-time low.

While households at all income levels may experience cost burden, higher-income households have more income left over after paying for housing costs while lower-income households have fewer funds left over to pay for the cost of living or have disposable income. In 2021, 19 percent of all households were cost-burdened, and 17 percent were severely cost-burdened. Portland's cost burden rate (36 percent) is higher than the state overall (33 percent) and higher than two comparable cities, Denver and Seattle (34 percent), and below Sacramento's cost burden rate (Figure 28).

Figure 28. Cost Burden in Oregon, Portland, and Comparative Cities, 2021

Level of Cost Burden	Oregon	Portland	Seattle	Sacramento	Denver
Not Cost Burdened	67%	64%	66%	61%	66%
Total Cost Burdened (30+%)	33%	36%	34%	39%	34%
Cost Burdened (30-50%)	*18%*	*19%*	*19%*	*21%*	*19%*
Severely Cost Burdened (50%+)	*15%*	*17%*	*15%*	*19%*	*15%*
Total	100%	100%	100%	100%	100%

Source: ACS 2021, B25091 and B25070

Renters were more likely to be cost-burdened and severely cost-burdened than owners, compared to just 26 percent of homeowners, nearly 50 percent of renters were cost-burdened.

Figure 29. Cost Burden by Tenure, 2021

Source: ACS 2021, B25091 and B25070

While nearly 50 percent of all renters in Portland are cost-burdened, the variance among renters based on income is significant. Renters with household incomes below $35,000 are more severely cost-burdened than cost-burdened, with 66 percent of renters with household incomes below $20,000 being severely cost-burdened. Severe cost burden declines as incomes increase above the $35,000 to $49,999 household income level.

Figure 30. Renter Cost Burden by Income, 2021, Portland

Source: ACS 2021, B25074

Disaggregating by race and ethnicity shows disparities among racial groups. Black or African American residents are the most cost-burdened as renters and as owners, having the largest proportions of the cost-burden total. They also have the highest percentage of severely cost-burdened residents by tenure, 22 percent of Black homeowners and 38 percent of Black renters (Figure 31).

Figure 31. Cost Burden by Tenure and Race and Ethnicity, 2019

Housing Location Analysis

The Housing Needs Analysis and Buildable Lands Inventory demonstrate that, overall, there is sufficient development capacity for the expected housing demand of the next twenty years. This additional location analysis can understand where that capacity and expected development is located and help identify priority areas for focusing where development could better meet the City's policy goals.

This location analysis helps develop an understanding of the current housing distribution, including regulated affordable housing, alongside the 2045 expected demand for new units and the current residential development capacity. The analysis is based on different geographies that correlate to key policy goals. The following analyses include a look at:

- **Racially Concentrated Areas of Affluence (RCAA) and Poverty (RECAP)**. Areas of racialized affluence or poverty to determine whether the distribution of housing opportunity is equitable.
- **Areas of Economic Vulnerability.** Areas where residents are more vulnerable to changing economic conditions, making resisting displacement more difficult.
- **Complete Neighborhoods**. Areas where residents have safe and convenient access to goods and services they need on a daily or regular basis.
- **Centers and Corridors**. Areas of mixed-use and multi-dwelling housing within a quarter mile of Portland's centers and along transit streets and neighborhood business districts.
- **Areas of Opportunity**. High opportunity areas offering a mix of desirable services, opportunities, and amenities that promote healthy, active living.
- **Low Carbon Areas/Areas of Low Residential VMT**– Areas with the lowest average of vehicle miles traveled for home-based trips, defined as trips that originate or end at a residence, that represent lower carbon neighborhoods.
- **Hazard Risk Areas**. Areas where households are more at risk of different environmental hazards, some of which will continue to worsen due to climate change.

The housing location analysis reveals promising opportunities and critical challenges to Portland's growth pattern. Over the past decade, new development has primarily clustered in key growth areas outlined in the Comprehensive Plan. These include complete neighborhoods, areas near centers and corridors, and high-opportunity areas. This trend is expected to continue, with 60 to 80 percent of Portland's anticipated housing demand targeted in these key growth areas. This approach is essential for achieving Comprehensive Plan goals that aim to increase Portland's share of the population within complete neighborhoods from today's 47 to 80 percent and increase Portland's total housing units near centers and corridors from 72 to 80 percent. While results show that there is sufficient development capacity to accommodate future demand in these areas, the City must remain committed to

implementing proactive measures to unlock additional capacity and ensure anticipated growth in these areas is not hindered.

However, merely accommodating demand in key growth areas falls short of addressing broader issues around fair and equitable housing practices and climate resilience preparedness. The RECAP/RCAA analysis reveals that many of Portland's racially concentrated areas of affluence are located in complete neighborhoods and high-opportunity zones but have effectively excluded low-income households, many of which are members from the protected classes, from accessing these areas, thereby perpetuating historical patterns of racial and income segregation. RCAAs account for eight percent of existing households, but only accounted for three percent of all permitted units between 2003 – 2022 and are expected to capture only three percent of the new housing demand in the next 20 years. Notably, RCAAs hold less than one percent of Portland's total regulated affordable housing units. Addressing the exclusionary zoning policies that uphold this fundamental barrier to fair housing is essential to increasing equitable access and opportunity for all residents.

Redressing exclusionary zoning policies also plays a role in alleviating market pressures in other neighborhoods expected to absorb a significant portion of new housing demand. This can be especially impactful in neighborhoods with above-average rates of cost-burdened households known as areas of economic vulnerability. A third of Portland's new demand is projected for these areas. By enabling greater capacity and growth in exclusionary neighborhoods that are also high-opportunity, housing demand pressures can be more evenly distributed, easing mounting pressures in economically vulnerable neighborhoods that could be subject to rising housing costs. These efforts should be complemented by policies aimed at allowing residents to stay in place to effectively mitigate displacement impacts on the city's most economically vulnerable residents.

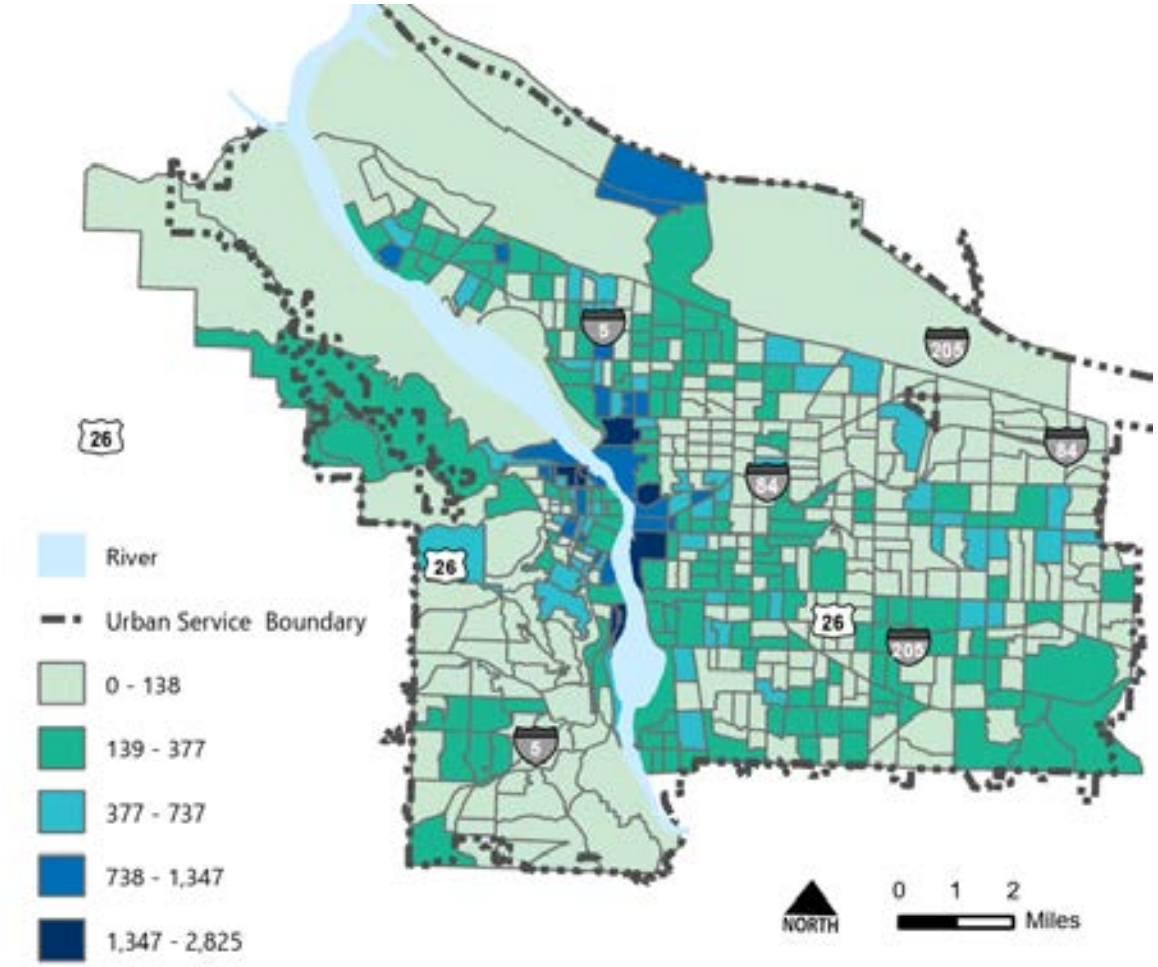
In addition, understanding the intersection between hazard risk areas, low residential VMT areas and key growth areas is essential for guiding the city towards resilient and sustainable growth. The Low residential VMT areas analysis shows that low VMT areas generally align with key growth areas, indicating that Portland's housing growth pattern is in line with the city's goals to reduce VMT and associated carbon emissions. The hazard risk analysis reveals that urban heat islands and high probability liquefaction zones are hazard areas most significantly affecting future growth. More than a third of the new demand is concentrated in urban heat islands and close to 20 percent in high-risk liquefaction areas. This analysis underscores the urgency of identifying and implementing policies to mitigate climate risk impacts on Portland residents. These policies can also enhance the resilience of Portland's most vulnerable residents residing in existing regulated affordable housing units, given that 44 percent of regulated affordable units are situated within urban heat islands and 20 percent within liquefaction-prone areas.

Housing Demand

Based on the 2045 HNA, the City should expect the demand of new housing units to be between 97,471 and 120,560. The 2045 HNA forecasted the potential demand of units based on the development trends from 2003-2022. If future housing growth follows the same pattern over the next twenty years as it did the last twenty years, then:

- Twenty six percent or 31,288 new units are expected to be in Central City Portland.
- Eleven percent or 12,731 new units are expected to be in East Portland.
- Sixteen percent or 19,844 new units are expected to be in North Portland.
- Twelve percent or 14,949 new units are expected to be in Northeast Portland.
- Nineteen percent or 23,141 new units are expected to be in Southeast Portland.
- Fifteen percent or 18,607 new units are expected to be in West Portland.

Figure 32. Expected Unit Demand Based on 20 Year Development Trends by Census Block Group



Source: BPS Analysis, 2045 Housing Needs Analysis

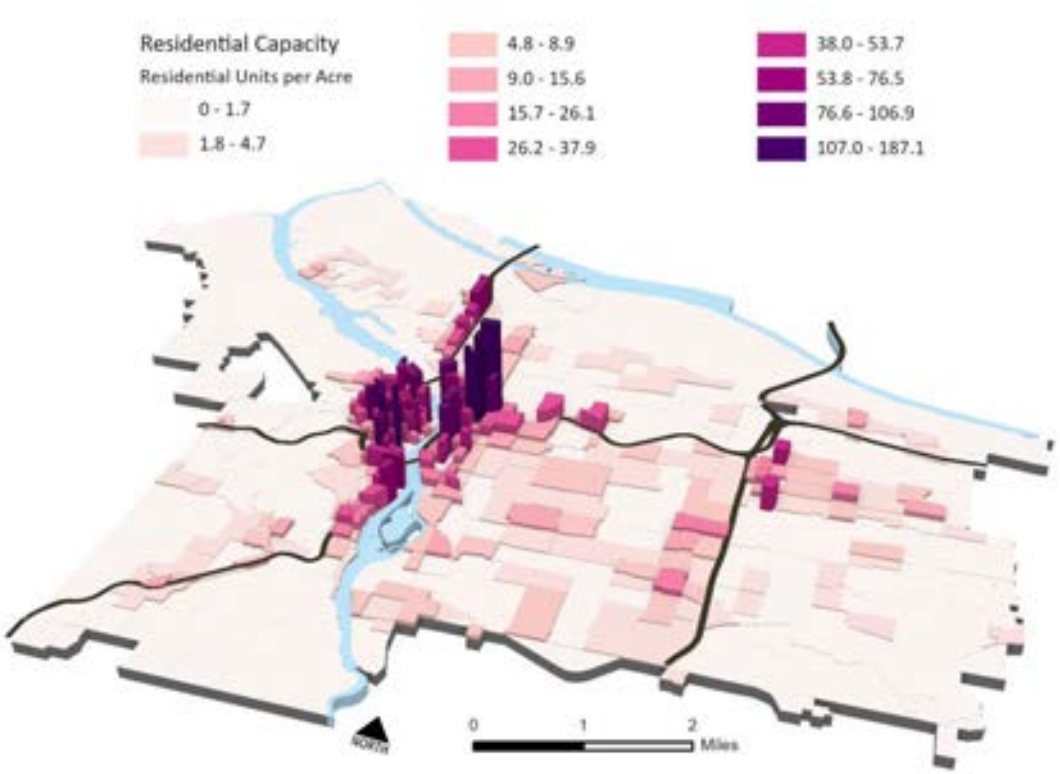
Housing Capacity

The Residential Capacity Map demonstrates the results of the Buildable Lands Inventory (BLI) and the residential capacity by Traffic Analysis Zone (TAZ), shown as housing units per acre (density). The BLI model applies a market-feasible development capacity lens that calculates the likelihood of development and at what scales. This methodology identifies capacity where development is financially feasible.

Areas of high-density residential capacity tend to be in Portland's centers (Central City, Hollywood, Gateway, etc.) and corridors (Interstate, 82nd Avenue) where most of the city's mixed-use and multi-dwelling zoning currently exists.

- Central City accounts for 29 percent of new housing capacity citywide, but five percent of Portland's vacant and underutilized lots, reflecting a high-density development capacity concentration.
- West Portland accounts for seven percent of new housing capacity, but 26 percent of the vacant and underutilized lots, reflecting the presence of both development constraints and lower-density zoning concentration.
- In the Outer market area (which is mostly East Portland), there are 16 percent of the city's vacant and underutilized lots and 16 percent of the total housing unit capacity.

Figure 33. Residential Capacity Map



Source: BPS Analysis, 2023, 2045 Housing Needs Analysis

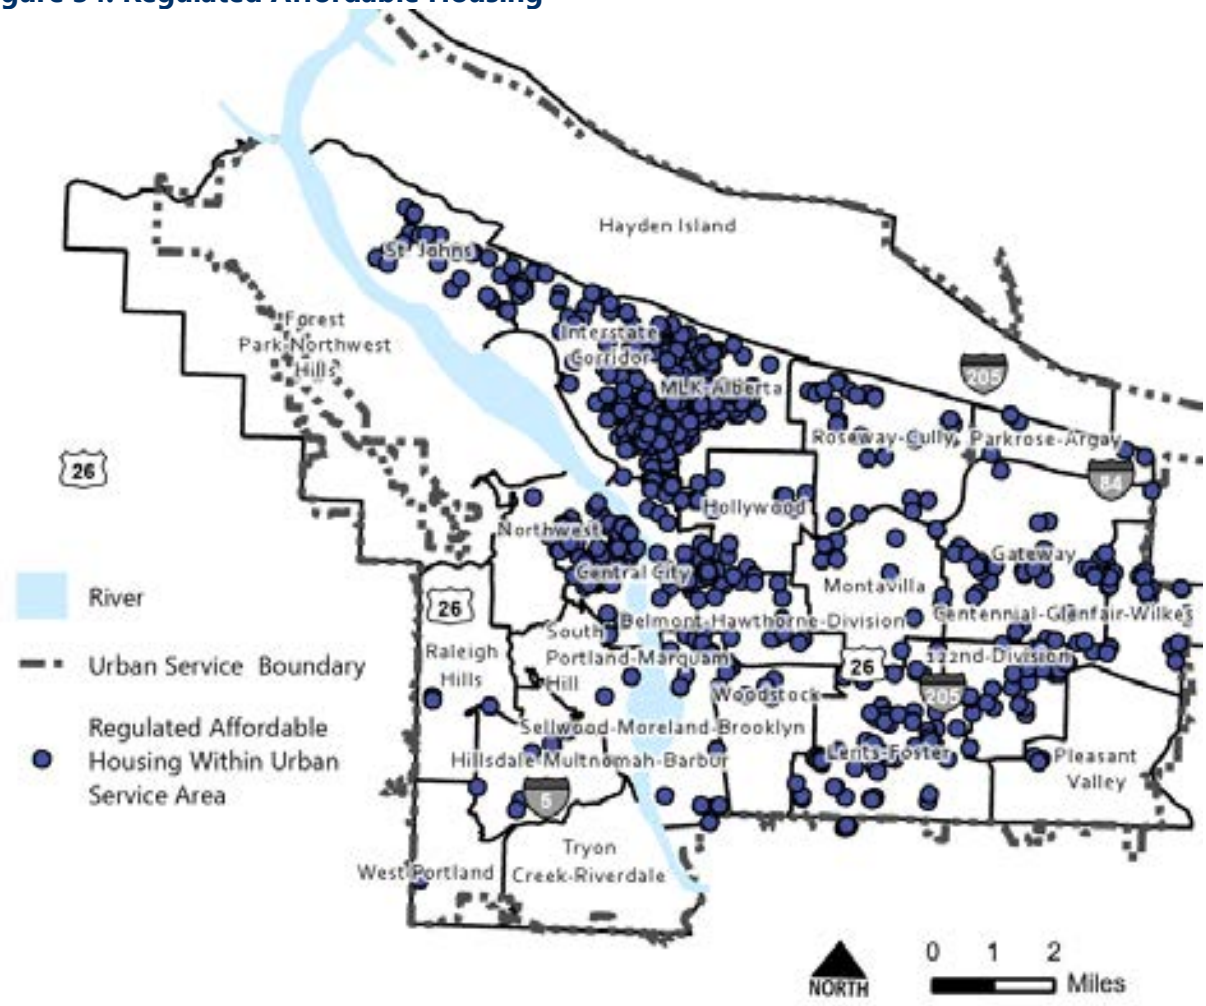
Distribution of Affordable Housing

Affordable housing that is located in a walkable neighborhood near active transportation, employment centers, open spaces, high-quality schools, and various services and amenities enhances the general quality of life for its residents. The City of Portland currently has 24,231 units of regulated affordable housing, making up roughly eight percent of the city's total housing stock.

Most of Portland's regulated affordable units are concentrated in Central City, North/Northeast, outer Southeast and East Portland. The loss of affordability of these units will result in a decrease in affordability in these areas. About 40 percent of Portland's affordable housing units were built between 2001 and 2021, however, analysis of OHCS data reports the number of projects and the associated number of units that have affordability restrictions expiring before 2032.

Nearly 15% of Portland's regulated affordable housing inventory is at risk of converting to market rate housing because of expiring affordability restrictions over the next 10 years.

Figure 34. Regulated Affordable Housing



Source: BPS Analysis, Metro Regulated Affordable Housing Inventory 2024

Racially Concentrated Areas of Affluence (RCAA) and Poverty (RECAP)

The segregation of households who are low-income and/or are members of protected classes can result in unequal access to opportunities such as education and employment. Just as problematic is the resulting exclusionary enclaves - areas of concentrated white households continue to be the most segregated of all racial groups, especially affluent white households. Recent studies show that while Portland Metro Area has a low prevalence of concentrated areas of poverty by federal standards, the Portland Metro Area has a high prevalence of concentrated areas of affluence.[15]

Racially Concentrated Areas of Affluence in this analysis, are census tracts that, utilizing ACS 2018-2022 five-year data have; [16]

- A higher than the regional average population of white residents[17] and
- A median income 1.5 times higher than the metro regional median household income.

Racially and Ethnically Concentrated Areas of Poverty (RECAP), in this analysis, are census tracts that, utilizing ACS 2018-2022 five-year date have;

- More than 40 percent of residents with incomes less than 200 percent of Federal poverty level and
- A higher than the regional average population of Black, Indigenous and Other Persons of Color (BIPOC) residents.[18]

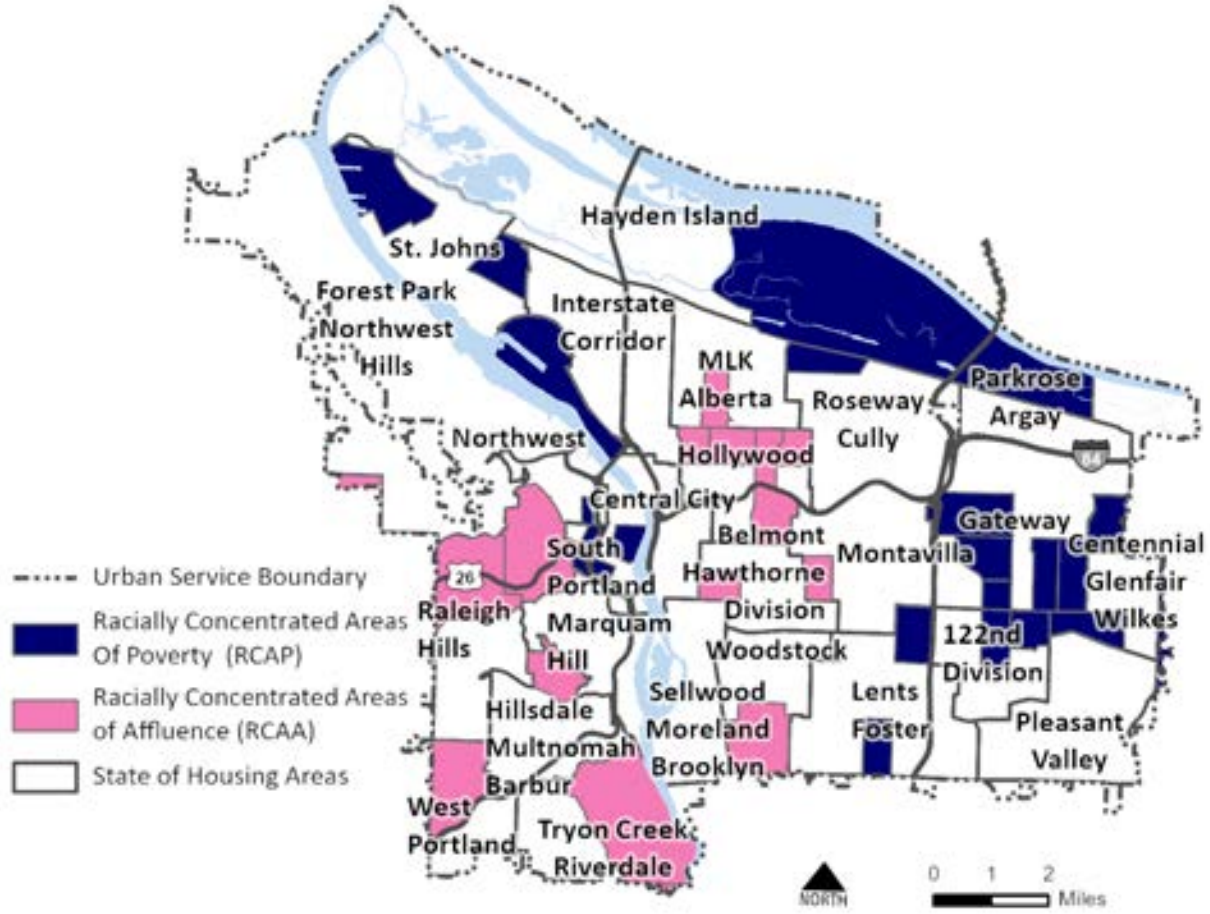
Census tracts that have racially concentrated affluence are in Raleigh Hills, Northwest, West Portland, Tyron Creek-Riverdale, Belmont Hawthorne-Division, Hollywood, Woodstock and MLK-Alberta. Typically, these areas represent lower population density and highlight the continued impact of historic discriminatory land use and development practices. When comparing to redlining maps of the early twentieth century, two of these areas were green, three were yellow, one was redlined, and one unrated.

Census tracts that have racially concentrated poverty are located in Central City, St. Johns, Hayden Island, Gateway, Roseway-Cully, Lents-Foster, 122nd-Division, Centennial-Glenfair-Wilkes. Only two of the areas were once historically redlined. The other areas were largely rural or undeveloped in the 1930s when the redlined maps were created.

---

[15] https://www.huduser.gov/portal/periodicals/cityscpe/vol21num1/ch4.pdf
[16] https://cahcd.maps.arcgis.com/home/item.html?id=4100330678564ad699d139b1c193ef14
[17] This Location Quotient (LQ) represents the percentage of total white population (White Alone, Not Hispanic or Latine) for each census tract compared to the total white population for the region. For example, a census tract with a LQ of 1.5 has a share of total white population that is 1.5 times higher than in the region.
[18] This LQ represents the percentage of total POC population (Excluding all White Alone, Not Hispanic or Latine) for each census tract compared to the percentage of total POC population for the region. For example, a census tract with a LQ of 1.5 has a share of total POC population that is 1.5 times higher than the average in the region.

Figure 35. Racially Concentrated Areas of Affluence (RCAA) and Poverty (RECAP)



Source: BPS Analysis utilizing 2018-2022 ACS 5-year

Results

The RCAA account for eight percent of current Portland households, but only three percent of all permitted units between 2003-2022. The RCAA areas only have three percent of the residential development capacity with an expected future housing demand of three percent – well below the current share of households.

The RECAP make-up 12 percent of current Portland households and 12 percent of all permitted units between 2003-2022. Based on current zoning and market factors, the estimated residential development capacity is a similar proportion (12 percent) of the total citywide capacity.

The RECAP have 6,695 regulated affordable units (28 percent of all regulated units) compared to just 91 units (less than one percent) in the RCAA tracts. These results may not be surprising given the economic segregation prevalent in these tracts, however they indicate that income integration, especially in high-opportunity RCAA areas is an opportunity to further Portland's fair housing goals.

Figure 36. Racially Concentrated Areas of Affluence (RCAA) and Poverty (RECAP)

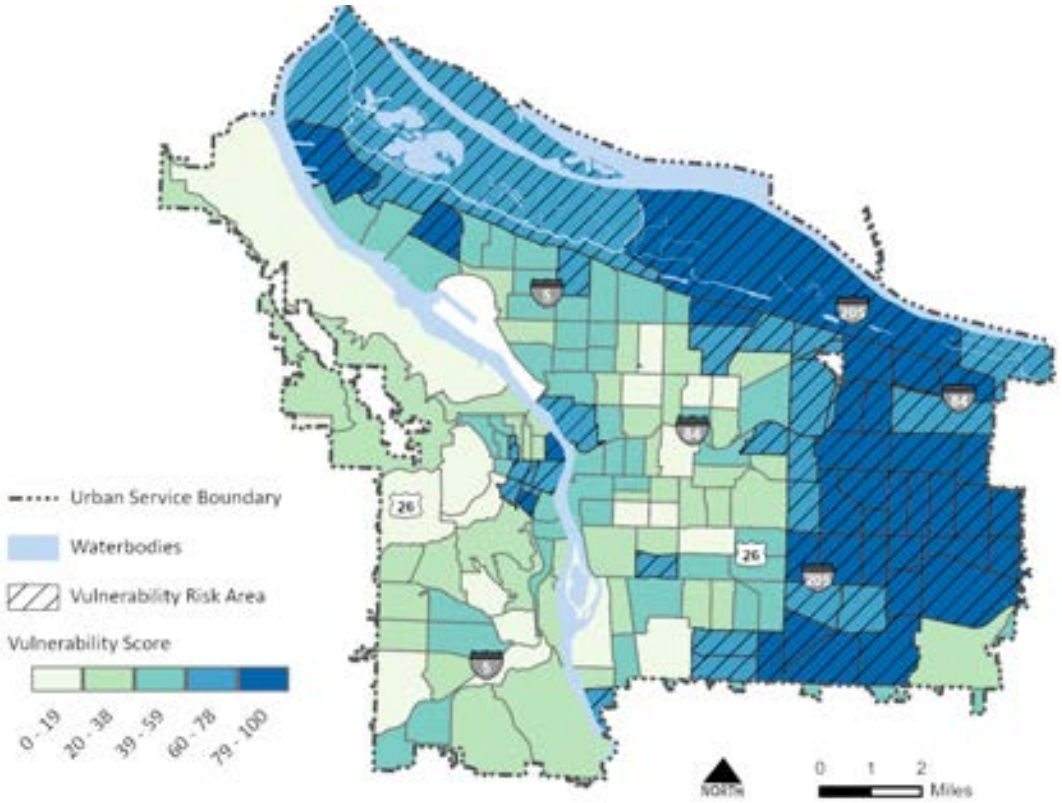
Areas of Economic Vulnerability

The Economic Vulnerability Assessment conducted by BPS identifies census tracts in Portland where residents are more vulnerable to changing economic conditions and displacement. This analysis is based on previous vulnerability risk analysis work by Dr. Lisa Bates. These areas have residents who are more likely to be "housing cost-burdened," pay 30 percent or more of their income on housing costs, belong to communities of color, particularly black and indigenous communities, lack 4-year college degrees, and have lower incomes. Areas of economic vulnerability are primarily concentrated in East Portland beyond I-205, Roseway-Cully, St. Johns, Old Town and Downtown, and Brentwood-Darlington.

Figure 37. Areas of Economic Vulnerability, 2022



Source: BPS Areas of Economic Vulnerability, utilizing 2018-2022 ACS 5-year

Results

About 35 percent of Portland's households reside in areas of economic vulnerability. These areas also have over 50 percent of regulated affordable housing units. These areas have a roughly proportional share of the development capacity – 36 percent. Based on recent development trends, these areas are expected to see about 30 percent of new housing demand – slightly less than a proportional share. While not expected to experience heavy development pressures, it is essential to implement measures that stabilize housing and help mitigate the involuntary displacement of vulnerable households.

Figure 38. Areas of Economic Vulnerability

Share of…	Vulnerability Risk Areas

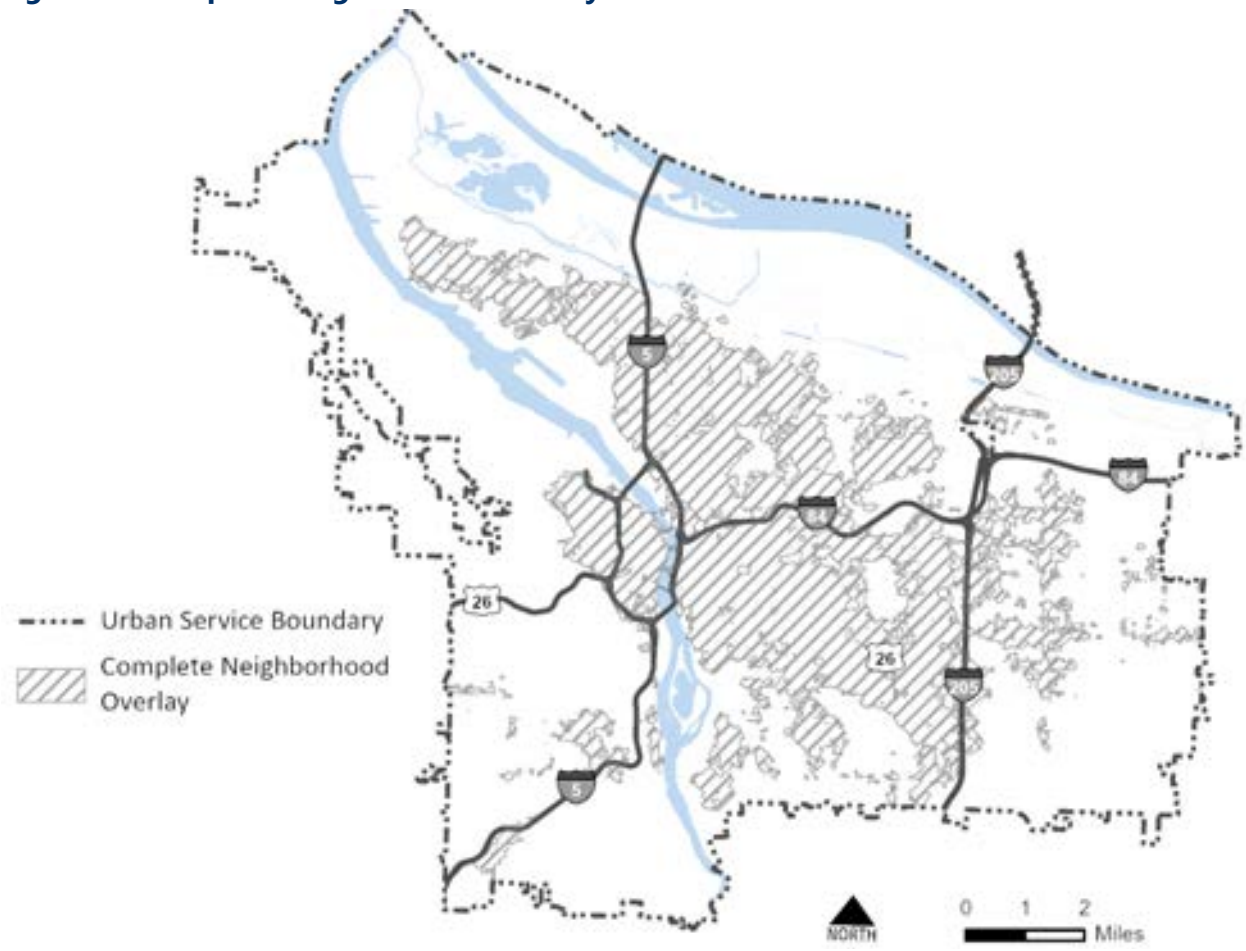
Complete Neighborhoods

A "complete neighborhood" is an area where residents have safe and convenient access to goods and services they need on a daily or regular basis. This includes access to healthy food, like grocery stores; Other neighborhood-serving commercial services; quality public schools; public open spaces and recreational facilities; and access to frequent transit. In a complete neighborhood, the network of streets and sidewalks is interconnected, which makes walking and bicycling to these places safe and relatively easy for people of all ages and abilities. A Portland Plan Goal is that by 2035, 80 percent of Portlanders live in a healthy complete neighborhood with safe and convenient access to the goods and services needed in daily life. Complete Neighborhoods are found primarily on the eastside of the Willamette River and in the Central City. Complete Neighborhoods are lacking in East and Southwest Portland.

Figure 39. Complete Neighborhood Overlay



Source: BPS Analysis

Results

About half of Portland's residents currently live in a Complete Neighborhood. However, about two-thirds of Portland's regulated affordable housing units are located in a Complete Neighborhood. Housing demand in Complete Neighborhoods is higher than the current proportion of residents, but there is ample capacity to accommodate it – with about 63 percent of the new housing demand and 61 percent of the future development capacity. Producing more units in Complete Neighborhoods will be important to meeting the Portland Plan Goal.

Figure 40. Complete Neighborhoods

Share of…	Complete Neighborhoods

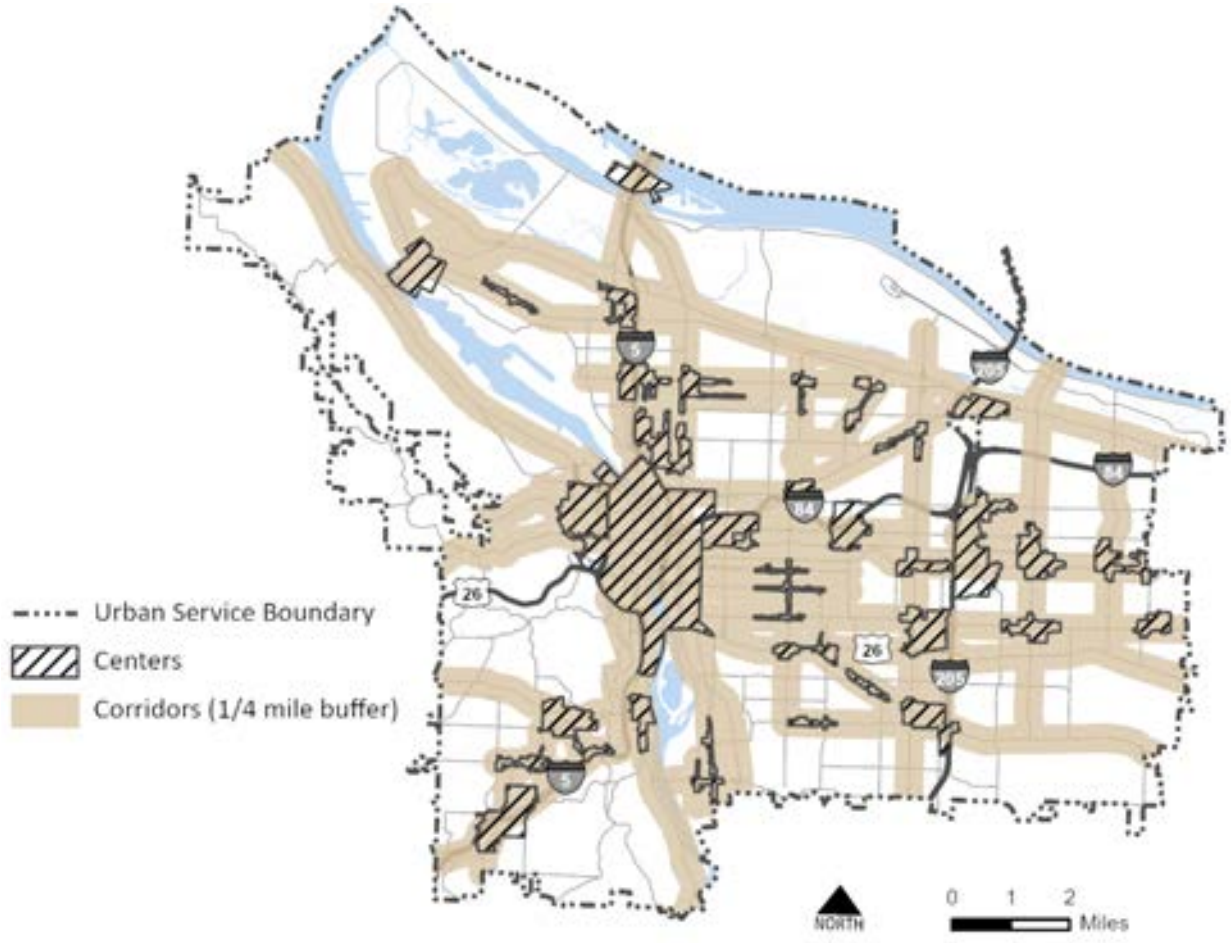
Centers and Corridors

As outlined in the 2035 Comprehensive Plan Urban Design Framework, the City's preferred growth scenario creates complete neighborhoods by locating new households and jobs in centers and corridors, maximizing investments in infrastructure, reducing redevelopment pressures on open spaces, employment districts and lower density residential areas and adding new people, businesses, and activities to the community.

Centers are expected to provide the primary areas for growth and change in Portland over the next 25 years. They are compact urban places that anchor complete neighborhoods, featuring retail stores and businesses, civic amenities, housing options, health clinics, employment centers and parks or other public gathering places. Focusing new growth in centers and the inner ring districts helps achieve goals of having more Portlanders live in complete neighborhoods, use more transit and active transportation, reduce their energy use and mitigate climate change.

Figure 41. Centers and Corridors (Quarter Mile Radius)



Source: BPS Analysis

Results

While 69 percent of Portland's residents currently live in Centers and Corridors, they are home to the vast majority (90 percent) of the city's regulated affordable housing units. Demand for units in Centers and Corridors is higher than the current proportion, but there is ample capacity to accommodate it. Centers and Corridors provide about 86 percent of the future development capacity in Portland.

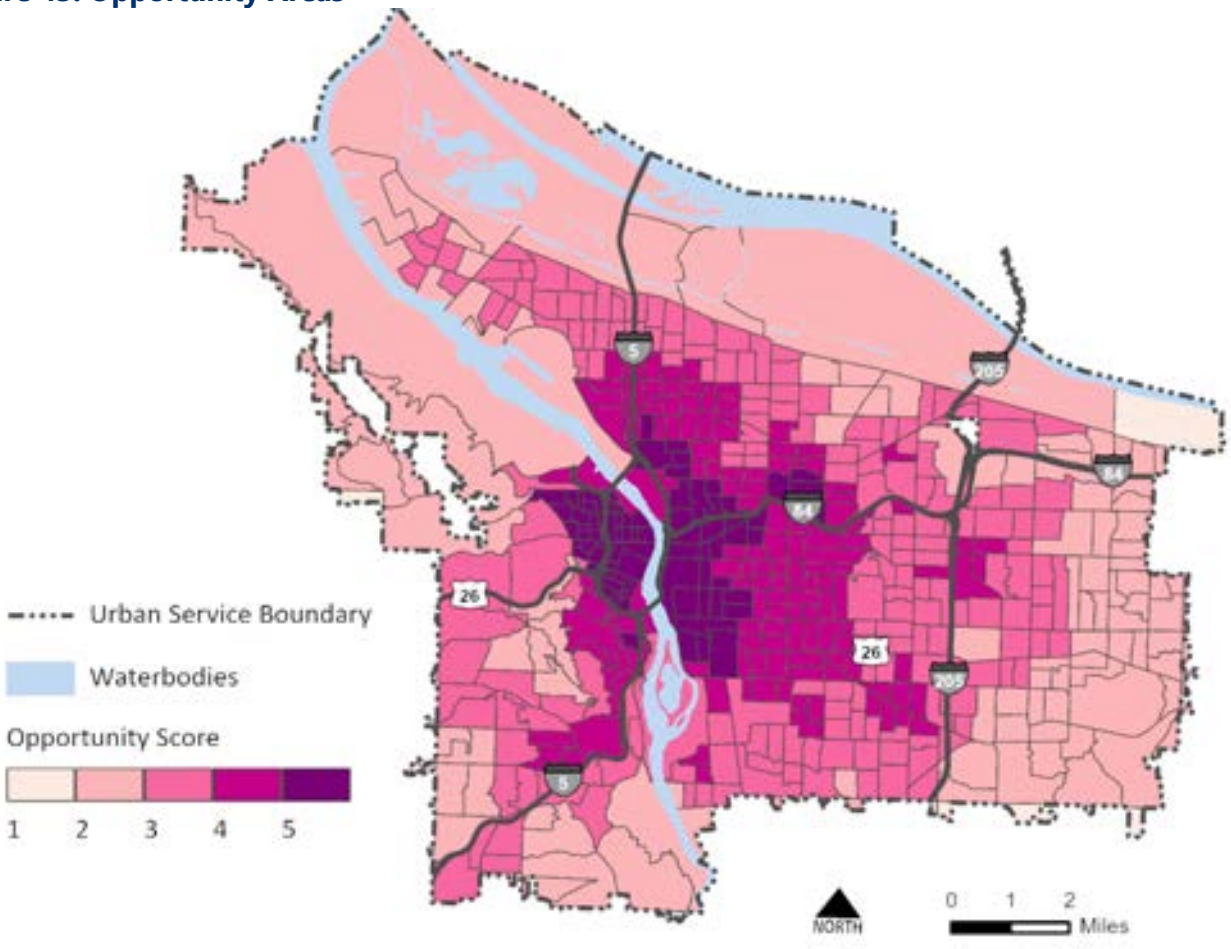
Areas of Opportunity

The Portland Housing Bureau (PHB) Opportunity Map identifies levels of opportunity in Portland neighborhoods. Using a 5-point scale, the map is based on variables that include access to childhood education, employment, transportation, living/family wage jobs, and community amenities that promote healthy, active living. The 2035 Comprehensive Plan and the Portland Plan's Healthy Connected City provide guidance to expand opportunities for Portlanders to live in complete communities or areas of high opportunity by offering a mix of desirable services and opportunities.

Figure 43. Opportunity Areas



Source: BPS Analysis utilizing 2018-2022 ACS 5-year, PHB Areas of Opportunity[19]

Results

About 42 percent of Portland's current households are within a "high opportunity" area (rated as a score of 4 or 5 on PHB's Opportunity Map). Comparatively, 61 percent of all regulated affordable housing units are within a "high opportunity" area. About 21 percent of households are within an area considered low opportunity (rated as a score of 1or 2) and only 12 percent of regulated affordable housing units are within a low opportunity area, showing a greater propensity for affordable housing providers to locate units in areas of high opportunity. Development of new housing units over the past 20 years have mostly concentrated in areas of high opportunity. About 60 percent for future housing demand is expected in high opportunity areas and there is the capacity to accommodate this demand.

[19]For the purposes of this analysis, block groups are assigned an opportunity score where the source layer overlaps 50% or more with a block group area

Figure 44. Opportunity Score

Low Carbon Neighborhoods

As Portland boosts housing production, the City can leverage that production to help meet other goals and priorities, including reducing carbon emissions. The City of Portland has an adopted target to reach a 50 percent reduction in carbon emissions from 1990 levels by 2030 and net zero emissions by 2050. Any time new buildings are added to the city, carbon emissions increase, both in terms of the embodied carbon in the building materials, emissions from the construction process, and the operational carbon emissions from use of appliances, (HVAC, lighting, etc.) in those new units. Portland recognizes the tension between the urgent need to build more housing and the urgent need to halt and reverse carbon emissions. With this in mind, Portland seeks to explore ways to reduce the climate impact of new housing units.

To quantify the emissions impact of forecasted new housing units, more information would be required about the type of construction, the materials used, the size, and energy performance of those new units. Lacking this information, BPS assessed the carbon impacts of new housing units, by focusing on Vehicle Miles Traveled (VMT) as a proxy for building carbon emissions. According to a US EPA study[20], "the location of a home relative to transportation choices had a large impact on energy consumption. Choosing to live in an area with transportation options not only reduces energy consumption, it also can result in significant savings on home energy and transportation costs." All things being equal, the study found a 38 percent reduction in energy use between a suburban development single-dwelling detached home and a single-dwelling transit-oriented development, due to location efficiency. As is noted above, the type of housing was also a significant factor for energy consumption. Energy use between single-dwelling detached homes and multi-dwelling units in low VMT areas achieved a 60 percent reduction in energy use. More compact housing units also have lower embodied carbon due to fewer materials than a larger unit. Adding to the benefits of building typology and location efficiency, high performance energy codes reduce carbon emissions even further.

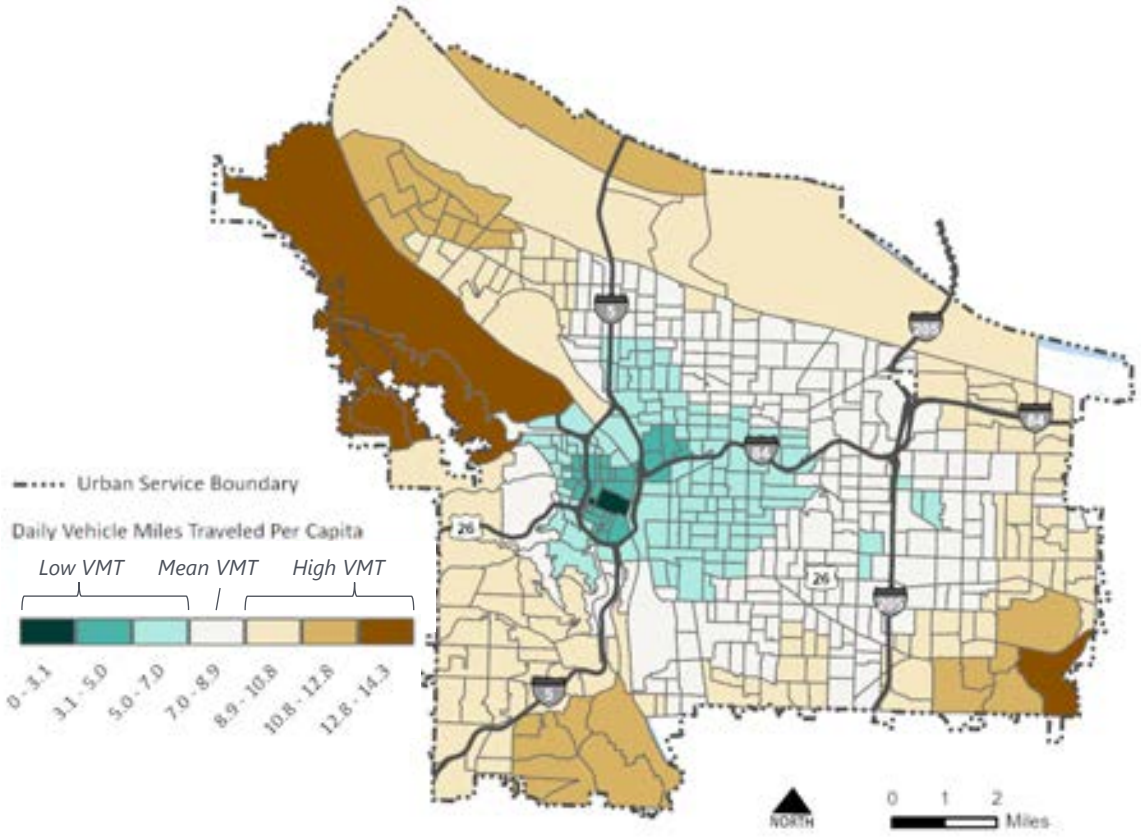
[20] https://www.epa.gov/sites/default/files/2014-03/documents/location_efficiency_btu.pdf

Areas of Low Residential Vehicle Miles Traveled (VMT)

Average vehicle miles traveled (VMT) of residents in various Portland neighborhoods offers important insights into reducing Portland's carbon emissions. Focusing growth in areas where residents, on average, rely less on cars to get around plays a vital role in mitigating the adverse effects of cars on climate change and public health. Portland's Comprehensive Plan and Climate Emergency Workplan emphasize the significance of growing in 'low VMT areas' to meet its transportation and climate goals. The climate benefits of focusing new housing units in low VMT areas are further supported by the fact that the zoning for inner-city centers and corridors are generally multi-dwelling/mixed use development. As the EPA study shows, the most efficient and lowest carbon housing units are compact multi-dwelling buildings in low VMT areas that have safe and reliable access to public transportation and generally shorter commute distances for residents. Given that Oregon adopted Clean Energy Targets (ORS 469A.410) requiring 100 percent renewable electricity by 2040, electrically heated multi-dwelling housing units in low VMT areas are the ideal development type to both meet our housing production needs and climate goals. Prioritizing growth in these areas underscores the city's commitment to building sustainable, healthier communities.

Figure 44 shows travel demand model estimates of average daily VMT per capita for home-based trips only by Census block group. Isolating for home-based trips is meant to specifically highlight how the location of housing has a significant influence on a household's driving habits. Classifications were created using standard deviation, which compares each block group's average daily VMT to the citywide average. Block groups with average daily VMT levels notably below what is typical in this VMT dataset were designated 'Low VMT areas'. Block groups with average daily VMT levels notably above the mean VMT areas are designated as 'High VMT Areas'.

Figure 45. Average Daily Residential Vehicle Miles Traveled (VMT) per Capita



Source: BPS Analysis utilizing 2018-2022 ACS 5-year and 2015 Metro Regional Travel Demand Model

Results

Low VMT areas, highlighted in the three different shades of green in Figure 44, are primarily located around the Central City and extends into the inner northeast and southeast neighborhoods such as MLK, Hollywood, Belmont, Hawthorne and Division.

Despite only a quarter of Portland's population and less than a third of its total households residing in Low VMT areas, nearly half of the future housing demand is expected in these areas, compared to 20 percent for High VMT areas (Figure 45). This suggests a notable shift towards promoting new residential development in low VMT areas. This trend not only increases the opportunity for more people to live in low VMT neighborhoods and access associated health and safety benefits but also has the potential to significantly reduce the city's overall average daily VMT, aligning with Portland's climate goals aimed at curbing transportation carbon emissions. In addition, over half of Portland's regulated affordable housing units are located in low VMT areas.

Figure 46. Levels of Average Daily Residential VMT

Share of…	Low VMT Areas (0 – 7 VMT)	Mean VMT Areas (7 – 8.9 VMT)	High VMT Areas (9 – 14.3 VMT)
Population	26%	40%	34%
Households	31%	38%	31%
Regulated Affordable Housing	55%	30%	15%
New Demand	49%	31%	20%
Capacity	50%	33%	17%

Hazard Risk Areas

Resilience is one of the guiding principles in Portland's 2035 Comprehensive Plan, guiding policies to mitigate risks from natural hazards, human-made disasters and climate change. The location of future housing plays a critical role in determining the ability for individuals and communities to withstand, recover from, and adapt to changes. Therefore, it's important to identify where future housing is anticipated to grow in relation to known environmental hazard areas in Portland. This analysis comprises five maps identifying block groups and census tracts that are at higher risk for landslides, wildfires, liquefaction during earthquakes, extreme heat, and flooding.

Results

Landslide and wildfire hazard areas are predominantly located in the West Hills of Portland, marked by steep slopes and denser urban forests (Figure 47, Figure 48). Additional wildfire hazard areas extend to East Portland, notably around Mt. Scott and Rocky Butte. Flood hazard areas primarily align with Portland's main waterways and sections of Johnson's Creek (Figure 50). Due to the inherently challenging terrain that these three areas pose to housing production, only a small fraction of Portland's expected demand for new units, estimated between 5 and 8 percent in these areas.

Conversely, the expected share of demand for new units in areas at high risk of liquefaction (Figure 49) and in areas designated as urban heat islands is relatively high given each area's existing share of population and households (Figure 51). This trend is particularly pronounced in areas prone to liquefaction that include neighborhoods likely to undergo continued growth such as Northwest Portland and Inner Southeast Portland. The expected demand for new units could double the number of households living in liquefaction areas by 2045. In addition, both hazard areas have a disproportionately high concentration of regulated affordable housing units compared to their shares of households. Notably, close to half of all regulated affordable units are situated in Portland's hottest block groups.

Figure 47. Hazard Risk Areas

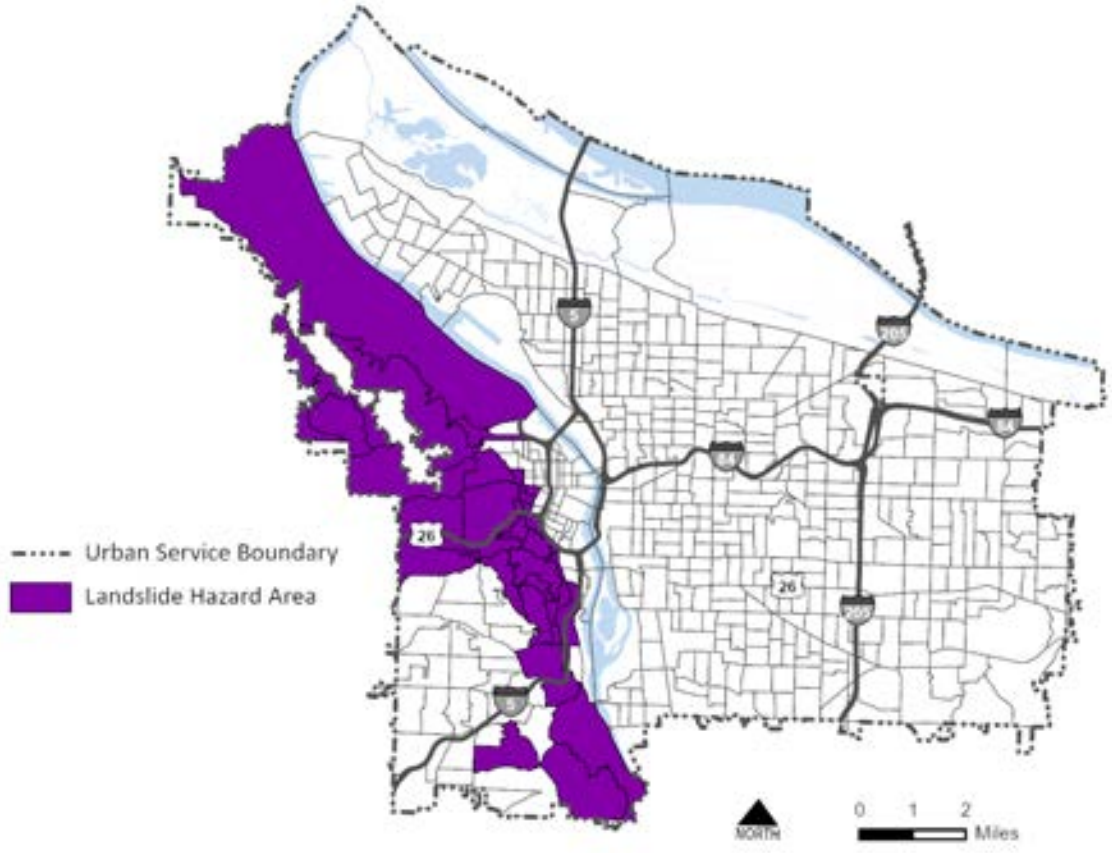
Share of…	Landslide Hazard Areas	Wildfire Hazard Areas	High Probability of Liquefaction Areas	Urban Heat Islands	Flood Risk Areas
Population	7%	6%	5%	21%	3%
Households	7%	6%	7%	24%	4%
Regulated Affordable Housing	2%	2%	20%	44%	5%
New Demand	5%	4%	17%	39%	8%
Capacity	6%	3%	16%	38%	8%

Source: BPS Analysis utilizing 2018-2022 ACS 5-year, 2023 Residential BLI and Metro Affordable Housing Inventory

Landslide hazard areas are census block groups characterized by geological or environmental conditions that increase the likelihood of landslides, including steep slopes, loose soil, heavy rainfall, or seismic activity.[21] Landslide hazard areas are only located in West Portland, along the steeper slopes in the West Hills and around OHSU.

[21] For the purposes of this analysis, block groups are flagged as landslide hazard areas if the landslide hazard source layer overlaps 50% or more with a block group area.

Figure 48. Landslide Hazard Areas

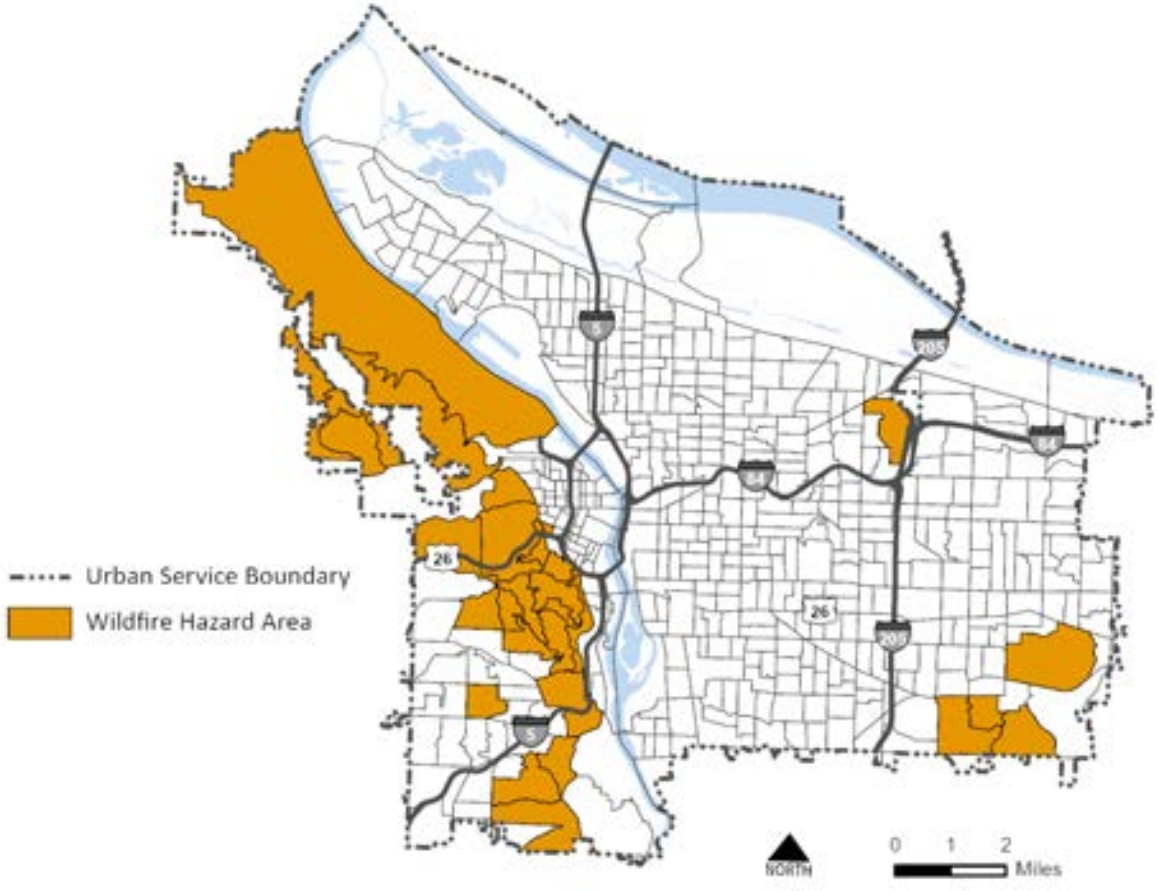


Source: BPS Analysis utilizing landslide inventory from IMS-57 for central and western Multnomah County, Oregon, DOGAMI.

Wildfire hazard areas are census block groups of elevated risk for wild land fires.[22] Vegetation, slope, and the ODF Fire Weather Hazard rating were the main factors used to determine wildfire hazard areas. Wildfire hazard areas in Portland are located in areas of the city that are less densely populated and include denser forests, such as the hills in Northwest and Southwest Portland as well as Mt Scott and Rocky Butte in East Portland.

[22] For the purposes of this analysis, block groups are flagged as wildfire hazard areas if the wildfire hazard source layer overlaps 50% or more with a block group area.

Figure 49. Wildfire Hazard Areas

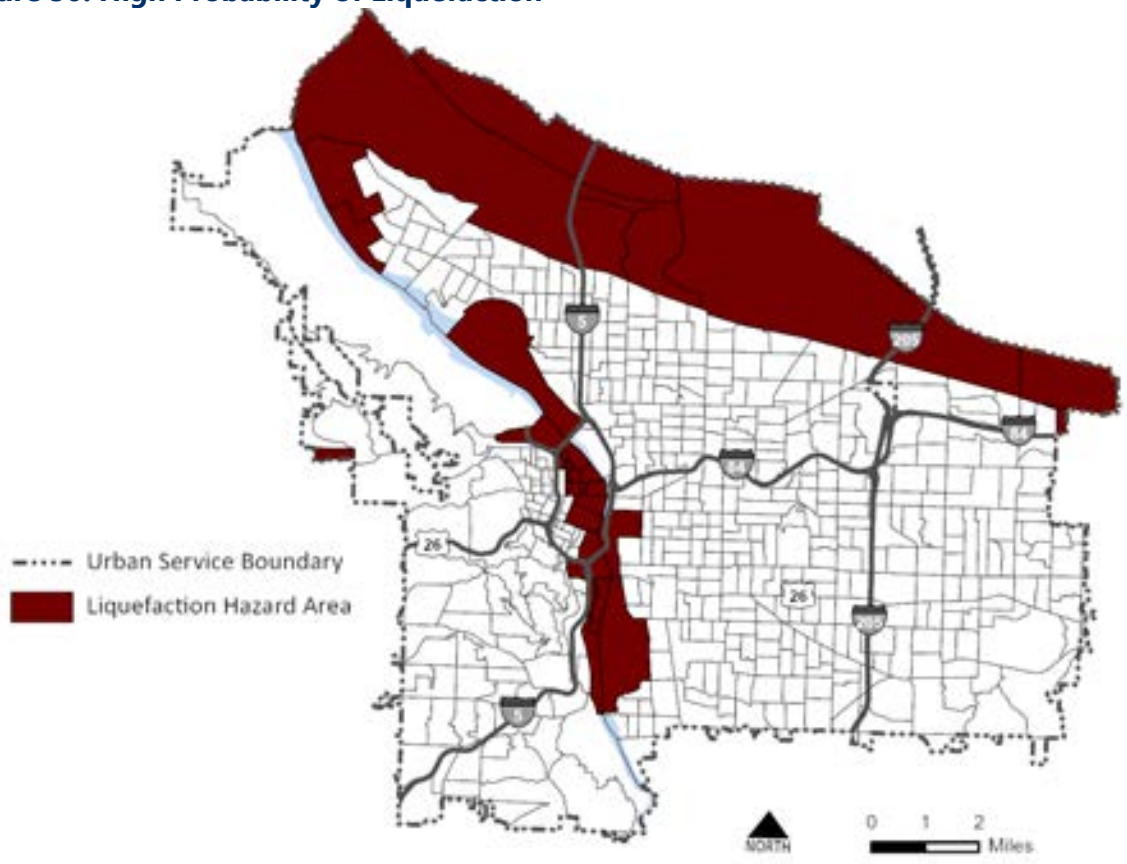


Source: BPS Analysis utilizing Metro's Wildfire Hazard Zones within the City of Portland from 2002.

Areas prone to liquefaction during earthquakes are census block groups where loosely packed, water-logged sediments at or near the ground surface lose their strength in response to strong seismic activity.[23] Liquefaction occurring beneath buildings and other structures can cause major damage during earthquakes. Areas with high probability of liquefaction in the event of a 9.0 earthquake are primarily located along Portland's waterways, notably in Downtown Portland and Portland's industrial districts in the Central City, North Portland and along the Columbia River.

[23] For the purposes of this analysis, block groups are flagged as high probability of liquefaction areas if the high probability liquefaction source layer overlaps 50% or more with a block group area.

Figure 50. High Probability of Liquefaction

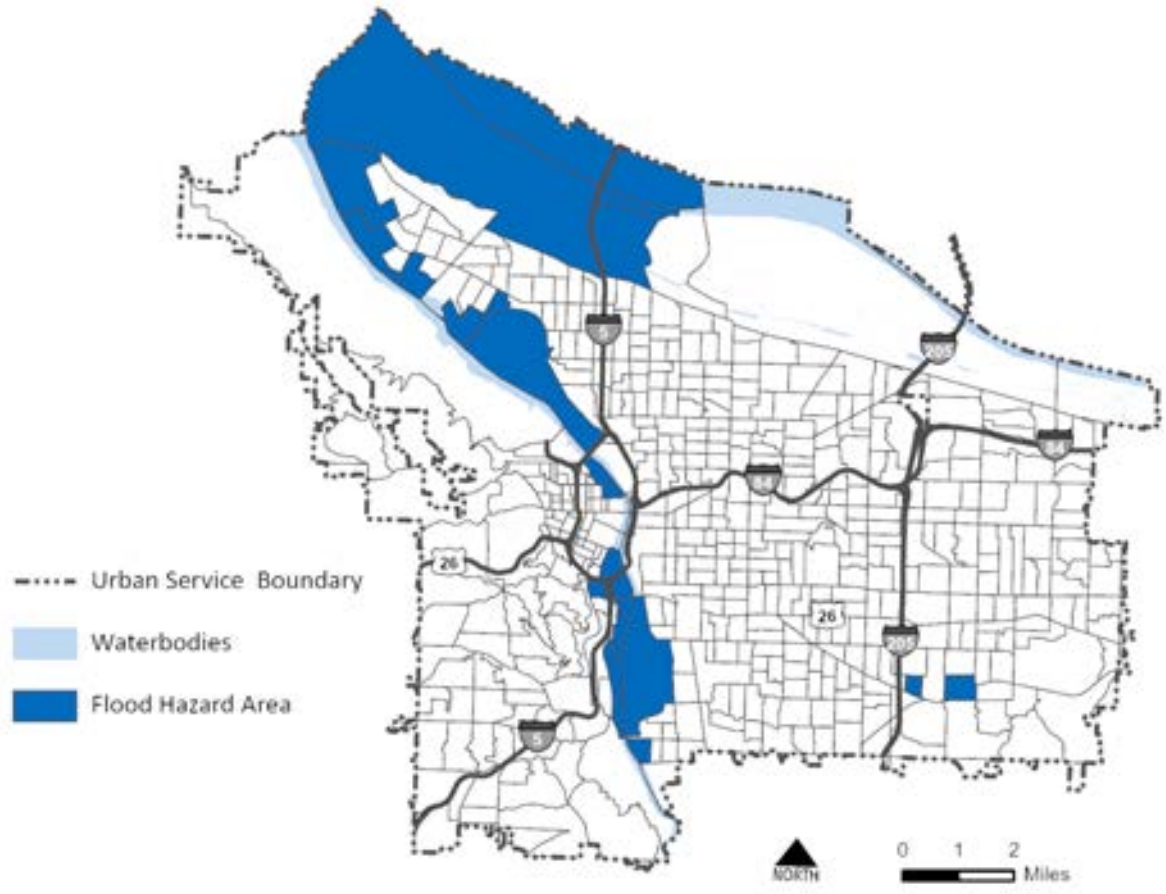


Source: BPS analysis utilizing the Cascadia Subduction Zone M 9.0 earthquake layer, DOGAMI O-18-02

Flood hazard areas are census block groups at an increased risk of experiencing flooding during periods of heavy rainfall, snowmelt, storm surges, or other hydrological events.[24] The flood hazard area highlighted in Figure 49 is comprised of the farthest landward extent of the FEMA 100-year Floodplain, the new Modeled Willamette River 1996 Flood Extent, and the 1996 Flood Inundation Area. Flood hazard areas are located along Portland's major waterways as well as Johnson Creek in Southeast Portland.

[24] For the purposes of this analysis, block groups are flagged as flood hazard areas if the flood hazard source layer overlaps 33% or more with a block group area.

Figure 51. Flood Hazard

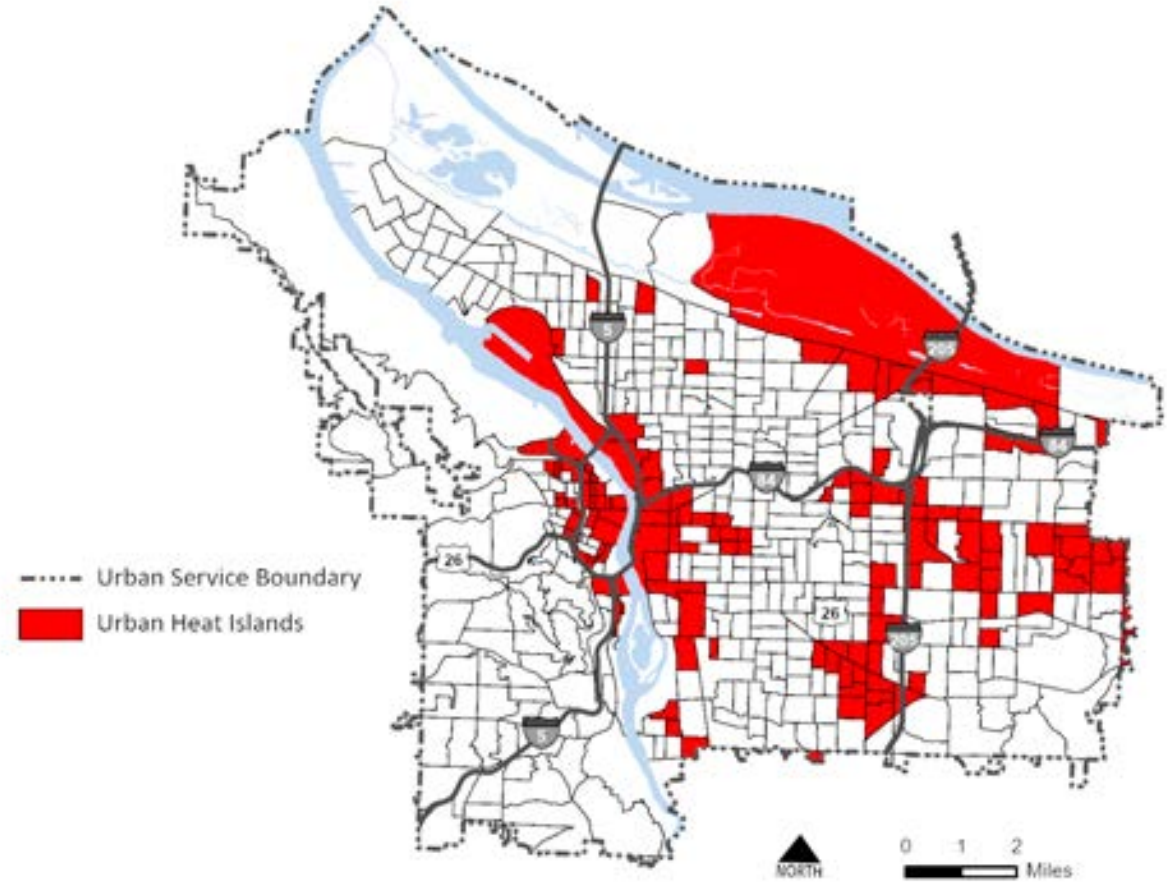


Source: BPS analysis utilizing the Title 33 Combined Flood Hazard Area

Block groups identified as 'Urban Heat Islands'[25] typically have high shares of impervious surfaces and fewer instances of green space/parks and street trees, all of which are factors known to contribute to higher surface temperatures. These characteristics are typical of very dense urban neighborhoods (such as Downtowns), industrial areas, auto-oriented commercial corridors or neighborhoods that have historically experienced disinvestment in green infrastructure. Block groups designated as urban heat islands are primarily clustered around Central City, industrial areas in inner southeast and Columbia Boulevard, Lents-Foster, Gateway, along 82nd, 102nd, and 122nd avenues and in Centennial.

[25] For the purposes of this analysis, block groups that recorded evening temperatures in the top quartile (82.6 degrees and over) are flagged as urban heat island block groups.

Figure 52. Urban Heat Islands, Multnomah County (CAPA Heat Watch)



Source: BPS analysis utilizing the evening temperatures reported in Multnomah County's 2023 Heat Watch Report, provided by the CAPA Heat Watch Program.

Market Conditions and Barriers Affecting Needed Housing

Existing Housing Stock

The 2021 estimate for housing units in the city shows that over half of the units are detached single-unit homes. Buildings with 20 or more units saw the largest increase and now account for 21 percent of all housing units (Figure 39).

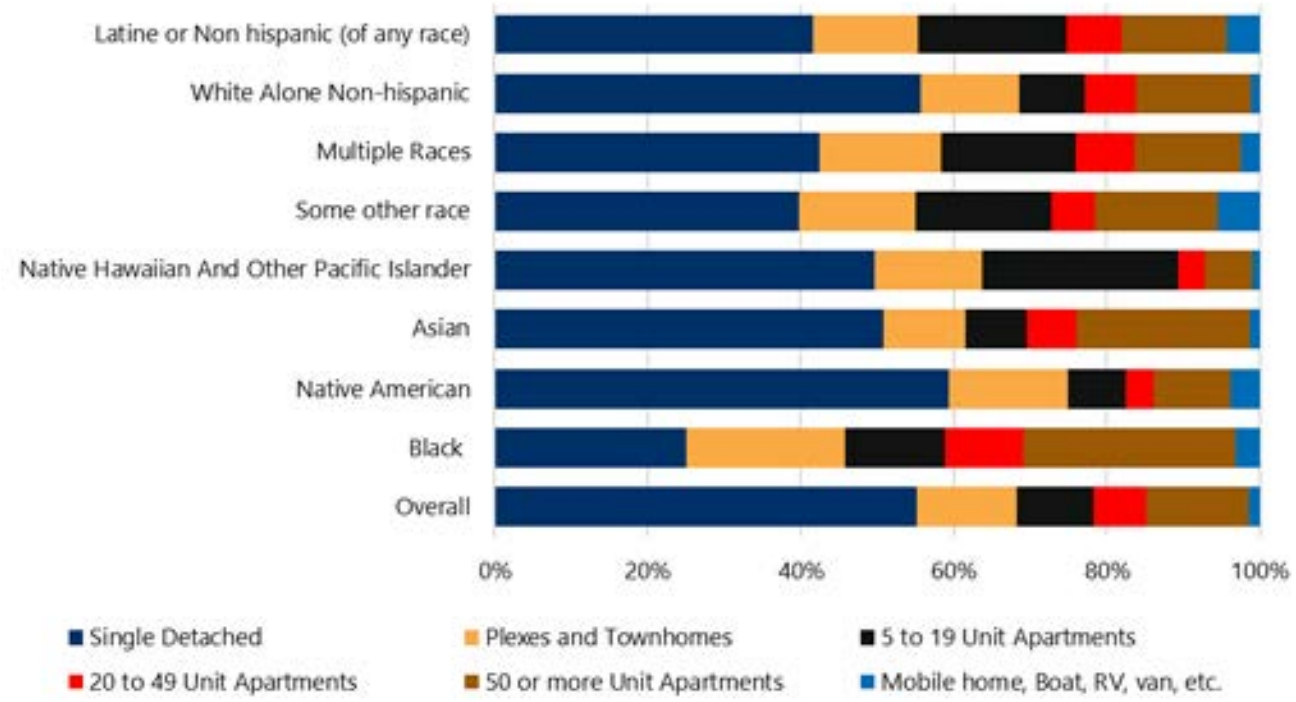
Figure 53. Units by Structure Type, 2010 and 2021

Structure Type	2021 Units *Estimate*	*Share*	2010-2021 Change (units) *%*
Single Detached	160,520	54%	6%
Townhouse/Rowhouse	13,578	5%	46%
Duplex	10,681	4%	-5%
Triplex or Quadplex	15,189	5%	3%
5-to-9-unit *apartments*	13,250	4%	-5%
10-to-19-unit *apartments*	15,946	5%	5%
20-to-49-unit *apartments*	20,567	7%	27%
50 or more-unit apartments	42,562	14%	60%
Mobile home, Boat, RV, van, etc.	4,186	1%	5%
Total:	296,479		13%

Source: ACS 2010 and 2021 5 Year Table B25024

Households living in existing occupied units, overall tend to live in single detached housing, given that it makes up 54 percent of the existing stock, though this varies by race and ethnicity of households. The majority of Black households live in large apartment buildings (50 or more units), plexes and townhomes or in small apartment buildings (5 to 19 units).

Figure 54. Existing Units by Structure Type and Race/Ethnicity of Householder, 2021



Source: ACS 2021 5 Year Table B25032 A-I

Between 2010 and 2021, the greatest increase of units by bedroom was studios, with an estimated increase of 11,711, or an increase of 86 percent. The smallest increase was in 2-bedroom units, increasing by just one percent. Overall, units that have three or more bedrooms, or would be considered family-sized units, account for about 45 percent of all units in the survey period.

Figure 55. Units by Number of Bedrooms, 2010 and 2021

Number of Bedrooms	2021 Units Estimate	Share	Change %
Studio	25,376	9%	86%
1	52,479	18%	16%
2	84,316	28%	1%
3	85,525	29%	5%
4	38,512	13%	23%
5 or more	10,271	3%	28%
Total:	296,479		13%

Source: ACS 2010 and 2021 5 Year Table B25024

Vacancy Rates

Approximately 17,000 housing units are counted as vacant, leading to a vacancy rate of 5.6 percent and down 1.2 percent from 2010. This vacancy rate is lower than that of the state of Oregon, which had a 7.5 percent vacancy rate in 2021 (ACS 5 year, 2010 and 2021 Table B25001). Fourteen percent of all vacant units were vacant for seasonal or recreational use (just 0.77 percent of all units), like the rate in 2010.

Figure 56. Vacancy Rate by Structure Type, Portland, 2021

Structure Type	Vacancy Rate	% Of Vacant Units
Single Dwelling Detached	4%	36%
Townhomes	3%	3%
Duplex	12%	8%
Triplex and Quadplex	7%	6%
5 To 9 Unit Apartment	4%	3%
10 To 19 Unit Apartment	5%	5%
20 To 49 Unit Apartment	7%	8%
50 Or More Unit Apartment	11%	29%
Mobile Home, Boat, RV, Van, etc.	5%	1%
Total	5.6%	100%

Source: ACS 2021 5 Year Table B25024, B25032

With strong demand from lower-income households (as shown in the 2045 HNA) but most new units affordable only to higher-income households, vacancy rates are highest (9.8 percent) for more expensive higher-quality buildings (rated four and five-star by Costar), 7.2 percent for three-star buildings, and 5.4 percent for less expensive one and two-star buildings. Market-rate rental units in buildings rated one, two, or three-stars tend to reflect unregulated affordable housing. Vacancy rates below or near 6.0 percent show continuing demand for new housing units.

Vacancy rates are slightly lower than Portland's averages at the regional level, with an overall vacancy rate of 6.7 percent, high vacancies in higher-quality buildings, moderate vacancies in three-star buildings, and a tighter supply of one and two-star buildings. The suburban inventory is more dispersed than similar products in Portland; Portland accounts for about 62 percent of the region's four- and five-star buildings and about half of its units.

Figure 57. Apartment Vacancy Rates, 2023 Q4

Rating	Portland	MSA
4-5 star	9.8%	8.5%
3 star	7.2%	6.4%
1-2 star	5.4%	5.0%
Overall	7.2%	6.7%

Source: Costar

Market Conditions

Rental Market Conditions

Rental Unit Affordability. The maps below show how rental affordability varies among different populations in Portland. On average, a household could afford a rental unit in green without becoming cost burdened and spending more than 30 percent of their monthly income on rent, not including utilities. Those in purple would be considered not affordable. Portland's neighborhoods are most affordable to white, Asian, and Pacific Islander households, and least affordable to Black, Latine, and Native American households.

Figure 58. 2-Bedroom Rental Affordability by Race and Ethnicity

Rental Housing Production. Portland has over one-third of the region's apartments, which primarily serve the local rental housing market. Over the past decade—a period of record-breaking apartment construction activity—Portland captured over half of the region's newly constructed apartments. These newly constructed buildings became increasingly larger, with most buildings built after 2014 averaging between 60 and 90 units, compared to under 50 units per project in the early 2000s. The average apartment building in Portland is now 28 units in size, up from 20 units in 2000.

Rent Growth. Portland's apartment construction activity in the 2010s was the result of prolonged pent-up demand for rental housing due to population growth over the past few decades (especially from upper-income households able to afford higher housing costs). With production trailing demand in the years prior to 2010, the tighter housing market combined with strong income growth to rapidly increase rents, especially for newly constructed buildings. While rent growth created a less affordable

rental market, it also increased the feasibility of higher-density projects, paving the way for the wave of new construction in the 2010s.

Since 2020, demand for rental housing decreased due to significantly lower levels of in-migration and the growing competitiveness of suburban submarkets, resulting in slightly elevated vacancy rates (relative to historical averages) and lower annual rent growth. However, underproduction has continued to contribute to a constrained housing market in which development activity has never 'caught up' to overall demand, especially not at the lower- and middle-income thresholds. With new market-rate construction generally targeting higher-income households, the average apartment rent in buildings constructed in the last five years is $1,700 per unit, versus an average rent across the entire multifamily inventory of $1,465 per unit.

Ownership Market Conditions

Portland's ownership housing market has been competitive for the past decade, with low vacancies and rapid home price growth the result of demand exceeding the supply of both new listings and new housing units. Higher interest rates in the latter half of 2022 and into 2024 have reduced average home values but exacerbated affordability concerns for prospective homebuyers pursuing traditional mortgages.

Historically, the ownership market has been dominated by single-dwelling homes and accounted for more than 80 percent of home sales between 2012 and 2020. Since the adoption of the Residential Infill Project (RIP) in 2020, and subsequently amended in 2021, attached units (housing such as middle housing, townhomes, and multiplexes) have accounted for 23 percent of sales. Attached units have also accounted for about half of all sales of newly constructed units since 2020, compared to 29 percent from 2012 to 2019. The Homebuyer Opportunity Limited Tax Exemption (HOLTE) Program has further supported the sale of new middle housing units, especially at lower prices.

According to American Community Survey 5-year estimates, Portland ended 2022 with an estimated sales vacancy rate of just 0.8 percent (down from 2.6 percent in 2010, but up from a historical low of 0.2 percent in the first quarter of 2021). A vacancy rate of less than 3.0 percent is typically considered an indicator of strong demand for ownership housing.

The Regional Multiple Listing Service (RMLS) provides details about housing unit transactions. An analysis of RMLS transaction data shows that for-sale home listings over the past six years have largely been unaffordable to the general population. About 60 percent of homes sold from 2018 to 2023 would be considered affordable to a household earning the median income the year the unit sold.

Figure 59. Homes Affordable by Median Household Income (MHI) and Year of Listing

	2018	2019	2020	2021	2022	2023
Homes Affordable at Median Income	39%	46%	42%	38%	41%	46%
Homes Not Affordable at Median Income	61%	54%	58%	62%	59%	54%

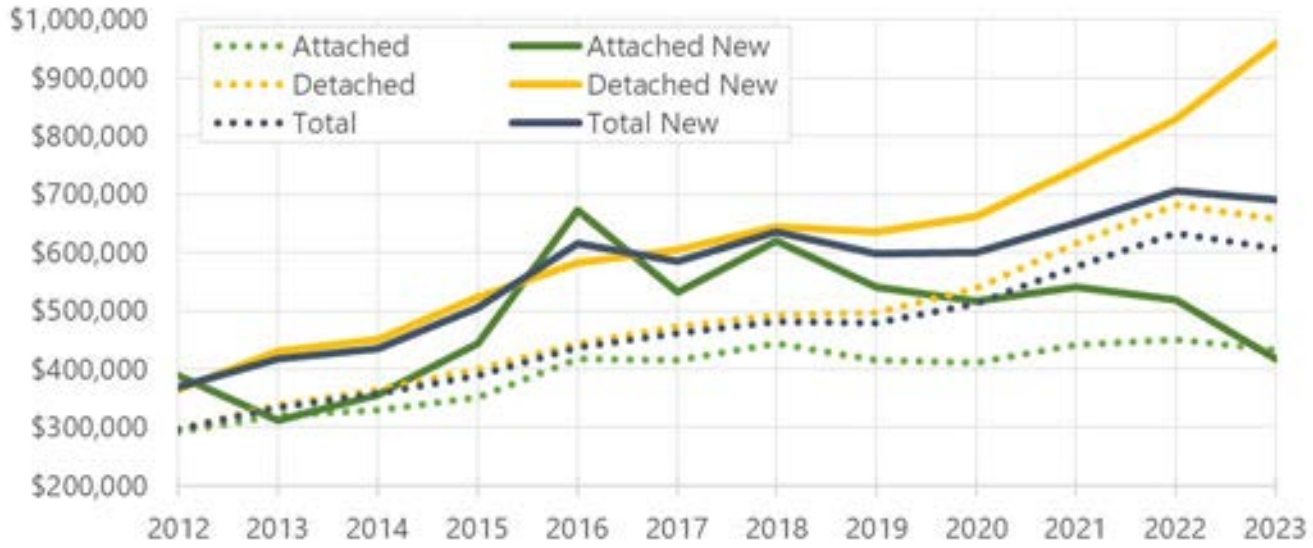
Source: RMLS, Homes Sold (Close Price), 2018-2023

The two main property types in the RMLS database are attached and detached housing (attached housing units include duplexes, triplexes, fourplexes, and townhouses). Citywide, the average home price for detached and attached homes increased by 31 percent from $500,000 in 2018 to a peak of nearly $650,000 in the second quarter of 2022. Average prices in 2023 were $606,000, an increase of $270,000 over 10 years.[26] Over this same period, detached housing sales closely followed the citywide average, while attached housing has stayed closer to $400,000. The average home sales price exceeded $400,000 in all 24 Portland Plan areas and was below $500,000 in only four areas—122nd, Centennial, Lents-Foster, and Gateway.

There continues to be a price difference between new attached and new detached housing units. The price of newly constructed detached housing has escalated in the last several years, increasing from $660,000 in 2020 to $960,000 in 2023. Meanwhile, the average price of newly constructed attached housing units has been decreasing since 2018 and in 2023, fell below the average price for all attached housing units, demonstrating the continuing potential of attached and middle housing units for meeting the City's affordability and homeownership goals.

[26] The decrease from 2022 to 2023 was due in part to lower attached housing sales prices. Note the median price for all housing types in 2023 was $505,000, highlighting the significant range at the upper end of the market.

Figure 60. Average Housing Unit Sale Prices by Year



Source: RMLS

Over the past decade, there was an average of about 10,000 real estate transactions for attached and detached units. Attached housing units have accounted for an increasing share of all transactions, going from about 19 percent in 2012 to 23 percent in 2023.

Figure 61. Number of Property Sales by Housing Type

Source: RMLS

When accounting only for newly constructed units, the market has seen a much greater proportion of attached housing units transacting. Newly constructed attached units have gone from capturing less than 20 percent of sales for new units in the early-to-mid-2010s to about half since 2020.

Figure 62. Attached Housing as a Proportion of New Home Sales

Existing And Expected Barriers To The Development Of Needed Housing

Development and Construction costs

Nationally, development costs have significantly increased over the past few years, especially early in the pandemic. Since 2020, several key construction materials have experienced rapid inflation. From 2020 to 2023, concrete costs increased by 15 percent, lumber by 16 percent and steel by 22 percent.[27] At the same time, rental rates and sale prices slowed, resulting in feasibility gaps for many residential projects. The escalation in pricing of construction materials has tested developers, and in certain instances forced them to utilize cost-effective alternatives that help projects stay within budget without compromising the quality of construction.

Since the Federal Reserve started raising interest rates in 2022, capital has become scarce and expensive, reducing sales transactions and undermining development feasibility.[28] Capital availability is critical for developers—most development costs, including acquisition, predevelopment, construction, and operations, are funded by debt. Interest rates are one of the most significant contributors to higher borrowing costs. Between 2019 and 2023, interest rates for residential development loans increased from five percent or lower to over eight and a half percent.[29]

Locally, System Development Charges (SDCs) are one-time impact fees charged on new development to help pay for infrastructure that serves or provides capacity for growth. Portland's SDCs are typically between $15,000 and $30,000 per unit. SDCs increase the cost of building new housing in ways that can skew housing development towards higher-cost homes and can impact buyers and renters.[30] Smaller and lower-cost housing units tend to be more affected by SDCs than larger and more expensive homes. SDCs typically account for a larger share of total costs for smaller homes, middle housing, and moderately priced apartments. These housing types are often targeted at moderate-income households who may not be able to absorb higher prices or rents, making them sensitive to small increases in development costs. As noted in the City's commissioned study, SDC waivers represent the largest potential cost savings for developers but may represent challenges associated with planned City capital improvements.[31]

Workforce Availability

The limited availability of labor, particularly in the construction workforce, is an acute pain point for developers that has also contributed to setbacks and challenges in construction. Projects are commonly delayed because of supply challenges and labor shortages. These delays sometimes increase costs to such an extent that developers cancel, postpone, or scale back projects. The general costs of trades

[27] https://blog.naiop.org/2023/12/how-rising-construction-costs-are-impacting-real-estate-development/
[28] https://knowledge.uli.org/-/media/files/emerging-trends/2024/2024-etre-us.pdf

[30] https://www.oregon.gov/ohcs/development/Documents/Oregon%20SDC%20Study_FinalReport_121422.pdf
[31] https://www.portland.gov/phb/documents/portland-development-cost-study-summary/download

have also increased, contributing to higher construction costs; as demand for these workers soars, there is little incentive for businesses to reduce costs. According to Associated Builders and Contractors, nationally, the construction industry needed to attract approximately 546,000 workers to meet the demand for labor in 2023.[32]

Financing and Investment Funding and Resources

Developers are currently facing funding availability challenges. Banks are willing to cover less of the overall project cost as lenders further hedge against risk. In 2019, a 65 to 70 percent Loan to Cost (LTC) metric was common, which refers to the amount a bank will finance of the total project cost. In 2023, that ratio dropped to roughly 55 percent.[33]

With banks and other lenders now less willing to lend as much, developers must seek other sources of funding. For some, that means putting in a greater proportion of their own equity, reducing their capacity for other projects; for others, that means taking on loans with less favorable conditions (higher interest rates, for example), reducing their ability to provide affordable units. For affordable housing developers, the pool of possible funders is small, and compliance can be challenging. Further, the Portland and Metro housing bonds passed by voters, which were effective funding sources, have largely been tapped.

Anecdotally, these national trends have been exacerbated by an extended wave of negative national media coverage of Portland since 2020, resulting in a diminished reputation amongst the development community—especially non-local developers who might otherwise invest in Portland.[34] Attracting those investment interests is critical to meeting future demand for housing units.

Competition for other funding and resources also reduces the ability of developers to meet the demand for non-market-rate and specialty housing units, e.g., units targeting the production of affordable or accessible units. Funding and resources tend to be tied up in complicated processes and distributed to providers with the expertise in navigating those processes. Further, compliance is criteria-based and promotes a 'bare minimum' development type to gain access to funding and tends not to reward developers that go above the basic requirements.

At the city level, funding is needed for staff time to implement the HPS but also to build units, preserve housing, support infrastructure development, and support redevelopment. Identifying funding sources will be necessary to achieve the outcomes of the HPS and increasing access to housing. Other funding sources may include the State of Oregon's Housing and Community Services Department and other

State agencies that fund infrastructure and other programs necessary to support housing development; and other private and nonprofit organizations.

Regulatory Burdens

In 2023, the City surveyed development professionals to better understand constraints affecting the building of needed housing in Portland, and to identify changes that may address these constraints and achieve development more quickly. The City asked for the top five requirements (out of 22 items) that the City should consider modifying to support production. The survey received 611 total respondents and identified the following 10 items: bicycle parking requirements, system development charges (timing of payment), floor area ratio limits, first-floor active use requirements, reduced public infrastructure requirements, demolition delay requirements, non-conforming upgrade requirements, parking impacts analysis, maximum height limits, and bird safe glazing requirements.[35]

Research conducted by the University of Oregon Institute for Policy Research and Engagement (IPRE) for the Department of Land Conservation & Development (DLCD) summarized the perceived barriers to housing production in Oregon.[36] They identified several barriers rated as 'extreme' that range from labor, buildable land supply and demand, construction costs, industry structure, and process:

- High construction costs (materials)
- Limited ability for low and moderate-income to compete in the market
- High cost of land
- High cost/limited supply of skilled labor
- Insufficient workers in skilled trades (e.g., licensed tradesperson)
- High construction costs (labor)
- Lack of available vacant buildable lots (e.g., for sale or owned by builders)
- High costs/limited supply of construction workers, generally
- Development not keeping pace with population growth
- Lack of larger (5+acre) development-ready tracts
- Developers not building enough needed housing that is affordable
- Not enough workers for other jobs

Mortgage And Loan Interest Rates

Mortgage interest rates dropped below five percent for the first time in history following the 2008-2009 Great Recession and remained there until 2022, while also reaching a record low of 2.65 percent in January 2021. Mortgage rates quickly rose to a peak of 7.08 percent in 2022 as inflationary pressures caused the Federal Reserve to significantly raise rates. With the Federal Reserve maintaining higher

[35] www.portland.gov/bds/news/2023/3/15/rubio-development-services-release-results-housing-production-survey
[36] https://bpb-us-e1.wpmucdn.com/blogs.uoregon.edu/dist/3/17202/files/2022/11/UO-IPRE-Barriers-to-Housing-Production-Summary-Report_Oct-2022.pdf

rates, mortgage interest rates have remained above 6.0 percent, reaching a peak of 7.79 percent in October 2023. Rates have hovered between 6.6 and 6.9 percent in the first quarter of 2024.[37]

These interest rate increases have been most consequential to housing affordability; the monthly payment on a median-priced house has increased by more than 50 percent due to higher rates. A jump in interest rates from 2.75 percent to 7.5 percent results in a 71 percent increase in a monthly mortgage payment. A $300,000 mortgage would be around $873 higher per month with a 7.5 percent interest rate compared to a 2.75 percent rate, nearly $10,500 more per year for the same size mortgage. Over the past year, housing has become less affordable due to modest gains in home prices, slower wage gains, and the continued rise in interest rates.

Additionally, homeowners may now be reluctant to sell their homes in the current interest rate climate, especially those locked in historically low-interest rates from 2020 to 2021 (91 percent of Oregonians have a mortgage interest rate "far below" six percent (Redfin 2022). This could further exacerbate affordability concerns by limiting the homes for sale, increasing competition amongst a tight supply, and putting upward pressure on home prices.

Resident Ability to Pay or Compete for Housing as A Commodity

Further complicating the issue of production and affordability, demand-side barriers present as mismatches in the housing market or an undersupply of new units at needed affordability levels. As a result, new housing units rarely match the incomes or needs of current households—both for renters and owners.

As demonstrated in the 2045 Housing Needs Analysis, 47 percent of Portland residents earn less than 80 percent AMI and nearly 50 percent of all renters in Portland are cost burdened. Additionally, in the Inclusionary Housing Recalibration study conducted by Portland Housing Bureau and BAE Economics, Portland renter incomes are lowest across peer comparison cities and lower than in the Metro Area.[38]

The rising cost of construction paired with lower incomes creates a challenging production environment where low- and moderate-income households have difficulties attaining affordable units, but achievable rental rates may not be high enough to support the cost of new development for private developers. The affordability of units can be improved by lower interest rates, lower home prices, or higher wages.

Short Term Rental Ordinance	• JOHS Motel Shelter Strategy
Rental Services Office (RSO)	• PSR Expansion 24/7
Fair Access in Renting (FAIR)	• Utility Debt Relief
Eviction Legal Support	• Eviction Legal Defense
Mandatory Relocation Assistance	• Housing Stabilization Contingency
Empowered Neighborhood Program	• Household & Legal Relief
Homeowner Foreclosure Prevention	• Rent Assistance; Safe Rest Villages
0% Home Repair Loans	• COVID-19 Houseless Services
Lead Hazard Control Grant Program	• Flexible household assistance
Safety Net Low Income Loans	• Rapid Workforce Training & Employment

Existing and Ongoing Housing Production Policy

Zoning and Code Changes

Strategies that proactively encourage needed housing production through zoning, code and map modifications.

- **Inclusionary Zoning.** Adopted 2016 and effective 2017 by Ordinance No. 188162 and 188163[39], the policy requires new medium and large (20 or more units) market-rate multi-dwelling development to provide affordable housing. It is a mandatory program with units affordable at 80 percent Area Median Income (AMI). There are financial incentives for units affordable below 60 percent AMI. There is a priority for units on-site over fee-in-lieu revenue or units off-site. Units must be comparable in quality, size, bedroom composition, and distribution and must maintain affordability for 99 years.
    - **Inclusionary Housing (IH) Calibration and Construction Cost Driver Studies.** Adopted in 2024 by Ordinance No. 191610, City council amended the property tax exemption for multiple-unit housing development code and inclusionary housing code to make technical corrections and adjust the property tax exemption for multiple-unit housing developments based on the work commissioned in 2023. The City worked with a consultant team to better understand the impact of various local code regulations on the cost of building housing in Portland. Those included inclusionary housing requirements, bike parking, ground floor active use, right of way improvements, design review, and associated fees/charges. This also included a cost comparison to build multi-dwelling housing in peer cities: Seattle, Denver, and Sacramento.[40]
- **Mixed Use Zoning.** Adopted in 2016 and effective 2018 by Ordinance No. 188177.[41] The Mixed-Use Zoning Project was adopted as part of the Portland 2035 Comprehensive Plan Early Implementation Package and developed new mixed-use planning and zoning designations to implement the "Centers and Corridors" concepts that emerged from The Portland Plan and the 2035 Comprehensive Plan Update planning processes. Subsequent amendments included floor area and height bonuses for inclusionary housing.
- **Manufactured Dwelling Parks (MDP) Zoning.** Adopted and effective in 2018 by Ordinance No. 189137.[42] The Manufactured Dwelling Parks (MDP) zoning project established a new residential multi-dwelling base zone specifically for manufactured dwelling parks. This project created the RMP zone, which exclusively allows for manufactured home parks, with a density of up to 29 units per

[39] https://www.portland.gov/bps/documents/inclusionary-housing-zoning-project/download
[40] https://www.portland.gov/phb/inclusionary-housing/calibration-study
[41] www.portland.gov/bps/documents/2035-comprehensive-plan-early-implementation-zoning-code-changes/download
[42] https://efiles.portlandoregon.gov/Record/12185077/

acre. The RMP zone also has an affordable housing bonus option in which the maximum density can be increased up to 43 units per acre when at least 50 percent of all the dwelling units on the site are affordable to those earning no more than 60 percent of the area median family income.

    - **Manufactured Dwelling Park Affordable Housing Density Bonus.** Adopted in 2020 and effective 2021 by Ordinance No. 189783 and 190523.[43] The MDP Affordable Housing Density Bonus was adopted to support the preservation of lower-cost market rate housing in manufactured dwelling parks; and ensure there are a variety of housing types available to low income and otherwise vulnerable people.

- **Central City 2035.** Adopted and effective in 2018 by Ordinance 189000 and in 2020 by Ordinance 190023.[44] These ordinances amended the Central City Plan District (33.510) to increase capacity for high-density, mixed-use and multi-dwelling housing where the most services and amenities are, streamlined bonus and transfer system, focused on inclusionary housing bonus, increased FAR/density and height in areas and applied minimum density requirements across Central City.
- **Better Housing by Design (BHD).** Adopted 2019 and Effective 2020 by Ordinance No. 189805.[45] This project re-wrote the Multi-Dwelling Residential Zones Chapter (33.120). The objective was to revise City regulations to better implement Comprehensive Plan policies that call for: increased housing opportunities in and around centers and corridors; housing diversity, including affordable and accessible housing; design that supports residents' health and active living; pedestrian-oriented street environments; safe and convenient street and pedestrian connections; design that respects neighborhood context and the distinct characteristics of different parts of Portland; nature and green infrastructure that are integrated into the urban environment; low-impact development that helps limit climate change and urban heat island effects. This project removed density maximums that were previously based on units per site area, and instead applied floor area ratio (FAR) limits to regulate density. It also added FAR and height bonus options for inclusionary housing, three-bedroom units, more accessible (visitable) units, and voluntary affordable housing units.

    - **Deeper Housing Affordability (DHA).[46]** Deeper Housing Affordability FAR Density Program. Adopted 2019 and Effective 2020 by Ordinance No. 189805; Amended and effective in 2021 by Ordinance Nos. 190093 and 190523. In addition to bonuses for mandatory inclusionary housing, and additional voluntary affordable units, the City offers an affordable unit floor area and height bonus for projects where at least 50 percent of the units are affordable at 60 percent AMI.

[43] https://www.portland.gov/code/30/01/130
[44] https://www.portland.gov/bps/cc2035/documents/ordinance-190023-amended/download
[45] www.portland.gov/bps/better-housing/documents/volume-1-adopted-better-housing-design-staff-report/download
[46] https://www.portland.gov/code/30/01#toc--30-01-140-deeper-housing-affordability-far-density-program-

    - **Visitable Unit Bonus.** In 2020, the City adopted zoning code changes to create a floor area bonus for visitable units (33.120.211.C.4). The Visitable units bonus option provides bonus FAR allowed up to the maximum with visitable units' bonus when at least 25 percent of all the dwelling units on the site meet the visitability standards, including standards for Visitable entrance, bathroom, living area and doors. this bonus is not available for projects with buildings that are required by the Oregon Structural Specialty Code to include Type A or Type B accessible units.
    - **Three-Bedroom Unit FAR Density Bonus Option Program.**[47] Adopted and effective 2021 by Ordinance No. 190037; amended by Ordinance No. 190523 It aims to increase the number of family-sized dwelling units available for sale or for rent to moderate-income households. Developments approved for the Three-Bedroom Bonus Program must maintain dwelling units that shall remain affordable for a period of at least 10 years and be available to households' earning 100 percent or less of area median income.

- **Expanding Opportunities for Affordable Housing.** With support from a Metro funded grant, the City adopted and made effective in 2020 by Ordinance No. 190000,[48] changes to the zoning code that streamlined the review process for community and faith-based organizations that plan to develop affordable housing on their land. The zoning code changes allow organizations that are in residential zones to 1) develop affordable housing on their land without a conditional use (CU) review if at least 50 percent of the units are affordable; 2) repurpose up to 50 percent of their parking area for an affordable housing project; and 3) add up to 2,000 sq ft of nonresidential use without a conditional use review.
    - **Expanding Opportunities for Affordable Housing Zoning Map Changes.** In addition to zoning code changes, zoning map changes were made on 19 faith-based or community-owned sites, which provide flexibility and options for future development.
- **Shelter 2 Housing Continuum (S2HC).** Adopted and effective in 2021 by Ordinance No. 190380, additional amendments adopted and effective in 2023 by Ordinance No. 191171. [49] The City adopted code amendments to address the growing crisis of houseless Portlanders. The City adopted zoning code changes to expand the housing and shelter options for individuals and households with extremely low incomes. These changes make it easier to site shelters, including outdoor shelters; increased the range of group living situations, including single room occupancy (SRO) units; and allows a recreational vehicle or tiny house on wheels on a residential property. In 2023, City Council adopted additional amendments to address unintended technical issues, and further streamline shelter site reviews. The code changes remove barriers that presented a burden

[47] https://www.portland.gov/code/30/01/160
[48] https://efiles.portlandoregon.gov/Record/13780746/
[49] https://www.portland.gov/bps/s2hc/documents/adopted-zoning-ordinance-no-190380/download

to City-County efforts to open more shelters. The SH2C package also included changes that expanded housing choice and facilitated the production of affordable housing projects.

- **Design Overlay Zone Amendments (DOZA).** DOZA Adopted and effective 2021 by Ordinance No. 190477.[50] [51] DOZA made several changes to update the tools and processes used to review applications within the Design overlay zone. Changes include updating the thresholds that trigger Design overlay zones requirements, including exemptions for affordable housing, and the assignment of land use reviews; allowing a greater number of projects to use the objective design standards, including some projects within the Gateway plan district; creating a new set of objective standards that employs a flexible menu approach. It also created a new set of nine Citywide Design Guidelines to replace the Community Design Guidelines; creating a new Type I lower level of review for smaller façade, sign and rooftop alterations; formalizing the process for Design Advice Requests and removing the Design overlay from most single dwelling overlay zones.

- **Residential Infill Project (RIP).** Adopted 2020 and effective 2022 by Ordinance No. 190093,[52] RIP2, adopted and effective 2022 by Ordinance No. 190851.[53] The City adopted rules that allow more middle housing options in neighborhoods. This includes accessory dwelling units (ADUs), duplexes, triplexes and fourplexes, and cottage clusters. RIP also adopted limits on the size and scale of residential development. In the R2.5, R5, R7, R10 and R20 zones, RIP adds flexibility to build housing through an increase in the number of units can be built on each lot; an increase in the number of allowable configurations of units and structures on lots; and removal of the off-street parking requirement in single-dwelling zones. For new construction with three or more units on the site, including ADUs, one of the units must be visitable. Visitability standards include: a no-step, barrier-free main entrance; a bathroom and small living area accessible to the main entrance; and 32-inch-wide internal doors between entrance, bathroom and living area for wheelchair accessibility.[54]

- **Historic Resource Code Project** (**HRCP)**. Adopted and effective 2022 by Ordinance No. 190687,[55] this project streamlined reviews and created exemptions for some alterations to historic resources. It also allowed for small new detached accessory dwelling units to be created in historic districts without a land use review, removed off-street parking requirements for historic landmarks and districts, removed unit density limits from R.25, R5, R7 and CR zoned landmarks and historic districts, and enabled two ADUs to be built in conjunction with a house, duplex, triplex, fourplex or multi-dwelling structure.

---

[53] https://efiles.portlandoregon.gov/Record/15213935/
[54] https://www.portland.gov/bds/zoning-land-use/residential-infill-project/visitability
[55] https://www.portland.gov/council/documents/This project ordinance/passed/190687

- **Parking Compliance Amendments Project (PCAP).**[56] Adopted and effective in 2023 by Ordinance No. 191310, the Parking Compliance Amendments Project removed minimum parking requirements citywide and makes other adjustments to parking maximums and parking standards to align with the 2022 Climate Friendly and Equitable Communities (CFEC) rulemaking process. These changes remove mandatory costs associated with providing required off-street parking, as well as enabling more of the development site to be used to create housing for people, rather than storage for cars.
- **West Portland Town Center Plan.**[57] Adopted 2022 by Ordinance No. 191079, the Zoning Code amendments include additional Zoning Code incentives and regulations to prioritize housing affordability and community benefits and proposed Zoning Map changes. Housing related provisions include changes to preserve existing multi-dwelling housing by adjusting FAR limits to be similar in scale to existing multi-dwelling development; allowing the deeper affordability bonus to prioritize affordability; incentives for sites preserving existing affordable housing through FAR transfer; FAR linked increases in multi-dwelling zones to housing affordability; and requiring inclusionary housing in order for other bonuses to be used (exempt purely commercial or employment projects).
- **EV Ready Requirement.**[58] Effective 2023, by Ordinance No. 191164, this augments state rules and provides more people the option to drive electric vehicles (EV) by making it easier to install chargers at multi-dwelling and mixed-use buildings. This update requires 50% of parking spaces, in new buildings with five or more units, to include EV-ready infrastructure, when more than six spaces are provided; or 100% of spaces, when six or fewer are provided. This is important to support the current and future of renters and low-income Portlanders living in multi-dwelling buildings.
- **Housing Regulatory Relief Project.**[59] Adopted 2024 by Ordinance No. 191609, the project amends the Zoning Code, providing both temporary suspensions of some regulations and permanent clarifications to the rules. The amendments are mostly based on the development issues identified through the Housing Production Survey from early 2023, conducted by the Bureau of Development Services on behalf of Commissioner Rubio. The temporary suspensions generally apply to projects that include housing and are in effect until January 1, 2029.
    - Development and design standards that are reduced or suspended include rules for bicycle parking, ground floor use and design standards, façade articulation, nonconforming upgrades, security gates, and Central City ecoroof standards. Process improvement changes include neighborhood contact processes, design review procedure types for market rate and affordable housing, approval criteria related to on-

[56] https://www.portland.gov/bps/planning/pcap
[57] https://www.portland.gov/bps/planning/wpdx-town-center
[58] https://www.portland.gov/bps/planning/ev-ready/about
[59] https://www.portland.gov/bps/planning/housing-regulatory-relief

street parking impacts, and land use review expirations. In addition, through a Council amendment, the regulations for inclusionary housing were simplified as well as aligned with state requirements.

- **Lower SE Rising Area Plan.**[60] Adopted in Spring 2024, this plan addresses the land use and transportation challenges in the Brentwood-Darlington neighborhood and nearby areas, including parts of the Woodstock, Mt. Scott-Arleta, and Lents neighborhoods. It focuses on recommendations for three primary types of implementation tools: 1) land use changes to provide more commercial and housing opportunities; 2) projects/programs to enable people to safely and conveniently walk or roll; and 3) community stabilization approaches to support housing and economic stability so that the community can benefit from improvements, such as growth allowed by zone changes and transportation projects.
- **Montgomery Park Area Plan.**[61] MPAP is exploring opportunities to create an equitable development plan for transit-oriented districts in NW Portland (Montgomery Park), as well as NE Portland (Hollywood District). The MP2H study considers land use and urban design options, affordable housing and economic development opportunities, as well as possible public benefits with a transit-oriented development scenario and the extension of the Portland Streetcar into the area. The project will also consider how such opportunities could support the City's racial equity, climate justice, employment and housing goals. A proposed draft will head to planning commission in May 2024.
- **Regulatory Improvement Code Amendment Package (RICAP 10).**[62] RICAP is designed as a regular omnibus package of code amendments that generally address technical issues, provide greater clarity, or simplify burdensome rules in the zoning code. These amendments typically have minor policy implications but are intended to overall improve the functionality and efficiency of the code. In 2023, Council re-established funding of the RICAP program, managed by BPS. RICAP 10 considers more than 80 items for possible regulatory improvement, with an emphasis on three themes: housing production, economic development, and regulatory reduction. The dozens of items are bundled to align with those three themes:
    - Housing production related proposed changes include amendments to regulations for: ground floor and ground floor façades, the design overlay zone, and historic resources. Economic development related proposals update the rules for the Central City Plan District, home occupations, and temporary activities. Regulatory reduction proposed changes include updates to bring the City into compliance with state and local laws, land use review processes, and miscellaneous regulatory cleanup

Tax Exemption and Abatement

Tax exemption and abatement programs intended to encourage developers to produce housing.

- **Non-Profit Low Income Housing Limited Tax Exemption (NPLTE).**[63] Authorized in 1985 by the Oregon legislature, the NPLTE is a property tax exemption for low-income housing owned and operated by charitable, non-profit organizations. The property must be located within the City of Portland and restrict the rents of the exempted units to be affordable to households earning no more than 60 percent of the area Median Family Income (MFI).
- **Multiple-Unit Limited Tax Exemption (MULTE).** Adopted and effective 2012 by Ordinance No. 185477, subsequently amended in 2018 by Ordinance No. 188869 and 189247.[64] With MULTE, multi-dwelling projects receive a ten-year property tax exemption on structural improvements to the property as long as program requirements are met. The program supports the creation of affordable housing units through the Inclusionary Housing Program; leverages market activities to advance housing and economic prosperity goals by aligning those activities with the goals of the Portland Plan and the PHB's Strategic Plan; and provide transparent and accountable stewardship of public investments.
    - **MULTE Extension.** Adopted and effective 2023 by Ordinance No. 191270.[65] Updates the City's Multiple-Unit Limited Tax Exemption (MULTE) rules to allow projects with expiring MULTE units a voluntary opportunity to extend their tax exemption for a limited amount of time in order to extend the affordability of the MULTE units. This change does not create new housing units but will help preserve the affordability of up to 279 units of existing affordable housing.
- **Homebuyer Opportunity Limited Tax Exemption (HOLTE).** First adopted and effective in 2012. Under the HOLTE Program, single-unit homes receive a ten-year property tax exemption on structural improvements to the home as long as the property and owner remain eligible per program requirements. Property owners are responsible for taxes on the assessed value of the land during the exemption. The property is reassessed when the exemption is terminated or expires after the ten years, and owners begin paying full property taxes.
    - **HOLTE Expansion.**[66] Adopted 2023 by Ordinance No. 191361, Portland City Council approved an increase to the annual HOLTE cap from 100 per year to 500. The program incentivizes private developers to build affordable homes by offering a property tax exemption if they are sold to an income-qualifying family.

[63] https://www.portland.gov/phb/nplte
[64] https://www.portland.gov/phb/multe
[65] https://www.portland.gov/council/documents/ordinance/passed/191270
[66] https://efiles.portlandoregon.gov/Record/16302674/

    - PHB took a temporary relief ordinance to Council on January 10, 2023, to increase the income threshold to 120%.

- **Affordable Housing Construction Excise Tax (AHCET) Exemption.** Effective 2016 by Ordinance No. 187855, construction permits for affordable housing for people at or below 80 percent AMI are exempt from the tax.

- **Inclusionary Housing (IH) Program.** To offset costs of compliance with the Inclusionary Housing (IH) program requirements and related zoning and code changes, the city offers financial and development incentives such as a property tax abatement, development bonus, and exemptions from other local taxes. As of 2023, over 1,000 units of affordable housing have been produced or are in development due to the Inclusionary Housing program (see above on Inclusionary Zoning for more details of program).

Financial Resources and Incentives

Financial incentives the City offers to encourage developers to produce needed housing. The City utilizes resources /programs at the local, state and federal level to provide funds for housing projects.

- **Tax Increment Financing (TIF).** Tax Increment Financing (TIF) supports regulated affordable housing and mixed-income, mixed-use projects within the City's Tax Increment Finance areas. A Tax Increment Financing (TIF) Set-Aside Policy was created in 2006 as a permanent resource to invest in meeting the City's housing needs by creating and preserving homes for the City's most vulnerable people and families. An updated Affordable Housing Set-Aside Policy was adopted in 2017 by Ordinance No. 180889, based on previous ordinances in 2011 and 2015 (Ordinance No. 185007, 187242 and Emergency Ordinance No. 187415). This policy now requires that 45 percent across urban renewal areas TIF funding to go to affordable housing**.** Existing TIF districts include Downtown Waterfront and River District (Old Town/ Broadway Corridor), Central Eastside, Gateway, Interstate, N Macadam, Lents Town Center and Cully. Past URA and TIF districts included Airport Way, Oregon Convention Center, South Park Blocks and the Willamette Industrial. A recent study regarding outcomes shows that while TIF districts make up a 11 percent of the City's land area, they contain 55 percent of the city's regulated affordable housing.

    - **Regulated Affordable Rental Housing.** Portland Housing Bureau has largely funded multi-dwelling, regulated rental housing through the Tax Increment Financing Set Aside resources. Regulated rental housing is provided for households earning 80 percent AMI and below. A 2019 TIF study indicated that between FY2015-18, a total of 1,886 units were created throughout the URAs, mostly for low (earning 60 percent AMI and below) and extremely low-income (earing 30 percent AMI and below) households.
    - **Acquisition and Rehabilitation of Existing Properties.** Tax Increment Financing (TIF) supports programs that purchase existing market-rate housing and/or sites, to convert into regulated, multi-dwelling affordable housing. PHB has used this mostly to acquire

properties for future redevelopment, to protect current residents from displacement and/or secure permanently affordable homes.

- **Gap Financing For Middle Income Housing.** Prosper Portland offers a Commercial Property Loan Program (CPRL) to assist with redevelopment, new development and **tenant** improvements that encourage business development and job growth within TIF districts and via a Strategic Investment Fund available citywide. Prosper Portland's commercial real estate TIF investments are largely guided by 5-year action plans outlining community priorities. Action Plans guide Prosper Portland's investments in Old Town, Gateway, Lents and Interstate via the N/NE Community Development Initiative Action Plan. CPRL investments have been instrumental to supporting middle income projects like The Nick Fish mixed-income, mixed-use project in Gateway and development of Oliver Station (complete), Lents Commons (complete), and 92nd and Harold (in permitting) in the Lents Town Center.
- **TIF Exploration.** After the adoption of Advance Portland strategy, Prosper Portland and PHB are working in partnership with community organizations to create new TIF districts in East Portland and Central City. If the exploration process created, these will capture increases in property taxes and redirect it to support local priorities related to housing and economic development. The TIF Exploration continues through 2024 with anticipated funding for housing development and production, for both affordable and middle income, coming in a number of years thereafter.
- **Neighborhood Prosperity Initiatives (NPI).**[67] The Neighborhood Prosperity Network are micro–Tax Increment Finance (TIF) districts designed to support social equity-based community economic development at the neighborhood level. Through grants, training, and support from Prosper Portland together with limited amounts of TIF, each Network organization is responsible for planning and implementing projects to improve the local commercial district, and depending on community priorities, has and can include the development of housing. Existing districts include Cully Boulevard Alliance, Division Midway Alliance, Historic Parkrose, Jade District, Our 42nd Avenue, Rosewood Initiative and St. Johns Center for Opportunity.

- **Short-Term Rental Lodging Tax.** Portland hotels, motels, Bed and Breakfasts, vacation rentals, and short-term rental operators who provide lodging on a non-permanent basis for eight or more days in a calendar year are subject to County and City Transient Lodgings Taxes. Portland's tax is 6 percent (5 percent to City general fund; 1 percent to Travel Portland).
    - A $4 nightly fee on short-term rentals, is due from Booking Agents and short-term rental hosts for each night a guest rents a room. This fee is in addition to the Transient

[67] https://prosperportland.us/neighborhood-prosperity-initiative/

Lodgings Tax being collected. The funds generated from this fee are used to fund affordable housing and houselessness initiatives in the Portland area.

- **Construction Excise Tax (CET)**. Effective 2016 by Ordinance No. 187855.[68] The tax, in the amount of 1 percent of the value of commercial and residential improvements, is imposed on new construction with a value greater than $100,000. For residential improvements, revenues are distributed as follows: 15 percent of net revenue remitted to the Oregon Department of Housing and Community Services to fund home ownership programs; 50 percent transferred to the PHB Inclusionary Housing Fund to fund finance-based incentives for programs that require affordable housing; and thirty-five percent transferred to the PHB Inclusionary Housing Fund for production and preservation of affordable housing units below 60 percent median family income.
    - For the tax imposed on commercial improvements, 100 percent of net revenue goes toward to the PHB Inclusionary Housing Fund for the production and preservation of affordable housing units at and below 60 percent median family income.
    - In addition, the CET funds have been used to support predevelopment loans to projects that are awarded Portland Housing Bonds and Metro Housing Bonds.

- **Portland Housing Bond**. In November 2016, Portland voters passed the city's first housing bond, dedicating $258.4 million under Measure 26-179 as proposed in Ordinance No. 187855.[69] Measure 26-179 was the first housing bond passed in the City of Portland with 62 percent of the vote with the stated aim to produce 1,300 permanently affordable homes for households earning under 60 percent AMI with a focus on families (goal of 650 family-sized units), very low income households (600 units at 30 percent AMI) and houseless (goal of 300 Permanent Supportive Housing or PSH units). To implement this measure, PHB included rental support in the form of Project Based Section 8 vouchers from Home Forward, the housing authority of Multnomah County, and supportive services funding from Joint Office of Houseless Services (JOHS). The Portland Housing Bond has exceeded all goals and committed all funds to 15 projects throughout the City in high opportunity location, representing 1,859 affordable units, a 43 percent increase over the original goal, to provide homes to over 4,000 low-income Portlanders.

    - Similar to all funding through PHB, the Portland Housing Bond had targets related to its Equity in Contracting policy with a targeted DMWESB-SDV of 30 percent contracting for hard costs and 20 percent for soft costs and targets under its Green Building Policy focused on sustainability. [70] [71]

[68] https://www.portland.gov/code/6/08
[69] https://portlandhousingbond.com/
[70] https://www.portland.gov/phb/about/equity-contracting
[71] https://www.portland.gov/phb/phb-affordable-housing-green-building-policy

    - The priorities and goals established by the bond's Policy Framework guide how PHB identifies, purchases, builds and renovates homes.[72]

- **Metro Housing Bond.** In November 2018, the Metro region voters passed Measure 26-199 dedicating $652.8 million for affordable housing. Portland's share is $211 million of the Metro Housing Bond by way of Ordinance No. 190095.[73] Similar to the Portland Housing Bonds, the Metro Housing Bond also has targets for production for a minimum of 1,475 new permanently affordable housing, 737 family sized units, 605 very low income, 30 percent AMI units and 300 PSH units. [74] Similar to the Portland Housing Bond, PHB is working with Home Forward for rental support and JOHS to provide supportive services to residents in these homes. As of 2024, PHB has committed approximately $160 million to fund over 1,700 units throughout Portland in high opportunity area in over 20 projects, that are open or in development, to house another 4,000+ low-income Portlanders. With the remaining Metro funds, PHB anticipates funding Phase 1 of the Broadway Corridor.

- **Metro Supportive Housing Services (SHS) Fund.** In 2020 voters in Multnomah, Washington, and Clackamas Counties took an unprecedented step toward meeting the rent assistance and supportive service's needs, with a particular focus on addressing the housing and support service needs of those extremely low-income individuals with disabilities who are experiencing long periods of street and shelter houselessness. By way of Ordinance 20-1442, Metro imposed an income tax on high-earning households and a regional business profit tax on businesses grossing over $5 million. SHS funds for Multnomah County are under the direction of the Joint Office of Houseless Services.[75]
    - These funds have been partially used to fund the supportive services required for PSH under the Portland Housing Bonds and the Metro Housing Bonds as well as any regulated affordable housing that becomes supportive housing. In addition, SHS funds have been used to provide Regional Long-term Rent Assistance (RLRA) which have been used to fund rental support to thousands of houseless households or those at risk of being houseless. [76]

- **Portland Clean Energy Community Benefits Fund (PCEF).**[77] Passed by ballot initiative in 2018, PCEF was charged with developing a Climate Investment Plan, which was approved in 2023. The plan outlines several strategic programs (SP) that will invest in energy efficiency and renewable energy upgrades in housing for low-income households over the next five years. These programs

[72]https://static1.squarespace.com/static/59d4128b80bd5e9928374e77/t/59de776090badeb45b424dd4/1507751778832/PHB+Bond+Policy+One+Pager+-+FINAL.pdf

[76] https://www.johs.us/regional-long-term-rent-assistance/
[77] https://www.portland.gov/bps/cleanenergy/climate-investment/documents/regulated-multi-family-affordable-housing-clean-energy/download

will result in single dwelling homes and multi-dwelling housing that are highly efficient, have lower and more stable utility bills, improved air quality, and are more comfortable for residents. Improvements that would not take place without PCEF investment may include but are not limited to deep whole home energy retrofits, solar panels, higher value insulation, high efficiency hot water heating systems, variable frequency drives, and air source heat pumps that keep residents healthy and comfortable. Improvements that would not take place without PCEF investment may include, but are not limited to:

  - PCEF SP1: Clean energy in regulated multi-dwelling affordable housing $60,000,000. This initiative is already underway in collaboration with PHB supporting clean energy in over 1,000 newly, regulated affordable homes in nine PHB funded projects.
  - PCEF SP2: Clean energy in unregulated multi-dwelling housing $50,000,000
  - PCEF SP3: Clean energy improvements in single-dwelling homes $140,000,000.

- **American Rescue Plan Act Funds.**[78] In 2021, as a large city, Portland received an award of $208 million of Local Fiscal Recovery Funds (Multnomah County received $157 million). Funds have supported numerous housing projects, some of which have contributed to the stabilization of households, and helped to acquire land, others have directly worked to house households, in temporary shelter such as:
  - **Safe Rest Villages**.[79] The City's Safe Rest Village team is adding to the mix of alternative shelters throughout Portland. The project team manages the largest portion of the City grant funds from ARPA, which includes the seven designated Safe Rest Villages, as well as two alternative shelters. Additionally, the State of Oregon has provided funding for the Sunderland RV Safe Park. As of July 2023, 49 percent of those who have exited from Safe Rest Villages have moved onto permanent or other housing.[80]

- **System Development Charges.** These charges help to fund critical infrastructure improvements; however, the City has provided strategic relief from these charges to help aid in the development of affordable units. Parks SDC are currently scaled by unit size and the Parks SDC Program has two sub-areas (Central City and Non-Central City). SDCs can be waived as affordable housing units by meeting the criteria in the waiver program administered by PHB.
  - **Exemptions and Waivers**.[81] Starting in 2018, the City provided SDC waivers for ADUs with the requirement that they not be used as short-term rental units. The City also provides waivers for affordable housing developments and houseless (mass) shelters. Inclusionary housing units are also exempt from SDCs- exempted units must be rented to households earning no more than 60 percent AMI.

---

[81] https://www.portland.gov/code/17/14/070

- **Freeze.**[82] In 2023, with the adoption of the City budget for FY 2023-24, the City has, for one fiscal year, froze SDCs for all development projects. Over the past several years, the City Council has chosen to charge lower SDCs than the legally allowable amount. In FY 2023-24, the City froze SDC rates and in FY 2024-25, Water and BES held their increases to 5 percent. Parks is increasing 6 percent and PBOT is increasing 8 percent.
- **Deferral.**[83] Adopted and effective in 2023, through Ordinance No. 191243, the City created a voluntary 24-month payment deferral program, without interest. This change means that housing developers do not have to carry the full financial burden of SDCs up front as they move through the construction process.
- **Office-to-Housing Conversion Fee Deferral.**[84] Adopted and effective in 2023, through Ordinance no 191202 and 191203, the City has waived SDCs to help offset the cost of required seismic improvements to facilitate the conversion of existing office space to residential.
- **Sanitary and Stormwater Rate Changes.**[85] [86] Code changes to PCC Chapter 17.36 were adopted and effective in 2023 by Ordinance No. 191537; the code changes along with updates to administrative rules will go into effect July 1, 2024. SDCs will now scale charges with size of development, including residential, and will simplify stormwater charges to be based only on impervious area. Other sanitary and stormwater changes include shifts to the rate structure; tiered stormwater charges for single dwelling accounts; Clean River Rewards program; retiring line and branch, and conversion charges; stopping active enforcement of the mandatory sewer connection program; and connections for non-conforming sewers will be less expensive going forward.

- Water SDC rate is also known as an impact fee, it provides revenue to utilities from new user hook ups to recover costs for building existing system capacity. It is based on the "cost per equivalent meter unit" times the size of the meter (in equivalent units) added to the water system. In FY 23-24, at the request of Council, the rate increase was 0% when it would have otherwise been 20.8%, in FY 24-25, a 5 percent increase was approved when it would have otherwise been 9.9%.

- **Local Transportation Infrastructure Charge (LTIC) Exemption.**[87] Adopted and effective in 2016 by Ordinance No. 187681, the city adopted a charge on new infill development occurring on specific streets in single-dwelling residential zones to fund improvements to the City's network of

[82] https://www.portland.gov/cbo/2023-2024-budget/adopted-budget
[83] https://www.portland.gov/council/documents/ordinance/passed/191243
[84] https://www.portland.gov/council/documents/ordinance/passed/191202 , https://www.portland.gov/council/documents/ordinance/passed/191203
[85] https://www.portland.gov/bes/news/2024/3/25/environmental-services-requests-public-comment-proposed-changes-administrative
[86] https://www.portland.gov/charter-code-policies/changes/2024/7/ordinance-191537
[87] https://www.portland.gov/transportation/permitting/ltic

unimproved local streets and adjacent or related transportation facilities. Accessory dwelling units, affordable housing, and low-income (less than 80 percent AMI) owner occupied units are exempt.

- **State Funding.** The Oregon Housing and Community Services (OHCS) provides competitive sources of funding including 9 percent Low-Income Housing Tax Credit (9% LIHTC), 4 percent Low-Income Housing Tax Credit (4% LIHTC), Local Innovation and Fast Track (LIFT) Program for Affordable Rental Housing Development, Local Innovation and Fast Track (LIFT) Homeownership, Preservation of Manufactured Dwelling Parks and Permanent Supportive Housing. Non-competitive sources of funding include the Affordable Housing Land Acquisition Revolving Loan Program, and Oregon Multifamily Energy Program.
    - **PHB** works with OHCS to align the State and City's strategic priorities, especially related to work with our communities of color and development of very low income, 30 percent AMI units and Permanent Supportive Housing (PSH) units. An example of collaboration occurred in 2022 when OHCS carved out of LIFT and Housing Trust Funds (HTF) totaling $35.28 million to local jurisdictions in the Metro region from which PHB was allocated over $20 million plus associated 9% and 4% LIHTC to advance PHB directed Metro Bond funded projects. Continued collaboration and alignment of State and local resources are critical to meeting the City and Governor Kotek's housing production strategy.
- **Federal Funding.** The Portland Consortium, consisting of the City of Gresham, City of Portland and Multnomah County, is required to produce a plan called the Consolidated Plan every five years. The Consolidated Plan is a five-year strategic plan that sets out a collaborative vision for community development in the Portland area. The Consolidated Plan also serves as the federal application for four federal programs run by the U.S. Department of Housing and Urban Development (HUD) , see below. [88] The Plan places an emphasis on how federal funds will be used to meet the local demand from low- and moderate-income households and emphasizes the formula block grant programs:
    - **Community Development Block Grant (CDBG).** CDBG funds aim to provide decent housing; create suitable living environments and expand economic opportunity. Funds are being used for rental housing development, administration, fair housing, workforce development, single dwelling assistance, and microenterprise and homeowner services.
    - **HOME Investment Partnerships (HOME).** HOME funds aim to expand decent, safe, sanitary, and affordable housing supply. Funds are used for acquisition, homebuyer assistance, homeowner rehabilitation, multi-dwelling rental new construction, multi-dwelling rental rehabilitation and new ownership construction.
    - **Emergency Solutions Grants (ESG).** ESG funds are utilized for programs that aim to reduce and prevent houselessness. Funds are used for conversion and rehabilitation of

[88] https://www.portland.gov/phb/consolidated-plan-and-action-plan

transitional housing, financial assistance, overnight shelter, rapid re-housing, rental assistance, services, and transitional housing.

- **Housing Opportunities for Persons with AIDS (HOPWA).** HOPWA funds are utilized to provide housing for persons with HIV/AIDS. Funds are used for permanent housing in facilities, permanent housing placement, short term or transitional housing facilities, short-term rent, mortgage, and utility (STRMU), supportive service and tenant-based rental assistance (TBRA).

- **Other Federal and Local Funding.** Other Federal funding opportunities are being explored and expanded in conjunction with the Office of Government Relations (OGR). Portland successfully accessed it first Congressional Directed Spending (CDS or earmarks) for housing production through a $2 million grant in The Fairfield, a 75-unit project, being develop by Home Forward and Urban League focused on the houseless with drug addiction and/or mental illness who need permanent supportive housing. CDS will continue to be a source of funding for other pipelined projects including one in N/NE Portland at the William + Russell site and one in SW Portland focused on the immigrant community. In addition, the City is working with Multnomah County in advancing projects in the predevelopment pipeline through its recent Last Gap solicitation and working with developers to explore strategies and options to expand affordable housing stock. [89]

Reducing Regulatory Burden and Improving Processes

These existing strategies, programs and projects address known impediments to providing needed housing. These include but are not limited to permitting and infrastructure impediments.

- **Permit Improvement Task Force and Permit Improvement Transition Team (PITT).** [90] [91] In 2021, Commissioner Ryan appointed a task force to develop recommendations to improve the City's permitting process. The Task Force consists of leaders from permitting bureaus and the development community. A number of improvement projects are being evaluated and undertaken by the task force. The Permit Metric Dashboard provides transparency for customers about the work to improve quality, timeliness, and efficiency of the permitting process.
    - **Regulatory Development Workgroup.** Comprised of staff from various bureaus participating in the Permit Improvement Task Force, the workgroup is developing further recommendations for changes necessary for a cohesive regulatory development and maintenance system. The recommended solution(s) provide direction to a) address problems with urgency; b) streamline the regulatory environment; c) monitor the effectiveness of adopted regulations; d) maintain feedback loop with code implementers and customers; e) evaluate proposed regulations holistically.

[89] https://www.portland.gov/phb/events/2023/8/25/metro-bond-solicitation-m-bos-last-gap-summer-2023
[90] https://www.portland.gov/permitimprovement/task-force
[91] https://www.portland.gov/permitimprovement/current-projects

    - **Code and Policy Coordination Team.**[92] This group is comprised of staff with policy development expertise. Their primary function is to evaluate proposed regulations in a holistic way, considering how they fit with other existing or proposed regulations. They are the stewards and keepers of the cumulative network of development-related codes and policies to which development needs to conform. A pilot of this process and group kicked off in September 2023.

- **Regulatory Reform Project.** First identified by the Permit Improvement Task Force in its first round of recommended process improvements building on the work of the Strategies for Accelerating Housing Development Report (2017) and in response to the Building Permit Review Audit (2021) it has been further reinforced by customers and staff via surveys as a leading cause for frustration and a barrier to moving permits through the process.
    - This project aims to streamline when code and fee changes are brought to Council and establish a new code and policy process that will: include the bureaus responsible for development regulations (BES, PBOT, Water, BDS, Parks/Urban Forestry, BES); ensure cross-code regulatory alignment; have frequent touch-points with Council to reduce code conflicts, identify development impacts, create a customer and staff feedback loop to codes writers; and collect and catalog barriers identified by review teams and customer-facing staff to be considered for review.
    - Development of a new right-of-way administrative rule utilized the new process prior to its adoption in early 2024. It defines thresholds for right-of-way dedications and frontage improvements, creating much needed predictability for both commercial and residential projects.

- **Residential Permitting Single Point of Contact.** Bureau of Development Services created a single point of contact for all housing projects, including New Single Dwelling Residential, Middle Housing Land Divisions, and Multi-Dwelling New Construction projects moving through the permitting process. In addition, there is now a manager in charge of overseeing assigned permit staff when building owners express an interest in office to housing conversion. Each project is assigned one person to work with as evaluation occurs.

- **Public Infrastructure Prescreen**.[93] Providing a public infrastructure prescreen is a process improvement in business process analyses led by the Permit Improvement Transition Team. PBOT is actively piloting a manual PBOT prescreen (for identifying primary PBOT permit approval requirements). Formalizing this prescreen step by adding technology, procedures and other infrastructure teams to the process will expand and solidify this solution and the benefits it will provide. Currently when a public works review is required as part of the permit review process, it

[92] https://www.portland.gov/permitimprovement/documents/regulatory-workgroup-recommendations-june-2023/download
[93] https://portlandoregongov.sharepoint.com/:w:/s/GT-Transportation-PWDevelopmentTeam/EeOFM5HiCL1NrqgYcO2G0rIB8TppjJPUwZCyJqtOIBIxZg?e=jZy1TH

does not happen until post-intake and an applicant has paid fees. If significant improvements are required in the public right of way, applicants may be surprised, and in some cases abandon the project. This can also lead to alternative request for variances, appeals, additional review processes, and increase the length of the overall permit review cycles and time. Providing a public works prescreen during the intake process will benefit both the customer and the public infrastructure reviewers, reducing conflict and time-consuming review lags.

- **Multi-Dwelling Housing Pilot.** Bureau of Development Services launched a Multi-dwelling Housing Pilot to proactively monitor and intervene to keep these projects moving through the permit process. The goal of this effort is to learn why projects are sitting in "approved to issue" status and projects that seem stuck in "under review" status.
- **Public Works Pilot**. A recommendation from the City's Permit Improvement Taskforce, the permitting teams in the City's four infrastructure bureaus are now being overseen by a shared manager. The new Infrastructure Team Manager launched a public works pilot project to make it easier to resolve conflicts that arise between various City codes as part of a permit review.
- **Temporary Early Assistance Fee Reduction.** From January to April 2023, through a resolution passed by Council, BDS made across the board cuts to early assistance fees for projects with 20 or more units.
- **Early Assistance Options for Middle Housing Projects.** With the range of housing options now available on single dwelling lots, it can be difficult to provide enough information during the 15-minute appointments, but other early assistance (EA) options are geared toward discussing specific proposals. BDS is launching a new EA option (with a fee) that would allow a planner and an interested party to discuss residential infill options on a site without specific site plans prior to any more formal analysis. The sessions would be 30 minutes, with a fee intended to be less than current zoning EAs. This new early assistance meeting option launched October 2023.
- **Single Permitting Authority Project**. [94] Adopted by Resolution No. 37628, City Council has directed the Chief Administrative Officer, with the cooperation of City bureaus, to prepare for consolidation of development review and permitting staff into one entity by July 2024. The intent is to develop a cohesive, effective permitting system essential in addressing housing crisis and economic recovery. Authority will be granted to the director to resolve conflicts, make decisions regarding development review and permitting services Effective, July 1, the permitting teams from the Environmental Services, Transportation and Water bureaus and the Urban Forestry Division of Portland Parks & Recreation, along with all Bureau of Development Services divisions, are now unified in a single bureau known as Portland Permitting & Development.

[94] https://www.portland.gov/council/documents/resolution/adopted/37628

- **Customer Intake Success.** This project will focus on the New Single Family Residential (NSFR) and new construction of detached ADU permit application submittal process, from application request to intake folder closed. In the 2022 customer survey, we learned that 93 percent of the surveyed permitting customers used the minimum submittal requirements documents provided online before submitting their permits. From July - September 2022, the average time from the Application Submittal to Under Review was 13 days and the goal is to reduce that timeline to 10 days.
- **Website Design and Alignment.** This endeavor is a collaborative effort to transition from uncertainty to clarity, prioritizing the end-user experience above all else. It necessitates deep collaboration and shared commitment. The Digital Service team and the bureau Product Managers will work together to update/create portions of the Portland.gov website. These updates will be made to solve the problems listed in this document and to achieve the objectives and key results. The scope focuses on helping users with wayfinding in four ways: Determining whether their project requires a permit or permits, defining all the different permits required, getting information on what they need to provide for a complete permit application specific to their project and location and who to contact for help.
- **Team Business Process Analysis Review.** The Permit Improvement Team provides Business Process Analysis (BPA) to plan review teams aimed at improving internal coordination and customer outcomes. These business operations projects work with staff to identify and implement improvements with the overarching goal of improving customer service and decreasing processing time. This is an ongoing activity. BPA work to date has been done with Life Safety, Water, Urban Forestry and Permitting Services.
- **Housing Development GATR (Government Accountability, Transparency, Results).**[95] In 2017 and 2018, a series of Housing Development GATR sessions were held to accelerate the development process and reduce costs to meet City goals for housing supply. A series of actions were assigned to development services bureaus. In 2018 this included, 1. Propose goals and clarify ownership roles for development; clearly identify accountability and responsibility within the development process. (Development Directors Group, OMF) 2. Provide a follow-up report on building permit review turnaround times. (BDS) 3. Develop a proposal to institute minimum sufficiency requirements for permit applications, to establish expectations and increase clarity. (BDS, infrastructure bureaus) 4. Utilize targeted recruitment strategies to close remaining vacancies for plans examiners. (BHR, BDS) 5. Provide a progress report on the Mayor's Fast Track Pilot. (BDS, IA bureaus) 6. Provide a progress report on technology improvements. (BDS, IA bureaus, BTS).
- **Pre-approved Detached ADU Plans.**[96] This is the first of many efforts that the Bureau of Development Services (BDS) will undertake to provide pre-approved plan sets to help homeowners

[95] https://www.portlandoregon.gov/cbo/72474
[96]https://www.portland.gov/bds/residential-permitting/news/2024/4/29/new-pre-approved-adu-plans-now-available

receive permits more efficiently. BDS and Portland Permitting and Development (PP&D) worked with the City of Eugene to provide pre-approved plans that can reduce the resources and time needed to receive a permit. There are four options to choose from that vary in roof and foundation type: An ADU with a gable roof and concrete slab on grade floor and foundations; An ADU with a shed roof and concrete slab on grade floor and foundations; An ADU with a gable roof and wood-framed floor and crawl space; and An ADU with a shed roof and wood-framed floor and crawl space.

Land

These strategies, programs and projects secure land for needed housing, unlock the value of land for housing, and/or catalyze housing developments.

- **Public Land Inventory.** In 2023, the City worked with a consultant team to identify City-owned and other publicly owned land in Portland that can be used for affordable housing development.
- **Land Banking.** PHB and Prosper Portland have previously independently acquired land and sites as funds are available for housing development throughout the City.
- **Land Banking for Affordable Housing.** PHB released nearly $5 million in ARPA Funds for grants to affordable housing developers to purchase land for future homeownership development. The project goal is to increase affordable housing developments in areas of Portland where Portlanders with lower incomes work and live and have access to transit, parks, and other community assets. This project will expend these funds by the end of calendar year 2024.

Other Policies and Programs; Stabilization, Anti-Displacement and More

Existing actions or programs the City has implemented related to stabilization, tenant or homeowner support, etcetera.

- **Joint Office of Houseless Services (JOHS).** Established in 2016, the office represents a shared commitment between the County and the City of Portland to address houselessness. JOHS works with community-based organizations and governments partners to provide services focused on people experiencing or at risk of houselessness. JOHS contracts with direct service organizations and monitors funds issued by the U.S. Department of Housing and Urban Development's Continuum of Care program.
    - **Services** funded through JOHS include rapid rehousing, permanent supportive housing, outreach/navigation, shelter/survival support, hygiene and employment.
    - **Funding** sources for the FY23 budget of $255.5 million include City of Portland: $45.4 million, Supportive Housing Services: $107.1 million, County General Fund: $59.8 million, American Rescue Plan: $27 million and Other federal/state/local funds: $13.3 million.
    - **Program** categories funding include; Behavioral health: $25 million, Shelter: $130 million (includes $53 million in capital), Housing: $106 million and Outreach: $12 million.
    - **Houselessness Response Action Plan.**[97] The draft plan lays out timelines and a concrete series of short-, medium- and long-term steps. Among the top objectives are: Sheltering or house an additional 2,699 people by Dec. 31, 2025, Adding 1,000 shelter beds in two years, and provide the housing and health resources , Adding hundreds more behavioral health beds and funding a drop-off sobering center, Increasing the

[97] https://www.multco.us/multnomah-county/houselessness-response-action-plan

number of adults leaving shelter for permanent housing by 15% by Dec. 31, 2025, and ensuring 75% of people housed in permanent supportive housing retain their housing 24 months after placement. Reducing houselessness among specific priority populations (including people of color and people identifying as LGBTQIA2S+). Ending discharges to the street from all behavioral health, health systems or hospitals by the end of 2025, and ending discharges to the street from corrections settings by the end of 2026. Ending houselessness for youth aging out of foster care in Multnomah County by 2027, Increasing the supply of affordable housing through regulatory changes, building conversions and new construction funding sources, among other strategies.

- **Tax increment Financing (TIF).** In addition to supporting the development of new housing, TIF has been utilized to support a number of stabilization, tenant and homeowner programs, including:
    - **Single Dwelling Home Repair**. TIF funds are used to support programs supporting low-income community members who own their homes through home repairs relating to life safety, code compliance, energy efficiency upgrades, and accessibility upgrades.
    - **Homeownership**. TIF funds are used to support programs that through the provision of down payment assistance and other types of financial assistance.
    - **Rehabilitation and Preservation of Existing Regulated Housing**. TIF funds are used to support programs that provide funding to rehabilitate and preserve the affordability of existing regulated affordable housing.
    - **Acquisition and Rehabilitation of Existing Market-Rate Housing**. TIF funds are used to support programs that purchase market-rate housing, including foreclosed and unoccupied properties, make needed repairs and renovations, and convert to regulated affordable housing (for individual ownership, cooperative ownership, and rental), in order to protect residents from displacement and secure permanently affordable homes.

- **Advance Portland.**[98] City Council adopted in 2023, by Resolution 37617, a new economic development strategic framework. The plan, Advance Portland: A Call to Action for Inclusive Economic Growth, acknowledges the need for expanded housing production in the central city and other areas. It includes actions such as increasing mixed income housing in subdistricts with a lack of residential uses and an imbalanced mix of uses, catalyzing public-private partnerships to unlock infill development of large scale mixed-use, mixed-income sites with high transit accessibility, addressing housing production across a continuum of affordability in vibrant commercial districts, and improving connections between residential and employment centers.

- **Anti-Displacement Action Plan**.[99] In 2021, BPS partnered with Anti-Displacement PDX (ADPDX) Coalition, to design community workshops to identify community priorities to reduce displacement

[98] https://www.advanceportland.com/
[99] https://www.portland.gov/bps/planning/adap

and achieve more equitable outcomes. BPS prepared a foundation report that provides an understanding of City's existing anti-displacement policies and programs. During the second phase of the project, City staff are working to create a shared framework to evaluate displacement risk related to City policy and investment decisions.

- **Action Plan for An Age-Friendly Portland.**[100] [101] Adopted in 2013 by Resolution No. 37039, the Age-Friendly Portland Advisory Council developed and provided City Council with an action plan to enhance Portland's, age friendliness and to be a city that has structures and services that are accessible and inclusive of older people with varying needs and capacities, emphasizes enablement rather than disablement, and is friendly for people of all ages and abilities. The action steps comprising the plan intend to move Portland toward future development and activities that foster not only physical environments but also social and service environments that meet these criteria, making Portland a community for all ages. Several actions in the plan relate directly to housing:
    - Action Item 1.1. Provide Education to Consumers, Planners and Developers
    - Action Item 1.2. Improve Accessibility: Policy efforts that lead to inclusive and accessible housing are critical for our city as we all continue to age.
    - Action Item 1.3. Encourage Innovative Approaches to Housing Older Adults: Advance planning and development of sustainable housing / communities for all ages.
    - Action Item 1.4. Advance Opportunities for Aging in Community.

- **Age- and Disability-Inclusive Neighborhood Project (ADIN).**[102] In 2019, City Council created the city's first age-friendly staff position at BPS. The position has coordinated an Age-friendly Executive Committee, collaborated with Age-friendly Multnomah County, and is part of the global and national networks of age-friendly cities and communities. In 2021, BPS formed a working group and explored strategies for creating age-friendly and disability-inclusive urban neighborhoods. Members of the group focused on advancing neighborhood "centers" by building on centers polices in Portland's 2035 Comprehensive Plan and the Action Plan for an Age-friendly Portland. In 2023, a draft Age- and Disability-Inclusive Neighborhood action plan was released.

- **North/Northeast Preference Policy.**[103] The North/Northeast (N/NE) Preference Policy aims to address harmful urban renewal impacts of by giving waitlist preference to applicants for affordable housing projects in the Interstate Corridor Urban Renewal Area with generational ties to North and/or Northeast Portland. The Housings Bureau's N/NE Preference Policy waitlist for rental housing is open on a rolling basis. Priority status is given to applicants, and/or their descendants, who previously owned property that was taken by Portland City government through eminent domain.

---

[102] https://www.portland.gov/bps/planning/adin
[103] https://www.portland.gov/phb/nnehousing/preference-policy

- **N/NE Community Development Initiative Action Plan[104].** The Action Plan was developed in 2017 to guide the $32 million TIF investment and is focused on 5 goals: property ownership, business ownership, home ownership, community livability and cultural hubs.

- **Fair Housing Policy Audits.** Through, the Consolidated Plan/Action Plan, the Consolidated Annual Performance and Evaluation Report (CAPER) and the Analysis Of Impediments To Fair Housing Choice And The Strategies To Address Them, the City regularly conducts fair housing audits and analysis of existing policies to identify both potentially discriminatory effects and opportunities to affirmatively further fair housing through regulations that directly affect what housing can be built and where.

- **Fair Housing Testing.[105]** The City regularly conducts fair housing testing to determine whether discriminatory patterns and practices pertaining to renting a place to live likely exist, the form that they take, and which protected class groups are most likely to experience them.

- **Affirmative Marketing For City Incentives.** As a requirement of City funding, via PHB, for affordable housing projects, the developer/owner must complete and submit an affirmative marketing plan: https://www.hud.gov/sites/dfiles/OCHCO/documents/935-2A.pdf

- **Workforce Development.** Each year, PHB submits a federal budget request for Community Development Block Grant (CDBG) funds. The CDBG allocation is the largest and most flexible source of federal funding used for affordable housing by the City of Portland. The fund's flexibility allows for broad use to address Portland's increasing need for affordable rental housing and for the repair of single-dwelling homes of low-income homeowners. Additionally, CDBG dollars assist with business and job training assistance, and assist nonprofit organizations providing workforce development programs to Portland. The City of Portland uses CDBG to invest in workforce development services through the Economic Opportunity Initiative (EOI), which encompasses the Economic Opportunity Program (Adult), NextGen (Youth) and the Community Workforce Navigator Program. These programs improve connections between target industry employers and people in historically underserved communities to quality job opportunities. As of June 30, 2020, 2,325 individuals had received services through workforce development programs funded in fiscal year 2019-20; of these, 70 percent were very low income and 19 percent were houseless at entry.

- **Affordable Housing Green Building Policy.[106]** The objective of the PHB Green Building Policy is to ensure that construction funded by the Portland Housing Bureau (PHB) advances environmental, social, and economic goals to: improve tenant health; reduce operations and maintenance costs; provide equitable access to high performance buildings; maximize public investment benefits;

---

[104] https://prosperportland.us/what-we-do/projects/nne-action-plan-update/
[105] https://www.portland.gov/phb/documents/city-portland-2022-2023-audit-testing-report/download
[106] https://www.portland.gov/phb/documents/appendix-e-phb-affordable-housing-green-building-policy-1/download

protect air, water, and other natural resources; and implement the Climate Action Plan of the City of Portland and Multnomah County.

- **Affordable Housing Air Conditioning Requirements.**[107] PHB is asking affordable housing developers to propose an in-unit air conditioning cooling strategy that best balances the needs of their project and populations while ensuring the project's efficient use of public resources. Acceptable cooling approaches may include central air conditioning, packaged terminal air conditioners (PTACs), ducted or ductless condenser or heat pump units, window A/C units, portable A/C units, hybrid, geothermal, or other emerging technologies.

- **Down Payment Assistance Loan Program.**[108] The Down Payment Assistance Loan (DPAL) is a second mortgage loan funded by the Portland Housing Bureau (PHB), and it is used in conjunction with a first mortgage loan from a participating lender. DPAL is designed with favorable terms to help first-time homebuyers purchase a home within the city limits of Portland. The funding source of the awarded DPAL will determine where in the city the home must be located.

- **Landlord-Tenant Mediation Pilot Program.**[109] In partnership with Resolutions Northwest, the Portland Housing Bureau has launched the Landlord-Tenant Mediation Pilot Program to provide free mediation services to landlords and tenants with rental housing disputes. The goal of the Landlord-Tenant Mediation Pilot Program is to increase housing stability for tenants, avoid court filings, and improve relationships between landlords and tenants.

- **Short Term Rental Ordinance.** [110] Short term rentals were legalized in the City of Portland in 2014, the City requires inspection and fee to obtain a short-term rental (STR) permit. In 2019, the City passed a new ordinance to get information from STR platforms. A property owner can get a permit for a short-term rental when the dwelling is mainly used for long-term occupancy. Only part of the dwelling unit can be used for short-term rental purposes. Bedrooms in legal detached accessory structures like guest houses can also be rented to overnight guests. The number of units in a multi-dwelling structure, triplex, fourplex or cottage cluster than can have an accessory short-term rental is limited to one unit, or 25 percent of the total number of units in the structure or on the site, whichever is greater, this is in an effort to preserve long term rentals.

- **Rental Services Office (RSO)**.[111] The office hosts a helpline for technical assistance and information on landlord-tenant laws and policy as well as provides trainings for landlords. RSO staff can provide referrals and information, however, they cannot offer legal advice.

---

[110] https://www.portland.gov/bds/astr-permits
[111] https://www.portland.gov/phb/rental-services

- **Fair Access in Renting (FAIR)**.[112] Effective in 2020, the City adopted policy that regulates security deposits, move in fees, and screening criteria that may be used to select tenants.
- **Eviction Legal Support.**[113] In partnership with the Oregon Law Center, Portland Community College's Clear Clinic, Metropolitan Public Defenders, and United Way of the Columbia-Willamette Portland Housing Bureau launched the Eviction Legal Defense Program to provide free legal support to tenants facing eviction. Tenants can seek these free legal services as soon as they receive a Notice of Termination and do not need to wait until an eviction case is filed.
- **Mandatory Relocation Assistance.** [114] Effective in 2018, the City requires landlords to pay relocation assistance to renters under certain conditions.
- **Empowered Neighborhood Program.**[115] This program assists vulnerable residents from communities of color and/or those with disabilities, who have code enforcement issues that require attention and aims to creates pathways to compliance and recourse.
- **Homeowner Foreclosure Prevention.**[116] The Homeowner Foreclosure Prevention program works through partner organizations to provide foreclosure prevention counseling and, where needed, financial assistance to homeowners facing foreclosure.
- **0% Home Repair Loans.** [117] PHB program offers a no-interest loan of up to $40,000 to fund repairs, like plumbing issues or a leaking roof. Funding is available to residents earning up to 120 percent of Portland AMI and additional funding available in certain TIF districts. This program additionally serves lower income homeowners who live in the Interstate Corridor Urban Renewal Area (ICURA).
    - **Home Repair Grants.** Portland Housing Bureau provides funding to community organizations to make home repair grants to low-income homeowners.
- **Lead Hazard Control Grant Program**.[118] The Lead Hazard Control Program provides an evaluation of lead-based paint hazards and financial assistance to reduce lead-based paint hazards in pre-1978 housing occupied by qualified low- and moderate-income households.
- **Bureau of Environmental Services Safety Net Low Income Loans.**[119] Property owners who qualify may use this low-interest loan to pay for the cost of putting in a sewer line when the City has required it. In some cases, loans are also available for repair or replacement of a sewer line that has

broken and needs to be replaced. Borrowers aged 62 and older may defer making payments until the property is sold or transferred. Loans are due in full upon sale or transfer of property.

- **Bureau of Environmental Services and Water Bureau Financial Assistance**.[120] The bureaus provide several types of financial assistance.
    - **Regulated Affordable Multifamily Assistance Program (RAMP).**[121] The RAMP three-year pilot will provide a bill discount to multi-dwelling properties that are approved for the City's Nonprofit Low-Income Housing Limited Tax Exemption (NPLTE) program. Starting in July 2023, RAMP will reach 12 percent of multi-dwelling housing units in the City, or 15,000 households annually, an estimated average benefit of $325 per unit.
    - **Bill discount.** Bill discounts are eligible to certain income qualifying homeowners.
    - **Crisis voucher.** If Homeowners have a personal crisis and are enrolled in the bill discount program, they may be able to receive a voucher (a credit) of up to $500.
    - **Water Efficiency Rebates,**[122] Rebates for new water-efficient toilets, outdoor irrigation devices, and commercial ice machines.
    - **Lead-In-Water Testing,**[123] Free lead-in-water test kit for Portland residents and some surrounding water providers.
    - **Water Leak Repair Assistance.** Homeowners enrolled in the bill discount program, may be eligible to have the leak fixed for free.
    - **Clean River Rewards**[124] Discount on stormwater bill for safely managing stormwater (rain that runs off roof) on property, i.e., soaks into the ground.
    - **Treebate Program.**[125] One-time credit on your sewer/stormwater/water bill for planting a tree in your yard. City of Portland sewer, stormwater, water customer.
    - **Native Plant Certificate**.[126] Provides funding for native plants. Maximum $50 for individuals, $500 for community groups.
    - **Financial Assistance for Tree Permit Application Fees.**[127] Get a waiver for certain permit application fees. Enrollment in PWB Bill Discount program.
    - **Drainage Technical Assistance.**[128] Free technical assistance for residential drainage concerns and clean river rewards.
- **Free Extra Capacity Waste Container.**[129] Increase trash disposal capacity at no cost. Low-income (PWB bill discount, SNAP etc.) or health condition.

- **Free Home Energy Assessment (Home Energy Score).** [130] Exemption, waiver, and free assessments for new construction. Low-income (PWB bill discount, SNAP etc.) homeowners.
- **PBOT Transportation Wallet for New Movers.** [131] Program created for residents of certain new multi-unit buildings constructed in Portland. The program is funded by a fee developers pay when they get their building permit. Residents of these buildings will get funds on TriMet Hop card and BIKETOWN bike-share credit.
- **RV Pollution Prevention Program.** [132] Portland residents living in recreational vehicles (RVs) parked on the street are eligible for the pump out program.
- **American Rescue Plan Act Funds.** [133] In 2021, Portland received an award of $208 million of Local Fiscal Recovery Funds (Multnomah County received $157 million). The first half of the award was delivered in the spring of 2021, and the second half delivered in spring 2022. The City used these funds to invest in water, sewer, or broadband infrastructure; replace lost revenue; provide premium pay to eligible workers; and respond to negative public health or economic impacts of the pandemic. Funding has supported the following projects, some of which have contributed to the stabilization of households, while others have directly worked to house households, in temporary shelter such as safe rest villages, or in permanent housing:
  - Rent Assistance Streets to Stability; Safe Rest Villages
  - COVID-19 Houseless Services
  - Flexible household assistance
  - Rapid Workforce Training & Employment for Vulnerable Portlanders
  - JOHS Motel Shelter Strategy
  - Affordable Housing Preservation
  - PSR Expansion 24/7
  - Afloat: Utility Debt Relief
  - Eviction Legal Defense
  - Homeowner Foreclosure Prevention
  - Housing Stabilization Contingency
  - Household Relief and Legal Defense
  - RV Pollution Prevention Program
  - Match2: Utility Debt Relief
  - 82nd Avenue Anti-Displacement Housing Stabilization

Appendix C. Engagement Plan and Activities

As the City of Portland developed the Housing Needs Analysis (HNA) and Housing Production Strategy (HPS), the City engaged with local government stakeholders, developers, residents and the broader community. The project team hosted several engagement opportunities throughout the course of the project to share information and gather feedback on the work conducted and the proposed housing production strategies. Outreach activities assisted the city in connecting with developers and residents of housing and in the development and adoption of the housing needs analysis and the housing production strategy in accordance with ORS 197.290 and OAR chapter 660, division 8.

Project information was shared and updated through the City's website and the website was used to gather feedback through a survey and online comment submittals (the MapApp) at key points during the project. Targeted outreach was also conducted with specific underrepresented communities to gather information on housing needs. The public had an opportunity to provide ideas and feedback at every stage of the project. Public engagement was split into three phases, each with a different engagement goal:

- **Phase 1 (January – October 2023)**: Introduce the project and seek feedback on housing needs; used to ground-truth the findings of the housing needs analysis (collaborate/involve).
- **Phase 2 (October 2023 – April 2024):** Share draft housing strategies with stakeholders and get feedback on the draft strategies; used to inform prioritization (involve/consult).
- **Adoption and Post-Adoption (April – August 2024)**: Make modifications as needed, share, and adopted housing strategies. Communicate results with stakeholders (inform).

Community Outreach

Staff prepared multiple outlets for in-person and online engagement activities to share and gather feedback on housing needs in Portland, potential housing policy options, and draft housing policies.

What We Have Already Heard from the Community

The Housing Needs Analysis and Housing Production Strategy is guided by existing community and city policy direction and builds on previous city engagement efforts. The community has long identified the need for housing, as described in the following community-led and Council-adopted documents. Some recent project engagement summaries are provided in the Summary of Engagement from Recent Projects section. Other recent projects that heard substantial comments regarding housing include:

- Housing Regulatory Relief Project
- Portland Insights Survey.
- Age- And Disability-Inclusive Neighborhoods (ADIN) Plan And Working Group
- Housing Regulatory Survey Response Code Change
- Lower SE Rising
- West Portland Town Center
- South West Corridor Equitable Housing Strategy
- Broadway Corridor

- N/NE Housing Strategy
- Cully TIF District
- Inclusionary Housing Calibration Study
- Building A Better 82nd Ave
- Residential Infill project
- Central City 2035
- Better Housing by Design (BHD)
- Permit Improvement Task Force
- Climate Emergency Workplan
- Portland Clean Energy Community Benefits Fund (PCEF)
- Homelessness Response Action Plan

Broad Community Outreach

Building on the community's longtime support for housing, staff tailored engagement to ask the community what housing needs exist and what other priorities should be considered. Community outreach involved presenting information and seeking feedback at in-person and online meetings and surveys with the broader Portland community. The comments and feedback helped staff prioritize draft housing production strategies and will help staff further revise the strategies for adoption.

Online Open House

An online open house was hosted in April 2024 presenting the results of the housing needs analysis, the draft housing production strategy, what are the policy choices and expected outcomes, what are the highest priorities and what are the next steps in the HPS legislative process. Outreach was done through BPS news and social media outlets, as well as organizations engaged throughout the HNA and HPS process were invited to share with their community and memberships.

SUMMARY

Attendees specifically expressed interest in family sized units, increasing transit service to high density development areas, advocating for the use funds to convert hotels into housing, greater emphasis on strategies that can provide opportunity specifically to the 0-30% AMI affordability range, identifying ways to increase access to opportunity for BIPOC homeowners and middle housing BIPOC contractors and developers and finally, support was expressed for the climate friendly nature of conversion and adaptive reuse goals.

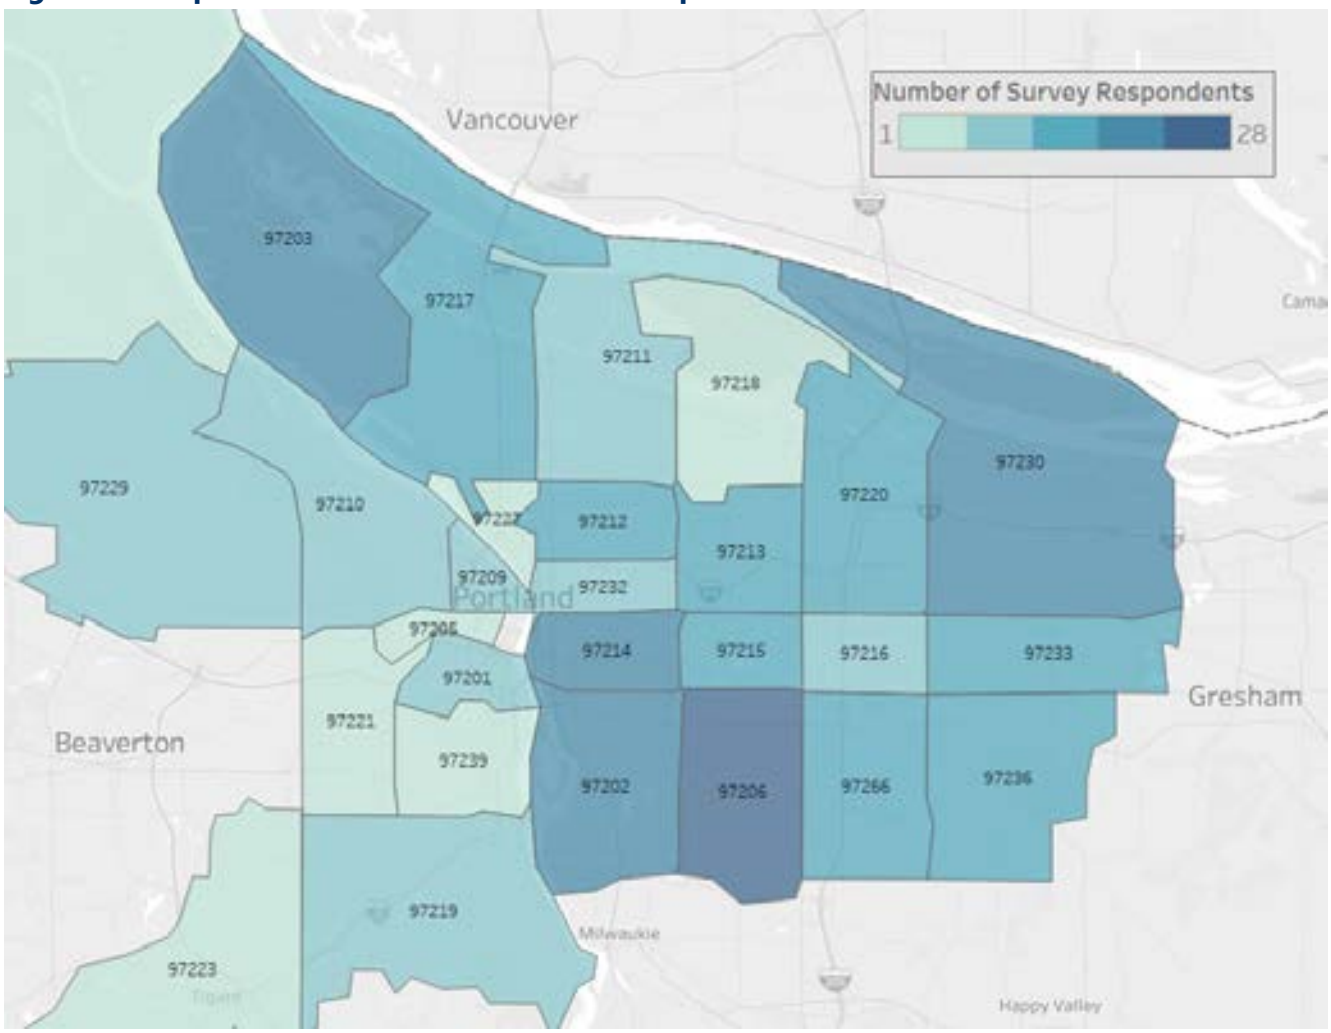
Survey

The survey was made available from March 8, 2024, to April 14, 2024. The survey was available in English, Spanish, Vietnamese, Simplified Chinese and Russian. The survey was reviewed by the internal working group, Technical Advisory Committee, the Community Involvement Committee, and the BPS Equity and Engagement team as well as by project staff and management. Outreach was done through BPS news and social media outlets, as well as organizations engaged throughout the HNA and HPS process were invited to share with their community and memberships.

A total of 350 survey responses were received over the six-week open period, about 30 of these respondents indicated they did not live in Portland. Survey responses were received from Portlanders in all but two ZIP codes in the city (Figure 66). The survey asked questions about experiences and needs

across several topics: Current needs, challenges in finding or keeping housing, accessibility needs, future needs, strategy priorities and closing thoughts.

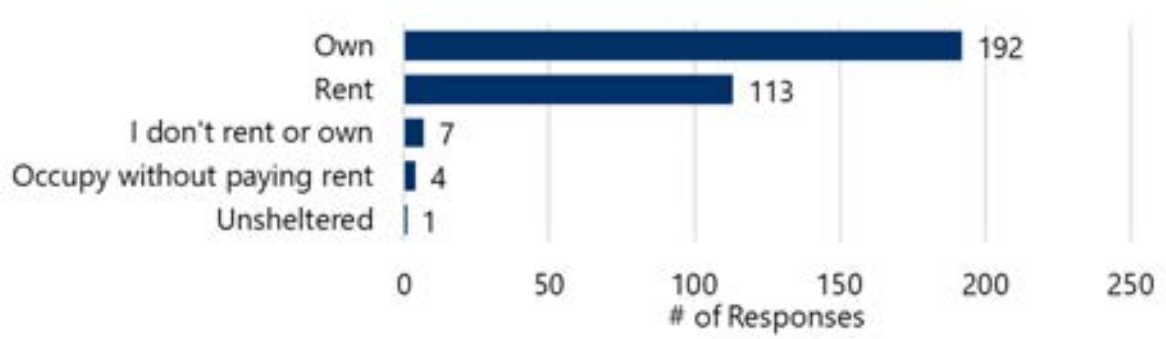
Figure 67. Map Of ZIP Codes Where Portland Respondents Lived



Source: BPS Analysis of HPS Survey

The only required questions in the survey were in the Introductory "About you" section; however, the majority of respondents answered all questions in the survey. The majority of respondents identified as owners (61 percent) while 36 percent identified as renters and three percent identified as either unsheltered, not renting or owning or occupying without renting (Figure 67). Currently, an estimated 47 percent of Portlanders are renters.

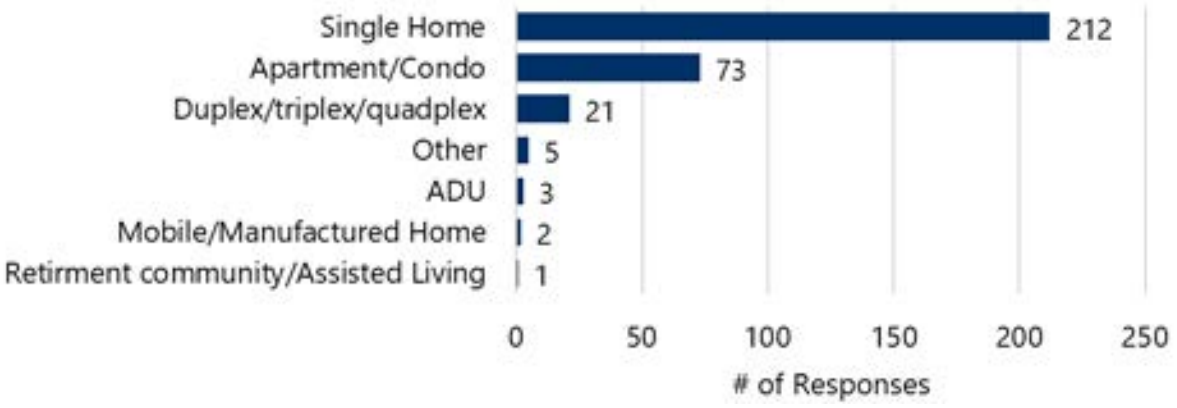
Figure 68. "Do you own or rent the housing you live in?"



Source: BPS Analysis of HPS Survey

The majority of renter respondents lived in apartment buildings with five or more units (53 percent) and most owners indicated they owned a singled detached unit (89 percent) (Figure 68).

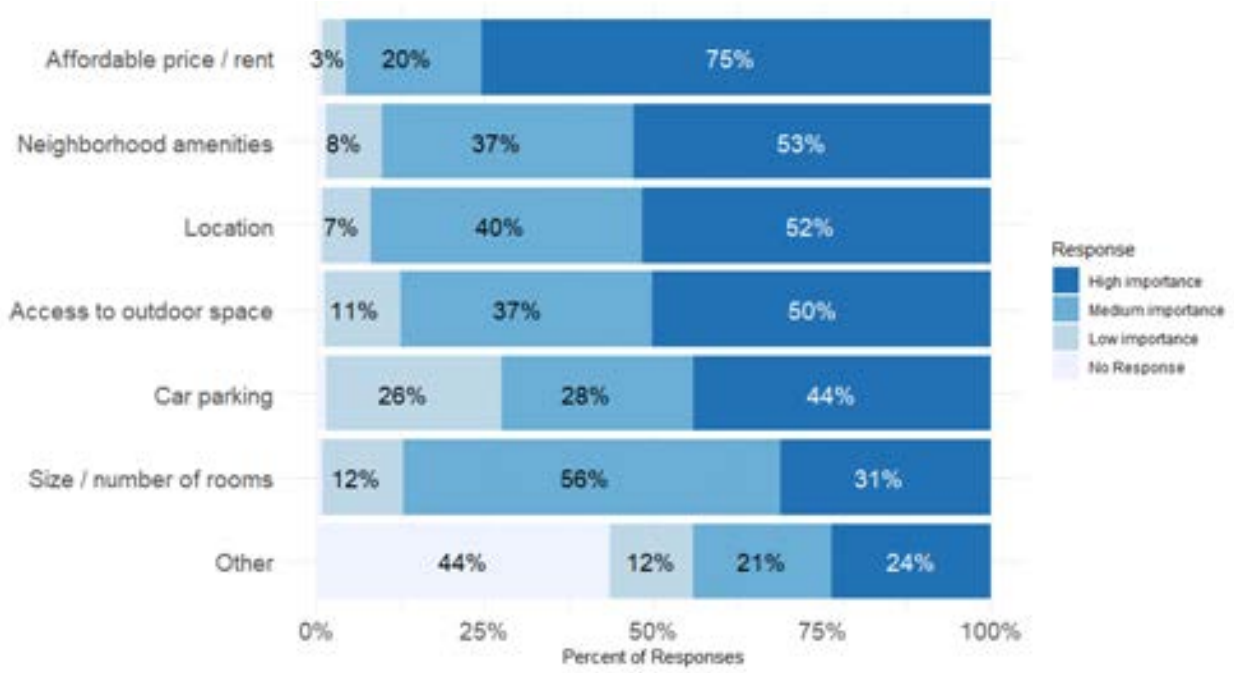
Figure 69. "What type of housing do you live in?" Renters and Owners



Source: BPS Analysis of HPS Survey

Key themes emerged in each section for respondents. In current needs, the most important aspect about a home to Portlanders was an affordable unit (76 percent indicated it as highest importance). Location, neighborhood amenities, and access to outdoor space were also indicated as high or medium importance for a majority of respondents (Figure 69).

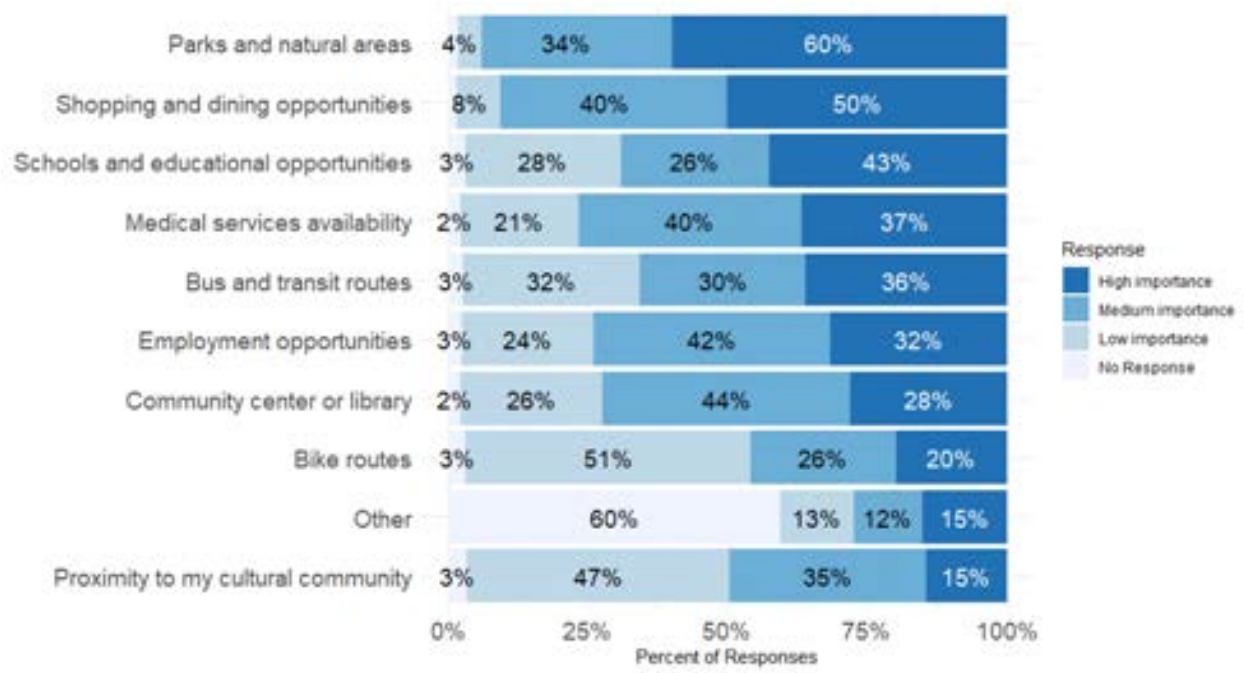
Figure 70. "What is most important to you about a home?"



Source: BPS Analysis of HPS Survey

For the qualities of an ideal neighborhood, most respondents indicated access to parks and natural areas as high importance (60 percent). Other qualities that were indicated as high or medium importance to the majority of respondents were shopping and dining, schools and educational opportunities, medical services availability, bus and transit options, employment opportunities and community center or library access (Figure 70).

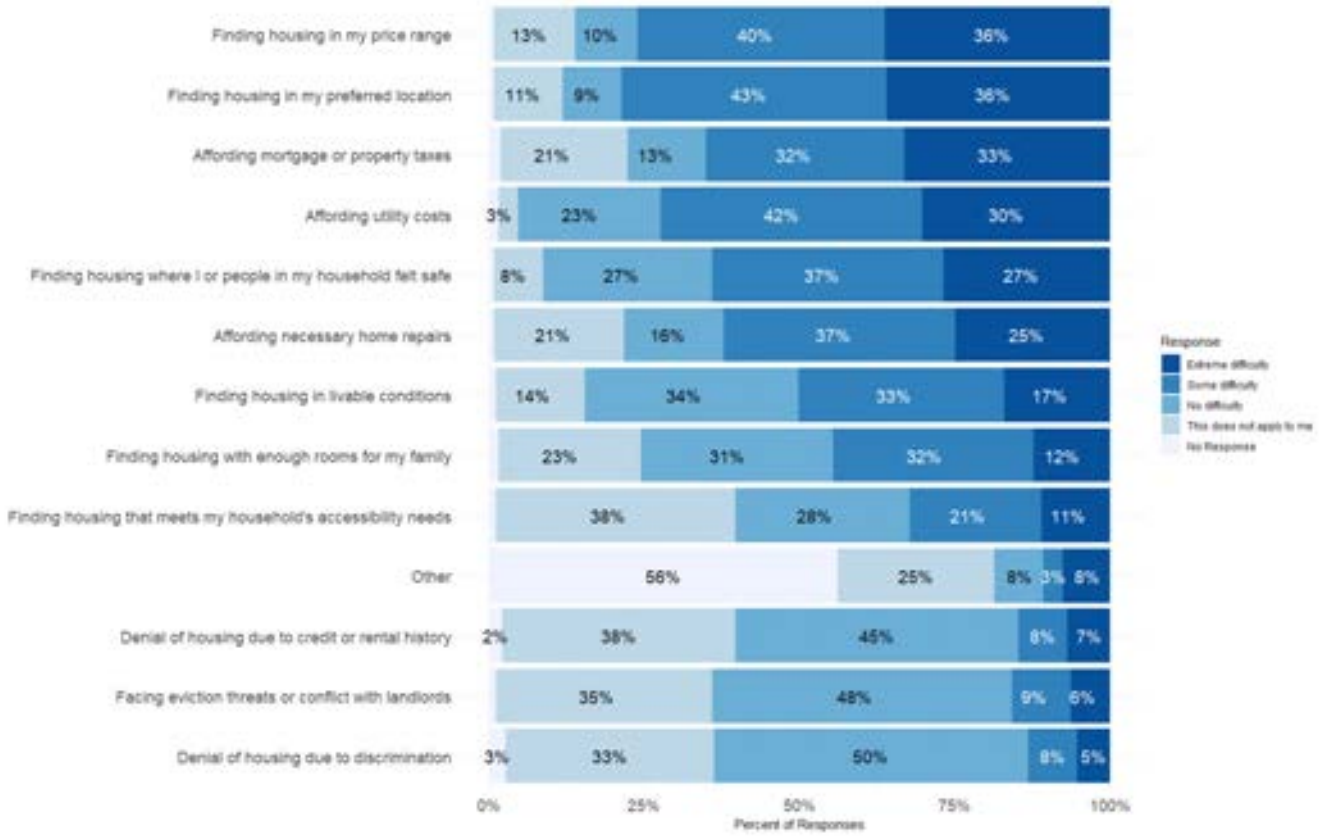
Figure 71. "What are the most important qualities of your ideal neighborhood?"



Source: BPS Analysis of HPS Survey

When Portlanders answered questions regarding finding housing that meets their needs, the greatest share indicated that they faced the greatest difficulty finding housing in their price range (36 percent indicated extreme difficulty, 40 percent indicated some difficulty). Other areas of extreme difficulty were finding housing in their preferred location, affording utility costs, affording their mortgage or property taxes and affording housing where they or their household felt safe (Figure 71). This shows that respondents are experiencing challenges among various areas of affordability and housing costs.

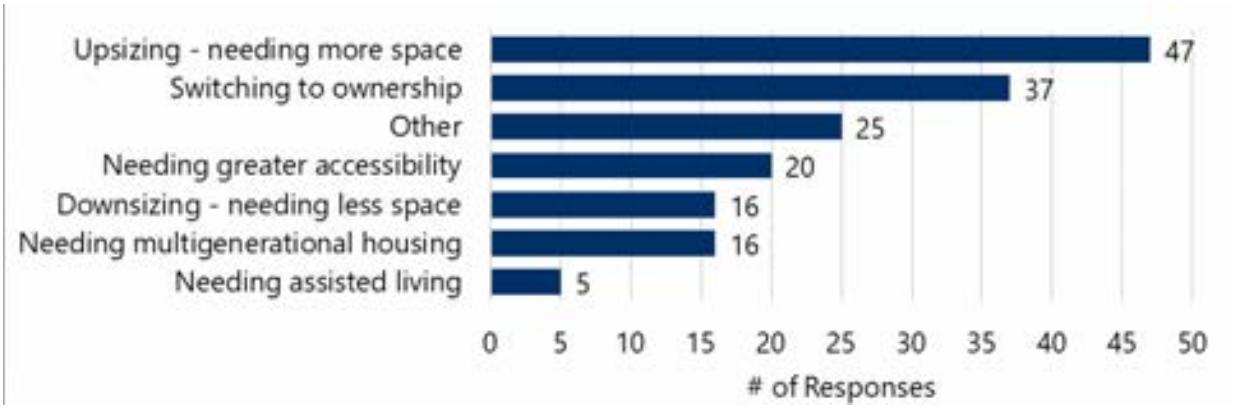
Figure 72. "What difficulty, if any, have you had finding housing that meets your needs in Portland?"



Source: BPS Analysis of HPS Survey

When asked if their current living situation would meet their housing needs 10 years from now, 58 percent of respondents (168) indicated that it would not, 46 percent said yes, and the remaining did not answer. Those who answered no were prompted to answer why not (Figure 72). Respondents were able to select from multiple prompts or to write in their own response. The greatest number of respondents (47) indicated that they would need more space ten years from now, 37 indicated a desire to move into ownership and another 25 indicated that some other aspect of their housing needs will change, including moving to more affordable housing, moving out of Portland and the area, and being unable to maintain their home as they age.

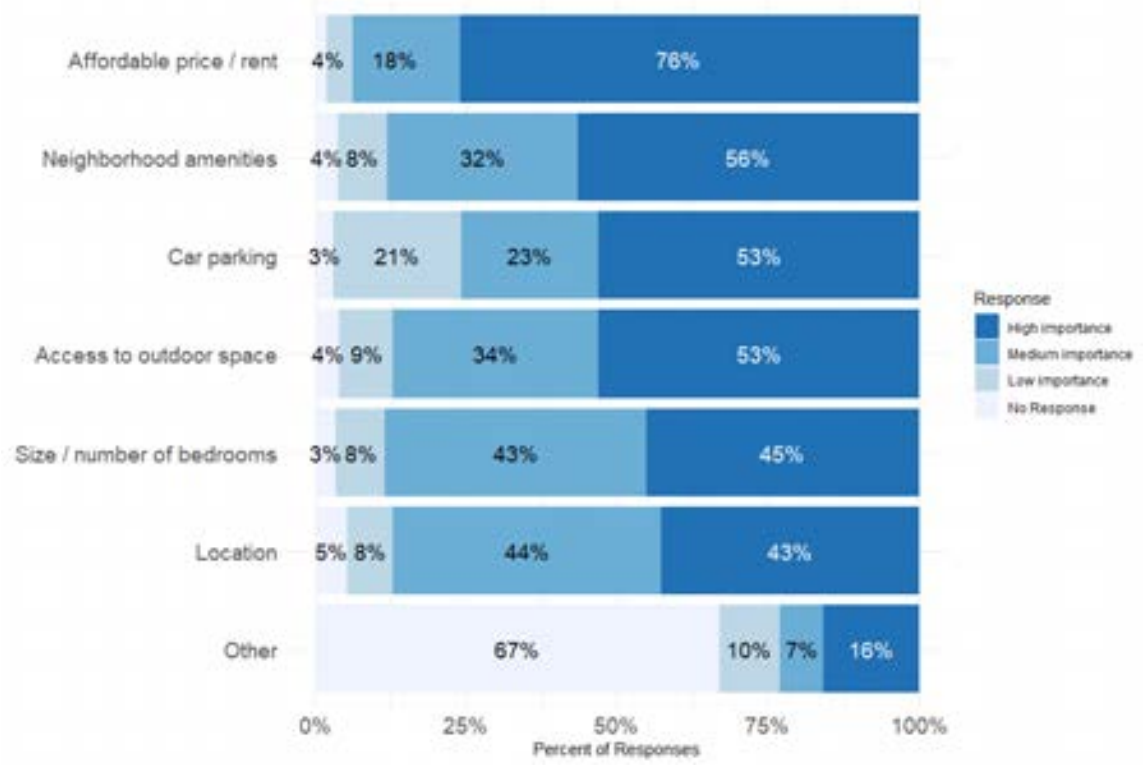
Figure 73. "If no, how do you expect your housing needs to change 10 years from now?"



Source: BPS Analysis of HPS Survey

Based on the 2045 Housing Needs Analysis, the City expects much of the development from now to 2045 to be multi-dwelling unit developments. When asked , what features or amenities would make living in an apartment more appealing or possible for them? The majority of respondents indicated factors of high or medium importance to be affordable price/rent (94 percent) neighborhood amenities (88 percent) size/number of bedrooms (88 percent) Access to outdoor space (87 percent) and location (87 percent) (Figure 73).

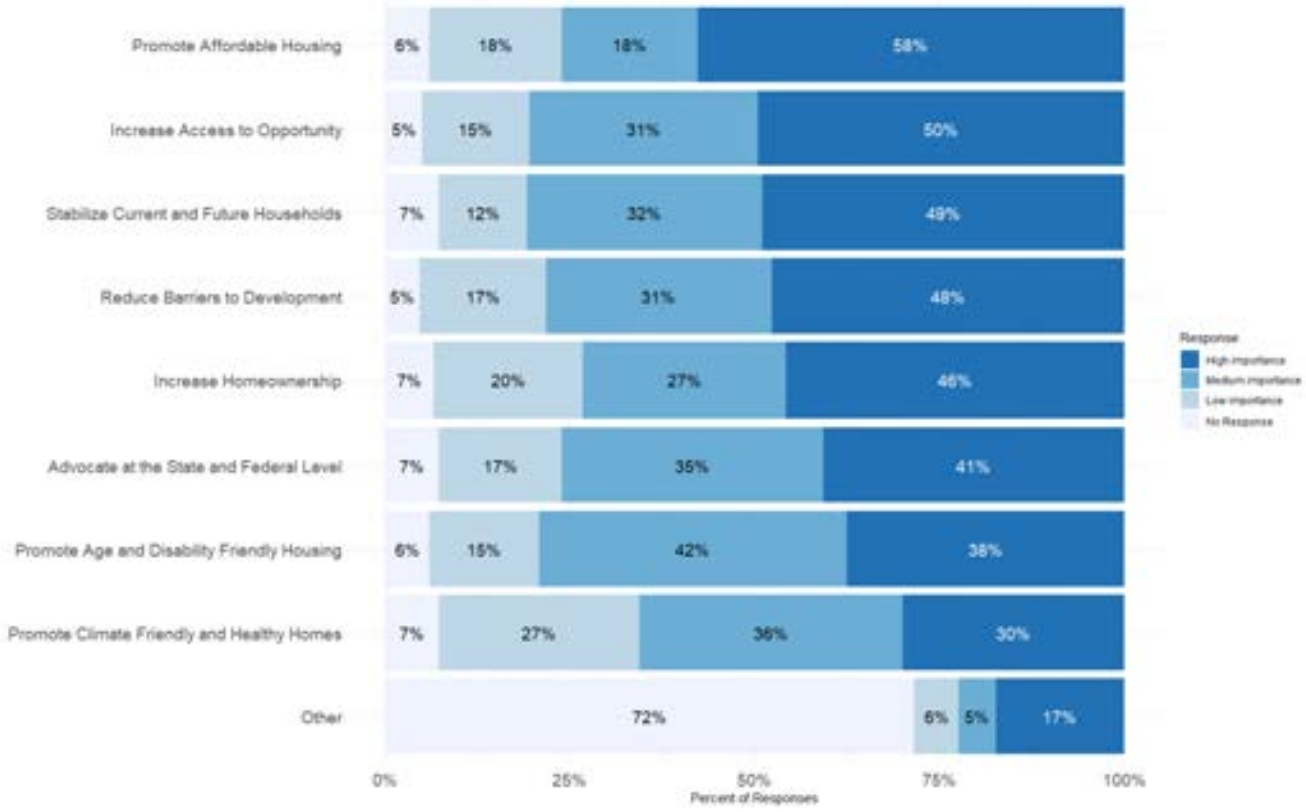
Figure 74. "Considering most of Portland's new housing will be in apartment buildings, what features or amenities would make living in an apartment more appealing or possible for you?"



Source: BPS Analysis of HPS Survey

When the survey was released, a discussion draft of the Housing Production Strategy was made available for public comment. Respondents were invited to view the draft and/or rank categories of strategies based on their view of what was most important. Respondents indicated that promoting affordable housing was of highest importance (58 percent) and 18 percent indicated as medium importance. Other categories that were indicated as high or medium importance include stabilize current and future households (81 percent), promote age and disability friendly housing (80 percent), increase access to opportunity (81 percent), reduce barriers to development (79 percent), and advocate at state and federal level (76 percent).

Figure 75. "Which housing strategies are the most important / highest priority in Portland?"



Source: BPS Analysis of HPS Survey

Open response questions were available throughout the survey by choosing "Other" in each section. In these open responses, safety was frequently mentioned and described in various ways in each section, especially in sections that did not have a question specifically about safety. For example, in Current Needs, 44 percent of respondents chose to describe something else important to them, and of those respondents, nearly half of them mentioned safety of some kind, from earthquake safety to safety from crime. Then, in open responses in the Challenges section, where a question regarding safety was asked, more respondents mentioned affordability and challenges with loans, taxes, and other economic issues. Survey responses indicated a clear need for housing that are in locations that are safe and are affordable to more Portlanders.

Map App

As part of BPS' standard public engagement procedures, the *2024 Housing Production Strategy, Proposed Strategies Discussion Draft* was released for comment on the Bureau's Map App.[134] The comment period was open from February 21, 2024, to April 7, 2024. The draft received 50 pieces of public comment. The Map App comment period was re-opened from May 14 to June 11 as part of the Planning Commission discussions and received an additional 57 comments. It will reopen again in Summer 2024 as part of the Council adoption process.

SUMMARY

Commenters specifically expressed interest in the following;

- Increase Accessibility - The most critically needed special needs housing types were identified as: housing for persons experiencing houselessness, mental health support, ageing individuals and households and persons with disabilities.
- Commit to action – Advocates expressed a desire for bureaus to articulate a higher level of commitment to action within the strategies (i.e., "study" vs "do").
- Address the diversity of needed housing types - Create equitable access for everyone by addressing housing cost, location, housing type, size, universal visitability, and culturally specific housing.
- Include advocacy around property tax reform to the state legislature.
- Increase rental assistance.
- Invest in Low Income Housing Tax Credits for affordable housing, community land trusts, and land banking, while exploring other non-market social housing models that have demonstrated success globally and do not further commodify housing.
- Affirmatively further fair housing by undoing historic racial discrimination and race-based housing segregation.
- Address homeownership inequities among households below 80% AMI. New resources to be directed to rental and homeownership opportunities for households below 80% AMI.
- A significant amount of comments expressed support around the further development of strategies that result in upzoning and area planning in the Inner East.
- Simultaneously, staff received comments from residents concerned about the impact of upzoning the inner east, citing concerns around adequate future engagement in an area planning process, the

[134] https://www.portlandmaps.com/bps/mapapp/

exclusion of other more constrained and less "Complete" neighborhoods from being considered in the upzoning project, namely southwest Portland.

- Engagement - Concern around engagement process for the HPS as well as future projects needing to be equitable and include impacted residents.
- Land banking - Identify publicly owned land that can be used for affordable housing.
- Adaptive reuse - Emphasis on reusing existing buildings, creating housing through the conversion of existing commercial or industrial structures.
- Support for state and federal advocacy priorities and for the City to add support for increased downpayment assistance targeted for communities historically excluded from homeownership and flexible state funds for affordable homeownership development.

Strategic Stakeholder Outreach

BPS staff also discussed the draft strategies with the community members through strategic outreach at various phases throughout the project.

HNA: July through October 2023

Staff attended group meetings, held via Zoom video conference, to introduce the project and collect feedback on the project engagement strategy, equity considerations, and housing needs. the following stakeholder and interested party groups: Portland State University Homelessness Research Center, Anti Displacement PDX, Sightline, Cully Neighborhood Association, Portland Neighbors Welcome, Development Review Advisory Committee, Community Involvement Committee, Portland Homebuilders' Association, Portland Building And Development Council, East Portland Action Plan Housing Committee, Central Eastside Industrial Council, Oregon Smart Growth, North Portland Land Use Group, SE Uplift, and the Southwest Land Use & Transportation Forum.

HPS: October 2023 through July 2024

Staff continued strategic conversations with community organizations, developers, builders and other interested parties. Staff wanted to develop awareness of draft strategies, engage around what the City can improve, what has been working well and what new ideas the City needs to consider implementing to have the greatest impact on creating housing opportunity, choice and support a housing abundant environment across Portland.

Community Organizations And Stakeholders Engaged Directly

Over 250 community members, developers and service providers were engaged through direct meetings and presentations to the following organizations and coalitions:

- N/NE Oversight Committee
- Central Northeast Neighbors LUTOP
- Northeast Neighborhood Coalition
- North Portland Land Use Group
- Northwest District Association planning committee
- Southeast UPLIFT
- East Portland Action Plan Housing Committee
- Southwest Land Use & Transportation Forum
- Southwest Corridor Equity Coalition
- Housing Land Advocates
- Housing Oregon; Portland Metro Policy Council
- Housing Alliance
- Neighborhood Partnerships
- Living Cully
- Welcome Home Coalition
- Fair Housing Council of Oregon
- 1000 Friends of Oregon
- Portland: Neighbors Welcome
- Portland Homebuilders' Association
- Oregon Smart Growth
- League of Women Voters
- Home Forward

SUMMARY

Key issues that attendees noted included the following;

- Affordability – Even with restricted rent, some housing is still out of reach and multiple types of services need to be combined to make it affordable. There was a greater desire to better understand how to get on lists for access to affordable housing that becomes available. Advocates suggested more focus on lower affordability levels for both rent and ownership strategies (<50% AMI) and at the 0-30% level there is a need for permanent supportive housing and rental assistance in addition to an affordable unit.
    - Targeting lower income levels for ownership programs is more likely to benefit BIPOC households given the current disparities in wealth and income distribution in Portland.
- Access – Infrastructure and the expansion of transit opportunities were identified as key investments needed to support the construction of housing and to provide mobility and access to key services, such as grocery stores in neighborhoods.
- Access to programs to gain or maintain homeownership – Greater access to homeownership is desired (esp. for lower income households). Greater access to stabilization or repair programs for middle income households.
- Accessibility - The most critically needed special needs housing types were identified as: housing for persons experiencing houselessness, mental health support, ageing individuals and people with disabilities.
- Fair Housing – There was a desire expressed, particularly by coalitions, to better understand how the City aims to address issues of fair housing with the HPS.

Black, Indigenous and Persons Of Color (BIPOC) Communities Outreach

One of the key issues identified in the 2045 Housing Needs Analysis (2045 HNA) is economic prosperity and housing opportunity for BIPOC Portlanders. The project team received a Department of Land Conservation and Development grant to conduct engagement specifically with BIPOC community members.

While there has been robust engagement around housing issues in the City, Black, Latine and Native American communities are still most impacted and priced out of housing market and wealth building opportunities. Staff wanted to provide an opportunity for BIPOC communities to give their input on housing issues and identify strategies that would be most impactful to create better living conditions and stable housing.

Black, Indigenous and Persons Of Color (BIPOC) Communities Outreach

One of the key issues identified in the 2045 Housing Needs Analysis (2045 HNA) is economic prosperity and housing opportunity for BIPOC Portlanders. The project team received a Department of Land Conservation and Development grant to conduct engagement specifically with BIPOC community members.

While there has been robust engagement around housing issues in the City, Black, Latine and Native American communities are still most impacted and priced out of housing market and wealth building opportunities. Staff wanted to provide an opportunity for BIPOC communities to give their input on housing issues and identify strategies that would be most impactful to create better living conditions and stable housing.

FOCUS GROUPS

Staff and two consultants hosted 6 focus groups between March and April 2024 with Black, Native, Vietnamese, Chinese, Slavic and Latine communities. The Black (10 participants), Native (10 participants), Vietnamese (12 participants), Chinese (11 participants) and Slavic (11 participants) focus groups were planned, recruited for and hosted by the Community Engagement Liaisons. The Latine focus group (7 participants) was planned, recruited for and hosted by LatinoBuilt.

The focus groups included information on Portland's housing conditions and forecast and explain the role and purpose of the HPS. The discussion explored key elements of need and desired housing opportunities that will help inform the HPS policy choices and evaluation.

Focus Group Discussion Questions

1. What is most important to you about a home?
2. What types of housing best meets your current needs?
3. Considering that most of Portland's new housing will be in apartment buildings, what features or amenities would make living in an apartment more appealing or possible for you?
4. What are the most important qualities for your ideal neighborhood?
5. What difficulty, if any, have you had finding/staying housing that meets your needs in the city?
6. What programs might be helpful to you or your household?
7. Which housing strategies are the most important/highest priority in Portland?

Figure 76. Latine Focus Group Led by Latinobuilt's Rosa Martinez

COMMUNITY MEETING

Building off of the results of the focus groups, staff worked with PKS International; Community Engagement Liaisons to host and facilitate an in-person East Portland BIPOC Community Meeting. This community meeting for Pacific Islander, Burmese, Cambodian and African immigrants was held in April

2024 in-person at a local restaurant on 82nd Avenue. The meeting included facilitators/translators to engage participants in their native languages. Participants included six CELS liaisons and staff, eleven Burmese, eleven Cambodian, five Pacific Islander and eight African community members.

SUMMARY OF BIPOC ENGAGEMENT ON HOUSING NEEDS AND PRIORITIES

Affordable Housing

The biggest housing issue identified is that over the years living in Portland has become a lot more expensive, so families are being pushed out of the city center. This has created economic segregation. Housing prices have significantly skyrocketed over the years, which identified another common theme among all the communities, affordable housing. Participants expressed desire to find ways to improve the way that current supportive housing is used and to consider how new rules or rule changes are impacting smaller landlords. Participants in the Black community brought up that there's a need for not just homes for the houseless or low income but people that are in between the middle class and 'poor'. There's not a lot of options in the housing stock and participants would like to see more develop.

> *"One of the challenges of affordable housing is new construction is very expensive, whether you want to purchase or want to rent, whereas older construction has already been depreciated. Those of the units that you're talking about leveling for the new construction, where those units are the ones that are the most affordable. So, I understand you want to bring in more density, but at the cost of taking out properties that people are living more affordably now."*

In the Latine focus group, it was a consensus that affordability was the most important for everyone when it comes to a home, with size/number of bedrooms coming in second and outdoor space for grills and gatherings tied with location for third. However, if we're looking into the future, having apartments with elevators and wider doorways was mentioned as something that would be desirable. Along with making sure the transportation system accommodates the increase in housing units.

The Russian community felt there is a perception that when affordable housing complexes are built, segregated areas with reputation for higher crime may be created. People and businesses avoid these areas. Units are built in areas that are not safe and often have homeless camps near them and don't have all the necessary things nearby (school, parks, playgrounds, hospitals etc.).

The Native community addressed buying their own home is out of reach, especially for single people with an average income. Many people will not be able to purchase their own home any longer because of not only the cost of the home, but also the interest rates, property tax, utilities, insurance, and all other expenses. Some participants shared that there's a lot of people in their community that work and

don't qualify for a lot of the programs but need those programs. So, changing the guidelines and qualification standards would be helpful for a lot of people to afford housing.

The Chinese and Vietnamese community shared there's housing demand for senior living communities, many are on the waiting list and the wait is too long. Another issue is the language barrier, many seniors don't understand English, and the application is only in English.

Safety

One common theme during the focus groups was the need for safety and security of the area where their home is located and the neighborhood itself. One community shared it doesn't matter the size of the home, big or small. They want to feel safe when they go to sleep at night. Participants in each community noted that to feel safe they want to see lower crime rates (theft, drugs, car racing, break-ins) and less homelessness in their neighborhood (homeless camps and abandoned vehicles).

Many of the communities mentioned having a clean, safe street would mean their families and children can walk around their neighborhood with less fear and would allow them to have a healthier lifestyle. Because of safety concerns of their neighborhood, several participants in the Native and Vietnamese communities expressed they've moved or see themselves wanting to relocate.

Participants in the Russian community shared, "Downtown already has a reputation of being unsafe, public transport unsafe and dirty, homeless camps and garbage in uptown and downtown. Adding more affordable housing units in Downtown poses the question of whether we will lose it as a desired landmark and place to visit in the future."

Location

Another common theme shared between all the communities is location. Many of the community groups discussed location being one of the main priorities on their list for an ideal neighborhood. There is a need to be close to public transportation. The Vietnamese community participants felt that if a lot of housing units are developed, and we don't think about transportation, it will be very difficult to get from East to West or North to South. So, if transportation is not addressed, and more houses are built, the road will become more challenging for traveling to work or to school and will create another challenge for both the residents and the city. Participants with families expressed the need to be close to schools, parks, community centers (for all ages), and an overall safe environment for children to play outside.

The Chinese and Native community also discussed that having close access to medical offices is critical for many people, especially for seniors, retirees, and families with young children. The communities

agree that having access to amenities near their neighborhood is important like shopping, grocery stores and being close to work.

The Black focus group participants discussed issues of safety as it relates to location. One participant shared that they are seeing developments along certain corridors with a disparity between the development that is targeted towards communities of color and lower income people and the development that is at market rate. So, a lot along MLK, along Lombard, Broadway and these areas are high crash zones. They're dangerous to walk around and they have lower air quality because of the traffic. They're more unbearable during heat and during rain, they flood and they generally have a lower quality of life versus locations like Williams. The participant lives close to Broadway and is right next to the freeway. Further up Broadway are these luxury units that have walkable grocery stores, trees, and the quality of life is clearly, and the infrastructure is clearly built better than a few blocks to MLK, where a lot more people of color are housed, and the quality is visibly worse.

Many of the communities discussed how locations in Portland differ between a good and adverse quality of life. For example, rich neighborhoods have clean air quality and walkable amenities while poor neighborhoods have more underserved communities and quality is visibly worse.

Expanding Programs

Discussion with focus group participants revealed a lack of awareness about certain programs that may already exist. More outreach in various venues about the City's housing assistance programs would be helpful. Below is a list of topics that were mentioned as programs to be implemented or expanded.

- Down Payment Assistance: Participants mentioned that rents are the same as monthly mortgages. They would love to own a home but are unable to produce a down payment or do not qualify for existing programs for various reasons, bad credit being one of them. However, they are able to pay their rent, and assistance with down payments would allow them to build wealth through home ownership.
- Home Buying Qualifications: The programs offered for homeownership require lots of documentation and qualifications, and sometimes, because of the in-depth need, they don't qualify. Can documentation be simplified?
- Loan Programs: Develop a loan program for mid-level professionals (e.g., teachers, firefighters, contractors, etc.) to buy homes by deducting a portion of their monthly check.
- Rental Incentives: Bad Credit limits rental ability. Create programs to help clean up credit issues.
- Coaching/Education Programs for first time home buyers. Oftentimes, ownership is a larger responsibility than is realized. Understanding how to save for repairs, etc. would be helpful.

- Home Repair Costs: Home repairs are costly, and energy efficiencies are not affordable, even with the incentives that are in place. Programs that assist with home repairs were encouraged.
- Foreclosure Prevention: Programs to prevent losing your home or going into foreclosure

What's Missing From The Draft Strategies

- PUBLIC TRANSIT SAFETY - Participants were very concerned about safety. Recognizing that much of the new construction would happen in the central core of Portland along bus lines with a push to use public transit, they felt conversations need to take place to ensure riders safety.
- ACCESSIBLE UNITS - Participants discussed this issue in depth and wondered why homes aren't being built with accessibility features as a standard. Can this be incorporated at the onset of building planning? If they have a sick family member and need modifications in their home, retrofitting is expensive.

At the East Portland BIPOC Community Meeting, the most common concern between the 5 groups was the need for affordable housing and financial stability. Participants mentioned a need for jobs for seniors and residents within the area. Safety came in as another high-ranking concern, especially with the combination of location and zoning when discussing the location of schooling and where affordable housing was located. Cultural needs and quality of living goes hand-in-hand, as many participants noted that they needed larger housing units to fit the number of family members living in one house. Similarly, the participants expressed wanting more space for recreational activities, such as nature areas, parks, or spaces within the household for families to hold celebrations or spend time together.

The most important factor that participants mentioned was the safety of the area where the home is located and the neighborhood itself. The participants do not feel comfortable with their homes being in areas with high rates of houselessness. Most groups expressed the need to have good schools and their work within a close proximity to their home. For seniors within the community, the participants noted that it is not easy for them to walk further distances. Grocery stores need to be within a walkable distance or have public transportation within the route. Participants also noted that they would prefer denser populated areas if it meant that they were near essential services, such as grocery stores, nearby. Easy access to public transportation was another factor that was considered. This includes having adequate parking infrastructure at the homes. Participants also addressed that their ideal home would have 3+ bedrooms to accommodate their family sizes. Finally, participants want to see newer high-quality homes that are fit for the weather year-round and have plenty of outdoor recreation areas for children to play on playgrounds or for community members to gather. They mentioned that the current houses are old, smelly, and moldy.

The most valued quality of an ideal neighborhood for all community groups was safety. There were multiple repeat comments about safety throughout the groups, with one group noting that safety is a priority and more important than anything else. Participants specifically noted that to feel safe they want to see lower levels of homelessness within their neighborhood (and lower levels in general),

decreased crime rates (break-ins, car theft, violent crime, etc.), higher levels of security, and also more street lights and sidewalks to promote road safety. Another participant noted that they want to be safe at night when they are working a night shift, both being outside and taking transportation.

The participants also expressed the want for more green spaces (private and public) around the neighborhood. They would like playgrounds for the children, community centers or communal space that gives them access to parks or green space. Similarly, participants also want community centers or shopping centers within their neighborhood as well (or within walking distance). Finally, some participants expressed that they would like to have close access to transit.

Financial issues emerged as the top challenge that participants had in finding or staying in their housing. Some examples are that multiple concerns were raised regarding the issue of finding affordable housing, as participants cannot afford housing with their current incomes. Many participants mentioned that the rising housing costs exceed the current income rates by far. Similarly, seniors, or those with fixed incomes, face limited options for finding supplemental earnings. Participants cannot afford housing that fits their needs, this includes seniors trying to downsize and families needing larger housing units. At the same time, multiple groups noted that there are not enough units to support their needs or units that are at a preferable location (participants discussed having to commute to work in order to afford housing). Households feel shameful asking for assistance or may not know where to go to seek assistance, which causes them to quietly go into houselessness. The overarching theme present is that the vast majority of the participants are struggling to find housing or maintain their housing due to the rising housing costs and limited means to achieve housing assistance, at the same time, if they are able to afford housing, there are not enough units that support their needs.

Another issue that was raised when discussing the challenges of finding/staying in housing, was credit. Participants noted that building credit is hard and expensive. Some mentioned that non-existent or bad credit impacts their eligibility for rental and homeowner services, and limits access to high quality and affordable rental housing. Other participants talked about needing more education about the process, credit scores, and saving, and ultimately more down payment assistance.

The most repeated program that participants mentioned was rental assistance. One participant specifically noted that there should be rent assistance support available for those who just arrived in the US and have not secured a job yet. In terms of renting or owning a house, multiple participants also noted that they would like mortgage or down payment assistance. A common theme seemed to be that participants were seeking assistance or pathways to homeownership. Another program mentioned between the groups was the need for energy and utility assistance, as bills have been increasing. Other highly mentioned programs were legal support for renter rights, fair housing, discrimination, and eviction support. Multiple participants noted that faster relief is needed after applying for the programs, and ultimately, households need more education about what programs there are and what they do. For some, they would also need language and interpretation services. One comment to note was that a participant suggested having loan programs that are specifically designed for immigrants.

Some other programs that were mentioned but not as frequently were, internet or digital access assistance, weatherization, any programs to support single adults with children (specifically moms), gym amenities, home repair assistance, debt relief, foreclosure assistance and finally, food assistance.

Most participants expressed wanting to own a house in 10 years. A number of participants noted that they would like to own a larger sized house so that they can support their family and friends. Some participants expressed wanting to own multiple houses and some even mentioned being a landowner so that they can rent to other immigrants or refugees in the community. They expressed desire to do so in order to help build the economy, support the immigrant and refugee community, as well as reducing houselessness. A few participants mentioned that while they would like to own a house, the inflation and gentrification will make it nearly impossible to buy a home. Even renting may be expensive to them. Another participant agreed buying a house would be ideal, but they would probably continue renting.

Seniors within the Cambodian community expressed the desire to downsize. Finally, a participant said that moving away might be their only option because they can't afford to live here, and their social security is not enough to make ends meet. They noted that they may have to move back to Cambodia, but they don't have enough savings to do so.

For most groups, the communities mentioned larger houses that fit all the family members. Some expressed wanting 3 or more bedrooms, some wanted 4–5-bedroom houses, others wanted 6-bedroom houses that fit the entire family with bigger rooms, balconies, spaces for kids to play, and other factors. A participant specifically mentioned that they wanted a bigger or more spacious house in order to conduct business or to assist others. One participant specifically mentioned that ideally a house would have more than 3 bedrooms, a yard or grounds to play in, barbeque area, and a garden. A different participant mentioned that if they were to own a house, they do not want to be restricted by how they choose to decorate their house or what the conditions of their plants were. Within these groups, a large number of participants mentioned having space for multigenerational or multifamily living.

On the other hand, other participants were wanting smaller houses. Some participants mentioned that apartments and townhouses would fit their current needs. It was expressed that apartments and mobile homes are really good and important for what they need. Others want small single houses or single dwelling/houses. Something to note is that this was a common theme from the senior attendees, who had previously expressed wanting to downsize. These differences highlight that even among cultural communities, there are still a range of needs and desires as it relates to housing type.

Figure 77. East PDX BIPOC Community Meeting

Housing Developers

In addition to the housing barriers survey conducted by Commissioner Rubio's office, and presentations to Oregon Smart Growth and Portland members of the Home Building Association of Greater Portland, BPS conducted interviews with sixteen developers to discuss their experiences in developing housing in Portland, barriers to development, and strategies to increase housing production. BPS met with representatives from the following organizations:

- Edlen & Co
- Sabr Development
- Oregon Homeworks
- Fish Construction
- Project PDX
- Urban Roost Development
- Owen Gabbert LLC
- HomeWork Development
- SkipStone Development
- ROSE Community Development Corporation (CDC)
- Community Partners for Affordable Housing (CPAH)

Barriers to housing production identified through these conversations ranged from regulatory code barriers, financial and market factors, and building code/process issues. Strategies identified to respond to these barriers cover regulatory code, permitting and development process improvements, financing opportunities and housing innovation considerations.

SUMMARY OF COMMENTS ON BARRIERS TO RESIDENTIAL DEVELOPMENT

Regulatory Code Barriers

- **Form.** There is a disconnect over the allowable FAR and building coverage. Lot coverage ratios are constraining, with 10-20 percent more coverage usually needed to maximize the FAR (especially with middle housing). Height limits could be enough to prevent out of scale development. The lack

of allowances for single staircase buildings means apartment buildings must be built with double-loaded corridors on larger sites; single staircase buildings could better utilize small sites.

- **Zoning Code.** There is a perception that there are large sections of outdated/irrelevant/complicated code, especially for multi-dwelling buildings.
- **Inclusionary housing.** The long-term covenant on affordable units is less attractive to investors. Perception among developers is that ongoing compliance is difficult, and there is a fear the City will charge an excessive fee-in-lieu if projects fall out of compliance.
- **Ground floor requirements. Active ground floor use requirements** are difficult to make financially feasible and are 'subsidized' by the housing units. Eliminating these requirements would reduce housing cost. Commercial space is a "loss leader" and is an especially big barrier to affordable housing developers – building commercial space pushes developers into a higher prevailing wage bracket.
- **Cottage cluster common area.** The code dictates 20 percent common area/courtyard, even when each unit has individual yards.
- **Middle housing/cottage cluster utilities.** There is a perception of a misalignment in the way the City requires developers to provide infrastructure on middle housing and cottage cluster lots. Developers would prefer more control over the infrastructure that can be shared and the infrastructure that must be separated for each individual unit on the lot. For example, stormwater infrastructure can currently be shared for middle housing and cottage clusters, but sewer must be individually provided.

Financial and Market Factors

- **Homebuyer Opportunity Limited Tax Exemption (HOLTE) Program.** There is a disconnect between the income cap of buyers and the price cap of units. There are many unsold units in the HOLTE program due to high interest rates decreasing buyers' disposable income, as well as general demand and growing pains associated with a new building form (i.e., attached fourplexes/townhomes with no parking).
- **Development costs.** Material costs remain high, albeit they are better than one year ago. Labor costs are high and finding contractors can be challenging (labor shortage). High interest rates are the major barrier and can add major costs to projects, reducing the ability of developers to provide affordable units.
- **System Development Charges (SDCs).** SDCs, especially for parks, are one of the biggest line items in construction budgets (e.g., $25,000 per unit for 800 sq. ft. cottage). The recent change for deferred payments is not effective because the City is in "first position" which interferes with the bank financing.
- **Tree preservation**. The tree code can be cost-prohibitive for new development.
- **Feasibility issues.** It is hard to finance debt. 15-35-unit projects are particularly challenging. Rent is too low for market-rate projects in East Portland. It is difficult to add detached units to land with existing homes – the value of the house typically exceeds the value of land.
- **Affordable housing financing challenges.** Projects typically have more than 10 funders and providers have difficulty navigating compliance (e.g., ongoing annual income recertification) with each one. Prevailing wage requirements around affordable housing is an ongoing tension.

- **Land supply issues.** It is difficult to find sites appropriately zoned, especially for higher density development. Affordable housing providers are unable to compete with market-rate developers because of the longer timelines associated with financing and development.
- **Low rent growth.** Rent growth has slowed down but costs (and capital) have continued to increase, especially with interest rates. Developers expect the lack of new housing development (diminishing supply) to result in higher rent growth by 2025, which will improve development feasibility but exacerbate affordability issues.

Building Code and Process Issues

- **Permitting delays.** While permitting review timeframes have been improving as a result of the Permit Improvement Task Force work, there is a perception amongst some developers that delays in permitting still occur across bureaus and departments to varying extents (and that the Water Bureau, Urban Forestry, and PBOT are potentially responsible). Developers also suspect time-consuming inefficiencies that result from the City's desire for everything to be perfect throughout the permitting process (rather than simply "good enough"). Getting HOLTE waivers is considered a slow process by developers. Some delays are due to the inspection process; the building inspector once had more flexibility and discretion in the field (e.g., inspectors were once able to use an orange colored in-the-field check-sheet for small adjustments and requests, but that is no longer used). Work is ongoing to improve the permitting and inspection process, yet uncertainty leads to developer hesitation to embark on new projects, especially if a developer perceives the code is applied differently for multiple similar projects with a code applied differently for each, adding unnecessary costs.
- **Inspections.** Uncertainty and subjectivity add risk to development projects. Barrier to a FIR-like program is finding inspector who understands all areas.
- **Adjustments**. The adjustment process is a good tool, but it is very subjective (builders/developers are hesitant to use the process) and there is little guidance about what developers must do. It is also a 3-4-month process and requires neighborhood notification.

SUMMARY OF FEEDBACK ON STRATEGIES TO INCREASE HOUSING PRODUCTION

Regulatory Code

- **Simplify the Zoning Code.** Implement a 'lean code' such as Tigard's vertical housing development code. Identify cumbersome/vague/contradictory language to eliminate.
- **Simplify middle housing building code.** Implement a middle housing code for 1-4 units (detached and attached), cottage cluster for 5+ units. Add flexibility to support building either attached or detached units regardless of the existing property usage. Provide more flexible standards if the existing structure is preserved, e.g., additional floor area ratio (FAR).
- **Increase allowable density.** Upzone for 3-8 stories near public transportation, increase FARs and let height prevent out-of-scale development, strategically increase CM2, CM3, RM3, and RM4/RX zoning throughout city, and identify opportunities to eliminate commercial ground floor requirements. Explore opportunities to more liberally apply zoning that allows three-story walkups (RM2/RM3)—the most feasible multi-dwelling development type.

- **Create specific East Portland production strategy.** Increase housing density in areas where there is existing or future planning and investments, e.g., corridor improvements on Powell, 82nd, and 122nd, and TIF districts.
- **Identify commonly accepted adjustments and revise code.** For example, the East Portland Pattern Area rear setback of 25% depth of lot, but typically 5ft elsewhere.
- **Reduce off-street parking depth.** For example, if there is a garage, 18ft driveway, if no garage, it's 28ft driveway.
- **Advocate for State legislative changes**. Allow single-staircase buildings, expand use of single-dwelling code to middle housing, etc.

Permitting and Development Process Improvements

- **Simplify the permitting process.** Provide more criteria-based processes, offer streamlined permitting tracks for needed housing types and affordability, improve transparency and certainty in all areas, identify and eliminate unnecessary steps in the process, improve inter-bureau coordination, etc.
- **Streamline permitting for previously approved plans.** Projects previously approved in other locations could be replicated with minimal additional work and cost.
- **Reduce neighborhood notification and demo permits wait times.** Applications often take multiple rounds; improve the ability of permit reviewers to accept submissions. Revise the demolition permitting process (e.g., it could be criteria-based).
- **Simplify the inspection process.** Look at the Field Issuance Remodel (FIR) program as a model to middle housing. Improve the ability of inspectors to make in-the-field decisions without the need to resubmit plans.
- **Allow applicants to choose a code if code changes apply mid-permit process.** Code changes while projects are in the permitting process are challenging but can also be beneficial. All code changes should be available to projects in permitting process, i.e., developers could be allowed to 'pick' which code they use (original code versus new).
- **Explore revisions to the energy code.** Realign the code to reflect the sustainability benefits of multi-dwelling development, feedback was that it is inequitable having a more stringent code for multi-dwelling than single dwelling.
- **Explore opportunities for development partnerships** on institutional campuses near transit.

Financing Opportunities

- **Include fair housing elements as part of the bonus and incentive structure** so developers can maximize density/height.
- **Provide a middle housing revolving loan fund** to cover acquisition and entitlement fees to bridge the initial fees to get a construction loan.
- **Expand the affordable definition** to 100-120% to open up bonuses and incentives for middle income housing units.
- **Reduce fees** if needed housing types involved, e.g., lower tree removal fees for middle housing

- **Revise SDCs.** E.g., consider SDC waivers to increase production of certain housing types. Defer payment until building completion. Developers would like SDCs to be scaled to the size of unit and/or density on the lot, and consider location, proximity to amenities like parks, transit, etc.
- **Explore opportunities to support private development with public finance.** E.g., the City could provide tax abatement, credit enhancement for bonds, and/or below-market capital. City can also buy bonds at 2-3% and offer to developers (employers can also do this for employee housing).
- **Explore funding sources for off-site infrastructure improvements.**

Housing Innovation/Other

- Support recruitment, training and education for code officials working with mass timber.
- Align maximum building heights with mass timber (eight stories).
- Allow single staircase buildings for under 4-5 stories (state legislative changes needed).
- Promote state modular code for use at city level.
- Review existing codes and zoning policies and revise to encourage reusing existing buildings. For example, policies could include allowing single point of access, building flexibility into the energy code for historic structures, and realigning City policies with state and federal.
- Consider an expansion of historic resource incentives, which allow a variety of uses not otherwise allowed.

Internal Outreach

The City has many capable and knowledgeable experts among the staff and the many community members serving in advisory capacities. The project team extended the opportunity to collaborate, participate and advise on both the HNA and HPS with an internal working group, to several advisory committees or groups, Planning and Sustainability (BPS) Staff and decision makers within the City.

HPS Internal Working Group

This engagement serves to inform, update and collaborate with bureau partners involved in regulation and development of housing. Bureaus meet bi-monthly for a total of 19 times in order to collaborate on updates and revisions until council adoption of HPS in Summer 2024. Participation has included staff from the following bureaus; Housing, Planning and Sustainability, Development Services, Prosper Portland, Management and Finance, and Transportation.

City Advisory Committees and Groups

Development Review Advisory Council

The Development Review Advisory Committee (DRAC) is a community advisory body, representing those with interests in the outcome of policies, budgets, regulations, and procedures that affect development review processes.

- **HNA Meeting: August 17, 2023.** Presented HNA basics and received feedback.
- **HPS Meeting: February 15, 2024.** Presented HPS basics and received feedback.

SUMMARY OF COMMENTS

DRAC members engaged in discussions on some of these issues as well as suggestions. Areas of discussion included the difficulty in tackling income inequality and unaffordability, finding other opportunities for tax abatement or relief to help make projects feasible, addressing the difficulty in making smaller projects pencil when they trigger infrastructure improvements. Other suggestions included further incentivizing the adaptive reuse of buildings, and determining the amount of funding needs to be able to meet housing targets. One member suggested that the target numbers were aggressive considering past production and the capacity of the construction industry. Many jurisdictions and agencies are having similar conversations and there was a concern about focusing too much on only one aspect (affordability) and losing sight of the holistic housing need.

Historic Landmarks Commission

The Landmarks Commission is a community advisory body, that provides leadership and expertise on maintaining and enhancing Portland's historic and architectural heritage.

- **HPS Meeting: April 21, 2024.** Presented HPS basics and received feedback.

SUMMARY OF COMMENTS

- Initiatives E - G are necessary and preventative. Household retention will be very important to solve this problem which can reduce the need to create new housing. It will be important to include a strategy to preserve existing housing. A home ownership repair program would help such strategy as these are often expensive.
- Initiatives F & G are important to scope beyond the housing itself. There is a need to consider the surrounding environment to ensure it supports the community, including the aging and disabled populations where the housing is built. This includes locations near transit hubs, the importance of placemaking and contact with nature, and keeping people involved in the community.
- Look for opportunities to double up efforts so the focus goes beyond housing. Consider multiple funding sources, rather than siloing funds. Consider not just the units themselves but also how the density increases within the community, to create a healthier environment for all. Examples might include focusing on adding housing in the Central City to help support that area and focusing on improvements to unreinforced masonry structures by finding ways to fund reinforcing existing unreinforced masonry buildings.
- The cost of housing is one part of the calculation, but there are other layers of costs that are also contributing to making it prohibitive, like property taxes, increased costs of utilities, cost of permitting, etc.
- In alignment with these strategies, the Landmarks Commission has a track record of promoting density. Support the efforts here to prioritize retrofitting existing assets, as low carbon building policies start with buildings that already exist.

- Support advocating for the historic tax credit. This, when layered with other funding mechanisms, can make a big impact on the production of housing.

Design Commission

The Design Commission is a community advisory body that provides leadership and expertise on urban design and architecture and advances the purpose of the Design overlay zone.

- **HPS Meeting: April 18, 2024.** Presented HPS basics and received feedback.

SUMMARY OF COMMENTS

- Public outreach is important. The extensive public outreach for this project is appreciated. The recent Housing Regularity Relief (HRR) project had much less time for public outreach during the process.
- Provide help for the current market, address barriers. Many of the changes done in the Housing Regulatory Relief program benefit housing developers, however, they are not helping get projects off the ground.
    - The recent SDC fee deferral requires the City to be in the first position in the loan repayment. As currently written, however, it is not useful as the banks won't accept this.
    - There are permits that are waiting to be picked up that are currently unfinanceable. Extensions of these building permits would allow already entitled projects to move forward in the future, which could quickly get off the ground.
    - The City might consider purchasing buildings on market, and switch to affordable units.
- Educate the public on available funding. Much of this depends on funding available. It would be helpful to show, given available funds, how much of this work can be done now, and in how many years. This process could educate the public and also illustrate where there are the gaps. Otherwise, it may appear that the City is going to go out and do all of this.
- Focus on increasing housing production for the 0-30% sector. While increasing home ownership covers a wider range of incomes, this sector has the direst need of housing so is the most critical to support. Providing stable housing for unhoused or those at risk of losing housing can increase the quality of life for all city residents. Incentives such as zoning bonuses can help make those projects more effective to build, however, many of the changes done in the Housing Regulatory Relief program benefited development of all housing sectors, rather than focusing on this sector. Support going a step further to help deeply affordable projects.
- Supporting the public realm and the quality of communal life are critical components to consider when adding more density. While there is some reference to climate friendly requirements, language related to quality of life and the quality of the street, neighborhood and public realm is missing. Would like to see language related to public stewardship included to maintain and support the quality of life in communities as they continue to grow and densify.

Community Involvement Committee (CIC)

The Community Involvement Committee (CIC) reviews and advises the way City staff engage with the public in land use and transportation planning. This is an important part of the City's 2035 Comprehensive Plan Community Involvement Program, supporting the goals and policies of the Comprehensive Plan.

- **Meeting 1: June 2023.** Attended the CIC to present the HNA basics and receive feedback on how to communicate results and successfully gather input on needed housing.
- **Meeting 2: January 2024.** Attended the CIC to present the HPS basics and receive feedback on how to communicate draft strategies, develop survey and successfully gather input.

Planning Commission

The Planning Commission focuses on land use planning, while continuing to advance the policies in Portland's Comprehensive Plan. By holding public meetings and discussing issues and proposals, the commission advises council on plans and policies regarding such issues as housing. For the Housing Production Strategy, the Planning Commission was engaged in an advisory capacity.

- **Meeting 1. December 12, 2024. Present HPS Outreach Plan.** Presented proposed outreach plan and DLCD BIPOC outreach grant.
- **Meeting 2. May 28, 2024. Present HPS Draft.** Presented Discussion Draft of the Housing Production Strategy and additional required elements for comment.
- **Meeting 3. June 11, 2024. HPS Planning Commission Discussion.** Concluded discussion of HPS.

SUMMARY OF COMMENTS

- Commissioners heard about study versus embark on a project and would like to understand the ability of staff to firm up commitments.
- Some commissioners expressed support that the City declared housing emergency, this should inform the HPS and place urgency on the work.
- A commissioner expressed support for Expanding Opportunities for Affordable Housing as a terrific project and agree that we should focus on this as Habitat has done and is knowledgeable about. It's not just land; properties are also selling for much lower than what we can even build. We need to be nimble.
- A commissioner expressed support for Climate-friendly and healthy homes have to do with the building and the edge of building codes… but the real opportunity is about how we power our homes, which is the much larger items. The City is not projecting much growth in the RCAA in close-in neighborhoods given the zoning capacity. From an equity perspective, this is a glitch. If we had the benefit of the RCAA analysis, we wouldn't have a comment in the Comprehensive Plan versus the actual density we have in inner southeast neighborhoods right now.
- A commissioner expressed support for Disability-friendly housing as "everybody housing," which is a greater home for the present as well as the future.

- Some commissioners wanted to know, How do we ensure the HPS is actionable and moves us forward?
- A commissioner expressed support to Urge bureaus to look at the 80% MFI as the threshold versus lower to reach more people.
- A commissioner expressed concerns around increasing the transient lodging tax could be counterproductive for an industry that's been facing challenges since the pandemic.
- Some commissioners expressed support that this is becoming more specific, and that staff are setting a good example on this.
- A commissioner expressed concerns around strategies that would support eliminating prevailing wage requirements.
- Some commissioners wanted to know if, based on recent testimony, about converting existing buildings into housing. Are there opportunities to include that to address the climate implications of demolition and building new?
- A commissioner expressed support for including PCEF SP3 in the "Promote climate-friendly and healthy homes" category. PCEF announced the SP3 Program which provides $140 million for over 3000 homes for home energy assessments and follow up work.

July 23, 2024

Dear Mayor Wheeler, Commissioner Rubio, and Commissioners Gonzalez, Mapps, and Ryan:

The Planning Commission, serving in its non-legislative, advisory role, has reviewed the draft Housing Production Strategy (HPS) for consistency with relevant 2035 Comprehensive Plan policies. We are impressed with the work of staff from Bureau of Planning and Sustainability, Portland Housing Bureau, Prosper Portland, Portland Planning and Development, and Portland Bureau of Transportation as well as other City, regional, and state partners for their ongoing efforts and coordination.

The Planning Commission finds that the HPS is consistent with the goals and policies of the Comprehensive Plan. Specifically, there are five housing goals, each of which are addressed in the HPS:

- **Housing Diversity**. Initiatives such as Promote Affordable Housing (0-80% AMI), Increase Access to Opportunity, Promote Age and Disability Friendly Housing and Increase Middle Income Housing and Homeownership aim to further this goal.
- **Equitable access to housing.** The HPS makes a special effort to remove disparities in housing access for people with disabilities, people of color, low-income households, diverse household types, and older adults The HPS addresses this goal through initiatives such as Promote Affordable Housing, Increase Access to Opportunity, Promote Age and Disability Friendly Housing with specific strategies like Create New Tax Increment Financing (TIF) Districts, Rezone Sites for Affordable Housing, and Conduct Inclusionary Housing (IH) Program Periodic Review.
- **Healthy connected city**. Living in safe, healthy housing that provides convenient access to goods and services that meet daily needs is a key principle of the Comprehensive Plan. Initiatives such as

Promote Affordable Housing (0-80% AMI), Increase Access To Opportunity and Promote Age, and Disability Friendly Housing aim to further this goal through strategies such as Create New Tax

Increment Financing (TIF) Districts, Rezone Sites for Affordable Housing, Increase Housing Capacity in Inner Centers & Corridors, Revise Zoning Bonuses and Incentives, Increase Housing Capacity in the Central City, and Identify Housing Opportunity Along 82nd Avenue.

- **Affordable housing**. The HPS initiatives Promote Affordable Housing (0-80% AMI), Stabilize Current and Future Households, Increase Middle Income Housing and Homeownership and Advocate at State and Federal Level promote this goal through strategies like Replace Housing Bonds Revenue Source, Establish a Comprehensive Citywide Land Banking Strategy, Expand Homeownership Programs, Rezone Sites for Affordable Housing, Preserve Existing Affordable Housing, and Advocate for preservation of expiring regulated affordable units.
- **High-performance housing.** Portlanders need access to resource-efficient and high-performance housing. The initiatives Promote Climate Friendly and Healthy Homes and Advocate at State and Federal Level further this goal through strategies such as Support Mass Timber and Modular Innovations, Develop Low Carbon Building Policies, Promote Commercial to Residential Conversion / Adaptive Reuse, Implement Heat Adaptation Recommendations, Advocate for reduced embodied carbon strategies, for all electric housing production, and for additional infrastructure resources.

To meet our housing goals, we need to increase production significantly and make living in Portland safe and affordable for everyone and all abilities. The HPS addresses Portland's housing needs in a way that achieves our housing, urban design, climate, health, and equity goals as articulated in the 2035 Comprehensive Plan.

The HPS lays out an ambitious five-year action plan with specific strategies across a wide range of issues. The Planning Commission looks forward to working with the Mayor and City Council to implement these actions to meet our long-term housing goals.

Sincerely,

Mary-Rain O'Meara Chair

City of Portland, Oregon | Bureau of Planning and Sustainability | www.portland.gov/bps 1810 SW 5th Avenue, Suite 710, Portland Oregon, 97201 | Phone: 503-823-7700 | Relay: 711

Decision Makers

The project team presented at Planning Commission and City Council meetings several times during the HNA / HPS process, corresponding to the timing of specific draft deliverables. The purpose of these meetings was to provide decision makers with information from the project and ask for feedback on key questions about assumptions and policy issues in addition to adoption of the final reports and policies as directed by the state.

Planning Commission

The Planning Commission focuses on land use planning, while continuing to advance the policies in Portland's Comprehensive Plan. By holding public hearings and discussing issues and proposals, the commission develops recommendations to share with City Council. The Housing Needs Analysis was adopted as part of a legislative process that modified the Portland Comprehensive Plan, the Planning Commission served both an advisory and legislative role in the Housing Needs Analysis.

- **Meeting 1. April 25, 2023. Introduce the HNA.** Staff provided a brief introduction to the HNA, HPS, and BLI, providing Planning Commission with information on its purpose, the process, the regulatory requirements, desired outcomes, and potential issues.
- **Meeting 2. September 26. HNA Planning Commission Hearing.** Testimony on the proposed draft collected from 08/17 to 09/26.
- **Meeting 3. October 10. HNA Planning Commission Continued Hearing and Work Session**
- **Meeting 4. October 24. HNA Planning Commission Recommendation.**

City Council

- **Meeting 1. July 26th, 2023. Joint Bureau Council Office Briefing/ Housing Work Session.** Alongside PHB, Prosper Portland and BDS, presented the HNA as well as ongoing and future housing work across bureaus.
- **Meeting 2. December 6th, 2023. City Council Hearing. Adopt the HNA. Present preliminary summary of housing production strategies.** City Council heard testimony on the Housing Needs Analysis and City staff presented a preliminary summary of existing and some drafted future strategies to the City Council and receive feedback.
- **Meeting 3. January 9th, 2024. City Council Resolution.** Adopt DLCD Grant for BIPOC outreach.
- **Meeting 4. August 28th, 2024. Present draft Housing Production Strategy.** BPS will attend one City Council meeting to present the draft HPS report and make revisions based on Council review.

- **Meeting 5. September 11th, 2024. Adopt final Housing Production Strategy Report.** BPS will attend one City Council meeting to respond to any final questions on the Housing Production Strategy.

Technical Advisory Committee (TAC)

The City recruited and established a Technical Advisory Committee (TAC) made up of members of regional jurisdictional partners to review and provide feedback on the analysis and guide strategy development. The HNA/HPS TAC meetings occurred as follows:

- **Meeting 1. May 2023. Project kickoff.** Staff provided an overview of the HNA and overall process, including project schedule, regulatory requirements, and desired outcomes. Staff presented the preliminary findings of housing needs, including key findings of the draft housing needs projection. The draft HNA was made available for TAC review and comment at this meeting.
- **Meeting 2**. **October 2023. Identify unmet housing need and policy gaps.** The TAC discussed a list of strategies to address housing need in Portland, gaps in existing housing policies and equity issues. Staff worked with the TAC to draft new strategies.
- **Meeting 3. December 2023. Develop details of each strategy.** This meeting continued the discussion from the previous meeting. It included finalizing a list of strategies and soliciting advice on the relative priority of each strategy.
- **Meeting 4. April 2024. Finalize strategies.** The TAC discussed the final list of strategies and discuss the timing of implementation of each strategy. The draft HPS report was made available.

Participants:

HNA Participants	Additional HPS Participants
Metro • Ted Reid, Dennis Yee, Clint Chiavarini **Portland Housing Bureau (PHB)** • Jessi Conner, Antoinette Pietka, Jill Chen **Multnomah County** • Max Nonnamaker, Abe Moland **Department of Land Conservation and Development (DLCD)** • Kelly Reid, Sean Edging, Celestina Teva **Portland State University** • Alan DeLaTorre	*Joining the HNA TAC members, these participants were brought into the TAC in Fall 2023.* **Metro** • Emily Liebe **Prosper Portland** • Lisa Abuaf, Sarah Harpole, Justin Douglas **Bureau of Planning and Sustainability (BPS)** • Ludwig Salzmann, Kyle Diesner **Joint Office of Homeless Services (JOHS)** • Lori Kelley, Jenna Kivanc, Claudia Sharygin

Core Engagement Principles

At BPS, it is our responsibility to seek out the voices and interests of underserved and underrepresented communities who may be impacted by a decision and use an equity framework to:

- Identify disproportionate adverse effects this work may have on a community, particularly low-income populations and communities of color.
- Identify ways in which communities' needs inform planning, investment and implementation

We know that we must intentionally allocate resources to overcome the cumulative impacts of institutional racism on historically underserved and under-represented people. Investing resources into quality engagement can prevent costly course corrections in the long run. Because community engagement with communities of color and low-income populations is highly relational, one of the best investments is ample staff time to develop relationships with underserved and underrepresented community members. Navigating across cultures and addressing previous negative experiences with government requires both cultural competency skills and time. It is important to note this work does not begin and end with a project but is an ongoing investment connected across projects over time.

When beginning to engage communities, staff have worked with the Equity and Engagement team closely and have been encouraged to center impacted community and continually ask;

- Has the design of this initiative been analyzed for cultural relevancy or versatility?
- Have select racial/ethnic groups been inequitably impacted or denied access by this work, or similar/related types of initiatives in the past?
- Is personal wealth or income a determining factor in the ability to benefit from this initiative?
- Is participation reliant upon an individual's ability to comfortably interact with mainstream educated, middle- and upper-class persons, BPS employees AND/OR their designated consultants?

Outreach Questions

Community Survey Questions

This survey has eight sections, each asking questions about different needs and experiences around housing. The sections are:

1. About you
2. Current needs
3. Challenges
4. Accessibility
5. Future needs
6. Priorities and Closing thoughts

1. What zip code do you live in?
2. Do you own or rent the housing you live in? (Select one)
    a. Rent
    b. Own
    c. Occupy without paying rent
    d. I don't rent or own
3. What type of housing do you live in? (Select one)
    a. Single home (detached from any other house)
    b. Mobile or manufactured home
    c. Accessory dwelling unit (ADU) (a smaller unit that shares a lot with a main dwelling, may be attached or detached)
    d. Duplex/triplex/quadplex (building with 2-4 units)
    e. Apartment/Condo (5+units)
    f. Retirement community or Assisted care/living facility
    g. Other (please specify)

Please answer these questions thinking about your and/or your household's current needs
Think about your household size, your accessibility needs, where your house is located, etc.

4. What is most important to you about a home? Please only select three as "high importance" (Options – high importance, medium importance, low importance)
    a. Affordable price/rent
    b. Size / Number of bedrooms
    c. Car Parking
    d. Access to outdoor space (Yard, garden, patio, etc.)
    e. Location (Close to employment/family, etc.)
    f. Neighborhood amenities/features
    g. Other (please specify)
        i. Please specify what other features are most important to you about a home.
5. What are the most important qualities for your ideal neighborhood? Please only select three as "high importance."(Options – high importance, medium importance, low importance))

a. Bike routes
b. Bus and transit options
c. Employment opportunities
d. Shopping and dining opportunities
e. Parks, natural areas and outdoor recreational areas
f. Schools and educational opportunities
g. Proximity to my cultural community
h. Community center or library
i. Medical services availability
j. Other (please specify)
    i. Please specify what other qualities your ideal neighborhood has.

Please provide more information to help us understand your needs.

6. What difficulty, if any, have you had **finding or staying in** housing that meets your needs in Portland? (Options – extreme difficulty, some difficulty, no difficulty, this does not apply to me)
    a. Finding housing in my price range
    b. Affording mortgage or property taxes
    c. Affording utility costs
    d. Affording necessary home repairs
    e. Finding housing in my preferred location
    f. Finding housing in livable conditions
    g. Finding housing that meets my or my household's accessibility needs
    h. Finding housing with enough rooms for my family
    i. Finding housing where I or people in my household felt safe
    j. Denial of housing due to credit or rental history
    k. Denial of housing due to discrimination
    l. Facing eviction threats or conflict with landlords
    m. Other
        i. Please specify what other difficulties you have had finding housing that meets your needs in Portland.
7. Which of these programs might be helpful to you or your household? (Choose all that apply)
    a. Rent assistance
    b. Eviction legal support
    c. Fair Housing/Anti-Discrimination
    d. Utility assistance
    e. Home repair assistance
    f. Down payment assistance
    g. Debt relief
    h. Foreclosure assistance
    i. Internet or digital access assistance

j. None
k. Other (please specify)

8. What challenges have you and/or your household had finding accessible units? (Choose all that apply)
    a. It is difficult to find any accessible unit
    b. It is difficult to afford an accessible unit
    c. It is difficult to find an accessible unit that specifically accommodates my needs
    d. Units that are accessible are not reserved for people with disabilities
    e. It is difficult to make my existing space meet my needs
    f. This doesn't apply
    g. other (please specify)
9. What accessibility features are needed in your housing? (Choose all that apply)
    a. Wider doorways / space for wheelchairs to move throughout the home,
    b. Low/adjustable cabinets and countertops,
    c. Grab bars in bathrooms / non-slip surfaces
    d. An accessible parking spaces
    e. Extra space for medical equipment
    f. Visual/audible alert systems
    g. No-step entry/ramps
    h. Level and complete exterior pathways and/or sidewalks
    i. Other (please specify)
10. What programs would support you or others with disabilities in helping make housing that meets your needs?
    a. Home modification programs
    b. Weatherization programs
    c. Transportation and mobility
    d. Home and community-based support services
    e. Renter/homeownership education
    f. Other (please specify)

Answer these questions thinking about the housing needs you and/or your household might have in the **next 10 years**. Think about your household size, your accessibility needs, etc.

11. Will your current living situation meet your housing needs 10 years from now?
    a. Yes
    b. No
12. If no, how do you expect your housing needs to change 10 years from now?
    a. Switching to homeownership
    b. Needing greater accessibility
    c. Downsizing – needing less space
    d. Upsizing – needing more space
    e. Needing assisted living
    f. Other

13. Considering that most of Portland's new housing will be in apartment buildings, what features or amenities would make living in an apartment more appealing or possible for you? Please only select three as "high importance." (Options – high importance, medium importance, low importance)
    a. Affordable price/rent
    b. Larger bedrooms
    c. Multiple bedrooms
    d. Access to outdoor space
    e. Sound and noise privacy
    f. Adequate heating and cooling
    g. Property security
    h. Community spaces
    i. Access to car parking
    j. Secure bike parking
    k. Neighborhood amenities/features
    l. Other (please specify)
        i. Please specify what other features or amenities are most important to you about an apartment.

Which housing strategies are the most important/highest priority in Portland? Please only select three as "high importance."(Options – high importance, medium importance, low importance)

a. Promote Affordable Housing (0-80% AMI)
    i. increase the supply of regulated and unregulated affordable housing units
b. Increase Homeownership
    i. Improve homeownership rates, retention, and locational choice for people of color and other groups who have been historically under-served and under-represented
c. Increase Access to Opportunity
    i. ensure equitable access to housing and increase the number of Portlanders living in safe, healthy housing with convenient access to jobs, goods and services that meet daily needs
d. Reduce Barriers to Development
    i. address known regulatory impediments to building needed housing
e. Stabilize Current and Future Households
    i. support the stabilization of households, prevent houselessness, and reduce housing insecurity
f. Promote Age and Disability Friendly Housing
    i. further Portland's ability to ensure equitable access to housing, making a special effort to remove disparities in access for people with disabilities and older adults
g. Promote Climate Friendly and Healthy Homes
    i. promote the development of climate friendly and healthy homes so that there is access to high-performance housing for people of all abilities and income levels

h. Advocate at the State and Federal Level
    i. some changes in codes or regulations that would promote production require the City to advocate at the State and Federal level
i. Other (please specify)
    i. Please specify which other housing strategies are most important/highest priority in Portland.

14. Is there anything else you'd like to share that would help us better understand your housing needs and challenges?

Questions for Developer Outreach

Questions for Affordable Housing Developers/Designers:

- What types of incentives are most beneficial to your organization?
- What are other ways that local governments have supported your work?
- Does your organization include accessibility features beyond the minimum federal requirements? What are the barriers to providing accessible units?
- Do you think financial, or code incentives would be effective in delivering more accessible units? What about requirements for accessibility beyond federal standards?
- One of the needs identified in Portland is more housing for multi-generational families. Does your organization provide units that meet these types of needs? What are the barriers? Would bonuses be an effective way to encourage multiple bedrooms?
- Do you see opportunities for SRO development in Portland?

Questions for Middle Housing Developers:

- What challenges have you faced developing middle housing in Portland?
- Are there development code or process barriers that should be addressed to make middle housing easier to build in Portland?

Questions for Multi-Dwelling Developers/Designers:

- Are there development code or process barriers that you think should be addressed to make multi-dwelling housing easier to build in Portland?
- Do you think higher allowed densities would make housing units more affordable? What density range would you target if there were no limits (except height)?
- Does your organization include accessibility features beyond the minimum federal requirements? What are the barriers to providing accessible units? What are the costs?
- Do you think financial, or code incentives would be effective in delivering more accessible units? What about requirements for accessibility beyond federal standards?

Summary of Engagement from Recent Projects

Homelessness Response Action Plan

The core goals of the plan include sheltering or housing an additional 2,699 people who are sleeping outside by Dec. 31, 2025; adding 1,000 units of shelter, which would increase shelter system capacity by nearly 40%; reducing homelessness among vulnerable populations (including people of color and LGBTQIA2S+ people); adding hundreds more behavioral health beds; opening a drop-off sobering center; and increasing the supply of affordable housing. The plan builds on the initial draft shared in spring 2024 with added goals and action items based on community feedback collected from nearly 200 emails and from nearly 300 people engaged during public forums and presentations:

- Better meeting the housing needs of refugees and asylum seekers through coordination with other governments and community partners.
- Supporting and expanding the behavioral health workforce.
- Increasing outreach services at library locations.
- Funding additional day services for people experiencing homelessness.
- Better meeting the accessible housing and shelter needs of people with physical disabilities.
- Increasing access to behavioral healthcare for people who have been involved in the criminal justice system by committing ongoing funding to the Department of Community Justice's Stabilization and Readiness Program.
- Developing an integrated healthcare management platform to coordinate care across housing and healthcare providers.
- Further acknowledging the geographic diversity and different service environments of East County.
- Adding a general member of the public to the Community Advisory Subcommittee — an oversight committee for the plan and for the Joint Office — to better align with the County's requirements for Community Budget Advisory Committees.
- The plan also updates or adds timelines for work that involves partners such as the Oregon Legislature.

Feedback was solicited through several avenues, including a joint session with the Board of County Commissioners and Portland City Council on March 12, multiple town hall meetings, and multiple direct meetings with service providers, business and health system partners.

Regulatory Improvement Code Amendment Package (RICAP 10)

RICAP projects are typically scoped based on items that have been entered into the Regulatory Improvement Request database that contains requests from city staff and the public for changes to the Zoning Code. Project staff sorted through the database and selected items that fell under the themes of housing production, economic development, or regulatory improvement. This formed the basis for the RICAP 10 Discussion Draft, which was released in November of 2023. The Discussion Draft was made available to the public and shared with all of the district coalitions and neighborhood associations, a broad spectrum of community groups and nonprofits that focus on land use, housing, equity and environmental concerns, as well as to the BPS email newsletter network. Comments on the draft were accepted through the MapApp, the BPS public comment and testimony database, in November and December of 2023.

The RICAP 10 Proposed Draft was released in January of 2024. Project staff met with neighborhood and community groups to present the project and discuss the proposals in more detail, including the land use groups for North Portland Neighborhood Services, Southeast Uplift, and the Southwest Land Use and Transportation Forum. Stakeholder engagement included meeting with the Development Review Advisory Committee, the Design Commission, and the Landmarks Commission. Ten pieces of written testimony were submitted via the MapApp, and one person testified at the RICAP 10 hearing before the Planning Commission on February 27, 2024. The Planning Commission made their recommendation for City Council to approve the proposal with two amendments on March 26. A public hearing on the project was held May 23.

Housing Regulatory Relief (HRR) Project

The genesis of the HRR project was in the survey that was done by Bureau of Development Services and sent to over 3,000 people who engage in the development review process, including applicants, developer, housing non-profits, newsletter subscribers and employees. The survey asked for a ranking of items based on the challenges impacting development. Over 600 responses were received and released in March 2023. The results of the survey, along with additional conversations with Bureau Development Services resulted in the HRR workplan.

The Proposed Draft was released in September 2023, and notice provided to the cities legislative list. The Bureau's Map App testimony database was opened up to allow people to testify directly to the system. Information was also provided through BDS' Plans Examiner newsletter in order to reach those who had participated in the survey. BPS staff also reached out to various interest groups and stakeholders who could potentially be impacted by the proposed amendments. The Planning Commission hearing included over 200 pieces of written testimony, and 30 people testified in person. As a result of this testimony, the Planning Commission amended the staff proposal on the ecoroof suspension and removed the amendments waiving bird-safe glazing.

During the public outreach period for both the Planning Commission and City Council hearings, staff also presented the proposal at neighborhood associations and district coalition meetings as well as with various interest groups. The City Council hearing on January 10, 2024, also generated a significant amount of testimony, much of it in support of the changes that the Planning Commission had made. Approximately 50 people testified at the hearing, and over 400 pieces of testimony was submitted through the Map App. The Council considered the recommendation, the scope of the testimony and a set of amendments, before ultimately approving the package with three amendments.

Housing Regulatory Survey Response Code Change

The online survey was open from Feb. 16 through March 3, 2023. Participation in the survey was promoted via email to:

- Those who applied for construction permits for housing-related projects since January 2019
- Non-profit organizations involved in the development of new housing units
- Business associations serving companies and consultants involved in housing development
- Subscribers to the Bureau of Development Services' Plans Examiner newsletter
- Employees involved in permitting functions at the City of Portland's seven development review bureaus (Development Services, Environmental Services, Fire and Rescue, Housing, Transportation, Urban Forestry, Water)

611 responses were received while the initial request for participation was sent to approximately 3,100 email addresses. Participants were provided a list of more than 20 current requirements in the development of new housing and asked to rank the top five they believe should be suspended or modified to encourage new housing development. That list represented feedback the City had already received over recent years.

Figure 78. Top Ten Policies That Received The Highest Numbers Of Top Five Priority Rankings

Policy	Priority 1	Priority 2	Priority 3	Priority 4	Priority 5	Total count
Bicycle parking requirements	53	54	37	34	45	223
System Development Charges (SDCs) – timing of payment	66	35	46	26	45	218
Floor area ratio (FAR) limits	44	45	27	27	20	163
First floor active use requirement	31	44	31	27	23	156
Reduced public infrastructure requirements	29	27	25	36	28	145
Demolition delay requirements	29	23	32	26	26	136
Non-conforming upgrade requirements	24	23	26	37	22	132
Parking impacts analysis	30	19	35	18	28	130

Policy	Priority 1	Priority 2	Priority 3	Priority 4	Priority 5	Total count
Maximum height limit	35	28	21	27	17	128
Bird-safe glazing requirements	15	23	28	20	38	124

Source: BDS Survey Results

The priorities identified were fairly consistent across these categories. Bicycle parking requirements, first floor active use, and timing of SDC payments ranked among the top four considerations across most participant categories. Only the two categories with the smallest numbers of respondents—non-profit developers and permit runners—did not mention SDC payments in their top five priorities. Non-profit developers are not subject to SDCs.

Portland Insights Survey

A few items were included in the Portland Insights survey that focused on housing and houselessness. Respondents were asked to identify the solutions to houselessness they would support being built in their neighborhood and if they knew about and needed the rental and housing assistance program and the water, sewer, and stormwater bill payment assistance program.

- A variety of solutions to address houselessness were identified by respondents, with Substance Abuse and Mental Health Clinics (65.2%) and Subsidized Apartment Complexes (61.9%) constituting the most frequently selected options.
- Over half of respondents (55.5%) knew about the Rental and Housing Assistance Program and the Water, Sewer, and Stormwater Bill Payment Assistance Program (53.3%), while proportions of respondents who need each of those programs were also comparable (18.3% and 18.1%).
- The proportions of individuals who needed but didn't know about the Rental and Housing Assistance Program (7.3%) and the Water, Sewer, and Stormwater Bill Payment Assistance Program (7.5%) suggest that educating the community about the programs would be beneficial. The largest proportions of respondents who needed, but did not know about the Water, Sewer, and Stormwater Bill Payment Assistance Program were in North (53.9%), Northeast (42.1%), and East (41.9%) Portland. The areas with the largest proportion of respondents who needed but did not know about the Rental and Housing Assistance Program were East (46.9%) and Southeast (44.7%).
- Respondents identified which solutions to houselessness they would support being built in their neighborhood. Approximately two-thirds of the respondents selected Substance Abuse and Mental Health Clinics (65.2%) and Subsidized Apartment Complexes (61.9%). Slightly over half of the respondents selected Indoor Shelter Facilities (54.0%) and Tiny Houses/Pods (50.4%).
- The majority of narrative responses to the survey's open-ended questions had things to say regarding housing, houselessness, and the increased number of camps within the city. Respondents

mentioned seeing and being affected by the increased numbers of camps and those living on the streets – in tents, in cars, and in RVs. Feelings of not being safe when having to walk around encampments that are located on the sidewalks, dirty streets and accumulated trash, and open drug use and criminal activity have created sadness, frustration, and anger for many Portlanders. A variety of ideas were shared about what to do with and how to support those who are houseless.

Aging and Disability Engagement

Extensive outreach was done in the work staff did for the Age- and Disability-Inclusive Neighborhoods (ADIN) working group and in the development of the Age- And Disability-Inclusive Neighborhoods (ADIN) Plan – BPS relied heavily on the extensive engagement and documentation done in this process so as to not over burden or be redundant in outreach. The ADIN coordinator worked with the project team to summarize the following efforts:

- Age- and Disability-Inclusive Neighborhoods Action Plan (ADIN) Discussion Draft [135]
- Age-Friendly Portland Cities Project [136]
    - Age-Friendly Portland Qualitative Research (With older adults, caregivers, and providers) [137]

Summary of Age- and Disability-Inclusive Neighborhoods On Housing Needs and Priorities

- Increase options for housing generations together or in close proximity.
- Increase range of accessible housing options to meet residents' aging and disability needs.
- Increase incentives for developing new accessible housing and retrofitting existing housing stock near transit and key services (e.g., bonuses, SDC waivers) so that they are "visitable" (i.e., no-step entrance, accessible hallways/doorways, and amenities on single floors).
- Update incentives for zoning code 33.229: Elderly and Disabled High Density Housing.
- Ensure housing accessibility is part of needs analysis and future planning actions.
- Support the addition of physically accessible housing in required Department of Land Conservation and Development (DLCD) needs analyses and housing production strategies.

[136] https://extranet.who.int/agefriendlyworld/wp-content/uploads/2014/05/PORTLAND-OREGON-USA-1.pdf

[137] https://extranet.who.int/agefriendlyworld/wp-content/uploads/2015/03/Age-Friendly-Cities-Project-in-Portland-Oregon-Summary-of-Findings.pdf

- Strengthen the focus on addressing houselessness for older adults and people with disabilities and ensure their rapid re-housing when they are experiencing houselessness.
- Because the process to apply for affordable housing is too difficult, Navigation should be available to help to fill out the forms and understand the systems and requirements/criteria.
- Streamline the many venues for referrals to housing, social services, etc., so people do not have to call multiple agencies. A one-stop source of information, answers, and referrals.
- Educate building industry and companies that provide rental housing and tenants' organizations about reasonable accommodation (RA) and reasonable modifications (RM)
- Educate PHB and others to require new apartment buildings to provide adequate parking. When parking bleeds into nearby neighborhoods, seniors and the frail have difficulty parking close to their homes. Leverage the trend to eliminate the requirement for parking for new apartment construction to include space for rideshare vehicles, safe curbside pick-up, vehicles for residents with disabilities.
- Create additional affordable housing for older adults and those with disabilities who have fixed or restricted incomes; limit property tax increases; assist older adults who are experiencing "condo conversions" (e.g., provide ample time for relocation, provide relocation assistance, including help with moving expenses); ensure housing near concentrated services is affordable.
- Provide a continuum of housing and care options that allow individuals to age in place within their neighborhood; explore the development and implementation of multigenerational and co-housing/cooperative housing that cut costs, offer shared facilities, and foster a sense of community, but recognize that these options will appeal to only some older adults; promote the current zoning allowance of ADUs as a viable and affordable option for older adults or for their caregivers or family, or for renting out as a source of additional income; explore a public program to facilitate the development of quality and appropriate ADUs in Portland; educate older home buyers concerning how best to age in place (e.g., find housing with services and transit nearby.
- Locate new age-specific developments (e.g., assisted living, co-housing) near services (e.g., grocery stores, parks, public transit options); ensure developments near planned centers and corridors are accessible, available, and affordable to older adults; develop links between programs for children and older adults (e.g., safe routes to schools/community centers); locate key services in areas where there are large or growing populations of older adults; co-locate more services for older adults.
- Develop housing with green spaces, gardening areas, and balconies; allow pets in housing for older adults; for new developments, consider design possibilities to make them more accessible to an aging population (e.g., elevators in smaller buildings, town homes with accessible ground floor units); install higher toilets, higher electrical outlets, and door levers instead of handles for those with physical and cognitive disabilities; consider allowing accessibility improvements made by renters in housing to remain rather than requiring the unit to be restored to its original condition;

design apartments and other shared housing for older adults to have windows facing hallways to foster a sense of community and safety; change building codes to require better accessibility in all homes; consider designing new housing to accommodate not only residents but also visitors with disabilities; develop an adequate supply of housing that has level entries (or ramps), first-floor bathrooms, rocker light switches, and wide hallways and doorways for wheelchair entry; provide seating and waiting areas outside of housing; develop single-level housing or multi-level housing with elevators or ground floor units; develop flexible housing that can be easily converted into multiple dwellings and/or remodeled to add accessible features (e.g., grab bars); reduce glare on floors (e.g., avoid direct light shining on floor, use blinds and dimmers); eliminate dramatic changes in floor color; remodel housing so that it appears similar to prior living arrangements to aid those with cognitive impairment; install radiant heating in floors; place locks on doors and cabinets.

Appendix D. Pre-Housing Production Strategy Survey

Figure 79. Pre-Housing Production Strategy Survey

Housing Portal Pre-HPS Survey Submission Page: 1 of 5 Year: 2022 City: Portland Submitted Date: 12/02/2022 6/11/2024 1:54:12 pm

Category	Strategy	Encourage Needed Housing	Increase Affordability	Reduce Rent Burden
A - Zoning and Code Changes	A01 - Ensure Land Zoned for Higher Density is not Developed at Lower Densities	Yes	No	No
Comments:				
A - Zoning and Code Changes	A02 - Zoning Changes to Facilitate the Use of Lower-Cost Housing Types	Yes	No	No
Comments:	Shelter to Housing Continuum project legalized many smaller lower cost shelter options. Residential Infill Project increased ADUs (2 per lot) and middle housing types			
A - Zoning and Code Changes	A03 - FAR, Density, or Height Bonuses for Affordable Housing	Yes	No	No
Comments:	Multi-dwelling and low-density residential zones include larger FAR and height bonuses for projects with more than 50% of units are regulated affordable units.			
A - Zoning and Code Changes	A05 - Code Provisions for ADUs	Yes	No	No
Comments:	Residential Infill Project changes allow for two ADUs on a lot.			
A - Zoning and Code Changes	A06 - Broaden the Definition of Housing Type	Yes	No	No
Comments:	Shelter to Housing Continuum Project			
A - Zoning and Code Changes	A08 - Promote Cottage Cluster Housing	Yes	No	No
Comments:	Residential Infill Project Phase 2			
A - Zoning and Code Changes	A09 - Short-Term Rentals Regulations	Yes	No	No
Comments:				
A - Zoning and Code Changes	A10 - Inclusionary Zoning	Yes	No	No
Comments:	Adopted and effective in 2017			
A - Zoning and Code Changes	A11 - Add Restrictive Covenants to Ensure Affordability	Yes	No	No
Comments:				
A - Zoning and Code Changes	A13 - FAR & Density Transfer Provisions	Yes	No	No

Category	Strategy	Encourage Needed Housing	Increase Affordability	Reduce Rent Burden
A - Zoning and Code Changes	A14 - Re-examine Requirements for Ground-floor Retail/Commercial	Yes	No	No
Comments:				
A - Zoning and Code Changes	A16 - Manufactured Housing Community Preservation Zone	Yes	No	No
Comments:				
A - Zoning and Code Changes	A17 - Small Dwelling Unit Developments	Yes	No	No
Comments:				
A - Zoning and Code Changes	A18 - Increase Density near Transit Stations and Regional Multi-use Trails	Yes	No	No
Comments:				
A - Zoning and Code Changes	A24 - Legalize Alternative Housing Types on Wheels and in Parks	Yes	No	No
Comments:				
A - Zoning and Code Changes	A25 - Legalize and Encourage Tiny Homes and Villages	Yes	No	No
Comments:				
B - Reduce Regulatory Impediments	B01 - Remove or Reduce Minimum Parking Requirements	No	Yes	No
Comments:	Current - Reduced minimums near transit. Spring 2023 - eliminate minimums per CFEC rule requirements			
B - Reduce Regulatory Impediments	B02 - Remove Development Code Impediments for Conversions	No	Yes	No
Comments:	Residential Infill Project - allowed for multi-unit conversions, eliminated parking minimums. State building code remains a barrier.			
B - Reduce Regulatory Impediments	B03 - Expedite Permitting for Needed Housing Types	No	Yes	No
Comments:	Expedited permitting for affordable housing projects			
B - Reduce Regulatory Impediments	B05 - Reduce Regulatory Barriers to Lot Division	No	Yes	No
Comments:	Residential Infill Project Phase 2. Current project to re-write land division code to include more clear and objective standards			

Category	Strategy	Encourage Needed Housing	Increase Affordability	Reduce Rent Burden
B - Reduce Regulatory Impediments	B06 - Streamline Permitting Process	Yes	No	No
Comments:	On-going process			
B - Reduce Regulatory Impediments	B07 - Flexible Regulatory Concessions for Affordable Housing	Yes	No	No
Comments:				
B - Reduce Regulatory Impediments	B14 - Adopt Affirmatively Furthering Fair Housing as a Housing Policy in Comprehensive Plan	Yes	No	No
Comments:				
B - Reduce Regulatory Impediments	B15 - Reduce the Power of NIMBYism to stop, slow, change, or reduce affordable housing	Yes	No	No
Comments:

School Goals

The mission of David Douglas High School is to provide comprehensive educational opportunities that acknowledge the diversity of the students' academic, career and social needs in preparation for post-secondary success.

State Goals

The Oregon Department of Education is partnering with school districts and local communities to ensure a 90% on-time, four year graduation rate by 2027. To progress toward this goal, the state will prioritize efforts to improve attendance, provide a well-rounded education, invest in implementing culturally responsive practices, and promote continuous improvement to close opportunity and achievement gaps for historically and currently underserved students.

Safe & Welcoming Environment

We commit to the safety of the school community by following the I Love You Guys Standard Response Protocols. Link Crew peer mentors help 9th grade students integrate into our school community. Advisory addresses the social-emotional needs of students and builds positive relationships. Faculty and staff have been trained in the implementation of restorative practices. Student voice is represented through the Associated Student Body and Presidential Council. We staff eight counselors and 1.5 social workers to ensure students are successful academically and socially.

About Our School

ADVANCED COURSEWORK

DDHS offers 11 Advanced Placement (AP) courses and approximately 34 College Now Dual Credit-eligible courses. The College Now Dual Credit Program through Central Oregon Community College, Clackamas Community College, Eastern Oregon University, and Mt. Hood Community College provides students the opportunity to get a head start on their college experience. Students take college level coursework from approved high school instructors. All College Now courses are taken at David Douglas High School and receive credit from both schools at no cost to the student. Students must apply to the College Now Program and register for each articulated course during the appropriate term to receive Credit.

CAREER & TECHNICAL EDUCATION

David Douglas School District believes that career technical education (CTE) and hands-on learning provides students of all ages with the academic and technical skills, knowledge and training to succeed in future careers. David Douglas High School has 11 Programs of Study. students. Programs of Study at DDHS: Automotive, Business Management, Computer Information Systems, Construction, Education, Engineering, Health Sciences, Hospitality & Tourism (Culinary), Metals Manufacturing, Natural Resources, and Technical Theater.

EXTRACURRICULAR ACTIVITIES

David Douglas High School encourages all students to be involved in extracurricular activities. Extracurricular and co-curricular activities provide opportunities for students to make positive connections with their peers and community. We offer a rich assortment of co-curricular activities for students. Many of these activities are sanctioned by OSAA. Through our 21st Century Community Learning Centers grant, Activities Director, and community partners we offer a wide variety of after school academic enrichment programs.

PARENT & COMMUNITY ENGAGEMENT

Building and maintaining strong family and community relationships are essential to student success. School communication is shared through ParentSquare, monthly newsletters, and our website. ParentVue is a system designed to provide up-to-date information on student grades, attendance, and information regarding class assignments, allowing caregivers and teachers to collaborate. We offer back-to-school night, fall conferences, spring student-led conferences, athletic competitions, career fairs, culturally-specific caregiver events and college nights. We currently house the largest food bank in Oregon and maintain a community garden. We partner with community-based organizations to meet the needs of our school community. We have active parent-led groups such as PTSA and Dad's Club.

School Goals

Our focus is on literacy and math fluency, with the aim of refining our instructional strategies and providing all students with the skills they need to be ready to succeed in college and careers. We strive to provide a welcoming environment and equitable opportunities for students of all races, genders, and home languages. We encourage you to contact us with any questions, concerns, or information that will help us ensure success for your students.

State Goals

The Oregon Department of Education is partnering with school districts and local communities to ensure a 90% on-time, four year graduation rate by 2027. To progress toward this goal, the state will prioritize efforts to improve attendance, provide a well-rounded education, invest in implementing culturally responsive practices, and promote continuous improvement to close opportunity and achievement gaps for historically and currently underserved students.

Safe & Welcoming Environment

We work hard to make our school a place where all students and families feel welcome and included. We celebrate our community's diversity and we honor this diversity in our learning activities. We understand how important it is to keep our students feeling safe, both physically and emotionally, when they are with us.

About Our School

ADVANCED COURSEWORK

Most high schools in Portland Public Schools offer Advanced Placement or International Baccalaureate courses in several subject areas. In addition, students have the option to earn college credit for some classes.

CAREER & TECHNICAL EDUCATION

District-wide we have 60 state-approved CTE programs of study. Career clusters include Architecture and Construction, Health Services, Information Technology, Manufacturing, and others. As part of these programs, we facilitate career learning experiences for students such as guest speakers, field trips, job shadows, etc. Visit our CTE web page for additional information: https://www.pps.net/Domain/190

EXTRACURRICULAR ACTIVITIES

Our school offers a variety of extracurricular activities. Check our website for details about specific activities.

PARENT & COMMUNITY ENGAGEMENT

Our school offers several meetings each year where we invite families to attend. The meetings are to discover what your children are learning at school, to see examples of their good work, and to learn ways that you can help them succeed at school. We will inform you of these school events and celebrations through our newsletters and other media. Please check our website for details about these events. We appreciate our community neighbors and want them to feel welcome to join us in supporting the success of our students.

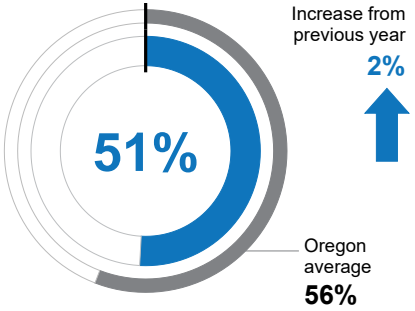
COLLEGE GOING

*Students enrolling in a two or four year college within 16 months of completing high school in **2020-21**. Data from the National Student Clearinghouse.*



School Goals

Gresham High School is focused on building a positive culture and climate in our school, where every student feels like they belong and will have an opportunity to thrive. We are prioritizing family engagement, culturally relevant instructional practice, and overall graduation rates. Our multi-tiered systems of support will provide intentional and well designed universal supports for all students, along with additional and intensified supports designed to help smaller groups and individual students find success.

State Goals

The Oregon Department of Education is partnering with school districts and local communities to ensure a 90% on-time, four year graduation rate by 2027. To progress toward this goal, the state will prioritize efforts to improve attendance, provide a well-rounded education, invest in implementing culturally responsive practices, and promote continuous improvement to close opportunity and achievement gaps for historically and currently underserved students.

Safe & Welcoming Environment

We celebrate the rich cultural diversity of our students, families, and staff. We honor that every student and family feels a sense of belonging in our school community. It is our goal to know every student by name, strength, and need to ensure a safe and welcoming environment for all.

About Our School

ADVANCED COURSEWORK

Gresham High School is in our third year of Advanced Placement course implementation. We offer twelve AP courses for our students with 4 options in Social Sciences, 2 in Language Arts, 2 in Science, 2 in Math, and 2 in World Languages. In addition, there are several opportunities for our students to earn college credit through community partners including Mt. Hood Community College, Western Oregon University, Eastern Oregon University, and Oregon Institute of Technology.

CAREER & TECHNICAL EDUCATION

At Gresham High School, Career and Technical Education Programs of Study provide an opportunity for students to earn college credit through the College Now program at Mt. Hood Community College. We offer CTE courses in Automotive Technology, Construction, Integrated Media, Education, Business Management, and Marketing Management.

EXTRACURRICULAR ACTIVITIES

As a member of the OSAA, Gresham High School offers co-curricular participation in 18 different sports and activities. In addition, our interest-based clubs include: MeCha, Black Student Union, GSA, Asian/Pacific Islander Club, Journalism, DECA, National Honor Society, Key Club, Theatre Arts, Yearbook, International Club, Hiking Club, and Social Justice Club.

PARENT & COMMUNITY ENGAGEMENT

Gresham High School partners with local businesses and community organizations to provide opportunities in the school, as well as in the community, that will bring enhanced engagement with our students. Partners include: SUN (Multnomah Family Services), TRIO, College Possible, Latino Network, Northwest Family Services, REAP, Trillium, IRCO, and many more. Each month, Gresham High School, SUN and the Oregon Children's Outreach program bring in, sort and deliver over 20 food boxes to Gresham community families. In addition, our community partners offer culturally relevant services to coach our students in their future endeavors (college/career), to re-engage students and families into our school, and to mentor and support our students during the school day.

School Goals

Hillsboro High School's goals center on scaffolding support for all students to access academic rigor and graduate college and career ready. We use the 5 Dimensions of Teaching and Learning Instructional Framework, equitable assessment practices, engaging learning environments, positive classroom cultures, and focused academic language instruction. Additionally, we target our most vulnerable students and utilize a 9th grade on-track team to ensure students begin high school feeling seen and supported as they work towards graduation and postsecondary opportunities.

State Goals

The Oregon Department of Education is partnering with school districts and local communities to ensure a 90% on-time, four year graduation rate by 2027. To progress toward this goal, the state will prioritize efforts to improve attendance, provide a well-rounded education, invest in implementing culturally responsive practices, and promote continuous improvement to close opportunity and achievement gaps for historically and currently underserved students.

Safe & Welcoming Environment

Common expectations, social emotional supports, and safety and security systems allow our students to feel safe, seen and welcome on our campus. Technology, systems and people support mental health, physical safety, and positive classroom environments across our campus. Students are connected through an advisor and access academic and social support through our Spartan Academy weekly schedule.

About Our School

ADVANCED COURSEWORK

Hillsboro High School is proud to be an International Baccalaureate World School. Within the IB program, we offer courses in Language and Literature (both Spanish and English), Japanese, French, Spanish, Biology, Physics, Sports Exercise and Health Sciences, Math Analysis and Approaches, Math Applications and Interpretations, Business Management, Psychology, Global Politics, History of the Americas, Theory of Knowledge, and Theatre. Additionally, we are a dual language school where students have the opportunity to earn a bilingual seal after completing core coursework at each grade level in both English and Spanish.

CAREER & TECHNICAL EDUCATION

Hillsboro High School offers the following career-technical education programs: Industrial Technology and Engineering Systems, Graphic Design, Communication and Media, Automotive Technology, Business Education, Computer Technology, Biotechnology, Sports Medicine, Early Childhood Education, Diesel Mechanics, and Veterinary Science.

EXTRACURRICULAR ACTIVITIES

Hillsboro High School's extracurricular activities include OSAA Athletics, OSAA Activities, OSAA Arts (Band, Choir, Theater, and Marching Band), 31 Academic and Service Clubs, and 3+ Theatrical productions each year. We also offer a variety of STEAM activities, including Robotics (multiple teams), Computer Programming, and Si Se Puede STEAM camp.

PARENT & COMMUNITY ENGAGEMENT

At Hillsboro High School, we value the diversity of our students and families and plan for community outreach accordingly. We partner with our community, families, and students through a variety of evening events: bilingual parent nights, AVID family nights, Back-to-School night, Academic Planning night, IB Family Night, College and Career Center nights, and parent conferences. Additionally, we have targeted outreach achieved through home visits, weekly newsletters, Principal Coffees, Remind notifications, and our Family Liaison.

School Goals

Lake Oswego High School strives to have 100% of its students graduate; 100% of its students feel safe, supported, challenged, and connected to a trusted adult; and 90% of its students take at least one AP, college, or dual-credit class before graduating.

State Goals

The Oregon Department of Education is partnering with school districts and local communities to ensure a 90% on-time, four year graduation rate by 2027. To progress toward this goal, the state will prioritize efforts to improve attendance, provide a well-rounded education, invest in implementing culturally responsive practices, and promote continuous improvement to close opportunity and achievement gaps for historically and currently underserved students.

Safe & Welcoming Environment

Our school strives to ensure all students and their parents feel welcome. The district has policies prohibiting discrimination, harassment, intimidation, and bullying as well as procedures to address incidents with fairness and compassion as soon as they occur. Our school's equity team works with district administrators in the ongoing, school-wide work of awareness, respect, and inclusion. The district provides access to translation and interpreters for our families who request these services.

PARENT & COMMUNITY ENGAGEMENT

Our school works diligently to engage community members through our cultural events, booster club events, equity team, and site improvement committee. Parents and community members support our school by volunteering for committees and providing guidance and support in our equity, diversity, and inclusion work. We encourage our local businesses to be involved in career exploration programs and mock interview events. The Lake Oswego Rotary, Kruse Way Rotary, and LO Chamber of Commerce are integral partners in the success of our school, along with other organizations.

School Goals

Our focus is on literacy and math fluency, with the aim of refining our instructional strategies and providing all students with the skills they need to be ready to succeed in college and careers. We strive to provide a welcoming environment and equitable opportunities for students of all races, genders, and home languages. We encourage you to contact us with any questions, concerns, or information that will help us ensure success for your students.

State Goals

The Oregon Department of Education is partnering with school districts and local communities to ensure a 90% on-time, four year graduation rate by 2027. To progress toward this goal, the state will prioritize efforts to improve attendance, provide a well-rounded education, invest in implementing culturally responsive practices, and promote continuous improvement to close opportunity and achievement gaps for historically and currently underserved students.

Safe & Welcoming Environment

We work hard to make our school a place where all students and families feel welcome and included. We celebrate our community's diversity and we honor this diversity in our learning activities. We understand how important it is to keep our students feeling safe, both physically and emotionally, when they are with us.

About Our School

ADVANCED COURSEWORK

Most high schools in Portland Public Schools offer Advanced Placement or International Baccalaureate courses in several subject areas. In addition, students have the option to earn college credit for some classes.

CAREER & TECHNICAL EDUCATION

District-wide we have 60 state-approved CTE programs of study. Career clusters include Architecture and Construction, Health Services, Information Technology, Manufacturing, and others. As part of these programs, we facilitate career learning experiences for students such as guest speakers, field trips, job shadows, etc. Visit our CTE web page for additional information: https://www.pps.net/Domain/190

EXTRACURRICULAR ACTIVITIES

Our school offers a variety of extracurricular activities. Check our website for details about specific activities.

PARENT & COMMUNITY ENGAGEMENT

Our school offers several meetings each year where we invite families to attend. The meetings are to discover what your children are learning at school, to see examples of their good work, and to learn ways that you can help them succeed at school. We will inform you of these school events and celebrations through our newsletters and other media. Please check our website for details about these events. We appreciate our community neighbors and want them to feel welcome to join us in supporting the success of our students.

METRO HOUSING BOND QUARTERLY REPORT | JULY-SEPTEMBER 2024

November 7, 2024

This is the third quarterly progress report for the Metro Affordable Housing Bond of 2024. Similar reports are produced quarterly with the goal of keeping the Housing Bond Community Oversight Committee, Metro Council, and other stakeholders and partners informed about ongoing implementation progress. A more detailed report will be provided annually for each calendar year, following submission of local progress reports by each participating implementation jurisdiction.

REGIONAL PRODUCTION PROGRESS

As of the end of September 2024, the Affordable Housing Bond program has 57 projects representing 4,671 new affordable homes in the portfolio, including 20 projects (1,373 units) that are in pre-construction. Forty-five projects have received final approval, of which fourteen (1,239 units) are under construction, and twenty-three projects (2,059 units) have completed construction and are accepting residents. Of these homes, 2,452 will have two or more bedrooms, representing 126% of the program's production goal of 1,950 family-sized homes; and 1669 will be affordable to households with incomes at or below 30% of area median income (AMI), representing 104% of the program's production goal of 1,600 deeply affordable homes. Collectively, the 57 projects in the portfolio represent 4,671 new affordable homes, or 120% of the total production target for the Housing Bond, while utilizing approximately 81% of allocated project funding.

Metro Affordable Housing Bond Program

Final Approval

Project Name: Wilsonville TOD
Implementing Jurisdiction: Housing Authority of Clackamas County
Metro IGA Contract Number: 936551
Anticipated construction start: July 2024
Anticipated construction completion: January 2026

Action:
Metro hereby provides the Housing Authority of Clackamas County (HACC) with Final Approval of $4,164,000.00 Metro Permanent Supportive Housing Pilot funds and $3,836,000.00 Metro Affordable Housing Bond funds for the development of Wilsonville TOD, a regulated affordable housing project located at 9699 SW Barber Street, Wilsonville. Metro staff findings are attached in Exhibit A, and a more detailed description of the Project, as provided by the Housing Authority of Clackamas County (HACC), is attached as Exhibit B.

This Final Approval is based upon the information contained in the final approval request provided to Metro by the Housing Authority of Clackamas County, including Project cost proformas and statements of sources and uses of funding needed to generate a Project with the following unit mix:

Number of Units	Bedroom type	AMI Level	Project Based/RLRA Vouchers	PSH Units
4	Studio	30%	4	4
16	One-bedroom	30%	16	16
21	One-bedroom	80%	0	0
13	Two-bedroom	30%	0	0
35	Two-bedroom	60%	0	0
19	Two-bedroom	80%	0	0
2	Three-bedroom	30%	0	0
8	Three-bedroom	60%	0	0
2	Three-bedroom	80%	0	0

Changes to the information contained in the final approval request provided by the Housing Authority of Clackamas County could result in reevaluation of the Project's need for Metro Affordable Housing Bond Funds and changes to the staff findings and funding allocation to

Metro

600 NE Grand Ave.
Portland, OR 97232-2736
oregonmetro.gov

the Project before funding disbursement. Disbursement of funds for the Project will be processed in accordance with the terms and conditions set forth in the Affordable Housing Bond Measure Program Intergovernmental Agreement between Metro and the Housing Authority of Clackamas County (HACC), and will occur within 10 days of Metro's receipt of the following items: a draft regulatory agreement meeting IGA requirements, a final sources and uses budget, a construction contract schedule of values, and an invoice from the Housing Authority of Clackamas County (HACC) including wiring or other instructions related to transfer of funds.

Andrew Scott
Deputy Chief Operating Officer

Date

Exhibit A: Metro staff findings and recommendations | Metro Affordable Housing Bond Final Approval request for Wilsonville TOD

Metro
600 NE Grand Ave.
Portland, OR 97232-2736

Drafted by: Jimmy Oporta, Senior Housing Bond Program Coordinator
and Alison Wicks, Housing Bond Program Supervisor
Date: July 15, 2024

Criteria for funding approval

Metro will issue Final approval to local implementation partner (LIP) upon Metro's determination that (a) the proposed Project reasonably contributes to the Unit Production Targets relative to the amount of the Eligible Share proposed to be used for the Project; and (b) the Project is consistent with the Local Implementation Strategy (LIS), the Work Plan, and the Bond Measure.

In addition, Metro will issue PSH Pilot Final approval upon Metro's determination that:
1) PSH Units produced by the PSH Pilot Project will serve Population A (as defined in the SHS IGA's) and utilize County coordinated access systems to serve the most vulnerable; 2) The proposed PSH Pilot Project maximizes PSH unit production as appropriate to the specifications of the site, PSH best practices, and population needs; 3) LIP has firmly committed to align ongoing County SHS funding for project-based rental assistance and wraparound services for the residents of the PSH Pilot Project; 4) For acquisition and rehab Projects to be occupied as a shelter on an interim basis during rehab, LIP must have a preliminary plan and capital funding to support the project's completion within 4 years of Final approval; 5) For all other PSH Pilot Projects, LIP must have a preliminary plan and capital funding to support the project's completion within 2 years of Final approval; 6) The Project is otherwise consistent with the LIP's Local Implementation Strategy the Work Plan and the Housing Bond Measure.

Staff recommendations

Staff recommends the Metro Chief Operating Officer (COO) provide Final approval of funding for Wilsonville TOD. Findings from Metro's staff review are summarized below. Additional information about the project can be found in Exhibit B, the project narrative submitted by the Housing Authority of Clackamas County (HACC).

Changes since Concept Endorsement

The project is being reviewed for Final Approval and has undergone changes since Concept Endorsement on October 23, 2023. Total project costs have increased to $58.86 million, up $2.06 million (3.6%) from the prior $56.8 million. The project's permanent loan has increased to $20 million, up $3.6 million (22%) from the prior $16.4 million. While the unit count (121 units) and number of family-sized units (79 units) is unchanged since concept endorsement, the unit affordability has changed. At concept endorsement, 40 units were affordable at 30% of AMI, 48 units were affordable at 60% of AMI, and 32 units were affordable at 80% of AMI. Now, at Final Approval, 35 units are affordable at 30% of AMI, 43 units are affordable at 60% of AMI, and 43 units are affordable at 80% of AMI. The project will also support 20 Permanent Supportive Housing (PSH) units. The Metro Housing Bond funding amount remains unchanged at $4,164,000 in Metro Permanent Supportive Housing Pilot funds and $3,836,000.00 Metro Affordable Housing Bond funds, for a total Metro funding award of $8,000,000.

- Total development costs are $58.86 million and Metro Housing Bond funding is $8,000,000.
- Net cash developer fee has been slightly reduced to 5.89% of developer fee basis. This amount is less than the Metro maximum of 6% for projects with 101 units or more.

- Construction start date in July 2024 with completion anticipated in January 2026.

Contribution to unit production targets

The Wilsonville TOD project requests $4,164,000.00 Metro Permanent Supportive Housing Pilot funds and $3,836,000.00 Metro Affordable Housing Bond funds. The project's combined funding will utilize 7% ($8,000,000) of HACC's total allocation of bond funds while delivering 120 units and 20 PSH units that meet the following unit production outcomes:

- 15% of HACC's overall unit production target;
- 11% of HACC's target of units affordable to households making 30% or less of area median income (AMI); and
- 20% of HACC's family sized unit target.

When combined with HACC's other pipeline projects, Wilsonville TOD puts the County on a path to have utilized 95% of HACC's total allocation of bond funds while delivering on the following cumulative unit production outcomes:

- 119% of HACC's overall unit production target;
- 121% of HACC's target of units affordable to households making 30% or less of area median income (AMI); and
- 139% of HACC's family sized unit target.

Eligibility and readiness to proceed

HACC has submitted and Metro staff have reviewed and evaluated submitted materials for evidence of project feasibility and readiness to proceed. These include:

- An executed memorandum of understanding between the City of Wilsonville and Palindrome Properties Group, LLC dated 5/31/2023 demonstrating evidence of site control
- Updated project pro forma dated 6/18/2024
- Development team resumes and developer schedule of real estate owned, demonstrating track record with affordable housing development in Oregon and nationally
- The site is appropriately zoned for the proposed design: Current zoning is Planned Development Industrial (PDI), which has no height or density restrictions and contemplates housing, commercial space, and other uses
- Permit set construction drawings by YBA Architects, dated 2/8/2024
- Phase 1 and Phase 2 Environmental Site Assessment reports, completed by Reynolds Engineering in March and April 2024, respectively
- Appraisal report completed by CBRE, dated 5/8/2024
- Letters of intent from CREA, LLC, Piper Sandler & Co., City of Wilsonville Grant, Clackamas County Health and Human Services Department
- Final HUD AFHMP (Affirmative Fair Housing Marketing Plan), dated 4/1/2024
- Final Community Engagement Outcomes report

Staff has not identified any unusual risks to project feasibility and readiness and will continue to request updates from the HACC regarding how work is proceeding. Given that this project is receiving Permanent Supportive Housing Pilot funds staff will provide technical assistance regarding permanent supportive housing services best practices as needed.

Advancing racial equity

Metro staff have reviewed final project materials to confirm consistency with the racial equity elements of the HACC's approved LIS. Key findings include:

- **Location:** The project is located at 9699 SW Barber Street in Wilsonville and within a half-mile are employers, natural areas and parks, and the City's planned I-5 Pedestrian Bridge connecting Wilsonville's west and east sides. Major commercial amenities are within a one-mile radius, including grocery stores, pharmacies, numerous restaurants, financial services, health, and personal care, and fitness. East of I-5, Wilsonville Town Center and its surrounding area offers Safeway, Wilsonville City Hall, Clackamas Community College and Wilsonville Community Center and Memorial Park. Current zoning is Planned Development Industrial (PDI), which has no height or density restrictions and contemplates housing, commercial space, and other uses.
- **Transit access:** The site is adjacent to the Wilsonville Transit Center, which provides connections to commuter rail and transfer to all SMART (South Metro Area Regional Transit) routes.
- **Diversity in contracting/hiring:** The project's General Contractor, PacifiCap Construction, seeks an aspirational goal of 35% MWESB participation for construction hard costs and an aspirational 30% goal for soft costs. Currently, when a subcontractor is needed, the COBID system is searched for vendors to be contacted for a proposal. At this time, the Wilsonville TOD project is utilizing four (4) COBID certified vendors for pre-development activities. COBID. COBID-firm selection and contract amounts will be verified upon construction completion, when the project submits its post-construction COBID participation report to Metro.
- **Access for historically marginalized communities:** Racial and ethnic minorities make up 26.8% of Wilsonville residents and 20.9% of Clackamas County residents. The proposed development is located at and will be integrated with Wilsonville's transit center, which provides easy connections to the commuter rail and quick transfer to all SMART transit routes. The geographic location of the proposed development would appeal to Communities of Color that rely on public transportation. Palindrome has partnered with Latino Network to provide referrals to the affordable housing community and provide culturally responsive programming. The property manager will periodically generate a summary statistics report to determine if targeted groups are showing interest in the property. If it is determined that the marketing has been unsuccessful in attracting underrepresented groups or those least likely to apply, new organizations will be identified to enhance outreach efforts and targeted messaging will be developed that speaks directly to the concerns and motivations of the target audience.
- **Culturally appropriate services:** Resident services will be provided by PacifiCap Management Inc. (PMI), in partnership with the Latino Network. A contract has been executed with Latino Network to provide outreach and culturally appropriate services to the Latino population at the project. Latino Network will provide programming to residents, along with case management. Case management will address housing barriers and include services such as budgeting/credit repair, referrals for mental health counseling and employment training. For additional details, see Latino Network's May 2024 Resident Services Plan document. Clackamas Women's Services (CWS) has been secured as the service provider for the PSH units. CWS will provide services for the PSH units and work with PMI for referrals and outreach through coordinated access for the project's 20 Permanent Supportive Housing (PSH) units. The wrap-around services from CWS are designed to support each household in achieving individualized goals centered on healing

from trauma, promoting well-being, and addressing the social determinants of health. For additional information regarding resident services and PSH services at the Wilsonville TOD project, please see HACC's Exhibit B Project Summary, under the "Partnership and Services" section.

- **Permanent Supportive Housing**: The 20 PSH units produced by the PSH Pilot Project funding will serve Population A (as defined in the SHS IGA's) and utilize Clackamas County's coordinated housing access (CHA) system to serve the community's most vulnerable residents. Clackamas County and the Housing Authority of Clackamas County are firmly committed to aligning ongoing Clackamas County SHS funding to provide project-based rental assistance and wraparound services to serve residents residing in these PSH units. Wilsonville TOD has a conditional award of 20 project-based Regional Long-Term Rental Assistance (RLRA) vouchers and up to $12,000 per unit per year for the provision of supportive services to support 20 units of Permanent Supportive Housing (PSH) with Supportive Housing Services (SHS) Funding. The term of the award will be through June 2031 and may be extended up to 20 years by mutual agreement if adequate resources are available.
- **Cooling plan:** The project will pursue an Earth Advantage sustainability certification and include a rooftop photovoltaic solar system to provide electricity for common areas. The project will also include enhanced insulation, high performance windows, LED lighting, energy star appliances and smart thermostats. Each residential unit will include through wall PTAC air-conditioning units, combined with ceiling fans in each bedroom. EV parking spaces will be provided on-site for residents and guests.

Community engagement to inform project implementation

Metro staff have reviewed the narrative to confirm consistency with the community engagement elements of HACC's approved Local Implementation Strategy (LIS). Key findings include:

- **Strategies for ensuring ongoing engagement around project implementation reaches communities of color and other historically marginalized community members:**

The development team convened focus groups and interviews during the summer of 2019. Online forums and surveys on Wilsonville's "Let's Talk Wilsonville" online public forum were offered from August 2019 to December 2019. Although this early engagement pre-dates the official Final approval review period, Palindrome continued community outreach in 2023 in partnership with Latino Network. This was done through engaging the targeted community on building and unit design features, supportive services, and culturally responsive programming. Engagement participants also completed project-specific surveys, where they shared their preferences for design features and services programming at the project. Two public meetings were held (October 18, 2023 and November 13, 2023) with a total attendance of 30 community members. Over half of the participants (53%) self-identified as BIPOC (Black, Indigenous and People of Color), with a large majority of BIPOC participants self-identifying as Hispanic, Latino or of Spanish origin.

Major themes gathered from community engagement included:

- Engagement participants were interested in paying affordable rent
- Resident services available for both children and adults
- Bilingual signage around the property, along with bilingual staff
- Services programming that includes cultural events for the community

- Security cameras and on-site security
- Ample lighting throughout the project at night
- Communal work and study spaces.

Major design feedback heard from community engagement included:

- Engagement participants expressed a preference for extra storage
- Addition of study rooms and tables in shared community space
- Free Wi-Fi and larger refrigerators in family-sized units
- Native plants and trees to help units stay cool in the summer
- Safe play areas and playgrounds for children
- Covered outdoor spaces, community gardens and flowers throughout the property
- Small dog park area for those with physical limitations

EXHIBIT B: Project summary submitted by Housing Authority of Clackamas County | Metro bond concept endorsement for Wilsonville TOD (WTOD)

Submitted by: Robert Gibson, Vice President
Palindrome Wilsonville Limited Partnership, rgibson@palindromecreates.com
Submitted on: 06/18/2024

The following narrative should be submitted at the concept endorsement stage and again at the final approval stage. As noted below, some items will be added to the report at the final approval stage.

Please do not change the formatting of margins, fonts, alignment or section titles ("project overview," "background"….)

Project Overview

Provide a general overview of the proposed project, including the requested amount of bond funding from Metro, the size of the site and its ownership status, any existing buildings and their current/past use, and high level financing structure for the project.

Palindrome Properties Group (Palindrome or PPG) was awarded the development rights to the Wilsonville Transit Oriented Development (WTOD) by the City of Wilsonville in response to a competitive Request for Qualifications (RFQ) in 2022. WTOD will be a mixed-use development with 121 affordable housing units over an active ground floor space. 100% of the housing units will be restricted to households earning 30% and 80% or less of area median income. The units will be a mix of studio, one, two and three-bedroom units.

The site is roughly 1.51 acres of vacant land owned by the City of Wilsonville adjacent to the Wilsonville Transit Station at 9749 SW Barber Street. The land will be deeded to Palindrome Wilsonville Limited Partnership at the close of financing. WTOD will be financed with tax exempt bond financing, 4% Low Income Housing Tax Credits (LIHTCs), energy tax credit equity, State grant funding for the Wilsonville SMART transit welcome center, a METRO transit-oriented development grant, and deferred development fees, as well as the $8,000,000 requested Metro gap funds. In order to complete this much needed development, the Wilsonville TOD project requests $8,000,000 in Affordable Housing Bond funding, of which $4,164,000.00 will be Metro Permanent Supportive Housing (PSH) Pilot funds and $3,836,000.00 from the Housing Authority of Clackamas County's eligible share of Metro Affordable Housing Bond funds.

Changes between Concept Endorsement and Final Approval (Final Approval only)

Summarize all changes to the project between concept endorsement and final approval and additional information provided in the report that was not previously included in the Concept Endorsement report. Specifically, please address how changes in total subsidy resulted in changes to the project that could impact sustainability, durability, climate resilience, and resident experience. If total subsidy increased, please describe whether a reduction in Metro bond funds is recommended and why or why not.

- Latino Network has been secured as the service provider for the residents; a Service Agreement and Resident Services Plan is provided.
- Clackamas Women's Services has been secured as the service provider for the PSH Units. A signed MOU will be provided prior to lease-up activities; a draft MOU is provided.

- Level Field Community Development Corporation has been contacted to become our non-profit partner, providing coordination of all service providers, so that we can provide the broadest possible services to our residents without overlap. Board approval is expected on May 15, 2023.
- The Metro TOD grant will be $250,000 (the maximum loan amount).
- The development will receive a partial SDC waiver. The SDC amount is reflected under the line item "Impact Fees/Tap Fees/Taxes/SDC" under the "Budget Uses" tab with the amount waived removed from this line item.
- The permanent lender has been finalized and the "Permanent First Loan, Hard Debt (Non-OAHTC)" amount now reflects the Piper Sandler LOI.
- The 45L and ITC equity amount has been updated based on expected subcontractor costs.
- The LIHTC equity line item has been updated based on selection of the LIHTC syndicator and changes to overall costs.
- "Construction Cost SOV" tab line items have been updated to reflect contractor and subcontractor updates. These changes do not reflect material changes in the project.
- Close of financing/construction start is scheduled for July 31, 2024.

Preliminary Development Program

Describe the planned development program including but not limited to number, size, and affordability of units; non-residential space, parking, and amenities; and total square footage.

The proposed building will be a single five-story elevator building with a landscaped plaza and a mix of on-site and shared parking on the adjacent Tri-Met parcel. In addition to providing affordable housing for 121 households, Palindrome proposes to activate the ground floor with community amenities, the SMART transit welcome center, Wilsonville Community Sharing food bank and a commercial space. For the commercial space, Palindrome proposes to create a coffee shop and craft beer tap room with a focus on commuters, area employees, and neighborhood residents within walking or biking distance.

Building amenities include on-site management offices, social service offices, parcel lockers, fitness room, multi-purpose community room, bike room and laundry room. The building will be fully accessible served by two elevators. Common areas will include complimentary Wi-Fi access.

Exterior amenities include, a children's playground, sports court, covered picnic tables, outdoor patio spaces and EV charging stations.

The total gross building square footage is 128,950 of which 5,830 is ground level commercial space.

Complete the below table summarizing unit breakdown. Add/delete rows as needed.

Unit size (no. of bedrooms)	*No. of units*	*AMI %*	*PSH*[1]	*PBVs*	*Square feet/unit*	*Gross monthly rent/unit*
Studio	4	30%	4	4	470	$619
1 BD/1 B	16	30%	16	16	630	$663
1 BD/1 B	21	80%			630	$1,770
2 BD/1 B	13	30%			870	$796
2 BD/1 B	35	60%			870	$1,593
2 BD/1 B	19	80%			870	$2,124
3 BD/2 B	2	30%			1125	$926
3 BD/2 B	8	60%			1125	$1,847
3 BD/2 B	2	80%			1125	$2,461
1 BD/1 B	1	MGR			630	MGR
Total	121		20	20		

Project Image

Provide a high resolution image in jpeg format (rendering is acceptable) of the project if available. If submitting final approval, please provide an updated image.

The project image is uploaded under separate cover (See WTOD - SD Renderings).

Background

Describe the process and timeline for how project was selected through a local funding process, and how the site was selected or acquired for affordable housing development. Provide an overview of due diligence and predevelopment completed to date.

The site was identified through the 2020 Wilsonville Equitable Housing Strategic Plan process. On March 18, 2020, the City of Wilsonville released an RFQ for the site. Palindrome responded to the RFQ on April 26, 2022. Subsequent Q&As and interviews were conducted, and Palindrome was ultimately awarded the development rights to the project on December 19, 2022. The City of Wilsonville and Palindrome are currently negotiating a Development and Disposition Agreement for the proposed project. Site due diligence, including a soil report, title review, *environmental* and survey, has been completed.

The site is appropriately zoned for the proposed design and Palindrome has received design review approval from the City design commission. Following design review approval, Palindrome completed design development drawings and construction pricing from the general contractor. In February 2024, Palindrome completed construction permit drawings and submitted for permit approval.

[1] Permanent supportive housing is housing that includes rental assistance and wraparound services, and is designated for households experiencing chronic homelessness and referred through coordinated access or local HUD Continuum of Care approved referral systems. PSH units include units with ongoing operating subsidy and services through Veterans Affairs Supportive Housing (VASH), Section 811 program for individuals with developmental disabilities, units with PSH funding from the state of Oregon, units supported through the Supportive Housing Services (SHS) program, and any other programs that provide ongoing funding to support housing stability for chronically homeless households.

Location and Neighborhood

[word limit: 100]

Describe the project location and surrounding zoning, land uses and activities. Describe any nearby services or community amenities, including schools or employment centers, grocery stores or farmer's markets, natural areas or parks. Describe walking distance and accessibility (e.g., sidewalks, signalized crossings) to nearby transit stations, and the existing/planned level and type of transit service (e.g., frequent service bus, MAX, etc.).

The project is located at 9749 SW Barber Street in Wilsonville and is adjacent to the Wilsonville Transit Center, which provides connections to commuter rail and transfer to all SMART routes. Current zoning is Planned Development Industrial (PDI), which has no height or density restrictions and contemplates housing, commercial space, and other uses via reference to the PDC and PDR zones. No rezoning is required.

Within a half-mile are employers, natural areas and parks, and the City's planned I-5 Pedestrian Bridge connecting Wilsonville's west and east sides. Major commercial amenities are within a one-mile radius, including grocery, pharmacy, numerous restaurants, financial services, health, and personal care, and fitness. East of I-5, Wilsonville Town Center and its surrounding area offers Safeway, Wilsonville City Hall, Clackamas Community College and Wilsonville Community Center and Memorial Park (see Amenities Table & Map provided at Concept Endorsement).

Provide an aerial map with key transit and amenity features labeled, along with the site location.

The aerial map is uploaded under separate cover (see Amenities Table & Map).

Site

[word limit: 300]

Describe key elements of the site including size, number of tax lots, site control/ownership, appraisal, and zoning. If the site includes existing buildings, provide an overview of the year they were built, past/current use, and future plans as part of the project.

Owner: City of Wilsonville
Primary Address: 9749 SW Barber St, Wilsonville, 97070
Estimated Acres: 3.45
Zoning: PDI
Jurisdiction: Wilsonville
Map Number: 31W14B
Taxlot Number: 31W14B 00703
Parcel Number: 05020822
Census Tract: 022707
Landclass: 300 (https://www.ci.wilsonville.or.us)
Current Year Assessed Value: $436,117.00
Market Building Value: $0.00 (No buildings onsite)
Market Land Value: $730,515.00

The total land area is 3.45 acres, so the lot will need to be subdivided, carving out the housing portion of 1.51 acres. There are no existing buildings on-site.

The site is zoned Planned Development Industrial which allows for the proposed mixed-use project as proposed.

<u>Final approval only:</u> Describe key findings from the Phase 1 environmental assessment and geotechnical report, and any follow up studies underway.

The Phase I Environmental Assessment dated 06/07/2024 shows no recognized environmental conditions.

<u>Building rehabilitation only:</u> Describe the findings from your capital needs assessment and anticipated repair needs. Describe hazardous materials assessments and planned abatement needs. Describe seismic risk assessment findings and related investment needs.

This section is not applicable.

Project Financing

Describe the estimated total development cost and total public subsidy, cost and subsidy per unit, and cost and subsidy per bedroom. Provide a table summarizing planned sources and uses of funding. Summarize funding contributions and any local incentives or policies benefiting the project (e.g., SDC waiver, property tax abatement, density bonus, reduced parking requirements, etc.).

Summarize the total developer fee and net cash developer fee and summarize how the following considerations informed the determination of the fee within the ranges specified by Metro's Developer Fee Guidelines: project complexity and risk (e.g. PSH units), developer organizational size and financial capacity, participation of small/emerging community based and culturally specific organizations in development, and exceptional track record or outcomes for serving communities of color. To receive a fee at the upper end of the fee limits projects should demonstrate alignment with multiple considerations. See Metro Developer Fee Guidelines for additional information.

Summarize ongoing funding sources for rental assistance and services, including total, and total per unit.

The estimated total development cost, excluding the commercial component, is $57,739,880 equating to $477,189 per unit and $274,951 per bedroom. The total requested Metro bond gap funds is $8,000,000 equating to $66,115 per unit and $38,095 per bedroom.

The sources and uses are included in the OHCS 4% NOFA application form submitted as part of the concept endorsement summary.

In addition to the land contribution, the City of Wilsonville is providing a $2,000,000 transit grant to support the Smart welcome center at the project and SDC waivers (see Section 4.1.3 of the provided DDA with the City of Wilsonville for specifics on the transit grant).. The project is benefiting from a shared parking agreement with Tri-met on the adjacent transit center park and ride parking lot. As part of the project's environmental sustainability measures, the proforma included energy tax credit equity from the photovoltaic solar credits. A letter of intent from the City for $1.9M is provided. The

The total developer fee is $7,106,011 of which $3 million is the net cash developer fee, which is below the maximum as outlined by "Exhibit G: Regional Guidelines for Cash Developer Fee" and is within the new construction range of 2% to 6%. The cash fee is justified as the project includes complexity and risk due to the integration of the development into the Wilsonville Transit Center, the mix of uses, and the number of proposed permanent supportive housing units. Further, Palindrome plans to partner with Latino Network to successfully engage and serve BIPOC communities through outreach and culturally responsive programming.

The initial total annual residential operating expenses are $675,872 or $5,585 per unit.

The 20 PSH units produced by the PSH Pilot Project funding will serve Population A (as defined in the SHS IGA's) and utilize Clackamas County's coordinated housing access (CHA) system to serve the community's most vulnerable residents. Clackamas County and the Housing Authority of Clackamas County are firmly committed to aligning ongoing Clackamas County SHS funding to provide project-based rental assistance and wraparound services to serve residents residing in these PSH units.

Wilsonville TOD has a conditional award of 20 project-based Regional Long-Term Rental Assistance (RLRA) vouchers and up to $12,000 per unit per year for the provision of supportive services to support 20 units of Permanent Supportive Housing (PSH) with Supportive Housing Services (SHS) Funding. The term of the award will be through June 2031 and may be extended up to 20 years by mutual agreement if adequate resources are available. The conditional award is provided.

Development Team

Describe the development team including the developer, general contractor, architect, and other key partners, and their relevant experience, respectively. If some members of the team are not yet selected as of the concept endorsement, this information can be added at the final approval step.

Developer:

Palindrome Properties Group

Palindrome has been a developer of affordable housing throughout the American West since 1999. Through its subsidiaries PacifiCap Construction and PacifiCap Management, it also builds and manages the affordable housing communities it develops. SOMOS Destinations, its hospitality subsidiary, owns and operates hotels, restaurants, breweries and tap rooms, while also managing the operations of dozens of micro-retail and food pod tenants.

Partnerships are essential to Palindrome's delivery of high-quality affordable housing. Palindrome has worked extensively with nonprofit partners, and city, state, and federal agencies, to produce a majority of its housing, retail and hospitality developments. Palindrome's real estate portfolio includes stabilized rental and mixed-use communities located in urban and suburban markets in Oregon, Washington, Colorado, Nevada, New Mexico and Arizona. Palindrome's approach to real estate investment focuses on initial success, as well as long-term feasibility. In its 25-year history, Palindrome has developed over 8,600 housing units, including 7,758 affordable units, and 389,000 square feet of commercial space.

General Contractor:

PacifiCap Construction

With over 20 years of general contracting experience, PacifiCap has become an expert in the niche of constructing affordable housing, with particular experience in public-private partnerships. The company employs highly experienced, technically qualified project managers and job superintendents who personally oversee and direct all aspects of every project. PacifiCap works with a team of loyal and reliable subcontractors who have had relationships with the company for many years.

Architect:
YBA Architects
YBA Architects is a full-service architecture, planning and interior design practice based in Portland, Oregon and engaged in projects worldwide. We forge enduring relationships with clients who share our passion for excellence, quality, and willingness to explore new approaches to craft vibrant places that delight, return exceptional value to investors, and can adapt well to change.

Community Engagement

Please summarize community engagement to inform project outcomes to support the needs of future residents. This could include engagement conducted previously by the LIP or developer to shape the goals of a NOFA or vision for a project. It could also include plans for further engagement to inform the design or programming of the project to meet the needs of historically marginalized community members.

As part of the Equitable Housing Plan process, the team conducted stakeholder and public engagement to understand housing challenges and possible solutions. The team conducted a process that included:

- One-on-one interviews with ten key stakeholders. Participants included community-based organizations, real estate professionals, and many others. Some of these organizations currently address the needs of underrepresented groups in Wilsonville.
- A survey of 15 community members who rent units in existing subsidized buildings.
- An online survey on Let's Talk, Wilsonville! with 80 participants.
- Three focus groups with nonprofit affordable housing developers, local employers, and community-based organizations that serve Wilsonville residents, including underrepresented populations.
- A kiosk at the Wilsonville Public Library that featured an interactive poll available in English and Spanish that was available during December 2019.
- A survey of employers with nine responses that indicated workforce housing costs were a concern.

Palindrome continued community outreach in 2023 in partnership with Latino Network engaging with the targeted community on building and unit design features and supportive services and culturally responsive programming. Two public meetings were held (October 18, 2023 and November 13, 2023) with a total attendance of 30 community members. Meeting forms provided.

Note: Outreach strategies for affirmative marketing and COBID participation should be described in the following section under "advancing racial equity." This section is focused on engagement to inform the goals, vision, design, or programming of the project.

Advancing Racial Equity

Summarize how the project will address strategies and policies for advancing racial equity, as described in your local implementation plan. Be sure to include:

- *How the project location reflects considerations related to racial equity (e.g., geographic distribution of affordable housing, access to opportunity, strategies to address racial segregation, and strategies to prevent displacement and stabilize communities)*
- *Fair housing strategies to eliminate barriers to housing access for communities of color and other historically marginalized groups (e.g., fair housing marketing strategies, community partnerships, low barrier screening, etc.)*
- *Strategies to include economic opportunities for people of color (e.g., MWESB/COBID participation and workforce diversity)*

Racial Equity: Racial and ethnic minorities make up 26.8% of Wilsonville residents and 20.9% of Clackamas County residents. The proposed development is located at and will be integrated with Wilsonville's transit center, which provides easy connections to the commuter rail and quick transfer to all SMART routes. According to the Pew Research Center, 23% of Black adults and 15% of Hispanic adults say they take public transportation on a daily, almost daily or weekly basis. Comparatively, this figure is 7% for White adults.[2] The geographic location of the proposed development would appeal to Communities of Color that rely on public transportation. Palindrome has a signed Service Agreement with Latino Network, including a Resident Services Plan which will provide referrals to the affordable housing community and culturally responsive programming. Please see the Partnerships and Services section for additional information.

Fair Housing: Palindrome's aim is to ensure all residents receive and maintain the basic human right of an affordable, high-quality home, along with support to maximize their probability of achieving stability and success. The property manager will periodically generate a summary statistics report to determine if targeted groups are showing interest in the property. If it is determined that the marketing has been unsuccessful in attracting underrepresented groups or those least likely to apply, new organizations will be identified to enhance outreach efforts and targeted messaging will be developed that speaks directly to the concerns and motivations of the target audience. This could involve highlighting the benefits of the community, addressing common misconceptions, and using language and imagery that resonates with those least likely to apply. At this point, a variety of outreach methods that go beyond traditional advertising and marketing channels may be used to reach these populations. This could include community events, partnerships with local organizations, targeted social media campaigns, and word-of-mouth referrals.

Economic Opportunities for People of Color: When a subcontractor is needed, the COBID system is searched to see if there is a compatible vendor that can be contacted for a proposal. Currently, the following COBID certified vendors are under contract and being utilized for pre-development activities:

RQ4D (Surveying) ESB and SDVBE Oregon Cert ID 12264
Emerio Design, LLC (Civil Engineering) DBE and MBE Oregon Cert ID 5611
Shaprio Didway LLC (Landscape Design) ESB Oregon Cert ID 10705
M.Thrailkill.architect LLC (Specifications) ESB Oregon Cert ID 9859
Valar (Structural Engineering) ESB and MBE Oregon Cert ID 9771

While Wilsonville TOD will utilize as many apprentices, women and people of color as possible, these statistics will not be tracked.

[2] https://www.pewresearch.org/short-reads/2016/04/07/who-relies-on-public-transit-in-the-u-s/

Wilsonville TOD has the following equitable contract goals for construction:
Hard Costs 35%
Soft Costs 30%

Partnerships and Services

Provide information about plans and partnerships for ongoing operations, including property management partner(s) or service providers. Describe strategies for aligning culturally specific programming or services to meet the needs of future residents. If your project includes PSH units, please describe if these will use coordinated access process, or another referral process.' Confirm that project will serve Population A – include definition.

PacifiCap Management Inc. (PMI) is a professional management company with 25 years of experience managing affordable multifamily housing communities. PMI uses a comprehensive strategy aimed at ensuring the efficient operation and maintenance of the property while fostering a vibrant community environment. PMI will provide a property management plan which encompasses various aspects including leasing and resident relations, financial management, maintenance and repairs, amenities management, and emergency preparedness. The plan will prioritize resident satisfaction through responsive communication channels, timely resolution of maintenance issues, and the provision of high-quality amenities and services.

Referrals into the apartment community will come from Clackamas Women's Services (CMS, through the Clackamas County's Coordinated Housing Access system) and Latino Network (LN). Palindrome Wilsonville Limited Partnership (Palindrome) through their affiliated management agent PacifiCap Management Inc. (PMI) will accept all referrals from RLRA referral partners and the coordinated access system and notify partners immediately when units are available or when management knows a PSH unit will become available in the future. Additionally, PMI will:

- Reduce screening barriers and/or accept applicants who have been pre-approved
- Limit application fees and security deposits to a reasonable limit
- Notify service partners when issues arise and work collaboratively to prevent damages or eviction
- Promote housing access and inclusion, and follow specific non-discrimination and anti-racism guidelines

PMI will work closely with both Clackamas Women's Services and Latino Network for referrals and resident services, based on their signed MOUs.

Case management services will be provided by Clackamas Women's Services onsite to the 20 PSH households supported by the voucher program. The Wrap-around services from Clackamas Women's Services are designed to support each household in achieving individualized goals centered on healing from trauma, promoting well-being, and addressing the social determinants of health. All Case Managers are state certified in domestic violence advocacy. CWS services work to enhance safety, mitigate isolation, and promote self-determination with individualized services. All services are voluntary and in the language of their choice, so participants are able to choose services that meet their needs and goals. Clackamas Women's Servies will provide trauma-informed and culturally responsive wrap-around services such as mental health counseling (individual and family), parenting support groups, art-based therapy, mentoring, legal representation, and health services recognizes that simply increasing one's income does not address the many root causes of homelessness, community harm, and interpersonal violence. They also include community connection activities and wellness programming in their wrap-around services to support

incorporating well-being into individualized service plans and to mitigate the harm caused by the isolation of domestic and sexual violence. Please see draft MOU attached.

Latino Network has identified several broad categories of services and opportunities that will benefit residents including:

- Health & Wellness Education
- Financial Education
- Legal Planning & Services
- Arts & Culture Activities

Latino Network will provide programming to building residents, and case management services to qualifying families through available programs as capacity permits. Case management will address identified housing barriers, including but not limited to, budgeting/credit repair, referrals for mental health counseling, housing, education, employment/training workshops, and parenting.

The goal of the Latino Network is to provide services from within these categories to residents on a monthly basis. Each month, the Latino Network will offer an opportunity from one of these service areas to residents, provided by the Latino Network directly or through an area community provider.

On-site activities and workshops will take place monthly in community spaces and will be advertised in advance. Additionally, an informative and practical schedule of free and low cost community events and activities will be posted in common areas for residents on a monthly basis. Events will be culturally specific, family friendly, low-cost or free and easily accessible within the neighborhood.

Additionally, Latino Network's staff will notify Property Management staff if any resident makes known issues that would affect the resident's ability to maintain housing. Latino Network will work with the resident/household to attempt to remedy the situation to maintain their housing. Finally, Latino Network will share with their clients the affordable housing opportunity at the Wilsonville development.

Livability and Accessibility

Please highlight design elements that enhance livability and accessibility (e.g. shared Wi-Fi, common spaces, universal design)

Starting with site grading and landscape design, the proposed project has been designed to maximize accessibility for residents and guests. The building is secure with an access control system with guest intercom. The main entry doors have push button controls to automatically open. The ground level entry and hallways are open and wide to eliminate obstacles for move in. The management office and common spaces are all located on the ground level with windows for visibility to enhance security. Common areas will include complimentary Wi-Fi access.

All units in the community are fully accessible and served by two elevators. Kitchens, bathrooms, and closets have been designed to maximize functionality and accessibility.

There are several outdoor spaces with covered seating areas to encourage residents to enjoy the outside environment.

Climate Resilience and Sustainability

Please describe the project's cooling plan to keep residents safe in extreme heat events, take into consideration Metro's Policy Statement of Air Conditioning (Sept. 14, 2021) for expectations related to cooling strategies. Include type of air conditioning system and cost. Including reasons why the type of air conditioning system was selected including sustainability, durability, expense, and feasibility given project constraints.

Please highlight sustainability certifications, elements and/or green building features for this project.

Each residential unit will include through wall PTAC air conditioning combined with ceiling fans in each bedroom. The common areas of the building will be serviced by roof-top condensers.

The project will pursue an Earth Advantage sustainability certification. Sustainability features include a rooftop photovoltaic solar system to provide for common area electric. Enhanced insulation and high-performance windows, LED lighting, energy star appliances and smart thermostats will provide energy efficient units for residents. The landscape design uses native water smart plants, and the units include low-flow water fixtures.

EV parking spaces will be provided on-site for residents and guests.

Anticipated Timeline

Describe the anticipated timeline and milestones for the project, including developer or contractor selection, concept endorsement, due diligence, final approval, closing, construction, and lease up – as well as any timelines related to community or elected body engagement.

The development team, including general contractor, design team, and property management, has been selected. The site due diligence, schematic design, and the City pre-application meeting has been completed.

The following timeline outlines the remaining key milestone to be completed:

Concept Endorsement	August, 2023
Community Outreach	September, 2023
Design Review Approval	November, 2023
Development & Disposition Agreement	May, 2024
Building Permit Application	February, 2024
Final Approval	August, 2024
Closing	July, 2024
Construction Completion	January, 2026
Initial Lease Up	January, 2026
Stabilization	June, 2026

600 NE Grand Ave.
Portland, OR 97232-2736
oregonmetro.gov

Metro Affordable Housing Bond Program

Final Approval

Project Name: Shortstack Milwaukie
Implementing Jurisdiction: Housing Authority of Clackamas County
Metro IGA Contract Number: 936551
Date of Concept Endorsement: November 15, 2023
Anticipated construction start: August 2024
Anticipated construction completion: July 2025

Action:
Metro hereby provides the Housing Authority of Clackamas County (HACC) with Final Approval of $700,000.00 in Metro Affordable Housing Bond funds for the development of Shortstack Milwaukie, a regulated affordable homeownership project located at 3736 SE Harvey Street, Milwaukie. Metro staff findings are attached in Exhibit A, and a more detailed description of the Project, as provided by the Housing Authority of Clackamas County (HACC), is attached as Exhibit B.

This Final Approval is based upon the information contained in the final approval request provided to Metro by the Housing Authority of Clackamas County, including Project cost proformas and statements of sources and uses of funding needed to generate a Project with the following unit mix:

Number of Units	Bedroom Type	AMI Level
15	Two-bedroom	80%

Changes to the information contained in the final approval request provided by the Housing Authority of Clackamas County could result in reevaluation of the Project's need for Metro Affordable Housing Bond Funds and changes to the staff findings and funding allocation to the Project before funding disbursement. Disbursement of funds for the Project will be processed in accordance with the terms and conditions set forth in the Affordable Housing Bond Measure Program Intergovernmental Agreement between Metro and Housing Authority of Clackamas County, and will occur within 10 days of Metro's receipt of the following items: a draft regulatory agreement meeting IGA requirements, a final sources and uses budget, a construction contract schedule of values, and an invoice from the Housing Authority of Clackamas County including wiring or other instructions related to transfer of funds.

Andrew Scott
Deputy Chief Operating Officer

July 15, 2024
Date

Exhibit A: Metro staff findings and recommendations | Metro Affordable Housing Bond Final Approval request for Shortstack Milwaukie

Metro
600 NE Grand Ave.
Portland, OR 97232-2736

Drafted by: Jimmy Oporta, Senior Housing Bond Program Coordinator
and Alison Wicks, Housing Bond Program Supervisor
Date: July 15, 2024

Criteria for funding approval

Metro will issue Final Approval to local implementation partner (LIP) upon Metro's determination that (a) the proposed Project reasonably contributes to the Unit Production Targets relative to the amount of the Eligible Share proposed to be used for the Project; and (b) the Project is consistent with the Local Implementation Strategy (LIS), the Work Plan, and the Bond Measure.

Staff recommendations

Staff recommends the Metro Chief Operating Officer (COO) provide Final Approval of funding for Shortstack Milwaukie. Findings from Metro's staff review are summarized below. Additional information about the project can be found in Exhibit B, the project narrative submitted by the Housing Authority of Clackamas County (HACC).

Changes since Concept Endorsement

The project is being reviewed for Final Approval and has undergone changes since Concept Endorsement on November 15, 2023. Project development costs have increased by 1% ($74.7K) and the construction loan has increased by the same amount. The Metro Housing Bond funding amount remains unchanged at $700,000.

- Total development costs are $7.62 million and Metro Housing Bond funding is $700,000.
- Net cash developer fee is 9.55% of developer fee basis. This amount is less than the Metro maximum of 14% for projects with 1 – 30 units.
- Construction start date in August 2024 with completion anticipated in July 2025.

Contribution to unit production targets

Shortstack Milwaukie will utilize 1% ($700,000) of HACC's total allocation of bond funds while delivering 15 homeownership units that meet the following unit production outcomes:

- 2% of HACC's overall unit production target;
- 4% of HACC's family sized unit target.

When combined with HACC's other pipeline projects, Shorstack Milwaukie puts the County on a path to have utilized 91% of HACC's total allocation of bond funds while delivering on the following cumulative unit production outcomes:

- 119% of HACC's overall unit production target;
- 139% of HACC's family sized unit target.

Eligibility and readiness to proceed

HACC has submitted and Metro staff have reviewed and evaluated submitted materials for evidence of project feasibility and readiness to proceed. These include:

- Purchase and sale agreement, dated 2/19/2023, demonstrating evidence of site control
- Updated project pro forma dated 5/18/2024
- Permit set drawings by Works Progress Architecture, date 2/29/2024
- Appraisal report by BBG Real Estate Services, dated 4/9/2024
- Phase I Environmental Site Assessment report by GeoPacific, dated 4/24/2023.
- Letters of intent from Craft3, City of Milwaukie CET Grant, USDA Forest Service – Wood Innovation Grant, OHCS LIFT Award Letter
- Development team resumes and developer schedule of real estate owned, demonstrating track record with affordable housing development in Oregon and nationally
- City of Milwaukie, Local Government Verification with Zoning and Land Use Regulations, dated 1/11/2023

Staff has identified this project as an affordable homeownership pilot project. Legal compliance of regulatory agreement and monitoring plan will need to be confirmed prior to funding disbursement and staff will continue to request updates from the Housing Authority of Clackamas County regarding how work is proceeding.

Advancing racial equity

Metro staff have reviewed final project materials to confirm consistency with the racial equity elements of the HACC's approved LIS. Key findings include:

- **Location:** The location in the Ardenwald neighborhood of Milwaukie was selected based on its ideal neighborhood location for affordable cottage homes. The neighborhood is well-connected to Milwaukie's thriving downtown commercial center, good schools, and major employers. The site is within walking distance to Providence Hospital, Safeway, Ardenwald Elementary School, Downtown Milwaukie, and many other public amenities. Water Tower Park is a block away and the larger Minthorn North Natural Area is ½ mile. The site is less than a ½ mile from SE 82nd Avenue commercial corridor.
- **Transit access:** The site is within ½ mile of the MAX yellow line, and less than ¼ mile from several tri-met bus lines (the nearest stop is only a block away).
- **Diversity in contracting/hiring:** The development team seeks an aspirational goal of 30% MWESB participation throughout the development and construction process of this project. The development team is in the process of finalizing a replacement bid from Owen Gabbert, LLC., the project's new General Contractor.
- **Access for historically marginalized communities:** Proud Ground recognizes inequitable access to homeownership has kept households of color, many of which are first-generation and first-time homebuyers, from building wealth and accessing high-quality neighborhood services, such as education and employment. For this reason, Proud Ground focuses its outreach on these groups, in particular historically marginalized communities with children and with limited English proficiency through marketing strategies and internal policies that break down barriers of accessing homeownership opportunities. In 2022, Proud Ground collaborated with Univision PDX for an Outreach campaign targeting the Spanish-speaking population, and Proud Ground services were highlighted in the Spanish show Elemento Latino (an independent television program that produces educational, social, and cultural programs related to Latino needs and issues). Proud Ground also began a partnership with Pueblo Unido PDX; Pueblo Unido is the Collective of Indigenous Interpreters of Oregon (CIIO), a group of interpreters of indigenous languages from Mexico, Central America, and South America that address barriers to legal and social services for indigenous language

speakers in Oregon. Pueblo Unido will be working in partnership with Proud Ground to conduct ongoing Information sessions in the top 10 indigenous languages from Mesoamerica that are spoken in this region. The Proud Ground waitlist policy, which has been approved by Fair Housing of Oregon, prioritizes larger households with children or households of 3 or more. Through targeted outreach to the BIPOC community, Proud Ground anticipates that most of the homes (75%) will be purchased by households identifying as BIPOC. 77% of Proud Ground homebuyers since 2021 identify as BIPOC households.

- **Culturally appropriate services:** Proud Ground will conduct regular information sessions to inform the public of homeownership opportunities and requirements. Once selected through the official waiting list, homebuyers gain access to Proud Ground's Homeownership Education and Counseling programs, which helps first-time homebuyers become mortgage ready. Proud Ground then administers down-payment assistance funds as buyers complete the purchasing process. In 2022, Proud Ground hired a Stewardship Manager to expand education, services and support to Proud Ground homeowners. Proud Ground offers post purchase education in a one-on-one and group format (in-person and virtual). A minimum of eight workshops are offered each year (4 in English and 4 in Spanish). Topics include: Estate Planning, Home Maintenance/Repair, Solar Panels, Budgeting, Insurance, Planning for Retirement, and more. Workshop partners include Solar for All, SparksNW, Financial Beginnings, Rebuilding Center, and Habitat for Humanity Portland Region.
- **Cooling Plan:** The all-electric homes will be designed to standards that exceed the energy efficiency requirements set forth by the City of Milwaukie building code. Heating and cooling for the homes will be provided by heat pump systems. The project will emphasize resiliency through integrated on-site stormwater management and a palate of native, naturally occurring plants and trees.

Community engagement to inform project implementation

Metro staff have reviewed the narrative to confirm consistency with the community engagement elements of HACC's approved Local Implementation Strategy (LIS). Key findings include:

- **Strategies for ensuring ongoing engagement around project implementation reaches communities of color and other historically marginalized community members:**

Community outreach will be used to drive income-qualified, first-time homebuyers to Proud Ground's information sessions to learn more about homeownership opportunities. Information sessions will be offered virtually and in person and include outreach materials, program application forms and program contracts in English and Spanish, as well as other languages upon request. If non-English speakers require a translator to proceed with the home buying process, Proud Ground will help cover that expense at no cost to the buyer. Organizationally, Proud Ground solicits and engages the community served, in developing solutions and improving services offered. This is supported by the organization by-laws which require 1/3 of Proud Ground's board directors to be current Proud Ground homeowners. All Proud Ground homeowners are voting members of Proud Ground's membership-based Community Land Trust (CLT) and have a voice in key decisions, including by-law changes.

Proud Ground partners with many culturally specific homeownership agencies in the Metro region, including: Bienestar, Hacienda CDC, NAYA, PCRI, OHDC, Pueblo Unido, IRCO, Univision PDS, VERDE, Rose CDC, Human Solutions and Centro Cultural. For Shortstack Milwaukie, Proud Ground intends to reach out to each agency offering advanced notice of the home purchase

opportunity before the homes are listed on the market, and to inquire if the agencies have an active presence in Milwaukie (or Clackamas County) or wish to expand their outreach into this area if they don't currently. Proud Ground will collaborate on outreach and info sessions with those partners that respond to the inquiry and who want to offer the homeownership opportunities to their service base.

Shortstack Milwaukie

Project Narrative
May 17, 2024

Project Overview

Provide a general overview of the proposed project, including the requested amount of bond funding from Metro, the size of the site and its ownership status, any existing buildings and their current/past use, and high level financing structure for the project.

The Shortstack Milwaukie project will deliver an innovative, replicable homeownership solution, led by a diverse team of industry experts. The project delivers 15 affordable homes in Milwaukie, through smart densification at the "missing middle" / "cottage cluster" scale. The project leverages recent up-zoning for middle housing neighborhoods and is located near amenities that working families need to thrive.

The project design for two-story, two-bedroom cottages was determined to be a compact, efficient design for cost purposes while providing a modern open ground floor plan concept that is desirable and marketable for home buyers. The units are intended to serve a mix of small families, couples, and individuals – all of whom are continuants in need of more affordable home buying options.

The Shortstack development concept is a direct response to housing legislation passed recently in Oregon, including House Bill 2001 (2019); the City of Portland's Better Housing by Design (2020) and Residential Infill Project (2021); and the City of Milwaukie's Middle Housing Zoning Code Update (2022). The policies address the State's desperate need for affordable housing options by creating opportunities to increase residential density for infill sites. This project also responds to affordable housing needs detailed in Governor Kotek's Executive Order No. 23-04 which calls for production of 36,000 housing units per year.

Thanks to partnership between Shortstack Developers Jessy Ledesma of HomeWork Development and Anna Mackay of Sister City, and Proud Ground, Oregon's largest non-profit Community Land Trust, homes at Shortstack Milwaukie will be priced for households earning up to 80% AMI.

Shortstack Milwaukie requests $700,000 from Metro to fill the financing gap for 15 affordable homeownership cottages to be built at 3736 SE Harvey Street, Milwaukie, OR.

Preliminary Development Program

Describe the planned development program including but not limited to number, size, and affordability of units; non-residential space, parking, and amenities; and total square footage.

Complete the below table summarizing unit breakdown. Add/delete rows as needed.

Unit size (no. of bedrooms)	No. of units	AMI %	Square feet/unit	2025 Sale Price
2 bed, 1.5 bath	*15*	*80%*	*960sf*	*$245,000-250,000*

Project Image

Provide a high resolution image in jpeg format (rendering is acceptable) of the project if available. If submitting final approval, please provide an updated image.

Background

Describe the process and timeline for how project was selected through a local funding process, and how the site was selected or acquired for affordable housing development. Provide an overview of due diligence and predevelopment completed to date.

Shortstack Milwaukie was selected for competitive funding processes as follows:

- May 2022: USDA Wood Innovation Grant
- December 2022: City of Milwaukie CET Grant
- May 2023: OHCS LIFT + LIFT Subsidy Award

Due diligence and predevelopment completed to date:

- Site due diligence: survey, Phase I environmental, Geotech report, land appraisal
- Architectural Plans: 95% Construction Documents
- Planning/Zoning entitlements: under review with the City of Milwaukie for building permits
- Contractor bid provide by Truebeck Construction
- Construction loan Letter of Interest provided by Craft3 (currently underwriting)

Location and Neighborhood

[word limit: 100]

Describe the project location and surrounding zoning, land uses and activities. Describe any nearby services or community amenities, including schools or employment centers, grocery stores or farmer's markets, natural areas or parks. Describe walking distance and accessibility (e.g., sidewalks, signalized crossings) to nearby transit stations, and the existing/planned level and type of transit service (e.g., frequent service bus, MAX, etc.).

The location in the Ardenwald neighborhood of Milwaukie was selected based on its ideal neighborhood location for affordable cottage homes. The neighborhood is well-connected to Milwaukie's thriving downtown commercial center, good schools and major employers.

The site is within ½ mile of the MAX yellow line, and less than ¼ mile from several tri-met bus lines (nearest stop is only a block away) and within walking distance to Providence Hospital, Safeway, Ardenwald Elementary School, Downtown Milwaukie, and many other public amenities. Water Tower Park is a block away and the larger Mintorn North Natural Area is ½ mile. The site is less than a ½ mile from SE 82nd Avenue commercial corridor.

Site

[word limit: 300]

Describe key elements of the site including size, number of tax lots, site control/ownership, appraisal, and zoning. If the site includes existing buildings, provide an overview of the year they were built, past/current use, and future plans as part of the project.

<u>Final approval only:</u> Describe key findings from the Phase 1 environmental assessment and geotechnical report, and any follow up studies underway.

<u>Building rehabilitation only:</u> Describe the findings from your capital needs assessment and anticipated repair needs. Describe hazardous materials assessments and planned abatement needs. Describe seismic risk assessment findings and related investment needs.

The site (3736 SE Harvey Street, Milwaukie, OR) is a 24,300 sf site on a single tax lot (Tax ID: 11E25DD02700). It is zoned R-MD; a Moderate Density Residential Zone.

There is an existing single-family home on the site (built 1940) which is scheduled for demolition. The existing tenant was given notice to vacate 60 days prior to land sale.

GeoPacific conducted an Environmental Phase 1 dated April 24, 2023 (reviewed by Craft3's environmental consultant May 2024 concluding the same). Their pertinent summarized findings are:

1. No surface water or drainages were observed at the site.
2. Site reconnaissance did not reveal the obvious presence of any environmental hazardous material contamination sources on the site, including soil staining or distressed vegetation except for the above ground heating oil tank on the east side of the residence. No signs of spill or leaks were observed in the vicinity of the above ground heating oil tank on the east side of the residence.

3. Available hydrogeologic literature suggests that the near surface groundwater table is likely between 80 and 120 feet below the ground surface at the lower elevations of the site.
4. The target property was not listed in any of the databases searched by EDR or GeoPacific.

Their conclusions and recommendations are as follows: GeoPacific has performed this Phase I environmental site assessment in general conformance with the scope and limitations of ASTM Standard E1527-13. The assessment did not reveal evidence of recognized environmental conditions (RECs) in connection with the property; no additional environmental investigation is necessary for this site.

A geotechnical engineering report was prepared by GeoPacific on May 3, 2023. Their site investigation indicates that the proposed development appears to be geotechnically feasible, provided that the recommendations of the report are incorporated into the design and construction phases of the project. The main geotechnical concern associated with the proposed site development is site preparation, due to the presence of undocumented fill material. This condition will be explored further in future phases of predevelopment.

Project Financing

Describe the estimated total development cost and total public subsidy, cost and subsidy per unit, and cost and subsidy per bedroom. Provide a table summarizing planned sources and uses of funding.

PROFORMA SUMMARY				
Sources		Public Subsidy	Per Unit	Per Bdrm
Construction Debt	3,622,092		241,473	120,736
OHCS LIFT Subsidy	2,745,000	X	183,000	91,500
Wood Innovation Grant	250,000	X	16,667	8,333
City of Milwaukie CET Grant	300,000	X	20,000	10,000
Metro Bond Funds - Clackamas County	700,000	X	46,667	23,333
Total Sources	**7,617,092**		**507,806**	**253,903**
Uses				
Land	600,000		40,000	20,000
Construction Costs	4,647,816		309,854	154,927
Soft Costs	1,808,223		120,548	60,274
Financing Costs (net of Sales Costs)	331,663		22,111	11,055
Contingency	229,391		15,293	7,646
Total Uses	**7,617,092**		**507,806**	**253,903**

Summarize funding contributions and any local incentives or policies benefiting the project (e.g., SDC waiver, property tax abatement, density bonus, reduced parking requirements, etc.).

Funding contributions are outlined in the sources/uses summary above. Local incentives such as SDC waivers are not available, however the City of Milwaukie supports the project via their CET grant program. A partial property tax abatement is provided under House Bill 3275, which exempts the land owned by a community land trust and a 27% discount for condominium homes with an affordable housing covenant.

Summarize the total developer fee and net cash developer fee and summarize how the following considerations informed the determination of the fee within the ranges specified by Metro's Developer Fee Guidelines: project complexity and risk (e.g. PSH units), developer organizational size and financial capacity, participation of small/emerging community based and culturally specific organizations in development, and exceptional track record or outcomes for serving communities of color. To receive a fee at the upper end of the fee limits projects should demonstrate alignment with multiple considerations. See Metro Developer Fee Guidelines for additional information.

Total developer fee/net cash developer fee: maximum of $695,000 or 10% of development costs per OHCS LIFT guidelines for affordable homeownership projects. Proforma includes a developer fee (inclusive of construction management) of $665,000.

OHCS does not provide for developer fee sizing for affordable homeownership projects according to project complexity and risk, developer organization size or other considerations. However, developer fee sizing of 10% does represent a reasonable fee for a small (15 unit) project, including participation of an emerging developer in partnership with an established non-profit community land trust.

The stated developer fee and net cash developer fee is within the Metro Developer Fee Guidelines outlined in Exhibit F of the 2021 Metro Report: 1-30 units / 8-14%.

Summarize ongoing funding sources for rental assistance and services, including total, and total per unit.

Not applicable for homeownership developments. Note that Proud Ground will provide ongoing homebuyer support and management for all home sales and re-sales for qualified buyers.

Development Team

Describe the development team including the developer, general contractor, architect, and other key partners, and their relevant experience, respectively. If some members of the team are not yet selected as of the concept endorsement, this information can be added at the final approval step.

<u>Jessy Ledesma of HomeWork Development, Co-Owner Shortstack Developer LLC:</u>

Jessy Ledesma is the Founder and Principal of HomeWork Development and co-Founder of Shortstack. Jessy founded HomeWork Development in early 2021 with a vision to build a new model for inclusive and responsive housing development. Prior to HomeWork, Jessy was Director of

Development at Beam Development (2015-2021) and previously developed affordable housing for both non-profit and for-profit ownership (2007-2015).

With 17 years of development experience in the Portland area, Jessy has transacted over $200M in development volume across 18 projects. This includes over 600 affordable housing units and 200,000 SF of commercial developments. Jessy is adept at creative structuring, including navigating complex for-profit/non-profit partnerships and layered financing stacks. Jessy currently serves on the Home Forward Board of Commissioners and chairs the ULI Northwest Women's Leadership Initiative.

Anna Mackay of Sister City, Co-Owner Shortstack Developer LLC:

Anna Mackay is the Founder and Principal of Sister City (2020) and co-Founder of Shortstack (2021). She has 12 years of experience as a real estate developer in Portland, Oregon. Through her work, Anna defines and field tests concepts of social impact in real estate, including:

- Delivering the first affordable multifamily housing project built using mass timber in Oregon (Chiles House, 2022).
- Structuring the first crowd-investing deal for new construction utilizing Regulation A in the United States ($1.5M, the Fair-Haired Dumbbell, 2016.
- Raising a tranche of crowd-invested equity from everyday Oregonians for a homelessness project in just 68 hours ($300,000, Jolene's First Cousin, 2018).
- Creating a non-displacement benefit to foster affordable retail (Rocket Empire Machine, 2020)

Prior to starting her own firm, she was the Director of Development at Guerrilla Development (2017-2020) where she managed equity raising, entitlements, construction, and lease up of 12 adaptive reuse and urban infill projects.

Briana Rae Mathias, Shortstack Developer CPA:

Briana Mathias is the Owner of Woodcrest Consulting, LLC, a boutique fractional CFO service firm supporting local business owners with their accounting and finance needs. Briana is a CPA with over 15 years of experience in public and private accounting and has primarily focused her career over the last several years on real estate focused businesses and projects. She also holds an active real estate license in Oregon and works part-time with a local commercial real estate firm, Macadam Forbes, as a broker for both landlords, developers, investors and tenants.

Briana acts a strategic financial partner and advisor for her clients and always provides the highest level of service. Currently, Briana is actively involved with clients ranging from real estate development, construction and property management, to high-net worth real estate investors. A majority of her time is dedicated to the Shortstack Team and suite of projects and Briana is primed to allocate her time and resources to support Shortstack's growth and evolution.

Community Land Trust Partner: Proud Ground

Proud Ground staff leadership have significant pre-development experience by taking the lead on the 5020 Condo project (COVID caused termination just before closing), New Spirit Village (including a LIFT award of 4.3 million), and the Portland Clean Energy Fund projects for 15 scattered site, net zero, permanently affordable homes. Additionally, Proud Ground developed a 12

unit sub division and partnered with a developer for a second 12 units condo in 2010/11. Habitat for Humanity Portland Region remains Proud Ground's strongest development partners.

Proud Ground staff members supporting this project include:

EXECUTIVE DIRECTOR, DOMINIQUE MERRIWEATHER: Dominique was recently appointed Executive Director Proud Ground in July 2023. Prior to joining Proud Ground, Dominique was the Director of Finance & Business Affairs for Innovative Housing, Inc. where he provided financial, operational, and human resources oversight and leadership. Dominique's professional background was developed in commercial lending for several local banks. Dominique received his bachelor's degree from Concordia University and holds a master's degree from Portland State University. He is a graduate of Benson High School.

Dominique has been an active community volunteer with organizations focusing on community leadership, youth sports and mentoring, housing security and diversity. Currently he serves as a Commissioner for the Vancouver Housing Authority, is a board member for Partners in Careers and sits on the finance committee for Second Step Housing. Dominique is excited for the opportunity to lead Proud Ground and to continue its mission of expanding home ownership opportunities to low- and moderate-income families such as to allow them to remain in communities of their choice. The community land trust model is proven, as represented by Proud Ground's nearly 25-year history, and Dominique believes that it is a useful tool in creating strong families, stable communities, economic viability, and permanent affordability.
Mr. Merriweather is married with a blended family of six children. A proud inductee to two halls of fame, he spends his spare time cooking, perfecting BBQ recipes and traveling to his kids sporting events or to tropical respites.

REAL ESTATE DEVELOPMENT MANAGER, MELISSA HOSKINS: Melissa graduated from High Point University with a bachelor's degree in business administration and Portland State University with a graduate certificate in real estate development. Her professional experience has focused on real estate finance and asset management of commercial properties including new multifamily development. She has been working with Proud Ground since May 2023 as Real Estate Development Manager overseeing a variety of development projects in the Proud Ground portfolio including New Spirit Village.

FISCAL DIRECTOR, DIANNE TOPP: Dianne has over 11 years of experience in community land trust fiscal management. Her fiscal support of the organization includes budget development, compliance support, overall management of Proud Ground's budget, financial reports and annual high-level audits. Her past experience includes work with OSPIRG, M & R Consulting, and she co-owned a small environmental consulting firm.

FUND DEVELOPMENT MANAGER, ALMA BARRAZA (BIPOC & BILINGUAL): Alma is a dedicated bilingual Spanish professional with over 16 years of fundraising and volunteer experience. She supports Proud Ground with public and private fund development through grants, sponsorships, and major donor fundraising. Alma brings extensive business experience, entrepreneurial skills, and passion for philanthropy to her work with Proud Ground.

HOMEOWNERSHIP PROGRAM DIRECTOR, KATIE ULLRICH: With 19 years experience as a CLT homeownership professional with Proud Ground, Katie is a leader in the industry. She has a Master's in Social Work, is a licensed Principal Real Estate Broker in Oregon and is a HUD Certified

Housing Counselor, providing Proud Ground clients with homebuyer counseling and education services, as well as post-purchase support.

CROSS CULTURAL OUTREACH MANAGER, YESIKA AREVALO (BIPOC & BILINGUAL): Yesika has provided bilingual and cross cultural support to Proud Ground families for over 12 years. She helps families learn about the CLT model and assists them through the homebuying process, with a focus on Spanish speaking families and families of color. She is a certified homeownership counselor.

REAL ESTATE BROKER AND PROJECT MANAGER, *Real Estate Development Manager, Melissa Hoskins: Melissa graduated from High Point University with a bachelor's degree in business administration and Portland State University with a graduate certificate in real estate development. Her professional experience has focused on real estate finance and asset management of commercial properties including new multifamily development. She has been working with Proud Ground since May 2023 as Real Estate Development Manager overseeing a variety of development projects in the Proud Ground portfolio including New Spirit Village.*
UNDRA ADAMS (BIPOC): As a licensed professional Real Estate Broker on staff for Proud Ground, Undra helps with CLT home closings and buyer representation, as well as home repairs and marketing. His goal is to "make sure my clients feel completely equipped and supported in the entire home buying and selling process.

Community Engagement

Please summarize community engagement to inform project outcomes to support the needs of future residents. This could include engagement conducted previously by the LIP or developer to shape the goals of a NOFA or vision for a project. It could also include plans for further engagement to inform the design or programming of the project to meet the needs of historically marginalized community members.

Note: Outreach strategies for affirmative marketing and COBID participation should be described in the following section under "advancing racial equity." This section is focused on engagement to inform the goals, vision, design, or programming of the project.

Proud Ground intentionally seeks input and engagement with the communities it intends to serve. Proud Ground is a membership-based organization, which gives homeowners and contributors voting rights on strategic organizational decisions. This ensures that the community members served by Proud Ground are part of its decision making.

Currently, over one-third of the organization's Board Members are Proud Ground homeowners and over half are people of color.

Proud Ground partners with many community organizations to reach its target populations (Additional detail in the "Advancing Racial Equity" and "Partnership and Services" sections, below). All outreach efforts focus on homebuyers attending Proud Ground information sessions. These sessions are available in English and Spanish, virtually or in person, and as pre-recorded sessions.

Advancing Racial Equity

Summarize how the project will address strategies and policies for advancing racial equity, as described in your local implementation plan. Be sure to include:

- *How the project location reflects considerations related to racial equity (e.g., geographic distribution of affordable housing, access to opportunity, strategies to address racial segregation, and strategies to prevent displacement and stabilize communities)*
- *Fair housing strategies to eliminate barriers to housing access for communities of color and other historically marginalized groups (e.g., fair housing marketing strategies, community partnerships, low barrier screening, etc.)*
- *Strategies to include economic opportunities for people of color (e.g., MWESB/COBID participation and workforce diversity)*

The Shortstack project is rooted in an ambitious and innovative development process aimed at diversification across all levels of the development, finance and construction processes. We are committed to engaging at least 30% COBID-certified MWESB firms for Shortstack Milwaukie throughout our development and construction process. The National Association of Minority Contractors Oregon Chapter (NAMC-O) is engaged to help create our outreach and representation plan. To date, **over 70% of our current consultant contract amounts (including development, architecture, engineering, civil, legal and others) are held with women-owned firms.**

Our development team consists of two woman-owned firms: HomeWork Development and Sister City. Our architect Works Progress Architecture is a woman-owned business, as is our civil engineer Vega and landscape architect Studio Wild. Our structural engineer is led by a female minority Principal.

Proud Ground has a rich history of serving people of color. Inequitable access to homeownership has kept Households of Color, many of which are first-generation and first-time homebuyers, from building wealth and accessing high-quality neighborhood services, such as education and employment. Therefore, Proud Ground focuses its outreach on Households of Color, first-time homebuyers, and households with children. Proud Ground's focus is to create programmatic strategies and internal policies that break down barriers preventing this population from accessing affordable homeownership opportunities.

The Proud Ground waitlist policy prioritizes households with children or households of 3 or more and then it is based on the buyer's date of application with the program. This policy has been approved by Fair Housing of Oregon. Through targeted outreach to the BIPOC community to develop a diverse waiting list, Proud Ground anticipates that a majority of the homes (75%) will be purchased by households identifying as BIPOC. 77% of Proud Ground homebuyers since 2021 identify as BIPOC households.

In 2021, Proud Ground launched its 5-year strategic plan with a goal to create another 200 homeownership opportunities, focusing on communities of color and historically marginalized communities through the Opening Doors initiative. Over five years, Opening Doors aims to increase Proud Ground's portfolio of permanently affordable homes from 350 to 550. At least 75% of these new homeownership opportunities will benefit families identifying as Black, Indigenous, or People of Color (BIPOC). Project leaders are committed to achieving this objective for sales of the new Shortstack Milwaukie units.

Partnerships and Services

Provide information about plans and partnerships for ongoing operations, including property management partner(s) or service providers. Describe strategies for aligning culturally specific programming or services to meet the needs of future residents. If your project includes PSH units, please describe if these will use coordinated access process, or another referral process.' Confirm that project will serve Population A – include definition.

Proud Ground partners with many culturally-specific homeownership agencies, including:

- Bienestar
- Hacienda CDC
- NAYA
- PCRI
- OHDC
- Pueblo Unido
- IRCO
- Univision PDS
- VERDE
- Rose CDC
- Human Solutions
- Centro Cultural

For Shortstack Milwaukie, Proud Ground intends to reach out to each agency offering advanced notice of the home purchase opportunity before the homes are listed on the market, and to inquire if the agencies have an active presence in Milwaukie (or Clackamas County), or wish to expand their outreach into this area if they don't currently. Proud Ground will follow up to partner more specifically on outreach and info sessions with those partners that respond to the inquiry and who want to offer the opportunity to their service base.

Proud Ground is committed to reducing barriers to program access for those with limited English proficiency through provisions of translation and interpretive services. Proud Ground's language access plan ensures those with limited English proficiency do not have barriers to accessing Proud Ground's services.

Proud Ground aims to mitigate barriers to homeownership for communities historically denied access to homeownership, including lower-income households and households of color. Prospective homebuyers gain access to Proud Ground's Homeownership Education and Counseling program, which helps first-time homebuyers become mortgage ready. Proud Ground then administers down-payment assistance funds as buyers complete the purchasing process. The combination of education and counseling with down-payment assistance breaks down the biggest barrier to homeownership and makes homeownership a possibility for families who would otherwise be locked out of owning their first home.

Livability and Accessibility

Please highlight design elements that enhance livability and accessibility (e.g. shared Wi-Fi, common spaces, universal design)

The Shortstack Milwaukie project operates under the residential building code which doesn't include accessibility or visitability requirements, since these are considered individual residential units. Nonetheless, the site is designed to be accessible from the public right-of-way to each unit; most of the homes do not include entrance stairs; and each home does include a half-bathroom on the ground level, which are all tenants of universal design.

Climate Resilience and Sustainability

Please describe the project's cooling plan to keep residents safe in extreme heat events, take into consideration Metro's Policy Statement of Air Conditioning (Sept. 14, 2021) for expectations related to cooling strategies. Include type of air conditioning system and cost. Including reasons why the type of air conditioning system was selected including sustainability, durability, expense, and feasibility given project constraints.

Please highlight sustainability certifications, elements and/or green building features for this project.

The Shortstack Milwaukie cottage cluster project embodies climate resiliency and energy efficiency throughout its design, build, and occupancy stages. Energy efficiency equates to further affordability for future residents and early coordination allows for decisions to be made with respect to this.

Shortstack Milwaukie, as with all Shortstack sites, prioritizes efficiency at the neighborhood scale, community scale and building scale. At the neighborhood scale, the project leverages the City of Milwaukie's recently adopted Cottage Cluster Zoning to maximize housing density across two properties in Milwaukie's Ardenwald neighborhoods. The development yields 15 units on one site through a unique double-cluster site design.

At the community scale, Shortstack Milwaukie is designed as 15 identical, replicable two-bedroom units. By perfecting one unit plan the project maximizes construction efficiency and trade buy-out efficiency. Each unit has the same structural package, the same kitchen package, the same bathroom and finish package. The two sites utilize the same landscape "kit of parts", tailored to the existing tree canopy and solar/shading conditions.

The cottage design includes research and development around mass timber panelized construction. One cottage will be built utilizing mass timber structure and fourteen cottages will be built utilizing panelized stick-framed structure. The team will compare the cost, speed of construction and marketability of the mass timber vs. conventional construction to optimize the design for future replicability. With respect to construction efficiency mass timber panelized buildings are constructed 20%-25% faster than traditional stick-built construction, with structure going up in a matter of days vs. weeks.

The multi-site development effort increases the efficiency of the development process through a cohesive design and engineering team and a kit-of-parts approach. In other words, the team does not

start from scratch to build 15 units – we are leveraging the knowledge, research and development, and relationship efficiency of several other Shortstack sites.

Each Shortstack Milwaukie unit is compact while still providing a desirable and marketable two-story, two-bedroom/1.5 bathroom layout. The prototype design comes from nearly two years of research out of the University of Oregon's Center for the Built Environment and the TallWood Design Institute, as part of their Mass Timber Coalition efforts to prototype mass timber housing options for statewide increased housing production. This R&D work is supported by a 2022 US Forest Service Wood Innovation Grant.

The all-electric homes are designed to standards that often exceed the energy efficiency requirements set forth by the City of Milwaukie building code. The homes include heating and cooling provided by heat pumps. In addition to sourcing building materials local to the Cascadia bioregion (such as our mass timber product) the project team is pursuing the Energy Trust of Oregon Energy Performance Score program.

The site emphasizes resiliency through design that integrates stormwater management with a palate of native new plants and trees sources from what Shortstack refers to as the Douglas Fir tree-shed– the naturally occurring habitat for one of Oregon's most resilient species.

Anticipated Timeline

Describe the anticipated timeline and milestones for the project, including developer or contractor selection, concept endorsement, due diligence, final approval, closing, construction, and lease up – as well as any timelines related to community or elected body engagement.

- Developer selection: complete
- GC Selection: complete
- Concept Endorsement: Q3 2023
- Due Diligence: complete
- Final Approval: anticipated July 2024
- Closing/Start of Construction: anticipated August 1, 2024
- Community Engagement via Proud Ground Marketing: anticipated Q4 2024-Q2 2025
- Home Sales: anticipated Q2-Q3 2025

600 NE Grand Ave.
Portland, OR 97232-2736

Metro Affordable Housing Bond Program

Final Approval

Project Name: Strong Site
Implementing Jurisdiction: Portland Housing Bureau
Metro IGA Contract Number: 937016
Anticipated construction start: August 2024
Anticipated construction completion: February 2026

Action:
Metro hereby provides Portland Housing Bureau with Final Approval of $3,150,000.00 in Metro Affordable Housing Bond funds for the development of Strong Site, a regulated affordable housing project located at 4931 N Williams Avenue, Portland. Metro staff findings are attached in Exhibit A, and a more detailed description of the Project, as provided by the Portland Housing Bureau, is attached as Exhibit B.

This Final Approval is based upon the information contained in the final approval request provided to Metro by Portland Housing Bureau, including Project cost proformas and statements of sources and uses of funding needed to generate a Project with the following unit mix:

Number of Units	Bedroom Type	AMI Level	Project Based Vouchers
3	One-bedroom	30%	0
18	One-bedroom	60%	0
5	Two-bedroom	30%	0
27	Two-bedroom	60%	0
3	Three-bedroom	30%	0
19	Three-bedroom	60%	0

Changes to the information contained in the final approval request provided by the Portland Housing Bureau could result in reevaluation of the Project's need for Metro Affordable Housing Bond Funds and changes to the staff findings and funding allocation to the Project before funding disbursement. Disbursement of funds for the Project will be processed in accordance with the terms and conditions set forth in the Affordable Housing Bond Measure Program Intergovernmental Agreement between Metro and Portland Housing Bureau, and will occur within 10 days of Metro's receipt of the following items: a draft regulatory agreement meeting IGA requirements, a final sources and uses budget, a construction

Metro

contract schedule of values, and an invoice from the Portland Housing Bureau including wiring or other instructions related to transfer of funds.

7/24/2024

Marissa Madrigal

Date

Chief Operating Officer

Exhibit A: Metro staff findings and recommendations | Metro Affordable Housing Bond Final Approval request for Strong Site

Drafted by: Jimmy Oporta, Senior Housing Bond Program Coordinator and Alison Wicks, Housing Bond Program Supervisor

Date: July 24, 2024

Criteria for funding approval

Metro will issue Final Approval to local implementation partner (LIP) upon Metro's determination that (a) the proposed Project reasonably contributes to the Unit Production Targets relative to the amount of the Eligible Share proposed to be used for the Project; and (b) the Project is consistent with the Local Implementation Strategy (LIS), the Work Plan, and the Bond Measure.

Staff recommendations

Staff recommends the Metro Chief Operating Officer (COO) provide Final Approval of funding for Strong Site. Findings from Metro's staff review are summarized below. Additional information about the project can be found in Exhibit B, the project narrative submitted by the Portland Housing Bureau.

Changes since Concept Endorsement

The project is being reviewed for Final Approval and has undergone changes since Concept Endorsement on June 1, 2023. Project development costs increased to $45.25 million, up $7.03 million (+18.4%) from the prior $38.22 million. Project funding sources have correspondingly increased $7.03 million, including an increase of LIHTC equity to $18.77 million (+12%) and an increase of grant funding to $4.49 million, up $3.35 million (+294.6%) from the prior $1.17 million. The Metro Housing Bond funding amount also increased to $11.40 million, up $150.0K (+1.3%) from the prior $11.25 million at Concept Endorsement. The proposed unit mix and affordability levels are unchanged, and the project will deliver 75 total units of which 11 will be affordable at 30% AMI (14.7% of total) and 54 units will be family-sized (72% of total) units. Key project highlights include:

- Total development costs are $45.25 million and Metro Housing Bond funding is $11.4 million
- Net cash developer fee is 8.13% of developer fee basis. This amount is less than the Metro maximum of 10.0% for projects with 31-75 units and is within Metro's maximum of $3.0 million.
- Developer fee considerations: The Strong site is a continuation of SEI and CDP's Alberta Alive portfolio, a multi-building umbrella of affordable housing developments designed and built to serve the African American community in North and Northeast Portland. The project will work with PHB's N/NE Preference Policy and help those with generational ties to north Portland return to their previous neighborhoods. SEI is Oregon's largest African American led nonprofit multi-service organization and will be the resident services provider at the project. Through CDP's and SEI's co-development partnership, SEI will receive 20% of the amount of Developer Fee paid to CDP. The Strong site seeks an aspirational 30% COBID contracting goal and will track workforce participation on contracts that exceed $300,000.
- Construction start date in August 2024, with completion anticipated in February 2026

Contribution to unit production targets

The Strong site will utilize 6% ($11,400,000) of Portland's total allocation of bond funds while delivering 75 units of affordable housing that meet the following unit production outcomes:

- 5% of Portland's overall unit production target;
- 2% of Portland's target of units affordable to households making 30% or less of area median income (AMI);
- 7% of Portland's family sized unit target; and

When combining this project with Portland's existing development portfolio, this puts the City on a path to have utilized 92% of total allocation of bond funds while delivering on the following cumulative unit production outcomes:

- 121% of Portland's overall unit production target;
- 98% of Portland's target of units affordable to households making 30% or less of area median income (AMI);
- 137% of Portland's family sized unit target; and

Eligibility and readiness to proceed

The Portland Housing Bureau has submitted and Metro staff have reviewed and evaluated submitted materials for evidence of project feasibility and readiness to proceed. These include:

- Updated project pro forma dated 6/12/2024
- OHCS Affirmative Fair Housing Marketing Plan
- Preliminary title report dated 5/8/2019
- Letters of intent from Citi Community Capital, JP Morgan Chase Bank and Hudson Housing Capital
- Development drawings provided by Holst Architecture, dated 11/21/2023
- Statutory bargain and sale deed dated 2/12/2019 as evidence of developer site control
- Community engagement outcomes report
- SEI, Inc. Resident Services Plan
- Phase 1 Environmental Site Assessment report from Farallon Consulting, dated 9/15/2023
- Development team resumes and developer schedule of real estate owned, demonstrating track record with affordable housing development in Oregon and nationally

Staff have not identified any unusual risks to project feasibility and readiness and will continue to request updates from the City of Portland regarding how work is proceeding.

Advancing racial equity

Metro staff have reviewed final project materials to confirm consistency with the racial equity elements of City of Portland's approved local implementation strategy (LIS). Key findings include:

- **Location:** The Strong site is located at the intersection of N. Williams and N. Alberta Street in the Humboldt neighborhood. Humboldt is one of several neighborhoods in Northeast Portland that are historically home to the City's African American population, which has been displaced over the last 30 years due to discrimination and rising housing costs. The

Strong site is well located due to its proximity to many essential services and amenities. The neighborhood schools are Boise-Eliot Elementary (1 mi), Harriet Tubman Middle School (1.6 mi) and Jefferson High School (0.3 mi). KairosPDX (0.2 mi), Albina Head Start (0.1 mi) and MLK Jr. Elementary (0.4 mi) are all very close alternatives as additional educational options. SEI's campus on N. Kerby (0.8 mi) is a longstanding center for youth afterschool and summer programs, family support and solidarity for the Black community. In addition to SNAP and child welfare assistance programs, the DHS building just north of the Strong property also houses a WorkSource Portland Metro site, which offers job search and training opportunities.

- **Transit access:** The project is served by the 44 TriMet bus, with a stop across the street from the site. The 72 and 6 bus lines are also within a half mile of the project site.
- **Diversity in contracting/hiring:** The Strong site, co-developed by Self-Enhancement Inc (SEI) and Community Development Partners (CDP) selected COLAS, a minority owned firm, as the general contractor of the project, along with Holst, a woman-owned firm, as project architect. The project seeks an aspirational COBID goal of 30% MWESB participation and will be tracking the diversity of the workforce. This is in alignment with PHB's aspirational goals of awarding 20% of workforce hours to apprentices, 22% of apprentice hours to minorities and 9% of apprentice hours to women on contracts that exceed $300,000. Similar goals have been applied to those working in journey level positions.
- **Access for historically marginalized communities:** As a result of gentrification and other public policies, many SEI families, including many African American families were displaced from North Portland neighborhoods and pushed out of the inner city to east Multnomah County. CDP and SEI recently completed the first two Alberta Alive projects, which include the Ronnie Herndown Building (21 units) and the Paul and Geneva Knauls Building (31 units of PSH Housing for Veterans). Phase II of Alberta Alive is underway with PHB's Dr. Darell Building, a Metro-funded project that will deliver 63 units for families participating in PHB's N/NE preference policy. The Strong site project is a continuation of SEI and CDP's Alberta Alive portfolio, which represents a multi-building umbrella of affordable housing developments designed and built to serve the African American community in North and Northeast Portland. Through these projects, CDP and SEI's marketing and lease-up teams will work closely with PHB to advance the N/NE Preference Policy and help those with generational ties to North Portland return to their previous neighborhoods.
- **Culturally appropriate services:** SEI, Inc. will lead resident services at the Strong project through a Resident Services Coordinator. The Resident Services Coordinator (RSC) will be responsible for connecting residents with resources and support needed to remain in stable housing. The RSC will be available at the Strong property at regular, set times on-site for resident appointments and drop-in access. The RSC will also have scheduled time off-site to coordinate with community partners and address residents' requests/needs. Services at the Strong project will be culturally appropriate and targeted to African American and other populations from communities of color and low-income backgrounds who are at risk of or have histories of displacement for North/Northeast Portland neighborhoods. Through SEI's two main departments, Youth Services and Community + Family Programs, Strong Property resident services will prioritize the goals and needs of individual households, including those focused on housing stability, financial growth, youth enrichment, and connection to the community.
- **Climate resilience:** The Strong site will pursue Earth Advantage platinum certification that fully aligns with PHB's Green Building Policies. The project will include a photovoltaic solar array on the roof that will help offset common area electrical costs. The building will also

offer 17 EV (electric vehicle) ready parking stalls and 4 EV charging stations. The building will include central heat pump hot water heaters and in-unit mini-split hear pumps that provide both heating and cooling.

Community engagement to inform project implementation

Metro staff have reviewed the narrative to confirm consistency with the community engagement elements of City of Portland's approved Local Implementation Strategy (LIS). Key findings include:

- **Strategies for ensuring ongoing engagement around project implementation reaches communities of color and other historically marginalized community members:**

For the Strong Family Property, SEI and CDP hosted a neighborhood meeting, inviting local neighborhood associations, businesses, school districts, and community members to review and provide input on the design. The project was also presented to the N/NE oversight committee, where it received support and feedback that was integrated into the design process. A public notice for design review was also published to solicit community comments. Beginning in 2023, SEI conducted a series of informational sessions about the N/NE Preference Policy for the Dr. Darrell Millner Building, part of the Alberta Alive initiative. In April 2024, 27 participants attended one of these sessions, where they received food, childcare, and assistance with registering for the N/NE Preference Policy, which the Strong project will use to increase access for historically marginalized community members.

- **Strategy for ensuring community engagement to shape project outcomes to support the success of future residents:**

Major themes heard from community engagement included:

- Strong emphasis on resident services programming that fosters community cohesion
- Project design that aligns with the architectural style of the Albina neighborhood
- Removing obstacles to affordable housing access and ensuring developments do not further displace Black Portland residents
- Outreach and marketing strategies that integrate collaboration between property management and community organizations

Major design feedback heard from community engagement included:

- Need for larger community spaces on the ground floor
- Inclusion of heat pump/AC units in each residential unit
- Indoor and outdoor areas with play elements for children
- Inclusion of site-based activities for children and youth

EXHIBIT B: Project summary submitted by The Portland Housing Bureau| Metro bond concept endorsement for Strong Site

Submitted by: Megan Grillo, Bond Housing Program Coordinator
Portland Housing Bureau, megan.grillo@portlandoregon.gov
Submitted on: 7/19/2024 (initial submission 3/21/2023)

Project Overview

The Strong Family Apartments are sponsored by Self Enhancement Inc. (SEI) and Community Development Partners (CDP). The project is a continuation of SEI and CDP's Alberta Alive portfolio, a multi-building umbrella of affordable housing developments designed and built to serve the African American community in North and Northeast Portland. The first two phases of Alberta Alive consist of the Ronnie Herndon Building, located at 510 NE Alberta and the Paul and Geneva Knauls Building, located at 780 NE Alberta with a combined 52 units designed for families and veterans (Phase I), and The Dr. Darrell Millner Building located at 5050 N Interstate, a 63-unit building designed for families (Phase II).

Co-owned and co-developed by SEI and CDP, the Alberta Alive development initiative aims to celebrate and strengthen Portland's historically Black N/NE neighborhoods by providing culturally specific affordable housing, supportive services, and a shared sense of community for underserved individuals and families.

Located at the prominent intersection of N. Alberta and N. Williams Avenue, the Strong property embodies visual and historical significance for long-time residents of North and Northeast Portland. The address of the site is 4931-4947 N. Williams Avenue and 20-114 N. Alberta Street. The site is 42,253 SF and is currently comprised of six tax lots – a tax lot consolidation is currently in process. Our proposed design aims to balance PHB's goals to achieve more than 50 units on the site while also maintaining a cost-efficient building type and the desire to create a community that is welcomed by residents and neighbors alike.

SEI and CDP are requesting $3,150,000 in Metro Affordable Housing Bond funding to develop 75 units of new construction rental housing and community space for households between 30% and 60% of AMI. We will pair the M-BOS funds with 4% LIHTC and tax-exempt bonds to finance the project. Multiple members of the development team have relationships with the Strong family and look forward to working with them on the naming of the final development.

The project does not have any Section 8 Vouchers.

Development Program

*Complete the below table summarizing unit breakdown for **Rental ONLY**. Add/delete rows as needed.*

	Unit size (no. of bedrooms)	No. of units	AMI %	PSH	PBVs	Square feet/unit	Gross monthly rent/unit
	1	3	30%	0	0	640	$663
	1	18	60%	0	0	640	$1,327
	2	5	30%	0	0	833	$796
	2	27	60%	0	0	833	$1,593

Courtyard

Background

In July 2019, PHB purchased an approximately .97-acre parcel of real property at 4931-4947 N. Williams Avenue and 20-114 N. Alberta Street, to further the goals of the N/NE Neighborhood Housing Strategy to address the community's strong desire to preserve property within the Interstate Corridor Urban Renewal Area (ICURA) for the development of affordable housing. The site currently contains a 1,288 square foot, single family house and detached garage built in 1906 and is zoned CM2. These structures will be deconstructed prior to construction of the apartment building.

Location and Neighborhood

The Strong property is located at the intersection of N. Williams and N. Alberta Street in the Humboldt neighborhood. The Humboldt neighborhood is one of several neighborhoods in North/Northeast Portland that are historically home to the City's African American population, which has been displaced over the last 30 years due to discrimination and rising housing costs. The Humboldt neighborhood is typical of many inner Portland neighborhoods containing a variety of different land uses and property types.

The Strong site has close proximity to many essential services and amenities. The neighborhood schools are Boise-Eliot Elementary (1 mi), Harriet Tubman Middle School (1.6 mi) and Jefferson High School (0.3 mi). In addition, KairosPDX (0.2 mi), Albina Head Start (0.1 mi) and MLK Jr. Elementary (0.4 mi) are all very close alternatives/additional educational options. SEI's campus on N. Kerby (0.8 mi) is a longstanding center for youth afterschool and summer programs, family support and solidarity for the Black community.

The site is served by the 44 TriMet bus, with a stop across the street from the Strong property and are within a half mile of the 72 and 6 bus routes. In addition to SNAP and child welfare assistance programs, the DHS building just north of the Strong property also houses a WorkSource Portland Metro site, which offers job search and training opportunities.

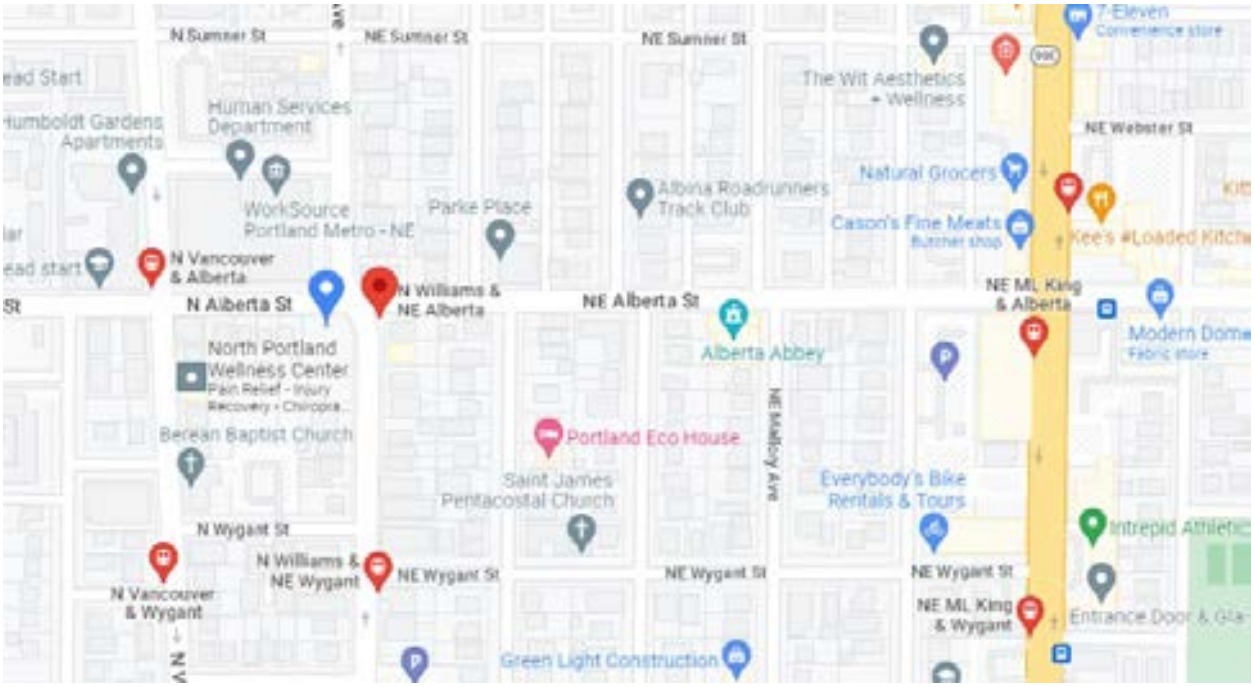
The sites are near ample retail businesses and services on major commercial streets including MLK Jr. Blvd., Alberta Street, Killingsworth Street, and Interstate Avenue. Legacy Emanuel and Kaiser Interstate medical campuses are 1.2 and 1.4 miles from the sites, respectively.

In addition to these essential services, the area is home to many places of cultural and community importance to the African American community, including many churches along the Williams/Vancouver corridor, Dawson Park, SEI's campus, Urban League of Portland, and Matt Dishman Community Center.

Site

The Strong property is zoned CM2d, a mixed-use zone with a design review overlay. Properties to the west and north are also CM2d - these consist of a mix of single family, multi-family and commercial uses. The Oregon Department of Human Services (DHS) building is directly to the north of the property. Properties to the east and south are zoned CM1 and RM2, respectively, and are mostly single-family homes.

The Strong property is located within a design overlay zone, which requires the project to go through Design Review or to utilize the City's Design Standards. The team reviewed the project against the Design Standards scorecard and determined that option to be the most cost and time efficient pathway. The project received Design Commission approval in February 2024.



Project Financing

Source of funds	Total Amount
4% LIHTC Equity	$18,688,807
PHB - Metro Housing Bond	$3,150,000
PHB – ICURA TIF	$8,250,000
Deferred Developer Fee	$2,545,305
Perm Loan	$7,100,000
ETO Grant	$35,000
PCEF Funds	$2,956,571
Solar ITC Tax Credit Equity	$99,335
OR-MEP Weatherization	$200,000
GP Equity	$200
Total Permanent Sources	**$43,025,218**

Uses	Total Amount
Acquisition	$6,750
Construction/Hard Costs	$29,935,661
Development/ Soft Costs	$7,162,026
Developer Fee	$5,350,000
Reserves	$570,781
Total Uses	**$43,025,218**

The Strong project budget includes hard costs hard bid COLAS in May 2024.

Operating expenses are projected at $8,651 per unit per year. Operating expenses are based on CDP's current portfolio expense data. Operating expenses include resident services at $85,000 per year. Management staffing assumes 1 FTE Manager and 1 FTE Maintenance staff.

Debt terms include a 6.4% permanent loan interest rate, and 40-year amortization schedule per the final terms of our permanent lender, Citibank. Construction debt will be provided by Chase and is priced at 7.22% (current rate plus 0.5% cushion). LIHTCs are priced at $0.895 – the price received from Hudson Housing LLC, the project's LIHTC investor.

Cost-efficient design, construction, and operations:
The apartment building will include stacked units for ease in construction and to minimize mechanical, electrical, and plumbing stacks and runs. The simple building massing keeps costs down and reduces the opportunities for weak points in the envelope.

To keep operating costs down and tenant utility bills low the building includes systems that are energy efficient and user-friendly. These include central heat pump hot water heaters and in-unit mini-split heat pumps that provide heating and cooling.

The building will also have a 105.5 kW PV array on the roof to help offset common area electrical costs (like corridor lighting, elevator, offices, etc). There will be 17 EV ready parking stalls 4 EV charging stations installed.

Development Team

CDP and SEI have formed a co-developer and co-sponsor partnership to address the Black, Indigenous, and Person of Color (BIPOC) housing disparity crisis currently prevalent throughout Portland. CDP and SEI have been working together since 2019 on a shared vision called Alberta Alive, which aims to bring Black families back to N/NE Portland. Alberta Alive is culturally specific, affordable housing at the historical heart of N/NE Portland's African American community that serves families, veterans, and displaced/long-term residents with a strong focus on the neighborhood, community, and resident homes.

CDP and SEI recently completed the first two Alberta Alive. Alberta Alive Phase I is a two-building development, the Ronnie Herndon Building (21 units of family housing at 510 NE Alberta) and the Paul and Geneva Knauls Building (31 units of PSH housing for Veterans at 780 NE Alberta). Alberta Street Phase II – the Dr. Darrell Millner Building is a 63 unit building for families. The SEI/CDP Partnership stakes out a different model for the African American community and puts a Black-led organization in an ownership role.

Working together on the Strong Property provides an opportunity to further build real estate capacity for SEI, one of the longest running and most effective organizations serving Portland's Black community, giving them an entry into real estate development and long-

term asset building in the heart of the City's historic African American neighborhoods. For the Strong property, the developer fee and cash flow split will be 80% CDP, 20% SEI. This represents an increase over Alberta Alive Phase I (where the split was 85%/15%). SEI also has a right of first refusal to purchase the property at Year 15 in Alberta Alive Phase II and the Strong property, if awarded.

- **Self-Enhancement Inc.** (Co-Developer & Co-Sponsor/Resident Service Provider)
  SEI is Oregon's largest African American-led nonprofit multi-service organization, and second-largest minority-operated employer. In 2018-19, SEI's comprehensive services benefited over 16,300 K-12 students, youth ages 18-25, families, and individuals across the City of Portland and Multnomah County. SEI's organizational philosophy and service delivery model are rooted in self-actualization and trauma-informed practices with the goal of overcoming persistent race-based disparities. SEI's Relationship Model and comprehensive service continuum are culturally specific for African Americans and culturally responsive for other populations.

  With 150 full-time and 46 part-time staff members; 75% African American and 89% from communities of color, SEI partners with 23 public schools in five districts across Multnomah County: Portland, Reynolds, Parkrose, David Douglas, Centennial. SEI's network throughout the Portland Black community is unrivaled and will be at the center of the project's success in attracting the BIPOC community to apply for units within the development. Alongside CDP, SEI will also lead all community engagement activities and represent the development team when meeting with community stakeholders such as the N/NE Oversight Committee.

  The project lead for SEI is Sahaan McKelvey. Sahaan is the Director of Community and Family Programs at SEI. Sahaan is also the SEI lead for Alberta Alive Phases I and II.

- **Community Development Partners** (Co-Developer & Co-Sponsor/Asset Manager)
  CDP's mission is to create life-enhancing housing that transcends the fundamental goal of providing high quality homes by building innovative and sustainable developments with a focus on long-term community engagement.
  As a mission-driven, for-profit organization, CDP is focused exclusively on creating vibrant affordable housing communities that incorporate art, public parks, gardens, fresh food, and cultural and social programming. CDP was formed in 2011 and in the relatively short time since, has successfully built or preserved over 2,000 affordable housing units throughout Oregon, California, Nevada, and Arizona, and has done so in partnership with many jurisdictions, Housing Authorities and non-profit organizations. CDP prioritizes impact over profit and as a Certified B-Corporation, is dedicated to the highest standards of social and environmental stewardship, public transparency, and legal accountability. The company's executive leadership team has over 60 years of combined experience working with cities and public agencies to bring new investment into existing neighborhoods.

The project lead for the Strong Property Housing Development is Jessica Woodruff. Jessica is the Director of Development for CDP and leads CDP Oregon's efforts across all spectrums of the development cycle. With over 18 years of affordable housing experience, Jessica is dedicated to the creation and preservation of affordable housing. CDP has a robust, capable and experienced development team. We have developed 10 affordable housing projects in Oregon, 4 of which are in the City of Portland. Additionally, we have 3 projects currently under development in Portland.

- **Holst** (Architect)
  Now entering its 30th year, Holst is an award winning, certified women-owned architecture firm based in Portland, Oregon, and led by partners Dave Otte, Renée Strand, Kevin Valk, and Kim Wilson. Holst's reputation in the community and among its peers is founded on their design acumen, as well as their team's ability to consistently deliver projects on time and on budget. They create innovative buildings tailored to each client's needs, while expressing the highest environmental, social, and aesthetic ideals. Holst works with its clients' budgets without compromising craft, each project reflecting a pursuit of clarity, balance, and authenticity. From conception to completion, they oversee all aspects of the planning, design, and construction processes to ensure that their projects are functional, efficient, financially responsible, and a source of creative inspiration for their client, end user, and the communities in which they reside.

  Holst has been a leader in creating the most innovative multi-family housing in Portland for the past fifteen years. From groundbreaking condominium projects to permanent supportive housing that has raised the bar, they know how to balance the typically narrow margins of housing projects to ensure that they meet the budget and schedule while squeezing every inch of design out of each opportunity. The firm has designed and built over 400 new units of affordable housing in the Portland metro region over the past ten years, with more than 400 more currently in design or under construction. Because Holst works with both market-rate and affordable housing developers on a regular basis, they leverage their varied experience to bring together the best of both worlds.

- **COLAS** (General Contractor)
  COLAS Construction is one of the largest Black-owned construction firms on the West Coast and brings sizable project experience with a proven track record of exceeding expectations in construction. As a 2nd generation, family-owned and operated BIPOC Prime Contractor (BPC), COLAS constructs value-based projects that create jobs and advance careers that reflect our community. COLAS Construction centers the highest standards by providing a commitment to hard work and the inherent value of equity, inclusion for diversity in every aspect.

  Founder, Hermann COLAS, Jr., arrived with his American dream from Port-Au-Prince, Haiti. He settled in Portland, after serving six years in the U.S. military. Hermann established COLAS to build legacies and strengthen communities. As a BIPOC Prime Contractor (BPC), COLAS is a pioneer in building quality projects that directly impact

marginalized communities; for each project they build, diverse and inclusive vantage points strengthen an unparalleled approach, adding value in tangible ways for the local community.

- Partnership Structure.
    a. The Project will be developed and owned by Strong AA Limited Partnership pursuant to an Agreement of Limited Partnership of the Partnership (the "Partnership Agreement"), in which SEI will own a .0049% interest and will act as the Co-General Partner. CDP will own a .0051% interest and will act as the Administrative General Partner. An investment limited partner not affiliated with or related to SEI or CDP will also be admitted to the Partnership (the "Investment Limited Partner") as the tax credit investor. SEI will also be credited with being the Co-Developer of the Project in all funding applications.

- Financial Participation.
    a. Developer Fee. The Partnership will pay CDP, as the Developer, a fee for services in the form of a Developer Fee from which SEI will receive a fee in the amount equal to 20% of the amount of Developer Fee paid to CDP. SEI's portion of the Developer Fee will be paid within 5 days of CDP receiving the Developer Fee payment. For the portion of Developer Fee that is deferred, SEI will also receive their portion at the time that CDP is paid which is anticipated to occur on an annual basis based on available cash flow from the operating properties.

    b. Partnership Fee. Commencing in the first full year of property operations after the conversion from the construction to the permanent loan and continuing every January 1st thereafter, in consideration for acting as the Co-General Partner of the Partnership and preparing the annual property tax exemption filing, SEI shall receive a partnership fee of $5,000 per year, unless SEI makes a 168(h) election in which case SEI shall receive a partnership fee of $10,000 per years (the "Co-GP Fee"), which shall be payable in whole or in part from net cash flow from operations of the Project and which is payable annually and will be increased each January 1st by 3%.

    c. Net Cash Flow and Sale or Refinancing Proceeds. Net cash flow and sale or refinancing proceeds available for distribution shall be distributed to the partners of the Partnership as described in the Partnership Agreement in effect at the time of distributions. SEI will receive 20% of the annual cash flow that is distributable and distributed to the general partners on an annual basis once the construction loan has converted to the permanent loan.

- Option Agreement.
    a. Pursuant to the terms of the Partnership Agreement, the General Partners have been given an option to acquire either the Limited Partner's partnership interests or the Project, and the Managing General Partner has been given a right of first refusal ("RFR") to purchase the Project. No later than ninety (90) days

prior to commencement of the period during which the Option can be exercised (the "Option Period"), the parties shall confer as to how they wish to participate in exercising the Option or in the alternative the Right of First Refusal. CDP will confer with SEI with respect to the negotiations. Neither party shall have the right to exercise the Option without the consent of the other except as stated below.

In the event both parties desire to participate in the ongoing ownership and operation of the Project, they shall mutually exercise the Option or ROFR and the parties shall mutually agree upon allocation of ownership interests and purchase price. In the event that the Parties cannot agree upon allocation of ownership and purchase price, SEI shall have the rights under section 3(3) below.

- Guaranties.
    a. CDP or another entity specified by CDP will provide all guaranties required in connection with the Project. SEI shall have no responsibility or obligation to provide guaranties or to fund any amounts in connection with the Project.

- Limited Liability.
    a. SEI and its partners, directors, officers, agents and employees shall have no personal liability with regard to any debt or obligation of the Partnership.

- Reimbursements.
    a. CDP will be responsible for payment of all pre-development expenses; provided, that all pre-development expenses incurred by CDP shall be reimbursed by the Partnership. SEI shall have no responsibility or obligation to fund pre-development expenses.

- Roles and Responsibilities.
    a. CDP will be primarily responsible for management of the development and construction of the Project.

Community Engagement

For housing projects to be accessible to everyone, outreach and marketing must be both wide-ranging and able to be tailored to specific populations. Coordination between SEI, PHB, the N/NE Oversight Committee, and community organizations is crucial to ensure that historically marginalized populations who are often least likely to apply are aware of these housing opportunities.

The backbone of SEI's involvement as a co-owner/co-developer in the Alberta Alive properties is their connection to BIPOC communities and specifically the Black community in Portland. SEI has deep and wide connections within this historically African American neighborhood, including local schools, faith-based organizations, advocacy groups, and other culturally specific service providers with whom we communicate about Alberta Alive

to build trust and interest in the projects. This reputation affords SEI the ability to interact with its community to receive ongoing feedback that informs our service delivery approach and has informed our design across all Alberta Alive phases.

SEI and CDP have organized focus groups where we have consulted with community members about what they as prospective residents would like to see in their Alberta Alive community and their home. These community members were compensated for their time and provided food and childcare. Our team places a high value on the input of our community members regarding our housing development projects, including this one. That is why we will always provide a stipend to pay the participants of our focus groups for their time and the invaluable information they provide.

Feedback from the focus groups resulted in larger community spaces on the ground floor, the inclusion of heat pump heat/AC units in each dwelling unit, indoor and outdoor areas with play elements for children. Participants also provided feedback that has helped shape the resident services, programs and events that will be offered. This feedback included having more site based activities for children and youth, and improving/clarifying the roles and responsibilities of resident services and property management staff.

SEI's Community + Family Programs (CFP) department served over 6,000 individuals in FY 2022. This included 680 families in our Homeless Housing Programs and 873 families who received some form of housing assistance. SEI staff will be able to work specifically with these program participants to identify community members who are ready to move towards a goal of home ownership. SEI will work closely with identified families, walking them through the process of preparing for a homeownership opportunity by completing a Preference Policy application and maximizing their potential points in the Preference Policy application process.

There are over 5,500 SEI families that are enrolled in our programs, including Schools Uniting Neighbors (SUN), afterschool programming, domestic violence participants, and housing and energy assistance programs. 70% of these participants are people of color. We intend to reach out to these families to inform them of the opportunities this project will provide. This outreach will include a targeted effort to inform these families of the rental and homeownership opportunities, criteria, and resources available to assist them. All program participants will receive marketing materials and have the opportunity to meet with staff to discuss how they may participate.

Advancing Racial Equity

One way we approach serving BIPOC households is by securing sites for affordable housing and offering co-development and co-ownership opportunities for organizations led by communities of color. To date in Oregon, CDP has created co-ownership structures with the Native American Youth & Family Center (NAYA) on three developments, Hacienda CDC on two developments, and SEI on two developments. These partnerships offer organizations led by communities of color a meaningful stake in the project, support long-term stewardship for the BIPOC population served, and provide long-term financial benefits for

each organization involved. CDP is a partner with NAMC-Oregon to broaden efforts to reach minority contractors and increase diversity on each of our projects.

SEI is Oregon's largest African American led nonprofit multi-service organization, and second-largest minority-operated employer. In 2018-19, SEI's comprehensive services benefited over 16,300 K-12 students, youth ages 18- 25, families, and individuals across the City of Portland and Multnomah County. SEI's organizational philosophy and service delivery model are rooted in self-actualization, providing trauma-informed practices with the goal of overcoming persistent race-based disparities. SEI's Relationship Model and comprehensive service continuum are culturally specific for African Americans and culturally responsive for other populations.

With 150 full-time and 46 part-time staff members; 75% African American and 89% from communities of color, SEI partners with 23 public schools in five districts across Multnomah County: Portland, Reynolds, Parkrose, David Douglas, and Centennial. SEI's network throughout the Black community in Portland is unrivaled and will be at the center of the project's success in attracting the BIPOC community to apply for rental and homeownership opportunities.

The Strong Site (along with Abbey Townhomes) project is the next step in SEI and CDP's shared Alberta Alive development initiative that aims to celebrate and strengthen Portland's historically Black N/NE neighborhoods by providing affordable housing, supportive services, and a shared sense of community for underserved individuals and families. Phase I and II of the Alberta Alive development initiative recently completed construction along Alberta St., totaling over 100 units. They include housing choices from permanent supportive housing (PSH) for veterans to family-sized units available to households earning between 30% - 60% AMI.

Like Alberta Alive Phases I and II, SEI will serve as the lead Resident Services provider for Phase III (the Strong and Abbey Lot projects). SEI's Housing and Community + Family Program (CFP) staff members are well connected to numerous public/private stakeholders and have well-established community outreach and engagement mechanisms that will greatly bolster the project team's advertising efforts to minority and marginalized communities.

CDP and SEI's marketing and lease-up team will work closely with PHB to advance the N/NE Preference Policy. Alberta Alive Phase II (Dr. Darrell Millner Building) is also subject to the Preference Policy and that development will provide CDP and SEI staff to gain familiarity with the Policy, eligibility criteria for applicants, timelines, and processes.

- N/NE Preference Policy and Rentals:

Guardian will be managing Alberta Alive Phase II/Dr. Darrell Millner Building for CDP and SEI. That 63-unit property will be Guardian's first that is participating in the Preference Policy. It has already begun pre-leasing and will come online prior to the Strong property. Through that lease up, Guardian, CDP and SEI will receive training, gain experience, and

work closely with PHB on the Preference Policy, all of which will be able to be applied to this site.

Guardian also has significant experience with other formalized preferences at multiple CDP properties as well as other properties throughout their portfolio. Guardian staff is very familiar with the processes involved in setting up and implementing preferences, including writing Tenant Selection Plans (TSP) that meet OHCS and HUD compliance requirements, conducting marketing and lease up practices that comply with stated preferences and Fair Housing laws, and maintaining applicable waitlists for properties' stated preferences.

The project is committed to achieving PHB's aspiration MWESB goal of 30% participation. Internally, the team set a more ambitious goal of 40% for participation from COBID and non-COBID/BIPOC firms. We are currently exceeding that internal goal based on our bid results from the GMP bid process. Those results are detailed below (and may change slightly as the bidders/budget is finalized).

COBID Certified Firms
- ESB - 4.16%
- MBE - 23.19%
- WBE - 0.62%

Total COBID Certified = 27.97%

BIPOC/non-COBID Firms
14.6%

COBID and BIPOC = 42.57%

We are currently tracking a COBID participation rate of 62.5% for professional services for the project, well above PHB's aspirational rate of 20%.

The project is also subject to PHB's Apprentice and Workforce Diversity program. This program requires a minimum of 20% of the hours worked, by trade, on contracts that exceed $300,000 and jobsite work hours exceed 300 hours in any given trade, must be worked by state registered apprentices throughout the duration of the project.

PHB's Apprentice and Journey Level Aspirational Diversity Goals are below:
- A minimum of 22% of the total apprentice hours shall be worked by BIPOC individuals
- A minimum of 9% of the total apprentice hours shall be worked by women
- A minimum of 22% of the total journey level hours shall be worked by BIPOC individuals
- A minimum of 6% of the total journey level hours shall be worked by women

The team will report monthly on progress toward these targets, and is committed to meeting these aspirational goals. Historically, the team has had greater success in meeting

and exceeding the BIPOC categories that the women categories, which continue to be a persistent challenge across trades.

Partnerships and Services

Guardian Management (Guardian) will act as our on-site property manager. Guardian is an Oregon-based firm doing business in the Pacific Northwest. The company has evolved into a leading management, development, and investment firm. Defined by their deep commitment to the communities in which they invest, Guardian continues to advocate for housing across the entire spectrum.

Guardian has extensive experience in providing resident services and collaborating with service providers to deliver targeted services that meet the needs of the resident populations they serve. Guardian has piloted a multitude of prominent real estate projects including, mixed use and mixed income projects, historic preservation projects, affordable housing, senior housing, and conventional apartments and condominiums. Currently the company's portfolio is comprised of over 130 communities throughout 90 cities in four states. Guardian currently provides Property Management services across 80% of CDP's Oregon portfolio and is working with CDP and SEI at Alberta Alive Phase I and Phase II.

Livability and Accessibility

The project contains a 4-story elevator building, built with Type 5A construction. The building is 86,252 SF with a floor area ratio (FAR) of 2.05:1 and 34 parking spaces (a 0.45:1 parking ratio). The height is 45'-0" and 49'-0" with the roof parapet.

Building and site amenities include a 3,500 SF outdoor courtyard, a 2,000 SF private play area, shared laundry facilities to foster community, an indoor community room, as well as a generous lobby and front porch area at the intersection of N. Williams Avenue and Alberta Street. These amenities and gathering spaces are targeted at families and children, who will make up the majority of the building's occupants. They are intended to provide indoor and outdoor spaces outside of one's apartment where residents can gather for community events, classes, informal get-togethers, and recreation at the onsite play structures.

Unit amenities will include energy efficient heating and cooling systems, direct ducted, continuous ventilation to ensure healthy indoor air quality, LVT flooring, and efficient operable windows.

Additional building amenities include a 3,500 SF landscaped courtyard and a 2,000 SF play area for children, 34 onsite parking spaces, and indoor bike storage rooms. The building has one elevator and units will include a mix of Type A and Type B ADA units.

Climate Resilience and Sustainability

Environmental efficiency and resiliency are critically important to CDP and SEI. As the Portland region continues to see increasing effects of the climate crisis we need to ensure

that our new buildings are built to withstand impacts like heat waves and smoke events. We place special emphasis on measures that directly benefit residents through lower utility bills, healthy indoor air quality, and respect culturally specific lifestyle preferences and practices.
We are meeting the following criteria of the PHB Green Building Policy:

- We will be pursuing Earth Advantage and will be targeting a Platinum rating
- The projects will have a 105,5 kW solar PV installation
- The projects will be EV Ready at a minimum and include 4 EV charging stations
- The Strong project will be registered with the multifamily market solutions offering program administered by the ETO

We intend to employ the following features and strategies in order to reduce energy and provide a healthy and resilient building for residents:

- Bicycle parking and storage provided
- A reflective surfaced roof to reduce the heat-island effect
- Enhanced insulation installation practices
- Double-pane, insulated windows
- Highly efficient mechanical and lighting systems
- A tight building envelope (i.e., special attention to seal air leaks)
- Direct ducted intake and exhaust from unit bathrooms and kitchens
- Third-party performance testing will be conducted to confirm compliance with Earth Advantage criteria and to improve energy performance, reduce draftiness and ensure enhanced indoor air-quality

The sites are highly walkable community with amenities located a short walk from public transportation, bike routes, and other community resources.

Having worked on many PHB and OHCS funded projects, Holst and COLAS are also very experienced with PHB requirements, including the PHB Green Building Policy, accessibility standards, Air Conditioning Policy, as well as the Equity in Contracting, Section 3 and workforce requirements and reporting. While they have not yet worked on a N/NE Preference Policy project, Guardian has ample experience managing PHB funded properties and their staff is very familiar with the ongoing compliance and reporting requirements that accompany PHB funding.

Anticipated Timeline

Metro Concept Endorsement	**6/2023**
Plans Completed	**2/2024**
Financial Commitments	**5/2024**
PHB Housing Investment Committee Approval	**6/2024**
Building Permits/Fees	**7/2024**
Financial Closing	**8/2024**

Construction Start	**8/2024**
Construction Completed	**2/2026**
Lease-Up Completed	**8/2026**

600 NE Grand Ave.

Metro Affordable Housing Bond Program

Final Approval

Project Name: The Dolores
Implementing Jurisdiction: City of Hillsboro
Metro IGA Contract Number: 936670
Anticipated construction start: September 2024
Anticipated construction completion: March 2026

Action:
Metro hereby provides the City of Hillsboro with Final Approval of $8,750,000.00 Metro Affordable Housing Bond eligible share funds and $1,750,000 Site Acquisition Program (SAP) funds for the development of The Dolores, a regulated affordable housing project located at 9985 NE Walker Road, Hillsboro. Metro staff findings are attached in Exhibit A, and a more detailed description of the Project, as provided by the City of Hillsboro, is attached as Exhibit B.

This Final Approval is based upon the information contained in the final approval request provided to Metro by the City of Hillsboro, including Project cost proformas and statements of sources and uses of funding needed to generate a Project with the following unit mix:

Number of Units	Bedroom type	AMI Level	Project Based Vouchers
10	One-bedroom	30%	2
10	One-bedroom	60%	0
6	Two-bedroom	30%	2
11	Two-bedroom	60%	0
12	Three-bedroom	30%	2
14	Three-bedroom	60%	0
2	Four-bedroom	30%	2
1	Four-bedroom	60%	0

Changes to the information contained in the final approval request provided by the City of Hillsboro could result in reevaluation of the Project's need for Metro Affordable Housing Bond Funds and changes to the staff findings and funding allocation to the Project before funding disbursement. Disbursement of funds for the Project will be processed in accordance with the terms and conditions set forth in the Affordable Housing Bond Measure Program Intergovernmental Agreement between Metro and the City of Hillsboro, and will occur within 10 days of Metro's receipt of the following items: a draft regulatory agreement

Metro

600 NE Grand Ave.
Portland, OR 97232-2736
oregonmetro.gov

meeting IGA requirements, a final sources and uses budget, a construction contract schedule of values, and an invoice from the City of Hillsboro including wiring or other instructions related to transfer of funds.

July 25, 2024

Marissa Madrigal

Date

Chief Operating Officer

Exhibit A: Metro staff findings and recommendations | Metro Affordable Housing Bond Final Approval request for The Dolores

Metro
600 NE Grand Ave.
Portland, OR 97232-2736

Drafted by: Jimmy Oporta, Senior Housing Program Coordinator and Alison Wicks, Housing Program Supervisor

Date: July 25, 2024

Criteria for funding approval

Metro will issue Final Approval to local implementation partner (LIP) upon Metro's determination that (a) the proposed Project reasonably contributes to the Unit Production Targets relative to the amount of the Eligible Share proposed to be used for the Project; and (b) the Project is consistent with the Local Implementation Strategy (LIS), the Work Plan, and the Bond Measure.

Staff recommendations

Staff recommends the Metro Chief Operating Officer (COO) provide Final Approval of funding for The Dolores. Findings from Metro's staff review are summarized below. Additional information about the project can be found in Exhibit B, the project narrative submitted by the City of Hillsboro.

Changes since Concept Endorsement

The project is being reviewed for Final Approval and has undergone changes since Concept Endorsement on May 10, 2023. Project development costs increased to $41.77 million, up $7.21 million (+20.9%) from the prior $34.56 million. Project funding sources have correspondingly increased $8.46 million. The Metro Housing Bond funding amount remains unchanged at $10,500,000, of which $8,750,000 will be from Hillsboro's eligible share of Housing Bond funds and $1,750,000 will be Metro Site Acquisition Program (SAP) funds. While the number of units affordable at 30% of AMI is unchanged at 30 (45.5% of total units), the affordability within the unit sizes has shifted: five one-bedroom units shifted from 30% to 60% of AMI affordability, two two-bedroom units shifted from 60% to 30% of AMI affordability, four three-bedroom units shifted from 60% to 30% of AMI affordability and one four-bedroom unit shifted from 30% to 60% of AMI affordability. Key project highlights include:

- Total development costs are $41.77 million and Metro Housing Bond funding is $10.5 million.
- Net cash developer fee is 6.58 % of developer fee basis. This amount is less than the Metro maximum of 10.0% for projects with 31-75 units and is within Metro's maximum of $3.0 million.
- Construction start date in September 2024 with completion anticipated in March 2026.

Contribution to unit production targets

The Dolores will utilize 39% ($10,500,000) of Hillsboro's total allocation of bond funds while delivering 66 units that meet the following unit production outcomes:

- 35% of Hillsboro's overall unit production target
- 39% of Hillsboro's target of units affordable to households making 30% or less of area median income (AMI);
- 49% of Hillsboro's family sized unit target

When combining this project with the City of Hillsboro's existing development portfolio, this puts the City on a path to have utilized 80% of total allocation of bond funds while delivering on the following cumulative unit production outcomes:

- 88% of Hillsboro's overall unit production target
- 90% of Hillsboro's target of units affordable to households making 30% or less of area median income (AMI)
- 123% of Hillsboro's family sized unit target

Eligibility and readiness to proceed

The City of Hillsboro has submitted and Metro staff have reviewed and evaluated submitted materials for evidence of project feasibility and readiness to proceed. These include:

- Updated project pro forma dated 5/31/2024
- Maul Foster Along, Phase I Environmental Site Assessment report, dated 2/2/2024
- Construction bid set drawings from Access Architecture, dated 6/30/2024
- Metro Site Acquisition Program approval letter, dated 6/9/2022 as evidence of developer site control
- CBRE, Inc. Appraisal Report, dated 5/10/2024
- Letters of intent from Beneficial State Bank, Red Stone Equity Partners, OHCS Multifamily Energy Program
- Development team resumes and developer schedule of real estate owned demonstrating a track record with housing development in Oregon
- Hacienda CDC Resident Services Plan
- Updated community engagement outcomes summary
- NWRECC Affirmative Fair Housing Marketing Plan, dated 5/31/2024

Staff have not identified any unusual risks to project feasibility and readiness and will continue to request updates from the City of Hillsboro regarding how work is proceeding.

Advancing racial equity

Metro staff have reviewed final project materials to confirm consistency with the racial equity elements of City of Hillsboro's approved local implementation strategy (LIS). Key findings include:

- **Location:** The Dolores is in a residential, commercial, and mixed-used neighborhood within the Tanasbourne area of Hillsboro. The site is near Magnolia Park, three grocery stores (Safeway, Trader Joes, Whole Foods Market), McKinley Elementary school, and public transit.
- **Transit access:** The project is served by the Cornell Road #48 bus line to the north, which is within walking distance of the site.
- **Diversity in contracting/hiring**: Hillsboro's Local Implementation Strategy calls for 20% of total project costs to be awarded to COBID-certified firms, with an aspirational goal to reach 30% COBID subcontractor participation. In addition, Hacienda has set an aspirational 30% goal for COBID professional services participation. Access Architecture is a minority-owned firm and consistently seeks out and contracts with certified firms in all areas of design and engineering. The project will be tracking workforce participation and will strive to meet or

exceed the aspirational goal of awarding 25% of workforce jobs to women and minority workers.

- **Access for historically marginalized communities:** Hacienda will partner with IRCO (Immigrant & Refugee Community Organization) to engage communities with diverse language and cultural needs throughout the marketing and lease-up process. Social media posts, flyers, television and radio ads will be designed and distributed in various languages across Washington County. Marketing will be primarily targeted to low income and BIPOC communities and will continue throughout the lease-up process. Three months before the project's application release date, Hacienda will invite community members, prospective tenants and community organizations to three information sessions presented in various languages and these will be offered both virtually and in-person. Within one week of the application release date, Hacienda will host an in-person event to provide technical assistance to future applicants and collect completed applications. Hacienda will work with Northwest Real Estate Capital Corporation (NWRECC) to ensure screening criteria are low barrier and consistent with Hillsboro's Local Implementation Strategy to increase access for historically marginalized communities.
- **Culturally appropriate services:** Hacienda will be providing culturally responsive, on-site services to support housing stability and promote the safety and wellbeing of residents. Hacienda's bilingual Resident Services Coordinator (RSC) will collaborate with property management staff in conducting site visits, sharing information to residents about community programs and resources, and review any possible lease violation matters to ensure actions are unbiased and appropriately documented. The RSC will also connect households with resources needed to stabilize their housing. These resources may include emergency rental assistance, food pantry, utility assistance, financial classes and provide medical or behavioral health referrals. Case management and wrap around services for the 12 PSH units will be provided by New Narrative. Dolores' PSH units will serve Population A and use Washington County's coordinated access system for resident referrals.
- **Cooling plan:** The Project will be designed to Earth Advantage Gold level certification. Air conditioning will be provided through mini-split HVAC systems in all units and community spaces.

Community engagement to inform project implementation

Metro staff have reviewed the narrative to confirm consistency with the community engagement elements of City of Hillsboro's approved Local Implementation Strategy (LIS). Key findings include:

- **Strategies for ensuring ongoing engagement around project implementation reaches communities of color and other historically marginalized community members:**

  In partnership with Access Architecture, Hacienda led two community engagement groups to gain feedback and input on building program services and design elements. To support engagement, an Advisory Round Table was convened, along with three separate resident focus groups. The Advisory Round Table was composed of community leaders representing a variety of organizations and met on three occasions over a five-month period. The Advisory Round Table focused on coordinating future community engagement activities, discussed design direction and feedback and brainstormed ideas for artwork and murals for the project. The resident focus groups also met on three occasions over a five-month period. The first group focused on design elements including courtyard layout, separation between private and public spaces and integration of permanent supportive housing residents into

the larger community. The second resident focus group reviewed interior common areas and layouts and provided feedback on connecting residents with each other though shared community spaces at the project. The third resident focus group came together to provide feedback on interior design finishes, materials, and color choices. The development team has agreed to conduct construction site tours with members of both the advisory round table and resident focus groups.

Major themes gathered from community engagement included:

- Developing separation between private and public realms (community spaces)
- Importance of covered outdoor seating areas
- Arranging children's play areas throughout the community
- Developing socializing nodes at various locations throughout the community to invite neighbors to connect with each other
- Using wood and nature-inspired colors at eye-level, which can be calming and grounding
- Increased amounts of natural light throughout the building

Major design feedback heard from community engagement included:

- Widening of corridors at unit entries and common areas for easier maneuvering
- Multi-purpose spaces with flexible seating for a wide variety of body types and abilities
- Clear and consistent wayfinding system to guide residents and visitors throughout the building
- Two elevators to increase access and minimize wait times for residents and visitors
- All-gender restrooms that accommodate all, regardless of gender identity or expression
- Integration of unit storage at all reach ranges, including full-height pantries wherever possible

Dolores – City of Hillsboro

Final Approval Project Narrative

Project Overview

The Dolores is a 3-story, elevator-served affordable housing development proposed on two parcels at 9965 NE Walker Rd. in Hillsboro. Named after labor activist Dolores Huerta, it provides 67 total units ranging from 1-bedrooms to 4-bedrooms, of which 66 affordable units will serve households making between 30% AMI and 60% AMI. The development dedicates 12 units to Permanent Supportive Housing (PSH), which will receive case management services through New Narrative. Hacienda CDC will be developer, owner, and resident services provider. The site is approximately 2.33 acres total gross with 1.95 acres net developable. The two parcels comprising the site are currently owned by Metro and will be conveyed to the developer at financial closing of the project.

Total project cost is estimated at $41.8 million and includes the following sources:

- $10.5 million in requested Metro Bond Funding
- $16.7 million in 4% LIHTC Equity,
- $8.7 million in Permanent Debt
- $2.3 million in Deferred Developer Fee
- $637,715 in Sponsor Loan
- $172,860 in Energy Credits
- $200,000 in energy incentives from ORMEP
- $20,000 in energy incentives from ETO

Changes between Concept Endorsement and Final Approval

1. **Total Development Cost:** increased from $34.6 Million to $41.8 Million, an increase of $7.2 Million, due to $5 million in additional construction hard costs associated with developed design, required offsite improvements to Walker Road and 101st, other infrastructure and construction costs, $500,000 in soft costs, approximately $500,000 in increased fees for financing, and an approximately $900,000 increase to developer fee.

2. **Increase in Developer Fee:** Increased development costs also resulted in an adjustment to the developer fee from $4,442,960 to $5,335,351 with the net cash fee adjustment from $1,805,985 to $2,362,285, accounting for a sponsor cash loan and any other sponsor equity contribution. Gross cash fee is estimated at $3 Million. See table below:

	Concept Endorsement	Current Budget
Gross Developer Fee	$4,442,960	$5,335,351
Gross Fee as % of TDC	15%	12.77%
Deferred Developer Fee	$1,286,975	$2,335,351
Gross Cash Fee	$3,155,985	$3,000,000
Sponsor Cash Loan	$690,000	$637,715
Sponsor Equity Contribution	$1,350,000	$0
Net Cash Fee	$1,805,985	$2,362,285

3. **Building Square Footage:** was reduced slightly due to site conditions and setback requirements. Square footages under OHCS requirements have been requested as variance in the project's NOFA applications and are under review.

4. **Parking**: was reduced by 2 stalls due to existing tree root boundaries, required setbacks and site constraints.

5. **Unit, Rent and Income Mix:** Two additional PSH units were dedicated to the project to receive additional rent subsidy grants from Washington County, which requires projects dedicate 30% of units to be vouchered in order to receive funds. Unit square footages have been adjusted per site conditions and building design. Rents were also increased to 2024 maximums.

6. **Property Management:** Changed to Northwest Real Estate Capital Corp.

7. **Community Engagement:** Efforts continued after Concept Endorsement and an updated summary of activities and results is included in this narrative.

8. **Project Schedule:** Financial close and property conveyance dates revised as shown in project schedule section. Construction period revised per LMC review of developed design drawings and required offsite improvements. Lease up and conversion schedule revised per extended construction timeline.

Preliminary Development Program

The development program of the Dolores includes 66 affordable units, with a total of 30 units provided at 30% of Area Median Income (AMI). The project features 46 family-size units of two-bedrooms or more, comprising nearly 70% of the project, and includes 26 three-bedroom units and 3 four-bedroom units. Ten units will be dedicated to Permanent Supportive Housing (PSH). The single 3-story building will total 75,209 square feet. Project amenities include a community room, bike room, laundry rooms on each floor, exterior courtyard with covered seating, playground, community garden and property management and resident services offices. The Dolores will provide 72 stalls of off-street parking, at a ratio of over one space per unit.

The preliminary development program unit mix, income and rent table follows below:

Unit size (no. of bedrooms)	No. of units	AMI %	PBVs	RLRA Vouchers	Square feet/unit	Gross monthly rent/unit[1]
2 Bed	1	Unrestricted Manager			800	$0
Studio	0					
1 Bed	2	30%	2		591 - 671	$663[2]
1 Bed	8	30%		8	591 - 671	$663[3]
1 Bed	10	60%			591 - 671	$1,327
2 Bed	2	30%	2		791	$796[2]
2 Bed	4	30%		4	791	$796[3]
2 Bed	11	60%			791	$1,593
3 Bed	2	30%	2		996 -1032	$920[2]
3 Bed	10	30%			996 -1032	$920
3 Bed	14	60%			996 -1032	$1,841
4 Bed	2	30%	2		1,335 - 1386	$1,026[2]
4 Bed	1	60%			1,335 - 1386	$2053
Total	67					

1 Maximum gross rents at time of execution of this Agreement. Maximum gross rents will be adjusted annually based on change in AMI published by HUD.

2 Current maximum gross rent that would be paid by residents in units with Project-Based Vouchers (PBVs). As long as units have PBVs, the gross rent is determined by the formula set by the Housing Services Office of Washington County for Project-Based Section 8. In the case of a loss of subsidy, the AMI will be increased up to 60% AMI.

3 Current maximum gross rent that would be paid by residents in units with Regional Long Term Assistance (RLRA) Vouchers. As long as units have RLRA vouchers, the gross rent is determined by Washington County Supportive Housing Services. In the case of a loss of subsidy, the AMI will be increased up to 60% AMI.

Project Image

Background

The City of Hillsboro, in partnership with Metro, issued a Request for Proposals (RFP) for affordable housing in late September 2022 to competitively bid disposition and development of the Metro-owned 2-acre property on NE Walker Rd. in Tanasbourne. The RFP resources also included up to $11 Million of Regional Housing Bond funds available for the project.

The following minimum requirements were identified in the RFP for the Walker Rd. site:

- 60 affordable housing units minimum
- Minimum 40% of total units regulated at or below 30% AMI
- Minimum 40% of total units at two bedrooms or more
- Racial Equity, Resident Services and Community Engagement plans
- Cooling plan providing for A/C in each unit

In addition, the following preferences were included in the RFP:

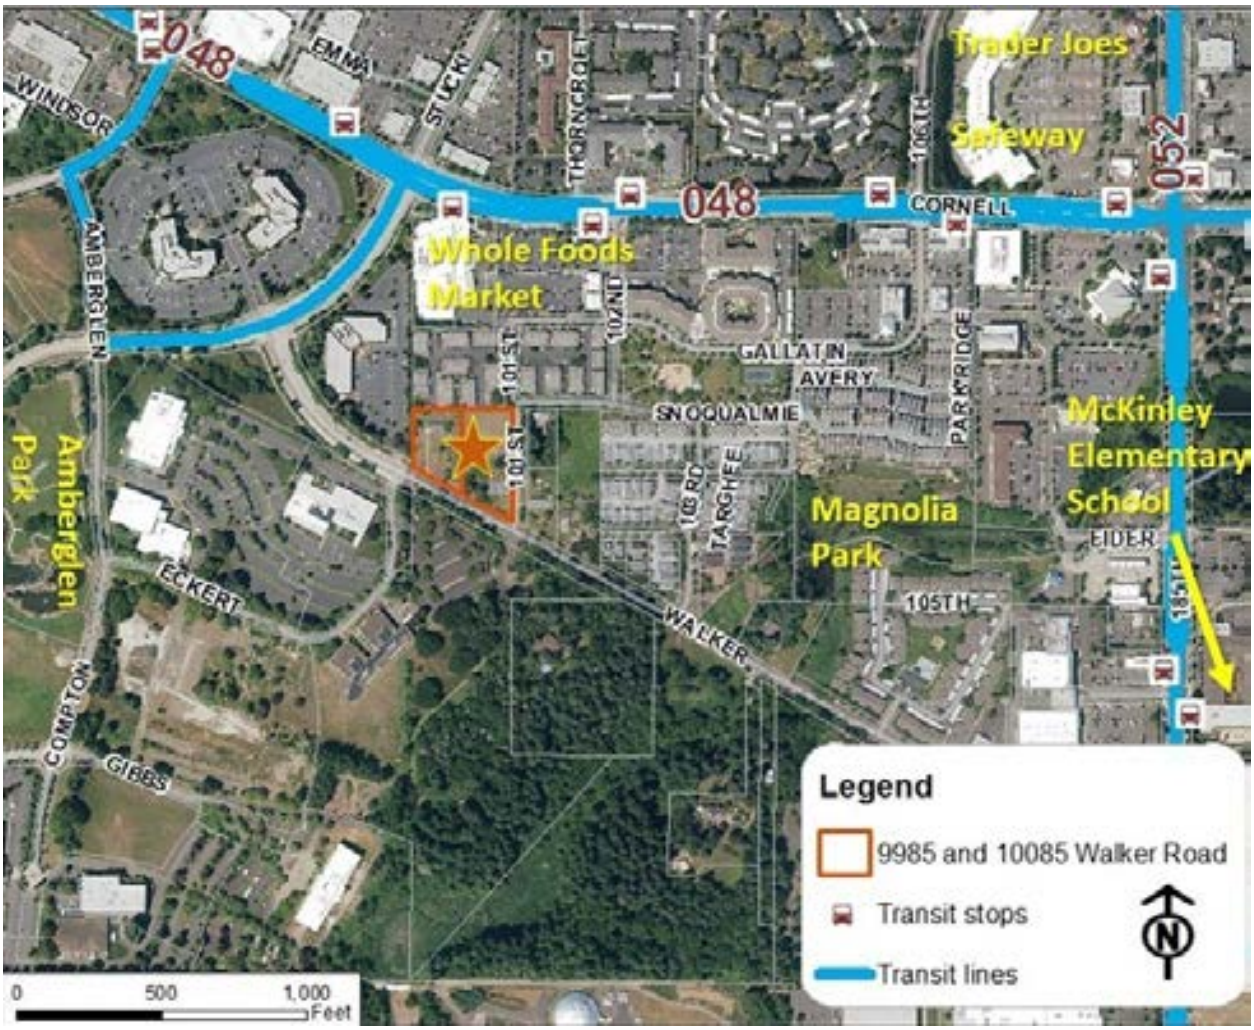
- Proposals with more than the minimum-required units
- Proposals that included dedicated Permanent Supportive Housing (PSH) units
- Diversity contracting utilization greater than 20% of total project costs
- Voluntary workforce tracking and reporting

At the December 2022 deadline, the City received three project proposals from affordable housing developers. The City and Metro formed an evaluation committee to review and score the proposals, informing the City Staff-recommended project. The committee met three times throughout the project evaluation period and submitted scores evaluating each proposal. The committee scored the Hacienda CDC proposal highest amongst the three proposals. After an interview with the Hacienda CDC development team and further project vetting, City Staff recommended selection of the Dolores project in accordance with the recommendation of the evaluation committee. Hillsboro City Council approved the selection and granted Concept Endorsement of Dolores on March 21, 2023.

The Metro Site Acquisition Program purchased the NE Walker Rd. properties in late June and early July 2022 working closely with the City. Due diligence conducted to-date includes Phase I and II Environmental Site Assessment (ESA) reports, a Contaminated Media Management Plan and a Geotech report. Metro also contracted with 3J Consultants for site development feasibility analysis and concept planning.

Location and Neighborhood

The Dolores project site is in a residential, commercial and mixed-use neighborhood proximate to a wide range of amenities, shopping, and services. Magnolia Park is a short walk away, the site is proximate to three grocery stores (directly abutting Whole Foods parking lot), McKinley Elementary school is a short distance to the south; the #48 bus line and stop on Cornell is walking distance and there are new market rate apartments being built directly south of the site. The addition of affordable housing at this location will help to create a vibrant mixed-income neighborhood within the Tanasbourne area of Hillsboro.



Site

The site is comprised of two abutting tax lots totaling 2.33 acres, with approximately 1.95 acres estimated as net developable after the required right-of-way dedications for 101st Ave and NE Walker Rd. As previously mentioned, the site is owned by Metro with disposition to Hacienda CDC anticipated through a future Disposition and Development Agreement (DDA). A single-family home on the western parcel has already been demolished and the home on the east lot has a tenant who will rent from Metro until July of this year. After relocation, that home will also be demoed to make way for the affordable housing project.

The Phase I and II Environmental Site Assessment (ESA) reports and a Contaminated Media Management Plan had the following findings:

- Decommissioned heating oil tank at 9985 Walker
    - DEQ closure letter issued June 2022
    - Contaminated Media Management Plan prepared by Maul Foster
- Electromagnetic scan found no other heating oil tanks
- Surface soil sampling found pesticides below levels of concern for human well being

- HazMat studies to be conducted on residential properties before demo by Metro/consultant
- No further action recommended.

A Geotech report was also completed. Analysis noted:

- Moisture sensitive soils
- Unconsolidated silts
- Unknown groundwater depth
- Site deemed suitable for shallow foundation construction with no underground parking
- Further pre-construction borings recommended

Metro also contracted with 3J Consultants on a site development feasibility analysis with the following findings:

- The sites contain a mix of Multi-Unit Residential (MR-2) and Mixed-Use Neighborhood (MU-N) zones
- Maximum allowed density with SB 8 bonus applied is 67 units
- A conceptual site study achieved 60 units with 60 parking spaces (1:1 parking ratio)
- An expired Planned Unit Development (PUD) approval defines re-alignment of 101st Avenue desired by City
- Required off-site improvements were estimated at $1 million

Project Financing

Total development costs for the Dolores are estimated at $41,766,813 or $623,385 per unit, and $286,073 per bedroom. The requested Metro bond funding amount for gap financing is $10.5 Million, equaling a subsidy of $159,091 per unit or $72,917 per bedroom.

Sources of proposed financing include:

- Metro Bond financing in the amount of $10,500,000, of which approximately $8,750,000 will be from Hillsboro's eligible share of Affordable Housing Bond funds and approximately $1,750,000 will be from Metro's Site Acquisition Program (SAP) funds.
- Total LIHTC equity of $16,777,179 based on pricing of $0.83 per available credit.
- Permanent mortgage of $8,724,086, based on terms provided by Beneficial State Bank
- Federal Energy Tax credits of $154,347, based on 30% of solar facility installation costs of $584,649.
- Sponsor cash loan of $637,715.
- Deferred Developer fee of $2,335,351.
- Energy Trust of Oregon rebates of $20,000 for installation of the solar facility.
- Oregon Multifamily Energy Program rebates of $200,000 for installation of energy efficient systems including heat pump water heaters and mini split systems.

Beneficial State Bank will make a direct purchase of the OHCS-issued private activity bonds (PABs) in an amount not to exceed $20,730,000.

The project is expected to apply and qualify for Hillsboro's Nonprofit-Owned Low-Income Housing Property Tax Exemption program.

A sources and uses table follows below:

Sources	Total	per Unit
LIHTC Equity	16,777,179	250,406
Federal Energy Credits	172,860	2,580
Permanent Loan	8,724,086	130,210
ORMEP	200,000	2,985
Energy Trust of Oregon	20,000	299
Sponsor Loan	637,715	9,518
OHCS LIFT	2,399,522	35,814
Metro Bond	10,500,000	156,716
Deferred Developer Fee	2,335,351	34,856
TOTAL SOURCES	**41,016,813**	**623,383**

Uses	Total	per Unit
Acquisition	100	0
Construction	28,608,023	426,985
Soft Costs	5,040,406	75,230
Financing Costs	2,226,166	33,226
Reserves	556,767	8,310
Developer Fee	5,335,351	79,632
TOTAL USES	**41,016,813**	**623,383**

As cited previously, the Gross developer fee is $5,335,351, or 12.77% of total development costs per City of Hillsboro underwriting guidelines. The gross cash developer fee is $3 Million. Taking into account contributed fees (sponsor loan), and general partner note contributions, the net cash fee to Hacienda CDC will be $2,362,285.

In November 2022, Hacienda submitted an RFI response to Washington County SHS requesting rent assistance contingency funding for rent assistance beyond the availability of SHS funding in June 2032 for the 12 dedicated PSH Units. Washington County SHS has agreed to fund a minimum of $1,540,673 ($154,067 per unit) for 15-year rent subsidy, with an option for reapplication for additional funding. Hacienda is currently coordinating reapplication efforts to obtain this additional funding. Hacienda continued correspondence with SHS, working with the department to develop a unique financing structure to ensure PSH units will be subsidized beyond the sunset date for RLRA vouchers. Hacienda and SHS are currently reviewing and negotiating a rental subsidy agreement for a total of $6,079,335.

The Dolores will contain 12 PSH units with services provided by New Narrative. The project is sponsored and will be owned solely by Hacienda CDC, a culturally specific developer with an exceptional track record of serving communities of color.

Development Team

Developer – Hacienda Community Development Corporation
Hacienda CDC (Hacienda) is the project sponsor, developer, owner, and resident services provider. Hacienda is a Latino Community Development Corporation that strengthens families by providing affordable housing, homeownership support, economic advancement, and educational opportunities. Since inception in 1986, Hacienda has worked to promote the wellbeing of low-income individuals and families, with expertise and focus on the Latino community. With a combination of affordable housing and services for residents and the community at-large, Hacienda has worked to improve the lives of residents, helping children stay in school and families thrive, and continues to strategically transform the neighborhoods in which they operate.

Hacienda Real Estate Development builds quality, affordable housing where families can live and thrive in safe, supportive, community-centered environments. Hacienda has rehabilitated or built 381 units of affordable housing in some of the most depressed areas of North and Northeast Portland and Molalla. In addition, Hacienda and Community Development Partners (CDP) co-developed Rockwood Village, 224 new units of affordable housing in Gresham, which opened this past summer, and are in construction on a new co-development venture, Maple in Oregon City (171 units). Both developments include Metro Bond funding. Hacienda has also completed construction on Las Adelitas, 142 new affordable homes in Portland's Cully neighborhood. Hacienda has also developed three community benefit commercial properties, the Ortiz Center, Hacienda CDC Administrative headquarters; and the Portland Mercado.

Hacienda Resident Services provides culturally responsive, on-site services for residents to support their housing stability, to build community, and to promote safety and wellbeing of residents. The Resident Services team is part of the Youth and Family Services Department and works to connect residents with resources and programs in the community and to Hacienda's programs and services.

Architect – Access Architecture
Using informed design and community engagement to foster meaningful connections. Access Architecture will facilitate the design of the project rooted in their commitment to quality housing for all and culturally responsive community engagement. Founded in 2018, Access Architecture, LLC is a mission-driven, minority owned, full service architectural and planning firm. Access Architecture provides professional services ranging from feasibility studies and funding packages to construction contract administration and post-occupancy evaluations.

Through an innovative Outcome-Based Design process, community engagement is paired with academic research to create designs that are better informed and more effective. Access Architecture is also committed to community involvement, utilizing its 5+ Project to devote time towards volunteer efforts.

With a combined 30+ years of experience working in affordable housing design, Access Architecture is well versed in projects obtaining local, state, and federal funding. They are intimately knowledgeable with public funding streams and understand the often-complex framework of requirements that apply to a project based on building typology, local jurisdictions, and project funding sources.

General Contactor – LMC Construction

LMC Construction will be the General Contractor on the Project. Founded in 2004, LMC Construction (LMC) is one of the leading General Contractors in Oregon & SW Washington. At LMC, they believe in building relationships, a commitment to quality, and developing communities that foster connections and enrich the lives of the residents who call the communities they build home.

Over the past 18 years, LMC's focus has been on projects that include affordable & market-rate housing, commercial buildings, expansions, ground-up, multi-family housing, renovations, and tenant improvements. Their extensive range of services begins well before a design has been conceived and continues long after construction is complete. At LMC, they pair the capacity and experience of a prominent, established builder with the accessibility and connectivity of a smaller, local company.

Property Manager – Northwest Real Estate Capital Corp

Northwest Real Estate Capital Corp. (NWRECC) is a nonprofit 501(c)(3) company established in 1999 whose mission is preserving affordable housing, enabling life with dignity for residents and creating a quality work environment for our employees. NWRECC fulfills its mission through property management, new construction and renovation of HUD/Section 8, Rural Development, and Tax Credit Housing. NWRECC currently manages 90 properties with 3,222 units in 8 States. Overall, NWRECC manages a diverse portfolio of properties and complies with income restrictions such as Section 8, LIHTC, LIHTC/Section 8, Section 236, Section 202, Section 811, HOME, Rural Development, and Supportive Housing for the Homeless.

PSH Case Management Provider – New Narrative

New Narrative is a licensed provider of mental health, alcohol and drug, and dual diagnosis services governed by contracts with city, county, State and Federal government. The strong, collaborative relationships with these entities is the foundation of their successful program development. New Narrative has consistently held contracts with Washington County since 1978 and Multnomah County since 2002 for services including outpatient and rehab-level mental health treatment, homeless outreach, peer services, and many other mental health related needs.

New Narrative employs a multi-disciplinary team including medical staff (M.D. and Psychiatric Nurse Practitioner), Mental Health Clinicians (QMHA & QMHP) trained in a variety of treatment methods, Residential Counselors, Skill Trainers, Peer Support Specialists, Housing Specialists, Nurses, Pharmacist and Pharmacy Technician, and a Representative Payee.

Their services are designed to meet the wide-ranging needs of individuals with varying types of mental health diagnoses and traumatic life experiences. New Narrative strongly believes in supporting each participant's overall well-being and quality of life. A full continuum of care at multiple levels provides individualized, holistic support. They endorse a trauma-informed organizational model that strives to protect the physical, psychological, social, cultural and medical safety of all participants and staff. Comprehensive delivery of services can involve multiple elements based on individual need including behavioral health counseling in both group and one-on-one settings, skills training, case management, employment assistance, obtaining benefits, prescriber services, medication consultation and management, medical coordination, connection to social supports and community resources. Services are delivered in the least-restrictive environment that is clinically appropriate.

Community Engagement

In Partnership with Access architecture, Hacienda led two community engagement groups with each project milestone to gain feedback and input on building program, design, community outreach and local programs.

Dolores Engagement Plan

The Dolores engagement effort is focused on informing, consulting, and involving members of the public in a transparent process to capture input effectively. The project team has designed an twofold engagement plan that a) aims to build relationships with stakeholders and potential partners in the Hillsboro community and b) seeks design feedback from residents, property managers, and community members with lived experience to ensure the project design aligns with community needs and aspirations.

Elements of the Engagement Plan include: the Engage with Dolores Website and Community Insights Web-Based Survey.

Advisory Round Table

- The engagement team kicked off the Advisory Round Table series on August 18. The group, composed of community leaders representing a variety of partner organizations, convened to discuss opportunities for collaboration, to share "lessons learned," to introduce Hacienda CDC to the Hillsboro community, and to strategize ways to support the Dolores development and its future residents. Future engagement opportunities include tabling at local events and other upcoming outreach activities.
- The second Advisory Round Table meeting was held virtually on October 13. The Hacienda team provided updates from the Resident Focus Group, with a focus on design direction and feedback shared by participants. The advisory group discussed upcoming engagement activities, including virtual presentations to community and neighborhood organizations.
- The third Advisory Round Table meeting was held at the Hillsboro Public Library on December 8. Attendees representing a range of community organizations, including Centro Cultural, Adelante Mujeres, Washington County, METRO, Community Action of Washington County, Hillsboro School District, New Narrative, Hillsboro Public Library, and more gathered to enjoy pan dulce and to brainstorm ideas for artwork and murals at the new Dolores development. A range of local artists and potential subjects were identified, as well as some funding and grant opportunities.

Resident Focus Group

- The first resident focus group met virtually on August 17, and focused on schematic and site design elements including the central courtyard, separation between private and public realms, culturally informed design, and integration of permanent supportive housing residents into the larger community. Key design takeaways included the importance of covered outdoor seating areas, the arrangement of children's play areas, and the expression of the wall element defining the courtyard edge.
- The second resident focus group met in person at Las Adelitas Event Space on October 2. Over light refreshments, participants took part in a robust design discussion, reviewed interior common areas and layouts, and provided feedback on a range of precedent images. Key takeaways for the design team included the importance of developing activity/socializing nodes at various locations throughout the building (such as the lobby, laundry rooms, and other public areas) to invite neighbors to connect with each other and build community.
- The third resident focus group met in person at Las Adelitas Event Space on December 6. Over a dozen participants, mainly residents of Hacienda properties as well as New

Narrative clients, came together to provide feedback on a range of interior design finishes and materials in a lively workshop focused on interior unit design. Attendees divided into two groups, each of which discussed the merits of the material samples on view and made recommendations to the design team. The winning selections informed unit finish plans and color choices.

With the design phase wrapping up with submittal for permit in April 2024, future touchpoints with both the Advisory Round Table and the Resident Focus Group will take place at the Groundbreaking and Grand Opening ceremonies, both of which are in the early planning stages. Construction site tours will also be offered to members of each group.

Advancing Racial Equity

Hillsboro is home to a racially and ethnically diverse population, with two in five people identifying as communities of color and a quarter of residents identifying as Hispanic or Latinx. A majority of those living below the poverty line in Washington County are people of color, and more than half of Black, Latino, Filipino, Middle Eastern, and North African residents are considered rent burdened.

As described previously under site considerations, the location of the Dolores in the Tanasbourne area of Hillsboro provides an amenity-rich, well-served and well-connected location with ample access to employment, healthcare, retail, and educational services and opportunities. The addition of the Dolores provides much needed regulated affordable housing in the Tanasbourne area and will help create a more racially diverse, mixed-income community in the immediate neighborhood.

The Dolores contains many features that advance racial equity, starting with Hacienda CDC as a culturally specific owner and resident services provider, the Latinx-inspired building design, trauma-informed building features and many other components.

When working with communities with diverse language and cultural needs, Hacienda engages interpretation and service delivery partners like IRCO. Nearly 30 years of experience with outreach to low income and BIPOC communities has informed their practices for the lease-up process, which can be daunting for applicants. Hacienda's affirmative marketing and lease up plan contains three main elements:

- Marketing - Social media posts, flyers, television and radio ads will be designed and distributed in various languages across Washington County and beyond once construction timelines are clear. Marketing will be primarily targeted to low income and BIPOC communities and will continue throughout the lease-up process.
- Community Info Sessions - Hacienda will invite community members, prospective tenants and community organizations to attend three info sessions presented in various languages three months before the application release date. These sessions will be a mix of virtual and in-person. There will be a brief presentation on the new development and lease up process. The remainder of the time will be reserved for questions and answers.
- Lease-up Event - After the Interested Parties List is opened and within the first week of the application release date, Hacienda will host an in-person event to provide technical assistance and collect completed applications. Again, Hacienda will decrease barriers by providing access to interpretation and provide support for those who have challenges with reading or writing.

Hacienda works collaboratively with NWRECC to ensure that all applicants receive a fair, low-barrier screening process. NWRECC's screening criteria are low-barrier consistent with the City of Hillsboro Local Implementation Strategy guidelines and are designed to directly respond to the inequities that have historically been tied to screening processes.

Hacienda's work is intentionally designed to mitigate the systemic barriers facing people of color, that prevent equal access to housing, education, economic success and asset-building opportunities. Hacienda has a zero-tolerance policy for discrimination based on protected classes, including race, color, sex, religion, national origin, familial status, disability, source of income, marital status, age, sexual orientation, and gender identity. All applicants of Hacienda properties

receive a fair, low-barrier screening process which includes income verification of disability, passing a criminal background check, and passing a landlord reference check. If an applicant is denied housing based upon screening criteria, they can request an appeal meeting to discuss the reason(s) for the denial. In most cases, property management staff are able to overturn the denial, at times in consultation and planning with Resident Services staff.

Hillsboro's Local Implementation Strategy calls for 20% of total project costs to be awarded to COBID-certified firms. The Dolores project will meet or exceed this goal with the following approaches taken by Hacienda and the development team.

Hacienda's team has set a voluntary minimum 30% goal for COBID professional services participation (soft costs). Access Architecture is minority-owned and consistently seeks out and contracts with certified firms in all areas of design and engineering. Hacienda will regularly monitor the State's list of COBID certified firms to look for potential new partners.

Hacienda has set a voluntary goal of 30% COBID subcontractor participation, with a minimum 20% of participation by minority or women owned companies during construction (hard costs). Hacienda's plan to achieve this goal includes: holding pre-bid outreach meetings allowing bidders to plan for the bid period and respond in a timely fashion; encouraging larger firms to utilize DMWESB-SDV firms as second-tier subcontractor and suppliers; conducting an exhaustive process of outreach to target businesses and the community; and encouraging prospective bidders to schedule one- on-one meetings with the team to review the requirements of the project to gain a full understanding of its scope.

Hacienda is also committed to achieving a minimum 20% of operations contract awards to qualified DMWESB/SDV firms. Further, NWRECC is equipped to track MWESB goals for operational suppliers and vendors through an automated vendor management system, allowing outcomes to be reported periodically for refinement.

As standard practice, Hacienda requires that 25% of workforce jobs created are completed by women or minorities on all development projects. They require that the general contractors provide updates regarding their equity progress prior to executing subcontract awards, midway through construction, an at project completion. These efforts allow the contractors to improve outreach and monitor progress regarding equity efforts in real time. Workforce utilization will therefore be tracked for Dolores with the 25% goal cited above.

Partnerships and Services

Hacienda has over 29 years of experience providing culturally specific services related to language, health navigation, food access, transportation, and basic resident stability. They work 1:1 with residents to maintain their housing stability, understand their needs, and work directly with partner organizations to enhance on-site services and connection to off-site services. Hacienda tracks success in resident services programming through social-emotional indicators. They recently launched a new survey to affordable housing residents that ask questions around: residents' feelings of safety in their home and neighborhood, financial security, health and wellness, and access to resources. These questions help Hacienda assess overall resident satisfaction and the changes they can make to program offerings. For the Dolores, Hacienda plans to do this survey annually.

Hacienda CDC's bilingual Resident Services Coordinator is continuously engaged in educating and collaborating with the third-party management staff about its mission driven services and

methods of implementation, including assertive engagement and trauma responsive communication. The coordinator meets almost daily with management staff, conducts site visits and ensures residents have their contact information and they regularly share information about various programs, along with community resources. Regular documentation of housing stability services provided also helps inform resident services needs.

The Coordinator is notified about any lease violation matter and will receive all adverse notices/ actions and review them with property management to ensure all actions are unbiased, appropriately documented and meet legal requirements. In addition, the Coordinator engages residents individually or together with property management staff and /or other residents, as appropriate to ensure all actions are culturally appropriate and meet procedural and legal requirements. The Coordinator will also connect the household with any needed resources that will stabilize their housing. These resources may include emergency rental assistance, food pantry, utility assistance, financial fitness class, or a medical or behavioral healthcare referral.

The Director of Youth and Family services working closely with the Resident Services Manager, Coordinator, and other support staff continuously review and evaluate the effectiveness of Hacienda programs and services. The Director also evaluates the collaboration between property management staff and the Resident Services Program staff to ensure residents needs are being met in a culturally appropriate manner.

Dolores' PSH units will serve Population A in the Metro/Washington County Supportive Housing Services (SHS) program definition: extremely low-income (30% or below as defined by HUD or by local definitions), have one or more disabling conditions, and who are experiencing or at imminent risk of experiencing long-term or frequent episodes of literal homelessness. The project intends to use Washington County's coordinated access system for resident referrals.

Livability and Accessibility

Accessibility, equity, and their intersection will be central to the design of the Dolores. Some of the ways these principles will manifest include:

Building Design:
• Regular widening of corridors at unit entries and common area nodes for easier maneuvering.
• Generous clearances and turning space throughout the facility.
• Increased amounts of natural light throughout the building compared to traditional multifamily housing, with a specific focus on circulation space.
• Multi-purpose spaces with flexible seating for a wide variety of body types and abilities.
• Comprehensive, clear and consistent wayfinding system to guide residents and visitors throughout the building.
• Integration of acoustic ceiling treatments to absorb sound and eliminate reverberation in large, open spaces.
• All-gender restrooms that accommodate all, regardless of their gender-identity or expression.
• Two elevators to increase access and minimize wait times.
• Designing with a trauma-informed lens - which includes:
    - Designing spaces with clear sight lines, multiple exits, and minimal barriers, which can help people feel safe and secure.
    - Using wood and nature-inspired colors at eye-level, which can be very calming and grounding.

Unit Design:

- Generous maneuvering clearances for all units, not just those designated as accessible.
- All unit types designed for ease of use.
- More audio/visual units than required by Code.
- Integration of unit storage at all reach ranges, including full-height pantries wherever possible.
- All electric appliances (no gas).
- Stoves will have smart burners that automatically turn off when not used.

As previously mentioned, the Dolores project amenities will also include a courtyard with playground, covered outdoor seating and gathering spaces.

Climate Resilience and Sustainability

Certification: This project will be designed to meet or exceed Earth Advantage Gold certification through specific strategies for the building envelope, energy, water, and indoor air quality.

Energy Modeling: Working with both Earth Advantage and MEP consultants, the project team will utilize advanced energy modeling through all phases of the project to assist with intentional decisions around building systems and initial costs vs long term savings

Energy Efficiency: Passive design strategies for Dolores include massing, orientation, strategic use of windows, daylighting, natural ventilation, and a well-insulated air-tight building enclosure. A highly efficient building envelope with a continuous air barrier will reduce energy loss and cut both heating and cooling costs. Compact and efficient unit layouts minimize the energy needed to heat and ventilate dwelling unit's spaces. The team will use highly efficient systems, including LED lighting, occupancy sensor controls, in-unit energy recovery ventilation, mini-splits, and energy efficient appliances. HVAC zoning and programmable thermostats will help optimize efficiency.

Water Efficiency: Low flow water-saving fixtures are incorporated to save water and energy through a reduced need for hot water. To achieve additional energy savings, the project will include a highly efficient central hot water production system. Hacienda will use water saving irrigation systems and plant selection in the Dolores's landscape design.

Managing Stormwater: The project will be designed to meet or exceed city standards by first looking to infiltrate all stormwater on site.

Renewable Energy & Resilience Strategies: Dolores will house a robust roof-top solar array and 10% of the on-site parking spaces will be EV ready. In addition, the team will explore the potential and available incentives for on-site renewable energy and seek incentives, grants, or third-party financing to support the implementation of renewable energy.

Indoor Air Quality: The project will include 100% outside air heat recovery ventilation, use interior materials that do not contain added urea-formaldehyde, and finishes, adhesives, and other materials will have zero or low VOCs (Volatile Organic Compounds).

Cooling/AC: With Oregon's summer temperatures breaking records for multiple years and heat crises disproportionately affecting low-income individuals and families of color, the Dolores will include mini-split HVAC systems in all units and community spaces. These systems were selected to provide programmable heating and cooling and air circulation without exposing residents to outside noise and pollutants. System costs are to-be-determined.

Anticipated Timeline

Proposed Project Schedule

Action	Proposed Date (Month/Year)
Design	
Complete Schematic Design	May 2023 **(Complete)**
Complete Design Development	November 2023 **(Complete)**
Complete Construction Drawings	February 2024 **(Complete)**
Land Use Approvals and Permits	
Submit Land Use Application (if applicable)	October 2023 **(Complete)**
Submit Site Development Permit Application	February 2024 (**Complete)**
Submit Building Permit Application	February 2024 **(Complete)**
Obtain Land Use Approval	January 2024 **(Complete)**
Obtain Site Development Permits	July 2024
Obtain Building Permits	July 2024
Financing	
Submittal of LIHTC Pre-application to OHCS (if applicable)	October 2023 **(Complete)**
Issue Solicitations for Financing (LIHTC, Construction Loan, and Permanent Loan)	February 2023 **(Complete)**
Select Financing Providers	April 2023 **(Complete)**
Obtain Financing Commitments	April 2023 **(Complete)**
Negotiate Substantially Final Form of LIHTC Syndication/Partnership Agreement	August 2024
Construction Agreement	
Select General Contractor	December 2023 **(Complete)**
Obtain All Needed Bids for Construction	July 2024
Finalize Construction Agreement with Guaranteed Maximum Price	July 2024
Disposition and Development Agreement (Metro) and Financing Agreements with City	
Finalize Disposition and Development Agreement (DDA) and Financing Agreements	July 2024
Development	
Closing of Property Conveyance	August 2024
Closing of Financing	August 2024
Begin Construction	September 2024
Complete Construction	March 2026
Obtain Certificate of Occupancy	March 2026
Lease-up and Operations	
Begin Lease-up	December 2025
Complete Lease-up	March 2026
Conversion to Permanent Financing	January 2027

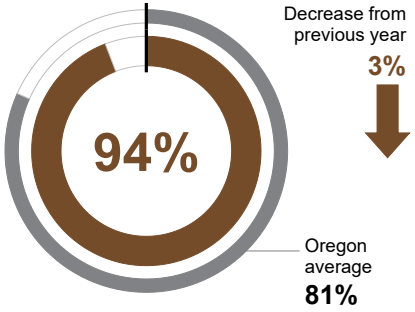
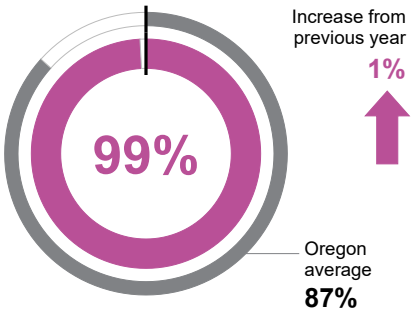
*Students earning a diploma within four years. Cohort includes students who were first-time ninth graders in 2018-19 graduating in **2021-22**.*



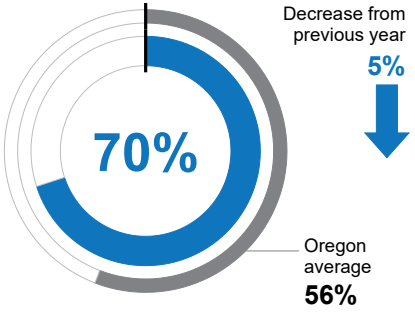
FIVE-YEAR COMPLETION

*Students earning a high school diploma or GED within five years. Cohort Includes students who were first-time ninth graders in 2017-18 finishing in **2021-22**.*



COLLEGE GOING

*Students enrolling in a two or four year college within 16 months of completing high school in **2020-21**. Data from the National Student Clearinghouse.*



School Goals

This year our school will focus on the following goals:

· All PLCs engage in collaborative PDSA cycles that include refinement of instructional practices based on team analysis of a variety of student data.

· All staff will engage in course-specific work that contributes to school-wide implementation of Standards-Based Grading.

· All activities within the school will be planned and implemented with intentional focus on fostering an inclusive and healthy environment through innovation and self-growth, empowering all learners to thrive.

State Goals

The Oregon Department of Education is partnering with school districts and local communities to ensure a 90% on-time, four year graduation rate by 2027. To progress toward this goal, the state will prioritize efforts to improve attendance, provide a well-rounded education, invest in implementing culturally responsive practices, and promote continuous improvement to close opportunity and achievement gaps for historically and currently underserved students.

Safe & Welcoming Environment

· Comprehensive school safety plan

· Defined emergency procedures/regular drills

· advisory program for culture, college, and career

· LINK Crew program for freshmen and new students

· SafeOregon school

· Mental health support

· Implementation of restorative practices

· Comprehensive anti-bullying policies and procedures

About Our School

ADVANCED COURSEWORK

· 13 Advanced Placement Courses

· Expanded Options partnership with Portland Community College

· Dual credit partnerships with 5 colleges

· Students earned over 6,000 college credits last year

CAREER & TECHNICAL EDUCATION

· Agricultural Science

· Business

· Computer Science

· Construction/Woodworking

· Culinary Arts

· Engineering/Architecture

· Metal Fabrication

· and more

EXTRACURRICULAR ACTIVITIES

· 23 Interscholastic athletics

· Comprehensive activity program: Band, Choir, Drama, and more

· 50 + School-based Clubs

· After-school Activity Bus

PARENT & COMMUNITY ENGAGEMENT

· Parent-Teacher Conferences

· Parent Support Organization (PSO)

· Parent access to Canvas/ParentVue

· Booster Clubs: Athletics, Band, and Performing Arts

· Parent Volunteer Program

· Community/business partnerships

· Sherwood Education Foundation

Housing Profile*
Demographic and Income Profile Report*

*The Third Party Demographic Reports are prepared using ESRI's Business Analyst Online (BAO). Reports are created by overlaying the Sherwood School District boundary onto the ESRI BAO data. These reports are for informational purposes only; DDP is not responsible for the accuracy of the data.

INTRODUCTION

The Sherwood School District has contracted with Davis Demographics & Planning, Inc. (DDP) to develop and analyze demographic data relevant to the District's facility planning efforts. The scope of contracted work includes: mapping the District, address matching the current student file, developing and researching pertinent demographic data, identifying future residential development plans and developing a ten year student population projection. DDP will then assist the District in developing solutions for housing future student population. Additionally, this study was prepared to assist the District's efforts in evaluating future site requirements and attendance area changes.

The purpose of this report is to identify and inform the District of current trends occurring in the community; how these trends may affect future student population; and to assist in illustrating facility adjustments that may be necessary to accommodate the potential student population shifts. The District can then use this information to better plan for the need, location and timing of facility or boundary adjustments.

The **Sources of Data** section details where the two sources of data, geographic and non-geographic, are collected and how each data item is used in the ten year student population projection model.

The **Ten Year Projection Methodology** section discusses in detail how the factors used in the study were calculated and why they were used. These factors include the calculation of incoming kindergarten classes, additional students from new housing (referred to as student yield), the effects of student mobility, and a detailed review of planned residential development within the District.

While reading this report, it is important to remember that this is a snapshot of current (October 2015) and potential student population based upon data gathered in Spring 2015. DDP uses known residential housing projects that have been filed with the City or County and estimates future annual phasing of only these projects. DDP does not estimate any additional units beyond the "known" filed projects and therefore it is possible that more units could be built during this ten year timeframe. Population demographics, development plans, funding opportunities and district priorities can all change, and therefore, new projections and adjustments to the overall Master Plan will continue to be necessary in the future.

EXECUTIVE SUMMARY

Davis Demographics & Planning, Inc. is assisting the Sherwood School District in planning for future student population changes. By factoring current and historical student data with demographic data and planned residential development, DDP calculated a ten year student population projection. This projection is based upon residence of the students and is designed to alert the District as to when and where student population shifts will occur.

The Sherwood School District has seen constant growth from 2012 to 2014. The current 2015/2016 school year saw a significant gain of about 137 K-12 students. Over the next ten years, the projections show that the Sherwood School District should continue to grow through 2025. As of October 2015, the District stood at 5,067 K-12 students, and by fall 2025 that figure could be closer to 6,535, a net increase of 1,468 K-12 students.

ELEMENTARY SCHOOL CONCLUSIONS

The Sherwood School District is projected to experience overall growth in its resident student population among the elementary grades over the next ten years. The resident student population is at 2,196 and could rise to 2,594 (a net gain of 398 K-5 students) by fall of 2025. It is important to note that the projected growth amongst the elementary attendance areas is most likely a result of new residential construction. The attendance areas with the biggest projected resident K-5 student population gains over the ten year projection period include Archer Glen ES (+198 K-5 Students) and Hopkins ES (+201 K-5 Students). On the other end of the spectrum is the attendance area with an anticipated net decrease in K-5 student population, Edy Ridge ES (-28 K-5 Students). The decline is a result of smaller projected incoming kindergarten classes that are due to enter the District and replace the bigger class size bubbles, which are graduating on through to the middle school grades. The projected smaller kindergarten class sizes are mostly a result of the declining birthrates.

Based on the K-5 ten year projections, boundary adjustments may be needed for most attendance areas based on declining enrollment, major growth, or non-contiguous boundaries. The Hopkins attendance area should be monitored as it is expected to exceed its current capacity of 675 by fall 2022. The District may also have to keep an eye on the Archer Glen attendance area due to anticipated growth exceeding its capacity. The monitoring of any potential future residential development will continue to be necessary, as this will play an important role to any potential resident population changes in the coming years.

MIDDLE SCHOOL CONCLUSIONS

The Sherwood School District has two comprehensive 6-8 middle schools, each with a distinct attendance area: Laurel Ridge Middle School and Sherwood Middle School. Overall growth for the middle school 6-8 student population is expected to grow by an additional 425 resident students by 2025. Laurel Ridge attendance area should experience most of this growth with a projected net increase of 352 resident grade 6-8 students. The resident 6-8 student population for the Laurel Ridge attendance area should remain relatively stable with a projected net gain of only 73 students by 2025.

With a total projected growth of 425 6th-8th grade students by fall of 2025, the District may need to consider adding portable classrooms. Therefore, no boundary re-alignments among the Middle School attendance areas may be necessary within the next ten years. However, the District should closely monitor the Laurel Ridge area since it does look like its resident counts may be approaching its designed capacity of 550 in 2018. However, from fall 2021 to fall 2025 the school may stabilize around 550 students. Most of the growth in Sherwood MS attendance area is a result of residential development from the specific planning areas within the boundary.

HIGH SCHOOL CONCLUSIONS

The Sherwood School District has experienced growth in the high school resident student population over the last four years with an enrollment of 1,537 as of fall 2015. A 39.8% net growth for the high school population is expected within the next ten years, which equates to a net gain of 645 9-12. The high school residential totals are currently exceeding the capacity of 1,550. With this large growth, the District should consider opening a new high school. By fall 2025 the District is expected to have a high school 9-12 student population surpass the 1,550 capacity mark by 715 students.

SOURCES OF DATA

Geographic Map Data

Five geographic data layers were created for use in the ten year student population projections:

1. Street Centerline Database
2. Study Areas
3. Schools
4. Students – Historical and Current
5. Planned Residential Development

1) Street Centerline Data

The street database has associated attributes that contains but are not limited to, the following fields: full street name, address range and street classification.

The main function of the streets is in the geo-coding process of the student data. Each student is address-matched to the streets by their given address. The geo-coding process places a point on the map for every student in the exact location that student resides. This enables DDP to analyze the student data in a geographic manner.

Another vital utilization of the digital street database is in the construction of study areas. Freeways, major streets, and neighborhood streets are used as boundaries for the study areas.

2) Study Areas

Study areas are small geographic areas and the building blocks of a school district; they are similar to neighborhoods. Study areas are geographically defined following logical boundaries of the neighborhood, such as freeways, streets, railroad tracks, rivers, etc. Each study area is then coded with the elementary, middle, and high school that area is assigned to attend. By gathering information about the District at the study area level, you can closely monitor growth and demographic trends in particular regions and spot potential need for boundary changes or new facilities. There are 104 study areas created for the Sherwood SD.

3) Schools

The District provided school detailed information to DDP for mapping the District facilities.

4) Student Data

a. **Historical Student Data** - Historical enrollment is used to compare past student population growth and trends as well as the effects of mobility (move in, move out from existing housing) throughout the District. DDP utilized the last three years (2012, 2013, and 2014) of student enrollment data for each October from fall 2012 through fall 2014.
b. **Current Student Data** - A student data file representing October 2015 (received by DDP as a computer data file from the School District) summarized by grade level and by study area is used as a base for enrollment projections. Existing students were categorized by study area through the address-matching process that locates each student

within a particular area based upon their given address. The projections run each of the next ten years from fall 2016 through fall 2025.

The Student Accounting Summary (Table 1) indicates the total student enrollment as of October 2015 and the number of students used in the ten year student population projections. The projection model is based upon student residence and excludes students residing outside of the District's boundary, students with Grades = 13, Special Education students, independent study students, prekindergarten students and students in which DDP was unable to match. Special Education students were excluded from the projections (due to different classroom loading standards and not all of the District's elementary schools housed Special Education Students).

Table 1– Student Accounting Summary

Fall 2015 Actual Enrollment (Representing October 8, 2015)

Total Students Provided by the District to DDP	5,108
Students Living outside of District boundary	- 108
Students with Grades = 13	-13
Special Ed Students	-27
Prekindergarten Students	-28
STUDENTS USED IN PROJECTIONS	**4,932**

5) Planned Residential Development - This data was obtained through discussions with District staff, developers that have current or future projects within District boundaries, and planning officials from the cities of Sherwood and Tualatin. Data includes, when available, development name, developer/owner, location, housing type, total number of units, and projected move-in dates (phasing estimates). Phasing for planned housing is factored into the ten year projections. (See Section Two for a detailed listing of the planned residential development). In the student population projection, DDP includes all Approved and Tentative tract maps in addition to any planned or proposed development that possibly will occur within the projection timeframe. The planned residential development information and phasing estimates show a snapshot of the District at the time of this study. Any of the residential development information contained within this report may change and should therefore, be updated at least annually.

Non-Geographic Data

Two basic sets of non-geographic data were compiled and reviewed for use in the ten year student population projections by residence:

1. Births by Zip Code
2. Mobility Factors

1) Births by Zip Code Data - Birth data by postal zip code was obtained from the Oregon State Center for Health Statistics, for the years 2003-2014 and roughly correlated to the Sherwood School District's boundary. Past changes in historical birthrates are used to estimate incoming kindergarten student population from existing housing.

2) Mobility Factors - Mobility refers to the increase/decrease in the migration of students within the District boundary (move-in/move-out of students from existing housing). Mobility, similar to a cohort, is applied as a percentage of increase/decrease among each grade for every year of the projections. The Mobility Factors help account for apartment movement, housing resales, and dropout rates at the high school level.

TEN YEAR "RESIDENCE" PROJECTION METHODOLOGY

The projection methodology used in this study combines historical student population figures, and past and present demographic characteristics to forecast future student population at the study area level. District-wide projections are summarized from the individual study area projections. **These projections are based upon where the students reside and where they should be attending school. DDP uses the actual location of where the students reside, as opposed to their school of enrollment, in order to provide the most accurate estimate of where future school facilities should be located.** The best way to plan for future student population shifts is to know where the next group of students will be residing. The following details the methodology used in preparing the student population projections by residence.

Ten Year Projections

Projections are calculated out ten years from the date of projection for several reasons. The planning horizon for any type of facility is typically no less than five years, often longer. Ten years is sufficient to adequately plan for any facility. It is a short to mid-term solution for planning needs. Projections beyond ten years are based upon speculation due to the lack of reliable information on birthrates, new home construction, economic conditions etc.

Why Projections are Calculated by Residence

Typically, school district projections are based on enrollment by school. However, this method is inadequate when used to locate future school facility needs because the location of the students is not taken into consideration. A school's enrollment can fluctuate due to variables in the curriculum, program changes, school administration, and open enrollment policies. These variables can skew the apparent need for new or additional facilities in an area.

The method used by DDP is unique because it modifies a standard cohort projection with demographic factors and actual student location. **DDP bases its projections on the belief that school facility planning is more accurate when facilities are located where the greatest number of students reside.**

The best way to plan for future schools is to know where the next group of students will be coming from. The following details the methodology used in preparing the student population projections.

1) Progression - Each year of the projections, 12th grade students graduate and continuing students progress through to the next grade level. This normal progression of students is modified by the following factors:

2) Incoming Kindergarten – Live birth data is reported to the Oregon State Center for Health Statistics, by the resident postal zip code of the mother. DDP uses birth data by zip code so, if need be, a different birth factor can be applied to various areas of the District.

Incoming kindergarten classes, for existing homes, are estimated by comparing changes in past births and birthrates. Table 2 shows the total births for the two main zip codes in the Sherwood School District area from 2003 to 2014. Incoming kindergarten classes are determined by multiplying the existing kindergarten class (2015) by the percent increase/decrease in the birthrate for the year the kindergarten class was born (2010). Assuming that the fall 2015 kindergarten class was born in 2010, DDP compared the total births in 2010 to the total births in 2011, to determine a factor for next year's kindergarten class (Fall 2016). Similarly, 2010 was compared to 2012 (Fall 2017 K class), 2010 to 2013 (Fall 2018 K class) and 2010 to 2014 (Fall 2019 K class).

Split between 2 counties Washington and Clackamas

	Washington 97140	Clackamas 97140	Combined	Real Birthrate	Birthrates used by DDP	Year of Projection
2003	317	5	322			
2004	299	7	306			
2005	316	0	316			
2006	351	0	351

				87.9%	**92.9%**	2024
				87.9%	**92.9%**	2025

= PEAK YEAR

Source: State of Oregon Center for Health Statistics

Table 2– Birth Data by Zip Code

According to Table 2, the birth data for zip code 97140 shows a decrease of births from 2006 to 2010 with total births in 2010 of 277 (for 97140 combined). Births for 97140 have not shown any kind of consistent trend. Births have been relatively unstable with average births from 2003 to 2010 of 312. There was a peak in births in 2006 of 351 live births for 97140 combined. The births then experienced an overall decline from 2010 through 2014. Birth factors for 2020-2025 are an average of the previous three years, and is conducted this way because the birth data is not yet available or the children have not been born; DDP elects to follow this common practice because it doesn't want to over or under project incoming kindergarteners.

3) Student Mobility Factors - Student mobility factors further refine the ten year student population projections. Mobility refers to the increase/decrease in the migration of students within the District boundary (move-in/move-out of students from existing housing). This factor takes into account the apartment movement within the District, as well as housing resales and dropout rates at the high school level. Mobility, similar to a cohort, is applied as a percentage of increase/decrease to each grade for every year of the projections. DDP used

the District's historical student data (representing data taken from the Fall timeframe) for calculating these factors.

A net increase or decrease of zero students over time is represented by a factor of 100%. A net student loss is represented by a factor less than 100% and a net gain by a factor greater than 100% (see the example below).

Example: 100 K grade students in the Archer Glen ES area for fall 2015
X 119.0% (the K-1 Archer Glen ES area Mobility Factor)
119.0 1st grade students in fall 2016 for that area in Archer Glen

The sampling used was taken over a four-year period (student data from 2012 through 2015) and three yearly groupings were calculated. For example, a comparison was made for the fall 2012 K student population to the fall 2013 1st grade students. This comparison was also conducted for the fall 2013 & fall 2014 and fall 2014 & Fall 2015 groupings. Table 3, below, shows the Mobility Factors that were used for this year's report.

Table 3-Mobility Factors

Using Fall 2012 through 2015 Student Data (3 Years of Change) by Elementary Attendance Area

Sherwood School District Mobility (Using Fall 2012 through Fall 2015 Student Data)

(Excluding Study Areas that Have Had Development and Ones that Contain Low Student Counts)

	K to 1	1 to 2	2 to 3	3 to 4	4 to 5	5 to 6	6 to 7	7 to 8	8 to 9	9 to 10	10 to 11	11 to 12
Archer Glen ES	1.190	0.990	1.070	1.020	1.010	1.060	1.040	1.030	1.100	0.960	0.970	0.960
Edy Ridge ES	1.140	1.110	1.070	1.000	1.020	1.110	1.010	1.030	1.080	0.980	0.990	0.990
Hopkins ES	1.160	1.050	1.050	1.070	1.040	1.080	1.050	1.030	0.990	1.020	0.990	0.960
Middleton ES	1.090	1.060	1.040	1.010	1.050	1.020	0.990	1.010	1.020	0.980	0.990	0.970

Based upon DDP's experience with many other school districts' data, the figures in Table 3 are very typical of communities like Sherwood SD. Archer Glen ES's K to 1 Mobility Factor is 119.0%. That means that for Archer Glens' area, as students transition from Kindergarten to 1st grade (K to 1st) there is an average student increase of 19%. Since kindergarten is not a required grade, many parents choose to keep their children in daycare facilities through kindergarten and then bring them into 1st grade at the public school. This accounts for the high K to 1 rates. Most of the Districts mobility factors are green (greater than 1.00). This means that parents are choosing to move into the Sherwood School District, specifically to enroll their children in their schools. The only losses (red) seen above are some very slight high school dropout rates.

4) Student Yield Factors (SYF'S) – Ten-Year Projections - The Student Yield Factors, when applied to planned residential development units, determine how many additional students will be generated from new housing construction within the District (see **Section Two** for details on planned residential development schedules). Student Yield Factors are sometimes referred to as Student Generation Rates (SGR's). DDP has elected to use student yield factors from Sherwood School District neighbors, West-Linn Wilsonville. Sherwood School District did not have a large enough sample size of new housing units to accurately create student yield factors.

Table 4- Student Yield Factors

Single-Family Detached (SFD) Units				
Grade Ranges	K-5	6-8	9-12	K-12
Student Yield Factor	0.285	0.142	0.135	0.562

Multi-Family Units (MFA) (apartments, condos, townhomes, etc)				
Grade Ranges	K-5	6-8	9-12	K-12
Student Yield Factor	0.096	0.048	0.061	0.205

Before the SYF's can be applied to the current housing units, the year of construction for each housing type must be analyzed. In general, new housing attracts young families with elementary school aged children. Over the next 12 to 15 years, the children grow older and pass through the grades. This cycle is then repeated throughout the life of the home. Analyzing the year of construction for new housing units can help estimate the number of facilities needed to accommodate new students.

5) Planned Residential Development and Student Yield Factors - Closely related to the Student Yield Factors (SYF) are planned residential development units. Planned residential development data is collected to determine the number of new residential units that will be built over the ten year period of the student population projections. The units built within the next ten years will have the appropriate SYF applied to it to determine the number of new students the planned residential development will yield.

This residential development data was obtained through the District, developers that have current or future projects within District boundaries, and planning officials from the cities of Sherwood and Tualatin. A database and map of the planned residential development was created, including, when available, project name, location, housing type, total number of units and estimated move in dates (phasing schedule). Projected phasing is based upon occupancy of the unit and is used to help time the arrival of students from these new developments. (see **Section Two** for details on planned residential development occupancy).

In the resident student projections, DDP includes all Approved and Tentative tract maps in addition to any planned or proposed development that possibly will occur within the projection timeframe. The planned residential development information and phasing estimates is a snapshot of the District at the time of this study. The residential development information changes quite often and should be updated at least on an annual basis.

APPLYING THE VARIABLES TO GENERATE THE PROJECTIONS

The following paragraphs summarize how DDP uses the factors to determine the student population projections. Remember that these projections are based on residence.

The Sherwood School District has been broken up into 104 study areas and each are coded for each of the District's elementary, middle and high school, depending upon what attendance area they fall in. The residential projections are calculated at the study area level. This means that DDP conducts 104 individual projections that are based upon the number of students residing in each study area.

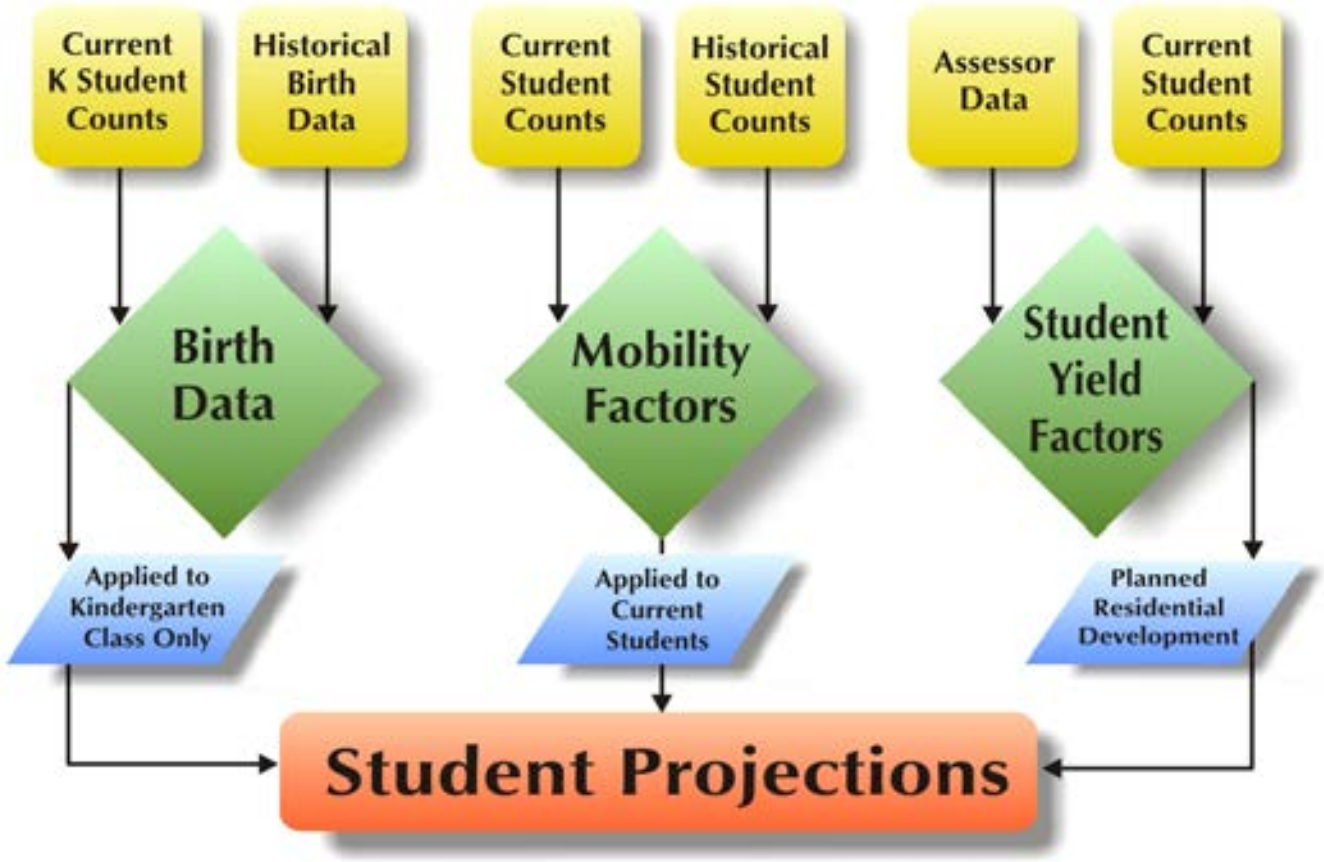
The first step in running these projections involves listing the number of students that live in a particular study area by each individual grade (Kindergarten through 12th grade). The current student base (Fall 2015) is then passed onto the next year's grade (2015's K become 2016's 1st graders, 2015's 1st graders become 2016's 2nd graders, and so on). After the natural progressions of students through the grades are applied, Birth Factors are then multiplied to the current Kindergarten class to generate a base for the following year's Kindergarten class. (*Section One*)

Next, a Mobility Factor is applied to all grades. Again, these factors take into account the natural in/out migration of students throughout the District. A specific Mobility Factor was calculated for each grade transition (K to 1st, 1st to 2nd, etc.) within each elementary attendance area and is applied to the appropriate grade (and school area) to estimate the next year's progressed students.

The last essential layer applied to the projections deals with additional students from planned residential development (*Section Two*). This is a simple calculation, again conducted at the study area level, where the estimated number of new housing units for a particular year is multiplied by the appropriate Student Yield Factors. For example, if 100 single-family detached (SFD) units are to be built in a specific study area in a given year, then you would multiply this number (100 units, for example) by the SFD K-5 Student Yield Factor (.285) and the resulting number (29 K-5 students) is divided evenly among the six grades. (*Section One*)

To finish generating the projections by residence, the same process is conducted for each of the 104 study areas. Once the projections have been run at the study area level, then it is simple addition to determine projections for each of the District's attendance areas or for a district-wide summary. For example, the residential projections for Archer Glen Elementary School are simply the summary of all of the study areas that make up this specific attendance area (see *Section Five* for the projections of each elementary attendance area). The District Summary for the "residence" projections (*Section Four)* is a total summary of all 104 study areas, which excludes all of the students that attend a district school and live outside of the District's boundaries and students unable to be mapped. Then out-of-district students are factored back into the projections by simply adding the existing totals in at the bottom of the projections (please see the Attendance Matrices in *Section Three* for a breakdown of the out-of-district students by school). DDP adds the current total out-of-district to each year of the projections because there is no accurate way to forecast these students in the future.

DDP Student Projection Model



PLANNED RESIDENTIAL DEVELOPMENT

This data was obtained through discussions with District staff, developers that have current or future projects within District boundaries, and planning officials from the Cities of Sherwood and Tualatin. A database and map of the planned residential development was created, including, when available, project name, location, housing type, total number of units and estimated move in dates (phasing schedule). Projected phasing is based upon occupancy of the unit and is used to help time the arrival of students from these new developments. Please see the next page (page 11) for a map of the known residential projects in the Sherwood School District area. Following the map (on page 12) is a breakdown of the estimated occupancy date for new housing units over the next ten years (from Fall 2016 through Fall 2025) by Study Area and by the three main housing types (single family detached – SFD – units; multi-family attached – MFA – units; and apartments – APT – units). This document is referred to as the District-Wide Residential Development Summary. In addition, DDP has included a Residential Development List (page 12), which is sorted by Study Area and is an inventory of all known residential projects that are expected to be active over the next ten years.

DDP estimates that as many as 1,155 Single-Family Detached units, 189 multi-family units, and 207 Apartment units could be built within the Sherwood District boundary over the next ten years. This amount of units is definitely possible and is not unprecedented. Most of these units are estimated to be constructed within the ten year period, with the fall 2021 and fall 2022 school years having the most units being built with 235 each year.

Please note that all phasing schedules are based on occupancy, all Approved and Tentative maps plus proposed and potential development are included on these lists, the Summary only includes units that may be occupied in the ten year timeframe of the projections and are based upon data gathered during the Spring of 2016 and may not reflect recent changes.

THE K-5 ATTENDANCE MATRIX

An Elementary (K-5) Attendance Matrix has been included to provide a better understanding of where students reside and where they attend school. This matrix helps to see a "snapshot" of the District's current Open Enrollment patterns. DDP has also created a Middle and High Attendance Matrix on the following pages.

The attendance matrix acts as a checks and balance for student accounting. It shows where the students reside (what is their School of Residence) based upon our address matching capabilities and what school they attend (School of Attendance) based upon data in the student file supplied by the District. The inclusion of this matrix is essential to showing how the students used in the projections match up to the District's records of enrollment for each school. The best way to plan for future facilities is to know where the next group of students will be coming from, not necessarily which school they are currently attending.

Remember, DDP's projections are based upon where the students reside, not where they attend school. DDP uses the actual location of where the students reside, as opposed to their school of enrollment, in order to provide the most accurate depiction of where future facilities (if necessary) should be located. Therefore, since the projections are based upon where the students reside, the figures DDP uses as a base for each school's resident projection may be slightly higher or lower than the actual reported enrollment for each school.

READING THE MATRIX

Looking at the K-5 Elementary School Attendance Matrix on page 15, let us begin with Archer Glen ES as an example. Following down the second column with the "Archer Glen ES" heading, on the first row you see that there are 486 K-5 grade students attending Archer Glen ES and residing in the Archer Glen ES attendance area. Continuing downward, four students attend Archer Glen ES, but reside in the Edy Ridge ES attendance area. Next, it shows that 17 students attend Archer Glen ES and reside in the Hopkins ES attendance area, and so on.

The row named "PK" refers to all prekindergarten students enrolled with the District. There are 0 prekindergarten students that attend Archer Glen ES. The row named "Special Education" refers to all elementary level Special Education students attending the District. No special education students attend Archer Glen ES. The item entitled "Out-of-District" refers to students living outside of the Sherwood School District but attending one of the District's schools. There are seven Out-of-District students attending Archer Glen ES. The "K-5 Totals" row shows the total number of K-5 students attending a school regardless of where they reside; this should reflect the District's enrollment counts for each school as of October 2015. There were 525 students attending Archer Glen ES as of October 2015. At the bottom of the matrix, DDP lists the District's "Open Enrollment Percentage," a figure that lists the total number of students attending the particular school but live outside of the designated boundary. There were 39 such students attending Archer Glen ES, calculating a percentage of 7.5%, which means that as of October 2015, 7.5% of Archer Glen ES's students came from outside of its current boundary.

The next step is to read across the matrix, beginning with the Archer Glen ES attendance area row. It is now understood that the 486 represent the total number of K-5 grade

students that reside in the Archer Glen ES attendance area and attend Archer Glen ES. The next column, titled "Edy Ridge ES", lists the number of K-5 grade students that reside in the Archer Glen ES attendance area, but attend Edy Ridge ES. There were six K-5 students who resided in the Archer Glen ES attendance area but attend Edy Ridge ES as of October 2015.

The K-5 Students column in the beginning represents the total number of students living in that particular attendance area. There are 507 K-5 students residing in the Archer Glen ES attendance area. Reading down the Totals column, you will find the number of K-5 students used in the fall 2015 projections - - 2,196 K-5 students (excluding Prekindergarten, Special Ed., and Out-of-District).

The Middle Matrix (on page 16) is read in the same manner as the Elementary School Matrix.

Fall 2015/2016 K-5 (Elementary School) Attendance Matrix

"Open Enrollment" Patterns

SCHOOL OF RESIDENCE (BASED ON CURRENT ATTENDANCE AREAS)		SCHOOL OF ATTENDANCE				
Attendance Area	K-5 Students	Archer Glen ES	Edy Ridge ES	Hopkins ES	Middleton ES	Transfer Out Rates
Archer Glen ES	**507**	**486**	6	10	5	4.1%
Edy Ridge ES	**534**	4	**517**	9	4	3.2%

	District-wide			

DISTRICT-WIDE STUDENT PROJECTIONS (BY "RESIDENCE")

The student population is projected out ten years for each of the study areas and for the entire Sherwood School District. The District-Wide Summary enables the District to see a broad overview of future growth and what impact this growth will have on existing facilities. The study area listings enable the District to monitor student population growth or decline in smaller geographic areas within the District (please see *Appendix A* for the individual 104 Study Area projections).

At any point in time, study areas and their projected resident students can be shifted between schools to assist in balancing enrollment growth. Together, these projection summaries present the means for identifying the timing of additional student arrival and overall facility requirements and location to accommodate the District's expected growth.

The following page shows the District-Wide Projections by "Residence" using the fall 2015 (mid-October) student data as the base and fall 2013 and fall 2014 listed for reference. Ten consecutive years are then projected from fall 2016 through fall 2025 with the Out-of-District, Unmatched, and Special Ed students separated from the sub-totals. The Out-of-District, Unmatched, and Special Ed student records are added back in for each projection year (after the sub-totals) using the same fall 2015 figures. At the bottom of the District-Wide Projection, a projected annual change is listed.

For an exact breakdown of how many Out-of-District, Special Ed and Unmatched students there were for each elementary school as of fall 2015, please see the K-5 Attendance Matrix on page 15 and the 6-8 Middle School Matrix on page 16.

The above projections are based upon a student data file provided to DDP by the Sherwood School District representing early October 2015.

13 students with a grade = 13 and 28 PreK students were given to DDP in the original student data file and were excluded from the above projections.

District Wide Student Population Projection Trends ("Residence" Method)

The Sherwood School District has experienced growth in resident student population since 2012. The District seemed to have experienced a big jump in its K-12 Student population from fall 2014 to fall 2015. According to the projections, the Sherwood School District could continue to see a gradual K-12 student population growth over the next ten years. A K-12 student population of 6,400 is projected by fall of 2025. The District may experience an average gain of about 147 students starting fall 2016 through fall 2025. This represents an overall net gain of 1,468 K-12 students or a 29% student population increase for the District by fall 2025.

According to the projections, the K-5 resident student population is expected to see growth throughout the ten years. The K-5 resident student population for 2015 is 2,196 and may reach 2,594 by fall of 2025 (2,594), a net gain of about 398 resident K-5. The K-5 resident student population is expected to grow by 65 (+2.8%) students between fall 2016 to fall 2017. By the fall of 2023, growth may start to slow down and level out from an average growth of 2% between fall 2016 through fall 2022 to an average growth of 0.7% between fall 2023 to fall 2025.

The middle school grades are expected to grow throughout the ten-year time frame. Gradual growth is expected for the middle school grades from fall 2016 through fall 2023, due mainly to high mobility factors. As of fall 2015, the District had a middle school population of 1,223 students. A total middle school population of 1,648 students is projected by fall 2025. This represents a net gain of 425 middle school students or a 34.8% growth for these grade ranges. By fall 2023 the 6-8 resident student population may stabilize around 1,648.

The Sherwood School District may experience the most growth in the high school grade levels. Over the ten-year timeframe, the District is expected to have a net gain of about 645 high school students. Currently (2015), the District has 1,620 9-12 students and the projections show that the district's 9-12 student population could reach 2,265 by 2025. Fall 2022 may be the year with the largest year-to-year growth. For fall 2021 resident 9-12 student population is projected to be 1,854 and in fall 2022 it is expected to grow to 1,958 (growth of 104 9-12 students or 5.6%).

Projection Trends for the District's Elementary School (K-5) Attendance Areas ("Residence" Projections)

The Sherwood School District is projected to experience overall growth in its resident student population among the elementary grades. The resident student population is at 2,196 and could reach 2,594 (a net gain of 398 K-5 students) by fall of 2025. It is important to note that the projected growth amongst the elementary attendance areas is most likely a result of new residential construction and high mobility. The attendance areas with the biggest projected resident K-5 student population gains over the ten year projection period include Hopkins ES (+201 K-5) and Archer Glen ES (+198 K-5). The Hopkins boundary area does have a potential for 674 new housing units over the next ten years, and the Archer Glen area has potential for 456 new housing units. On the other end of the spectrum are those attendance areas with the largest anticipated net decreases in K-5 student population. This includes Edy Ridge ES (-28 K-5 Students). The decline is a result of smaller projected incoming kindergarten classes that are due to enter the District and replace the bigger class size bubbles, which are graduating on through to the middle school grades. In fact, these smaller kindergarten classes have already hit some attendance areas as of fall 2015. The projected smaller kindergarten class sizes are mostly a result of the declining birthrates for the next three years.

INDIVIDUAL ELEMENTARY SCHOOL ATTENDANCE AREA ANALYSIS

The **Hopkins Elementary School** attendance area has the largest projected growth among the District's four elementary boundaries. Gradual growth is expected for this attendance area over the next ten years. A total of 750 K-5 students is expected for this area by the end of the projection period in 2025 (201 more K-5 students). This represents a net growth of 36%. The high mobility factors indicate that the Hopkins Elementary attendance area is a very desirable location for families to settle. Scheduled residential development will also play an important role in the projected elementary grade population for this attendance area. There are 342 single-family, 125 multi-family, and 207 apartment units scheduled to be built within this attendance area over the next ten year timeframe. With an actual enrollment of 567 PK-5 students as of fall 2015, this anticipated growth may place this school beyond its designated capacity. With the neighboring schools at or near capacity, the District may want to consider adding portables to Hopkins Elementary or expanding the facility to accommodate this projected growth. The Hopkins ES attendance area will definitely continue to experience significant growth in its resident K-5 student population and the District will need to look at options on how to properly house these additional students.

The **Archer Glen Elementary School** attendance area is expected to experience the second largest projected growth in elementary grade resident student population. As of fall 2015, this attendance area had 507 resident K-5 students living within its boundaries. It is projected that the attendance area could see as many as 705 K-5 resident students by fall of 2025. This represents a net growth of 198 resident K-5 students (39% growth) which amounts to about 6-7 classrooms worth of students. This growth is mainly due to the scheduled residential development that is due to be constructed within this area, a total of 456 new residential units over the next ten years. The development is focused within the city of Sherwood's Brookman Road Concept Plan. Along with the development, Archer Glen also has a high mobility rate with an average gain of 5% from kindergarten to fifth grade. Archer Glen ES has a current enrollment count of 525 K-5 students. The District will need

to closely monitor the residential development activity to get a better grasp on what is truly going to occur within this attendance area in the future and to determine whether or not the school can handle the amount of growth. Archer Glen has a capacity of 650 and by fall 2019 the school may be near that number with resident population of 626 and by fall 2020 a resident K-5 total of 670.

The **Edy Ridge Elementary School** attendance area is projected to be the only school to experience a net decrease over the projection window. As of fall 2015, there were 534 resident K-5 students living within the Edy Ridge attendance area and is projected to contain 506 resident K-5 students by fall 2025 (a net loss of 28 students or a 5.3% net decrease). The attendance area may experience a peak enrollment in 2018 with 566 resident K-5 students. This population decrease should start around 2019 when the larger student class sizes begin to graduate on through to the middle school grades. Smaller resident kindergarten class sizes have contributed to recent declining resident counts and similar sized K classes are anticipated for this attendance area for the next ten years. Kindergarten classes are expected to be around 65 resident students and graduating 5th graders are expected to be about 100 resident students.

The attendance area that is projected to stay relatively stable is **Middleton Elementary School** attendance area. In fall 2015, this attendance area had 606 K-5 students. By fall 2025, this attendance area could have 633 resident students, which indicates a net increase of 27 resident K-5 students over the next ten years (a net increase of 4.3%). The beginning years of the projection may not see much growth. Development in the area is not expected to begin until 2018 with a piece of the Brookman Road Concept Plan. From fall 2016 through fall 2019 the attendance area may experience a decline of 11 resident K-5 students. The year with the largest growth may be in 2020 with a growth of 29 students and a resident total of 624 K-5 students The Middleton attendance area currently has a non-contagious boundary, with 470 resident K-5 students living in the larger central part of the attendance area and 136 resident K-5 students living in the smaller northern part. Of the 136 resident K-5 students living in the smaller northern part of the Middleton attendance area, two students do not attend Middleton, they transfer to Edy Ridge. If possible, the District may consider boundary adjustments with Edy Ridge. This may help Edy Ridge with declining enrollment as well as alleviate funds being used to transport students living in the non-contiguous area of Middleton.

ELEMENTARY SCHOOL CONCLUSIONS

Based on the K-5 ten year projections, some boundary adjustments may need to be done for most attendance based on declining enrollment, major growth, or non-contiguous boundaries. With the projected growth for the Hopkins attendance area, the District may have to consider expansion options or programmatic changes to the Hopkins Elementary School, which could be nearing. The same could be said for the Archer Glen ES area which may see large growth throughout the ten years. The District may also consider adjusting boundaries for Middleton to help alleviate transportation costs in the non-contiguous area. The monitoring of any potential future residential development will continue to be necessary, as this will play a very important role to any potential resident population changes in the coming years.

Above projections EXCLUDE Out-of-District students and Special Education students. For a breakdown of Out-of-District students and Special Education students per school, then please refer to the Middle School 6-8 Attendance Matrix on page 16.

Projection Trends for the District's Middle School (6-8) Attendance Areas ("Residence" Projections)

The Sherwood School District has two comprehensive 6-8 middle schools, each with a distinct attendance area: Laurel Ridge Middle School and Sherwood Middle School. Both attendance areas feed directly into Sherwood's one high school, Sherwood HS. Overall growth for the middle school 6-8 student population is expected. A net increase of 425 6-8 students and a total of 1,648 6-8 students is expected by 2025. The Sherwood MS may experience the most growth. By 2025 Laurel Ridge may have 15.2% growth and Sherwood MS may have 49% growth.

Sherwood Middle School attendance area is expected to grow the most over the next ten years. Although a slight decline of two 6-8 resident students is expected for this attendance area by fall 2016, steady growth is expected for this area beyond 2016. As of fall 2015, Sherwood's attendance area had 718 6-8 students living within it and is projected to reach around 1,070 students by 2025. That is a net increase of 352 6-8 students when comparing 2015 to 2025 (+49%). The growth is mainly due to the anticipated construction of the Brookman Road Concept Plan and the Basalt Creek planning area. Both plans are still under review. However, the City of Sherwood still expects construction to start in 2018 for Brookman Road and 2020 for Basalt Creek. Currently, Sherwood MS gains 31 6-8 students (gain 4.3%) from outside its boundary, it loses 17 6-8 students (lose 3.5%) to Laurel Ridge. Sherwood MS's area is expected to see a large growth within the ten year timeframe and it appears that the school may approach its capacity of 1,090 by 2025. However, the District should closely monitor the Brookman Road Concept Plan and the Basalt Creek planning area; Sherwood MS's growth is closely tied to these projects.

As of fall 2015, the **Laurel Ridge Middle School** attendance area had 481 resident 6-8 students living within this attendance area. It is projected that Laurel Ridge MS's attendance area could experience an increase of about 73 grade 6-8 students by fall 2025, potentially giving it a total population of about 554 6-8 students. Laurel Ridge is expected to see a total of 393 residential units built within the ten year timeframe. Of the 393 units; DR Horton is expected to construct 15 single family and 50 multi-family units in the Cedar Brook development, Venture properties is expected to build 86 single family homes in the Mandel Farms subdivision, and Roshun Village is expected to build 14 townhomes in the Roshun Village Townhome development. Although most of the Brookman Road Concept Plan is located in the Sherwood MS boundary part of it falls within Laurel Ridge. Within the Laurel Ridge the plan is expected to yield 228 single family homes. It is also important to note that the Sherwood West planning area is expected to be within the Laurel Ridge attendance area. This planning area is not expected to be developed within the ten year window, however the District may want to follow the status of this development as it may possibly yield 4,400 units. The District will need to monitor Laurel Ridge because it may reach its designed capacity of 550 by fall 2018 with a resident 6-8 population of 557.

MIDDLE SCHOOL CONCLUSIONS

With a total projected growth of 425 6^{th}-8^{th} grade students by fall of 2025, the District may need to consider adding portable classrooms to the two middle schools. Most of the growth in resident middle school student population is a result of the parts of specific plans

expected to begin within the ten-year projection timeframe. Therefore, the District will need to closely monitor planning area and concept plan developments within the District area since those developments may potentially yield a large number of housing units.

Projection Trends for the District's High School (9-12) Attendance Area ("Residence" Projections)

The Sherwood School District has one high school, Sherwood HS. The high school has experienced growth within the 9-12 resident student population over the last four years with a total of 1,537 students as of fall 2015. A 39.8% net growth for the high school population is expected within the next ten years, which equates to a net gain of 645 9-12. By the end of the ten-year projections the resident 9-12 total may be about 2,182. Currently, the capacity for Sherwood HS is 1,550 and it may pass that figure by next year. It is anticipated that by 2025 the District may have 2,182 resident 9-12 students. The District may need to add portables to house students within the near future. However, the District should immediately start to look into how it plans on housing these additional high school students. Permanent expansion of the existing Sherwood HS site may be needed or a second high school site should be considered.

School Codes and School Assignments by Study Area

The Sherwood School District has assigned each school a code and DDP has incorporated these same codes in the databases and data layers that they have created/maintained for the district. Each study area is then coded with the elementary, middle and high school that the area is assigned to attend.

ELEMENTARY SCHOOLS (K-5)

Only Schools with assigned attendance areas are listed

School Code	Elementary School Name	Study Areas for Each Attendance Area
1334	Archer Ridge ES **24 Study Areas**	58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 78, 79, 80, 81, 84, 85A, 85B, 86A, 86B, 86C, 86D, 87
4730	Edy Ridge ES **20 Study Areas**	1, 10, 11A, 11B, 12, 13, 14, 15, 19, 2, 20, 21, 3, 4, 45, 5, 6, 7, 8, 9

INTRODUCTION

The Sherwood School District has contracted with Davis Demographics & Planning, Inc. (DDP) to develop and analyze demographic data relevant to the District's facility planning efforts. The scope of contracted work includes: mapping the District, address matching the current student file, developing and researching pertinent demographic data, identifying future residential development plans and developing a ten year student population projection. DDP will then assist the District in developing solutions for housing future student population. Additionally, this study was prepared to assist the District's efforts in evaluating future site requirements and attendance area changes.

The purpose of this report is to identify and inform the District of current trends occurring in the community; how these trends may affect future student population; and to assist in illustrating facility adjustments that may be necessary to accommodate the potential student population shifts. The District can then use this information to better plan for the need, location and timing of facility or boundary adjustments.

The **Sources of Data** section details where the two sources of data, geographic and non-geographic, are collected and how each data item is used in the ten year student population projection model.

The **Ten Year Projection Methodology** section discusses in detail how the factors used in the study were calculated and why they were used. These factors include the calculation of incoming kindergarten classes, additional students from new housing (referred to as student yield), the effects of student mobility, and a detailed review of planned residential development within the District.

While reading this report, it is important to remember that this is a snapshot of current (October 2015) and potential student population based upon data gathered in Spring 2015. DDP uses known residential housing projects that have been filed with the City or County and estimates future annual phasing of only these projects. DDP does not estimate any additional units beyond the "known" filed projects and therefore it is possible that more units could be built during this ten year timeframe. Population demographics, development plans, funding opportunities and district priorities can all change, and therefore, new projections and adjustments to the overall Master Plan will continue to be necessary in the future.

EXECUTIVE SUMMARY

Davis Demographics & Planning, Inc. is assisting the Sherwood School District in planning for future student population changes. By factoring current and historical student data with demographic data and planned residential development, DDP calculated a ten year student population projection. This projection is based upon residence of the students and is designed to alert the District as to when and where student population shifts will occur.

The Sherwood School District has seen constant growth from 2012 to 2014. The current 2015/2016 school year saw a significant gain of about 137 K-12 students. Over the next ten years, the projections show that the Sherwood School District should continue to grow through 2025. As of October 2015, the District stood at 5,067 K-12 students, and by fall 2025 that figure could be closer to 6,535, a net increase of 1,468 K-12 students.

ELEMENTARY SCHOOL CONCLUSIONS

The Sherwood School District is projected to experience overall growth in its resident student population among the elementary grades over the next ten years. The resident student population is at 2,196 and could rise to 2,594 (a net gain of 398 K-5 students) by fall of 2025. It is important to note that the projected growth amongst the elementary attendance areas is most likely a result of new residential construction. The attendance areas with the biggest projected resident K-5 student population gains over the ten year projection period include Archer Glen ES (+198 K-5 Students) and Hopkins ES (+201 K-5 Students). On the other end of the spectrum is the attendance area with an anticipated net decrease in K-5 student population, Edy Ridge ES (-28 K-5 Students). The decline is a result of smaller projected incoming kindergarten classes that are due to enter the District and replace the bigger class size bubbles, which are graduating on through to the middle school grades. The projected smaller kindergarten class sizes are mostly a result of the declining birthrates.

Based on the K-5 ten year projections, boundary adjustments may be needed for most attendance areas based on declining enrollment, major growth, or non-contiguous boundaries. The Hopkins attendance area should be monitored as it is expected to exceed its current capacity of 675 by fall 2022. The District may also have to keep an eye on the Archer Glen attendance area due to anticipated growth exceeding its capacity. The monitoring of any potential future residential development will continue to be necessary, as this will play an important role to any potential resident population changes in the coming years.

MIDDLE SCHOOL CONCLUSIONS

The Sherwood School District has two comprehensive 6-8 middle schools, each with a distinct attendance area: Laurel Ridge Middle School and Sherwood Middle School. Overall growth for the middle school 6-8 student population is expected to grow by an additional 425 resident students by 2025. Laurel Ridge attendance area should experience most of this growth with a projected net increase of 352 resident grade 6-8 students. The resident 6-8 student population for the Laurel Ridge attendance area should remain relatively stable with a projected net gain of only 73 students by 2025.

With a total projected growth of 425 6th-8th grade students by fall of 2025, the District may need to consider adding portable classrooms. Therefore, no boundary re-alignments among the Middle School attendance areas may be necessary within the next ten years. However, the District should closely monitor the Laurel Ridge area since it does look like its resident counts may be approaching its designed capacity of 550 in 2018. However, from fall 2021 to fall 2025 the school may stabilize around 550 students. Most of the growth in Sherwood MS attendance area is a result of residential development from the specific planning areas within the boundary.

HIGH SCHOOL CONCLUSIONS

The Sherwood School District has experienced growth in the high school resident student population over the last four years with an enrollment of 1,537 as of fall 2015. A 39.8% net growth for the high school population is expected within the next ten years, which equates to a net gain of 645 9-12. The high school residential totals are currently exceeding the capacity of 1,550. With this large growth, the District should consider opening a new high school. By fall 2025 the District is expected to have a high school 9-12 student population surpass the 1,550 capacity mark by 715 students.

SOURCES OF DATA

Geographic Map Data

Five geographic data layers were created for use in the ten year student population projections:

1. Street Centerline Database
2. Study Areas
3. Schools
4. Students – Historical and Current
5. Planned Residential Development

1) Street Centerline Data

The street database has associated attributes that contains but are not limited to, the following fields: full street name, address range and street classification.

The main function of the streets is in the geo-coding process of the student data. Each student is address-matched to the streets by their given address. The geo-coding process places a point on the map for every student in the exact location that student resides. This enables DDP to analyze the student data in a geographic manner.

Another vital utilization of the digital street database is in the construction of study areas. Freeways, major streets, and neighborhood streets are used as boundaries for the study areas.

2) Study Areas

Study areas are small geographic areas and the building blocks of a school district; they are similar to neighborhoods. Study areas are geographically defined following logical boundaries of the neighborhood, such as freeways, streets, railroad tracks, rivers, etc. Each study area is then coded with the elementary, middle, and high school that area is assigned to attend. By gathering information about the District at the study area level, you can closely monitor growth and demographic trends in particular regions and spot potential need for boundary changes or new facilities. There are 104 study areas created for the Sherwood SD.

3) Schools

The District provided school detailed information to DDP for mapping the District facilities.

4) Student Data

a. **Historical Student Data** - Historical enrollment is used to compare past student population growth and trends as well as the effects of mobility (move in, move out from existing housing) throughout the District. DDP utilized the last three years (2012, 2013, and 2014) of student enrollment data for each October from fall 2012 through fall 2014.
b. **Current Student Data** - A student data file representing October 2015 (received by DDP as a computer data file from the School District) summarized by grade level and by study area is used as a base for enrollment projections. Existing students were categorized by study area through the address-matching process that locates each student

within a particular area based upon their given address. The projections run each of the next ten years from fall 2016 through fall 2025.

The Student Accounting Summary (Table 1) indicates the total student enrollment as of October 2015 and the number of students used in the ten year student population projections. The projection model is based upon student residence and excludes students residing outside of the District's boundary, students with Grades = 13, Special Education students, independent study students, prekindergarten students and students in which DDP was unable to match. Special Education students were excluded from the projections (due to different classroom loading standards and not all of the District's elementary schools housed Special Education Students).

Table 1– Student Accounting Summary

Fall 2015 Actual Enrollment (Representing October 8, 2015)

Total Students Provided by the District to DDP	5,108
Students Living outside of District boundary	- 108
Students with Grades = 13	-13
Special Ed Students	-27
Prekindergarten Students	-28
STUDENTS USED IN PROJECTIONS	**4,932**

5) Planned Residential Development - This data was obtained through discussions with District staff, developers that have current or future projects within District boundaries, and planning officials from the cities of Sherwood and Tualatin. Data includes, when available, development name, developer/owner, location, housing type, total number of units, and projected move-in dates (phasing estimates). Phasing for planned housing is factored into the ten year projections. (See Section Two for a detailed listing of the planned residential development). In the student population projection, DDP includes all Approved and Tentative tract maps in addition to any planned or proposed development that possibly will occur within the projection timeframe. The planned residential development information and phasing estimates show a snapshot of the District at the time of this study. Any of the residential development information contained within this report may change and should therefore, be updated at least annually.

Non-Geographic Data

Two basic sets of non-geographic data were compiled and reviewed for use in the ten year student population projections by residence:

1. Births by Zip Code
2. Mobility Factors

1) Births by Zip Code Data - Birth data by postal zip code was obtained from the Oregon State Center for Health Statistics, for the years 2003-2014 and roughly correlated to the Sherwood School District's boundary. Past changes in historical birthrates are used to estimate incoming kindergarten student population from existing housing.

2) Mobility Factors - Mobility refers to the increase/decrease in the migration of students within the District boundary (move-in/move-out of students from existing housing). Mobility, similar to a cohort, is applied as a percentage of increase/decrease among each grade for every year of the projections. The Mobility Factors help account for apartment movement, housing resales, and dropout rates at the high school level.

TEN YEAR "RESIDENCE" PROJECTION METHODOLOGY

The projection methodology used in this study combines historical student population figures, and past and present demographic characteristics to forecast future student population at the study area level. District-wide projections are summarized from the individual study area projections. **These projections are based upon where the students reside and where they should be attending school. DDP uses the actual location of where the students reside, as opposed to their school of enrollment, in order to provide the most accurate estimate of where future school facilities should be located.** The best way to plan for future student population shifts is to know where the next group of students will be residing. The following details the methodology used in preparing the student population projections by residence.

Ten Year Projections

Projections are calculated out ten years from the date of projection for several reasons. The planning horizon for any type of facility is typically no less than five years, often longer. Ten years is sufficient to adequately plan for any facility. It is a short to mid-term solution for planning needs. Projections beyond ten years are based upon speculation due to the lack of reliable information on birthrates, new home construction, economic conditions etc.

Why Projections are Calculated by Residence

Typically, school district projections are based on enrollment by school. However, this method is inadequate when used to locate future school facility needs because the location of the students is not taken into consideration. A school's enrollment can fluctuate due to variables in the curriculum, program changes, school administration, and open enrollment policies. These variables can skew the apparent need for new or additional facilities in an area.

The method used by DDP is unique because it modifies a standard cohort projection with demographic factors and actual student location. **DDP bases its projections on the belief that school facility planning is more accurate when facilities are located where the greatest number of students reside.**

The best way to plan for future schools is to know where the next group of students will be coming from. The following details the methodology used in preparing the student population projections.

1) Progression - Each year of the projections, 12th grade students graduate and continuing students progress through to the next grade level. This normal progression of students is modified by the following factors:

2) Incoming Kindergarten – Live birth data is reported to the Oregon State Center for Health Statistics, by the resident postal zip code of the mother. DDP uses birth data by zip code so, if need be, a different birth factor can be applied to various areas of the District.

Incoming kindergarten classes, for existing homes, are estimated by comparing changes in past births and birthrates. Table 2 shows the total births for the two main zip codes in the Sherwood School District area from 2003 to 2014. Incoming kindergarten classes are determined by multiplying the existing kindergarten class (2015) by the percent increase/decrease in the birthrate for the year the kindergarten class was born (2010). Assuming that the fall 2015 kindergarten class was born in 2010, DDP compared the total births in 2010 to the total births in 2011, to determine a factor for next year's kindergarten class (Fall 2016). Similarly, 2010 was compared to 2012 (Fall 2017 K class), 2010 to 2013 (Fall 2018 K class) and 2010 to 2014 (Fall 2019 K class).

Split between 2 counties Washington and Clackamas

= PEAK YEAR

Source: State of Oregon Center for Health Statistics

Table 2– Birth Data by Zip Code

According to Table 2, the birth data for zip code 97140 shows a decrease of births from 2006 to 2010 with total births in 2010 of 277 (for 97140 combined). Births for 97140 have not shown any kind of consistent trend. Births have been relatively unstable with average births from 2003 to 2010 of 312. There was a peak in births in 2006 of 351 live births for 97140 combined. The births then experienced an overall decline from 2010 through 2014. Birth factors for 2020-2025 are an average of the previous three years, and is conducted this way because the birth data is not yet available or the children have not been born; DDP elects to follow this common practice because it doesn't want to over or under project incoming kindergarteners.

3) Student Mobility Factors - Student mobility factors further refine the ten year student population projections. Mobility refers to the increase/decrease in the migration of students within the District boundary (move-in/move-out of students from existing housing). This factor takes into account the apartment movement within the District, as well as housing resales and dropout rates at the high school level. Mobility, similar to a cohort, is applied as a percentage of increase/decrease to each grade for every year of the projections. DDP used

the District's historical student data (representing data taken from the Fall timeframe) for calculating these factors.

A net increase or decrease of zero students over time is represented by a factor of 100%. A net student loss is represented by a factor less than 100% and a net gain by a factor greater than 100% (see the example below).

Example: 100 K grade students in the Archer Glen ES area for fall 2015
X 119.0% (the K-1 Archer Glen ES area Mobility Factor)
119.0 1st grade students in fall 2016 for that area in Archer Glen

The sampling used was taken over a four-year period (student data from 2012 through 2015) and three yearly groupings were calculated. For example, a comparison was made for the fall 2012 K student population to the fall 2013 1st grade students. This comparison was also conducted for the fall 2013 & fall 2014 and fall 2014 & Fall 2015 groupings. Table 3, below, shows the Mobility Factors that were used for this year's report.

Table 3-Mobility Factors

Using Fall 2012 through 2015 Student Data (3 Years of Change) by Elementary Attendance Area

Sherwood School District Mobility (Using Fall 2012 through Fall 2015 Student Data)

(Excluding Study Areas that Have Had Development and Ones that Contain Low Student Counts)

	K to 1	1 to 2	2 to 3	3 to 4	4 to 5	5 to 6	6 to 7	7 to 8	8 to 9	9 to 10	10 to 11	11 to 12
Archer Glen ES	1.190	0.990	1.070	1.020	1.010	1.060	1.040	1.030	1.100	0.960	0.970	0.960
Edy Ridge ES	1.140	1.110	1.070	1.000	1.020	1.110	1.010	1.030	1.080	0.980	0.990	0.990
Hopkins ES	1.160	1.050	1.050	1.070	1.040	1.080	1.050	1.030	0.990	1.020	0.990	0.960
Middleton ES	1.090	1.060	1.040	1.010	1.050	1.020	0.990	1.010	1.020	0.980	0.990	0.970

Based upon DDP's experience with many other school districts' data, the figures in Table 3 are very typical of communities like Sherwood SD. Archer Glen ES's K to 1 Mobility Factor is 119.0%. That means that for Archer Glens' area, as students transition from Kindergarten to 1st grade (K to 1st) there is an average student increase of 19%. Since kindergarten is not a required grade, many parents choose to keep their children in daycare facilities through kindergarten and then bring them into 1st grade at the public school. This accounts for the high K to 1 rates. Most of the Districts mobility factors are green (greater than 1.00). This means that parents are choosing to move into the Sherwood School District, specifically to enroll their children in their schools. The only losses (red) seen above are some very slight high school dropout rates.

4) Student Yield Factors (SYF'S) – Ten-Year Projections - The Student Yield Factors, when applied to planned residential development units, determine how many additional students will be generated from new housing construction within the District (see **Section Two** for details on planned residential development schedules). Student Yield Factors are sometimes referred to as Student Generation Rates (SGR's). DDP has elected to use student yield factors from Sherwood School District neighbors, West-Linn Wilsonville. Sherwood School District did not have a large enough sample size of new housing units to accurately create student yield factors.

Table 4- Student Yield Factors

Single-Family Detached (SFD) Units				
Grade Ranges	K-5	6-8	9-12	K-12
Student Yield Factor	0.285	0.142	0.135	0.562

Multi-Family Units (MFA) (apartments, condos, townhomes, etc)				
Grade Ranges	K-5	6-8	9-12	K-12
Student Yield Factor	0.096	0.048	0.061	0.205

Before the SYF's can be applied to the current housing units, the year of construction for each housing type must be analyzed. In general, new housing attracts young families with elementary school aged children. Over the next 12 to 15 years, the children grow older and pass through the grades. This cycle is then repeated throughout the life of the home. Analyzing the year of construction for new housing units can help estimate the number of facilities needed to accommodate new students.

5) Planned Residential Development and Student Yield Factors - Closely related to the Student Yield Factors (SYF) are planned residential development units. Planned residential development data is collected to determine the number of new residential units that will be built over the ten year period of the student population projections. The units built within the next ten years will have the appropriate SYF applied to it to determine the number of new students the planned residential development will yield.

This residential development data was obtained through the District, developers that have current or future projects within District boundaries, and planning officials from the cities of Sherwood and Tualatin. A database and map of the planned residential development was created, including, when available, project name, location, housing type, total number of units and estimated move in dates (phasing schedule). Projected phasing is based upon occupancy of the unit and is used to help time the arrival of students from these new developments. (see **Section Two** for details on planned residential development occupancy).

In the resident student projections, DDP includes all Approved and Tentative tract maps in addition to any planned or proposed development that possibly will occur within the projection timeframe. The planned residential development information and phasing estimates is a snapshot of the District at the time of this study. The residential development information changes quite often and should be updated at least on an annual basis.

APPLYING THE VARIABLES TO GENERATE THE PROJECTIONS

The following paragraphs summarize how DDP uses the factors to determine the student population projections. Remember that these projections are based on residence.

The Sherwood School District has been broken up into 104 study areas and each are coded for each of the District's elementary, middle and high school, depending upon what attendance area they fall in. The residential projections are calculated at the study area level. This means that DDP conducts 104 individual projections that are based upon the number of students residing in each study area.

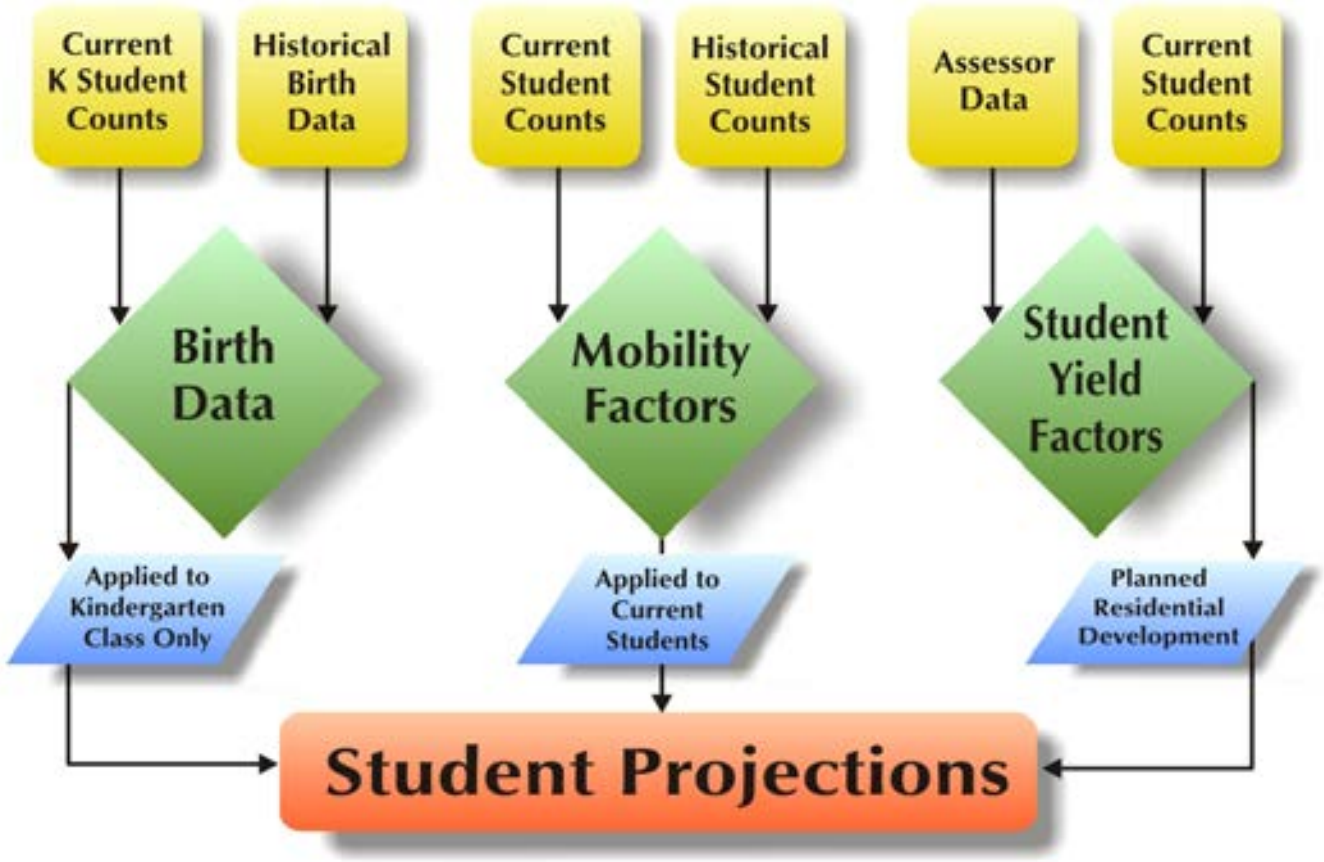
The first step in running these projections involves listing the number of students that live in a particular study area by each individual grade (Kindergarten through 12th grade). The current student base (Fall 2015) is then passed onto the next year's grade (2015's K become 2016's 1st graders, 2015's 1st graders become 2016's 2nd graders, and so on). After the natural progressions of students through the grades are applied, Birth Factors are then multiplied to the current Kindergarten class to generate a base for the following year's Kindergarten class. (*Section One*)

Next, a Mobility Factor is applied to all grades. Again, these factors take into account the natural in/out migration of students throughout the District. A specific Mobility Factor was calculated for each grade transition (K to 1st, 1st to 2nd, etc.) within each elementary attendance area and is applied to the appropriate grade (and school area) to estimate the next year's progressed students.

The last essential layer applied to the projections deals with additional students from planned residential development (*Section Two*). This is a simple calculation, again conducted at the study area level, where the estimated number of new housing units for a particular year is multiplied by the appropriate Student Yield Factors. For example, if 100 single-family detached (SFD) units are to be built in a specific study area in a given year, then you would multiply this number (100 units, for example) by the SFD K-5 Student Yield Factor (.285) and the resulting number (29 K-5 students) is divided evenly among the six grades. (*Section One*)

To finish generating the projections by residence, the same process is conducted for each of the 104 study areas. Once the projections have been run at the study area level, then it is simple addition to determine projections for each of the District's attendance areas or for a district-wide summary. For example, the residential projections for Archer Glen Elementary School are simply the summary of all of the study areas that make up this specific attendance area (see *Section Five* for the projections of each elementary attendance area). The District Summary for the "residence" projections (*Section Four)* is a total summary of all 104 study areas, which excludes all of the students that attend a district school and live outside of the District's boundaries and students unable to be mapped. Then out-of-district students are factored back into the projections by simply adding the existing totals in at the bottom of the projections (please see the Attendance Matrices in *Section Three* for a breakdown of the out-of-district students by school). DDP adds the current total out-of-district to each year of the projections because there is no accurate way to forecast these students in the future.

DDP Student Projection Model



PLANNED RESIDENTIAL DEVELOPMENT

This data was obtained through discussions with District staff, developers that have current or future projects within District boundaries, and planning officials from the Cities of Sherwood and Tualatin. A database and map of the planned residential development was created, including, when available, project name, location, housing type, total number of units and estimated move in dates (phasing schedule). Projected phasing is based upon occupancy of the unit and is used to help time the arrival of students from these new developments. Please see the next page (page 11) for a map of the known residential projects in the Sherwood School District area. Following the map (on page 12) is a breakdown of the estimated occupancy date for new housing units over the next ten years (from Fall 2016 through Fall 2025) by Study Area and by the three main housing types (single family detached – SFD – units; multi-family attached – MFA – units; and apartments – APT – units). This document is referred to as the District-Wide Residential Development Summary. In addition, DDP has included a Residential Development List (page 12), which is sorted by Study Area and is an inventory of all known residential projects that are expected to be active over the next ten years.

DDP estimates that as many as 1,155 Single-Family Detached units, 189 multi-family units, and 207 Apartment units could be built within the Sherwood District boundary over the next ten years. This amount of units is definitely possible and is not unprecedented. Most of these units are estimated to be constructed within the ten year period, with the fall 2021 and fall 2022 school years having the most units being built with 235 each year.

Please note that all phasing schedules are based on occupancy, all Approved and Tentative maps plus proposed and potential development are included on these lists, the Summary only includes units that may be occupied in the ten year timeframe of the projections and are based upon data gathered during the Spring of 2016 and may not reflect recent changes.

THE K-5 ATTENDANCE MATRIX

An Elementary (K-5) Attendance Matrix has been included to provide a better understanding of where students reside and where they attend school. This matrix helps to see a "snapshot" of the District's current Open Enrollment patterns. DDP has also created a Middle and High Attendance Matrix on the following pages.

The attendance matrix acts as a checks and balance for student accounting. It shows where the students reside (what is their School of Residence) based upon our address matching capabilities and what school they attend (School of Attendance) based upon data in the student file supplied by the District. The inclusion of this matrix is essential to showing how the students used in the projections match up to the District's records of enrollment for each school. The best way to plan for future facilities is to know where the next group of students will be coming from, not necessarily which school they are currently attending.

Remember, DDP's projections are based upon where the students reside, not where they attend school. DDP uses the actual location of where the students reside, as opposed to their school of enrollment, in order to provide the most accurate depiction of where future facilities (if necessary) should be located. Therefore, since the projections are based upon where the students reside, the figures DDP uses as a base for each school's resident projection may be slightly higher or lower than the actual reported enrollment for each school.

READING THE MATRIX

Looking at the K-5 Elementary School Attendance Matrix on page 15, let us begin with Archer Glen ES as an example. Following down the second column with the "Archer Glen ES" heading, on the first row you see that there are 486 K-5 grade students attending Archer Glen ES and residing in the Archer Glen ES attendance area. Continuing downward, four students attend Archer Glen ES, but reside in the Edy Ridge ES attendance area. Next, it shows that 17 students attend Archer Glen ES and reside in the Hopkins ES attendance area, and so on.

The row named "PK" refers to all prekindergarten students enrolled with the District. There are 0 prekindergarten students that attend Archer Glen ES. The row named "Special Education" refers to all elementary level Special Education students attending the District. No special education students attend Archer Glen ES. The item entitled "Out-of-District" refers to students living outside of the Sherwood School District but attending one of the District's schools. There are seven Out-of-District students attending Archer Glen ES. The "K-5 Totals" row shows the total number of K-5 students attending a school regardless of where they reside; this should reflect the District's enrollment counts for each school as of October 2015. There were 525 students attending Archer Glen ES as of October 2015. At the bottom of the matrix, DDP lists the District's "Open Enrollment Percentage," a figure that lists the total number of students attending the particular school but live outside of the designated boundary. There were 39 such students attending Archer Glen ES, calculating a percentage of 7.5%, which means that as of October 2015, 7.5% of Archer Glen ES's students came from outside of its current boundary.

The next step is to read across the matrix, beginning with the Archer Glen ES attendance area row. It is now understood that the 486 represent the total number of K-5 grade

students that reside in the Archer Glen ES attendance area and attend Archer Glen ES. The next column, titled "Edy Ridge ES", lists the number of K-5 grade students that reside in the Archer Glen ES attendance area, but attend Edy Ridge ES. There were six K-5 students who resided in the Archer Glen ES attendance area but attend Edy Ridge ES as of October 2015.

The K-5 Students column in the beginning represents the total number of students living in that particular attendance area. There are 507 K-5 students residing in the Archer Glen ES attendance area. Reading down the Totals column, you will find the number of K-5 students used in the fall 2015 projections - - 2,196 K-5 students (excluding Prekindergarten, Special Ed., and Out-of-District).

The Middle Matrix (on page 16) is read in the same manner as the Elementary School Matrix.

Fall 2015/2016 K-5 (Elementary School) Attendance Matrix

	District-wide			

DISTRICT-WIDE STUDENT PROJECTIONS (BY "RESIDENCE")

The student population is projected out ten years for each of the study areas and for the entire Sherwood School District. The District-Wide Summary enables the District to see a broad overview of future growth and what impact this growth will have on existing facilities. The study area listings enable the District to monitor student population growth or decline in smaller geographic areas within the District (please see *Appendix A* for the individual 104 Study Area projections).

At any point in time, study areas and their projected resident students can be shifted between schools to assist in balancing enrollment growth. Together, these projection summaries present the means for identifying the timing of additional student arrival and overall facility requirements and location to accommodate the District's expected growth.

The following page shows the District-Wide Projections by "Residence" using the fall 2015 (mid-October) student data as the base and fall 2013 and fall 2014 listed for reference. Ten consecutive years are then projected from fall 2016 through fall 2025 with the Out-of-District, Unmatched, and Special Ed students separated from the sub-totals. The Out-of-District, Unmatched, and Special Ed student records are added back in for each projection year (after the sub-totals) using the same fall 2015 figures. At the bottom of the District-Wide Projection, a projected annual change is listed.

For an exact breakdown of how many Out-of-District, Special Ed and Unmatched students there were for each elementary school as of fall 2015, please see the K-5 Attendance Matrix on page 15 and the 6-8 Middle School Matrix on page 16.

District-Wide 10-Year Forecast

The above projections are based upon a student data file provided to DDP by the Sherwood School District representing early October 2015.

13 students with a grade = 13 and 28 PreK students were given to DDP in the original student data file and were excluded from the above projections.

District Wide Student Population Projection Trends ("Residence" Method)

The Sherwood School District has experienced growth in resident student population since 2012. The District seemed to have experienced a big jump in its K-12 Student population from fall 2014 to fall 2015. According to the projections, the Sherwood School District could continue to see a gradual K-12 student population growth over the next ten years. A K-12 student population of 6,400 is projected by fall of 2025. The District may experience an average gain of about 147 students starting fall 2016 through fall 2025. This represents an overall net gain of 1,468 K-12 students or a 29% student population increase for the District by fall 2025.

According to the projections, the K-5 resident student population is expected to see growth throughout the ten years. The K-5 resident student population for 2015 is 2,196 and may reach 2,594 by fall of 2025 (2,594), a net gain of about 398 resident K-5. The K-5 resident student population is expected to grow by 65 (+2.8%) students between fall 2016 to fall 2017. By the fall of 2023, growth may start to slow down and level out from an average growth of 2% between fall 2016 through fall 2022 to an average growth of 0.7% between fall 2023 to fall 2025.

The middle school grades are expected to grow throughout the ten-year time frame. Gradual growth is expected for the middle school grades from fall 2016 through fall 2023, due mainly to high mobility factors. As of fall 2015, the District had a middle school population of 1,223 students. A total middle school population of 1,648 students is projected by fall 2025. This represents a net gain of 425 middle school students or a 34.8% growth for these grade ranges. By fall 2023 the 6-8 resident student population may stabilize around 1,648.

The Sherwood School District may experience the most growth in the high school grade levels. Over the ten-year timeframe, the District is expected to have a net gain of about 645 high school students. Currently (2015), the District has 1,620 9-12 students and the projections show that the district's 9-12 student population could reach 2,265 by 2025. Fall 2022 may be the year with the largest year-to-year growth. For fall 2021 resident 9-12 student population is projected to be 1,854 and in fall 2022 it is expected to grow to 1,958 (growth of 104 9-12 students or 5.6%).

Projection Trends for the District's Elementary School (K-5) Attendance Areas ("Residence" Projections)

The Sherwood School District is projected to experience overall growth in its resident student population among the elementary grades. The resident student population is at 2,196 and could reach 2,594 (a net gain of 398 K-5 students) by fall of 2025. It is important to note that the projected growth amongst the elementary attendance areas is most likely a result of new residential construction and high mobility. The attendance areas with the biggest projected resident K-5 student population gains over the ten year projection period include Hopkins ES (+201 K-5) and Archer Glen ES (+198 K-5). The Hopkins boundary area does have a potential for 674 new housing units over the next ten years, and the Archer Glen area has potential for 456 new housing units. On the other end of the spectrum are those attendance areas with the largest anticipated net decreases in K-5 student population. This includes Edy Ridge ES (-28 K-5 Students). The decline is a result of smaller projected incoming kindergarten classes that are due to enter the District and replace the bigger class size bubbles, which are graduating on through to the middle school grades. In fact, these smaller kindergarten classes have already hit some attendance areas as of fall 2015. The projected smaller kindergarten class sizes are mostly a result of the declining birthrates for the next three years.

INDIVIDUAL ELEMENTARY SCHOOL ATTENDANCE AREA ANALYSIS

The **Hopkins Elementary School** attendance area has the largest projected growth among the District's four elementary boundaries. Gradual growth is expected for this attendance area over the next ten years. A total of 750 K-5 students is expected for this area by the end of the projection period in 2025 (201 more K-5 students). This represents a net growth of 36%. The high mobility factors indicate that the Hopkins Elementary attendance area is a very desirable location for families to settle. Scheduled residential development will also play an important role in the projected elementary grade population for this attendance area. There are 342 single-family, 125 multi-family, and 207 apartment units scheduled to be built within this attendance area over the next ten year timeframe. With an actual enrollment of 567 PK-5 students as of fall 2015, this anticipated growth may place this school beyond its designated capacity. With the neighboring schools at or near capacity, the District may want to consider adding portables to Hopkins Elementary or expanding the facility to accommodate this projected growth. The Hopkins ES attendance area will definitely continue to experience significant growth in its resident K-5 student population and the District will need to look at options on how to properly house these additional students.

The **Archer Glen Elementary School** attendance area is expected to experience the second largest projected growth in elementary grade resident student population. As of fall 2015, this attendance area had 507 resident K-5 students living within its boundaries. It is projected that the attendance area could see as many as 705 K-5 resident students by fall of 2025. This represents a net growth of 198 resident K-5 students (39% growth) which amounts to about 6-7 classrooms worth of students. This growth is mainly due to the scheduled residential development that is due to be constructed within this area, a total of 456 new residential units over the next ten years. The development is focused within the city of Sherwood's Brookman Road Concept Plan. Along with the development, Archer Glen also has a high mobility rate with an average gain of 5% from kindergarten to fifth grade. Archer Glen ES has a current enrollment count of 525 K-5 students. The District will need

to closely monitor the residential development activity to get a better grasp on what is truly going to occur within this attendance area in the future and to determine whether or not the school can handle the amount of growth. Archer Glen has a capacity of 650 and by fall 2019 the school may be near that number with resident population of 626 and by fall 2020 a resident K-5 total of 670.

The **Edy Ridge Elementary School** attendance area is projected to be the only school to experience a net decrease over the projection window. As of fall 2015, there were 534 resident K-5 students living within the Edy Ridge attendance area and is projected to contain 506 resident K-5 students by fall 2025 (a net loss of 28 students or a 5.3% net decrease). The attendance area may experience a peak enrollment in 2018 with 566 resident K-5 students. This population decrease should start around 2019 when the larger student class sizes begin to graduate on through to the middle school grades. Smaller resident kindergarten class sizes have contributed to recent declining resident counts and similar sized K classes are anticipated for this attendance area for the next ten years. Kindergarten classes are expected to be around 65 resident students and graduating 5th graders are expected to be about 100 resident students.

The attendance area that is projected to stay relatively stable is **Middleton Elementary School** attendance area. In fall 2015, this attendance area had 606 K-5 students. By fall 2025, this attendance area could have 633 resident students, which indicates a net increase of 27 resident K-5 students over the next ten years (a net increase of 4.3%). The beginning years of the projection may not see much growth. Development in the area is not expected to begin until 2018 with a piece of the Brookman Road Concept Plan. From fall 2016 through fall 2019 the attendance area may experience a decline of 11 resident K-5 students. The year with the largest growth may be in 2020 with a growth of 29 students and a resident total of 624 K-5 students The Middleton attendance area currently has a non-contagious boundary, with 470 resident K-5 students living in the larger central part of the attendance area and 136 resident K-5 students living in the smaller northern part. Of the 136 resident K-5 students living in the smaller northern part of the Middleton attendance area, two students do not attend Middleton, they transfer to Edy Ridge. If possible, the District may consider boundary adjustments with Edy Ridge. This may help Edy Ridge with declining enrollment as well as alleviate funds being used to transport students living in the non-contiguous area of Middleton.

ELEMENTARY SCHOOL CONCLUSIONS

Based on the K-5 ten year projections, some boundary adjustments may need to be done for most attendance based on declining enrollment, major growth, or non-contiguous boundaries. With the projected growth for the Hopkins attendance area, the District may have to consider expansion options or programmatic changes to the Hopkins Elementary School, which could be nearing. The same could be said for the Archer Glen ES area which may see large growth throughout the ten years. The District may also consider adjusting boundaries for Middleton to help alleviate transportation costs in the non-contiguous area. The monitoring of any potential future residential development will continue to be necessary, as this will play a very important role to any potential resident population changes in the coming years.

Projection Trends for the District's Middle School (6-8) Attendance Areas ("Residence" Projections)

The Sherwood School District has two comprehensive 6-8 middle schools, each with a distinct attendance area: Laurel Ridge Middle School and Sherwood Middle School. Both attendance areas feed directly into Sherwood's one high school, Sherwood HS. Overall growth for the middle school 6-8 student population is expected. A net increase of 425 6-8 students and a total of 1,648 6-8 students is expected by 2025. The Sherwood MS may experience the most growth. By 2025 Laurel Ridge may have 15.2% growth and Sherwood MS may have 49% growth.

Sherwood Middle School attendance area is expected to grow the most over the next ten years. Although a slight decline of two 6-8 resident students is expected for this attendance area by fall 2016, steady growth is expected for this area beyond 2016. As of fall 2015, Sherwood's attendance area had 718 6-8 students living within it and is projected to reach around 1,070 students by 2025. That is a net increase of 352 6-8 students when comparing 2015 to 2025 (+49%). The growth is mainly due to the anticipated construction of the Brookman Road Concept Plan and the Basalt Creek planning area. Both plans are still under review. However, the City of Sherwood still expects construction to start in 2018 for Brookman Road and 2020 for Basalt Creek. Currently, Sherwood MS gains 31 6-8 students (gain 4.3%) from outside its boundary, it loses 17 6-8 students (lose 3.5%) to Laurel Ridge. Sherwood MS's area is expected to see a large growth within the ten year timeframe and it appears that the school may approach its capacity of 1,090 by 2025. However, the District should closely monitor the Brookman Road Concept Plan and the Basalt Creek planning area; Sherwood MS's growth is closely tied to these projects.

As of fall 2015, the **Laurel Ridge Middle School** attendance area had 481 resident 6-8 students living within this attendance area. It is projected that Laurel Ridge MS's attendance area could experience an increase of about 73 grade 6-8 students by fall 2025, potentially giving it a total population of about 554 6-8 students. Laurel Ridge is expected to see a total of 393 residential units built within the ten year timeframe. Of the 393 units; DR Horton is expected to construct 15 single family and 50 multi-family units in the Cedar Brook development, Venture properties is expected to build 86 single family homes in the Mandel Farms subdivision, and Roshun Village is expected to build 14 townhomes in the Roshun Village Townhome development. Although most of the Brookman Road Concept Plan is located in the Sherwood MS boundary part of it falls within Laurel Ridge. Within the Laurel Ridge the plan is expected to yield 228 single family homes. It is also important to note that the Sherwood West planning area is expected to be within the Laurel Ridge attendance area. This planning area is not expected to be developed within the ten year window, however the District may want to follow the status of this development as it may possibly yield 4,400 units. The District will need to monitor Laurel Ridge because it may reach its designed capacity of 550 by fall 2018 with a resident 6-8 population of 557.

MIDDLE SCHOOL CONCLUSIONS

With a total projected growth of 425 6^{th}-8^{th} grade students by fall of 2025, the District may need to consider adding portable classrooms to the two middle schools. Most of the growth in resident middle school student population is a result of the parts of specific plans

expected to begin within the ten-year projection timeframe. Therefore, the District will need to closely monitor planning area and concept plan developments within the District area since those developments may potentially yield a large number of housing units.

Above projections EXCLUDE Out-of-District students and Special Education students. For a breakdown of Out-of-District students and Special Education students per school, then please refer to the High School 9-12 Attendance Matrix on page 16.

Projection Trends for the District's High School (9-12) Attendance Area ("Residence" Projections)

The Sherwood School District has one high school, Sherwood HS. The high school has experienced growth within the 9-12 resident student population over the last four years with a total of 1,537 students as of fall 2015. A 39.8% net growth for the high school population is expected within the next ten years, which equates to a net gain of 645 9-12. By the end of the ten-year projections the resident 9-12 total may be about 2,182. Currently, the capacity for Sherwood HS is 1,550 and it may pass that figure by next year. It is anticipated that by 2025 the District may have 2,182 resident 9-12 students. The District may need to add portables to house students within the near future. However, the District should immediately start to look into how it plans on housing these additional high school students. Permanent expansion of the existing Sherwood HS site may be needed or a second high school site should be considered.

School Codes and School Assignments by Study Area

The Sherwood School District has assigned each school a code and DDP has incorporated these same codes in the databases and data layers that they have created/maintained for the district. Each study area is then coded with the elementary, middle and high school that the area is assigned to attend.

ELEMENTARY SCHOOLS (K-5)

Only Schools with assigned attendance areas are listed

School Code	Elementary School Name	Study Areas for Each Attendance Area

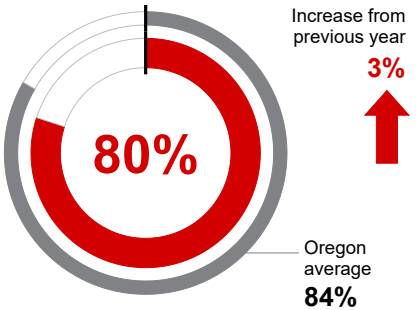
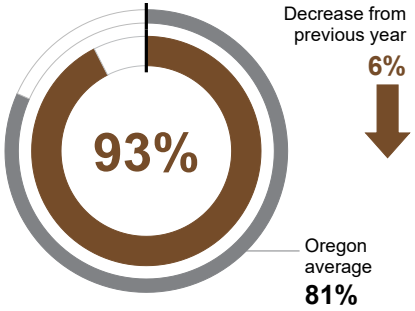
Students earning one-quarter of graduation credits in their 9th grade year.



Academic Success

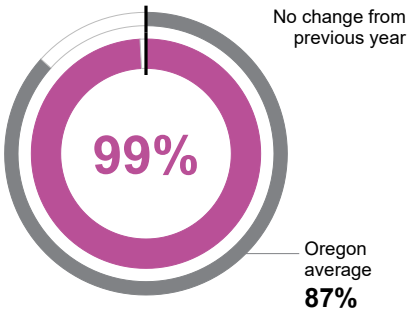
ON-TIME GRADUATION

*Students earning a diploma within four years. Cohort includes students who were first-time ninth graders in 2018-19 graduating in **2021-22**.*



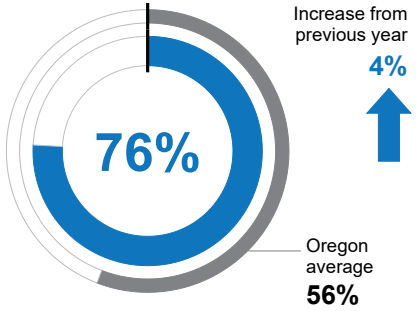
FIVE-YEAR COMPLETION

*Students earning a high school diploma or GED within five years. Cohort Includes students who were first-time ninth graders in 2017-18 finishing in **2021-22**.*



COLLEGE GOING

*Students enrolling in a two or four year college within 16 months of completing high school in **2020-21**. Data from the National Student Clearinghouse.*



School Goals

All students will meet proficiency standards in English Language Arts and Mathematics as measured by Oregon Statewide Assessments and standards-based course assessments. All students will participate in rigorous and meaningful academic and co-curricular learning that prepares them for careers and post K-12 learning. All students will experience belonging to a strong and welcoming school community.

State Goals

The Oregon Department of Education is partnering with school districts and local communities to ensure a 90% on-time, four year graduation rate by 2027. To progress toward this goal, the state will prioritize efforts to improve attendance, provide a well-rounded education, invest in implementing culturally responsive practices, and promote continuous improvement to close opportunity and achievement gaps for historically and currently underserved students.

Safe & Welcoming Environment

District and school equity teams implement actions to ensure all students have every opportunity to reach their full potential and to embrace students' and families' diversity. Appreciating and respecting differences is an integral part of all daily instruction. A commitment to inclusive practices drives programs and practices.

PARENT & COMMUNITY ENGAGEMENT

The West Linn-Wilsonville School District is deeply grateful for its supportive parents and families. West Linn-Wilsonville understands strong relationships with parents lead to increased student success in the classroom. The district strives to develop strong parent partnerships to enhance students' educational experience at school and at home. The district leads parent evenings that are designed to engage parents in post K-12 learning.

Data are suppressed to protect confidential student information.

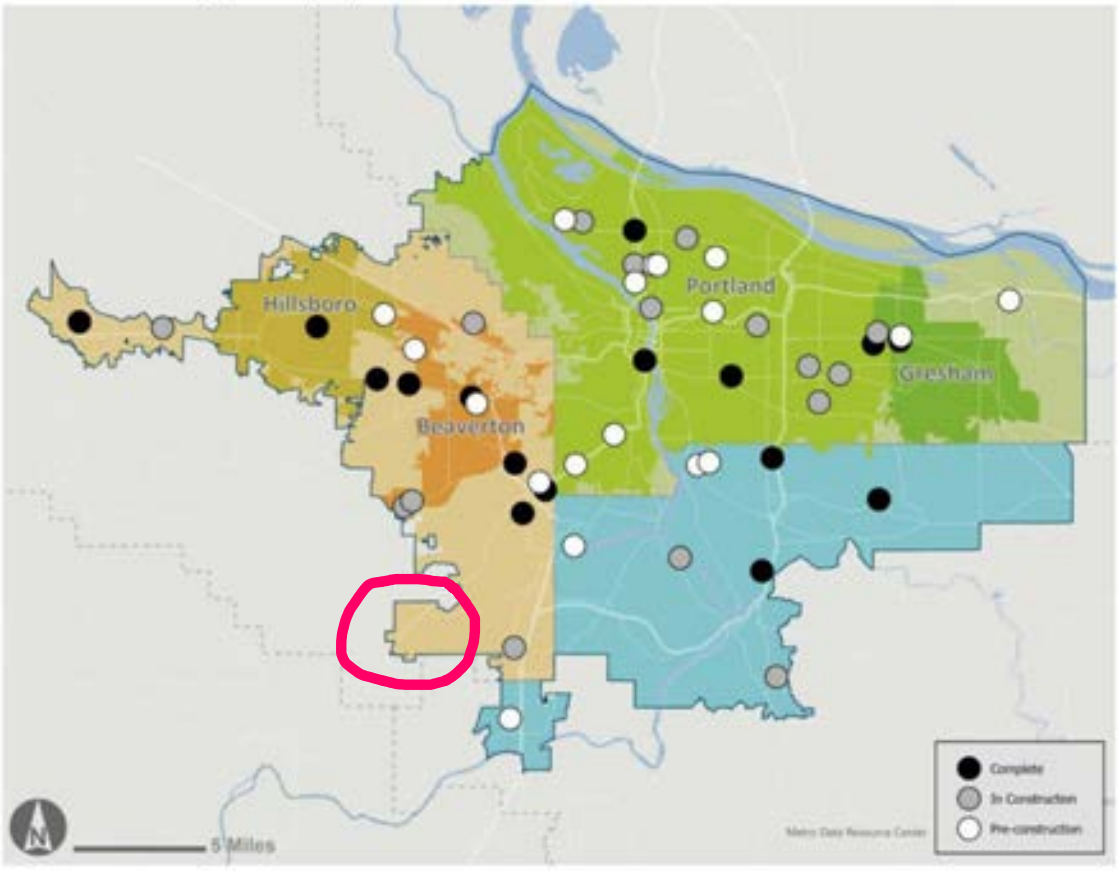
No Metro Affordable Housing Bond Project Located in Sherwood

Affordable housing projects using Metro's housing bond program have been built across the region, including in affluent suburbs like Lake Oswego and Happy Valley, and in the neighboring cities of Tigard, Tualatin and Wilsonville, but not in Sherwood.

2023 Annual report
June 20, 2024

Metro affordable housing bond program

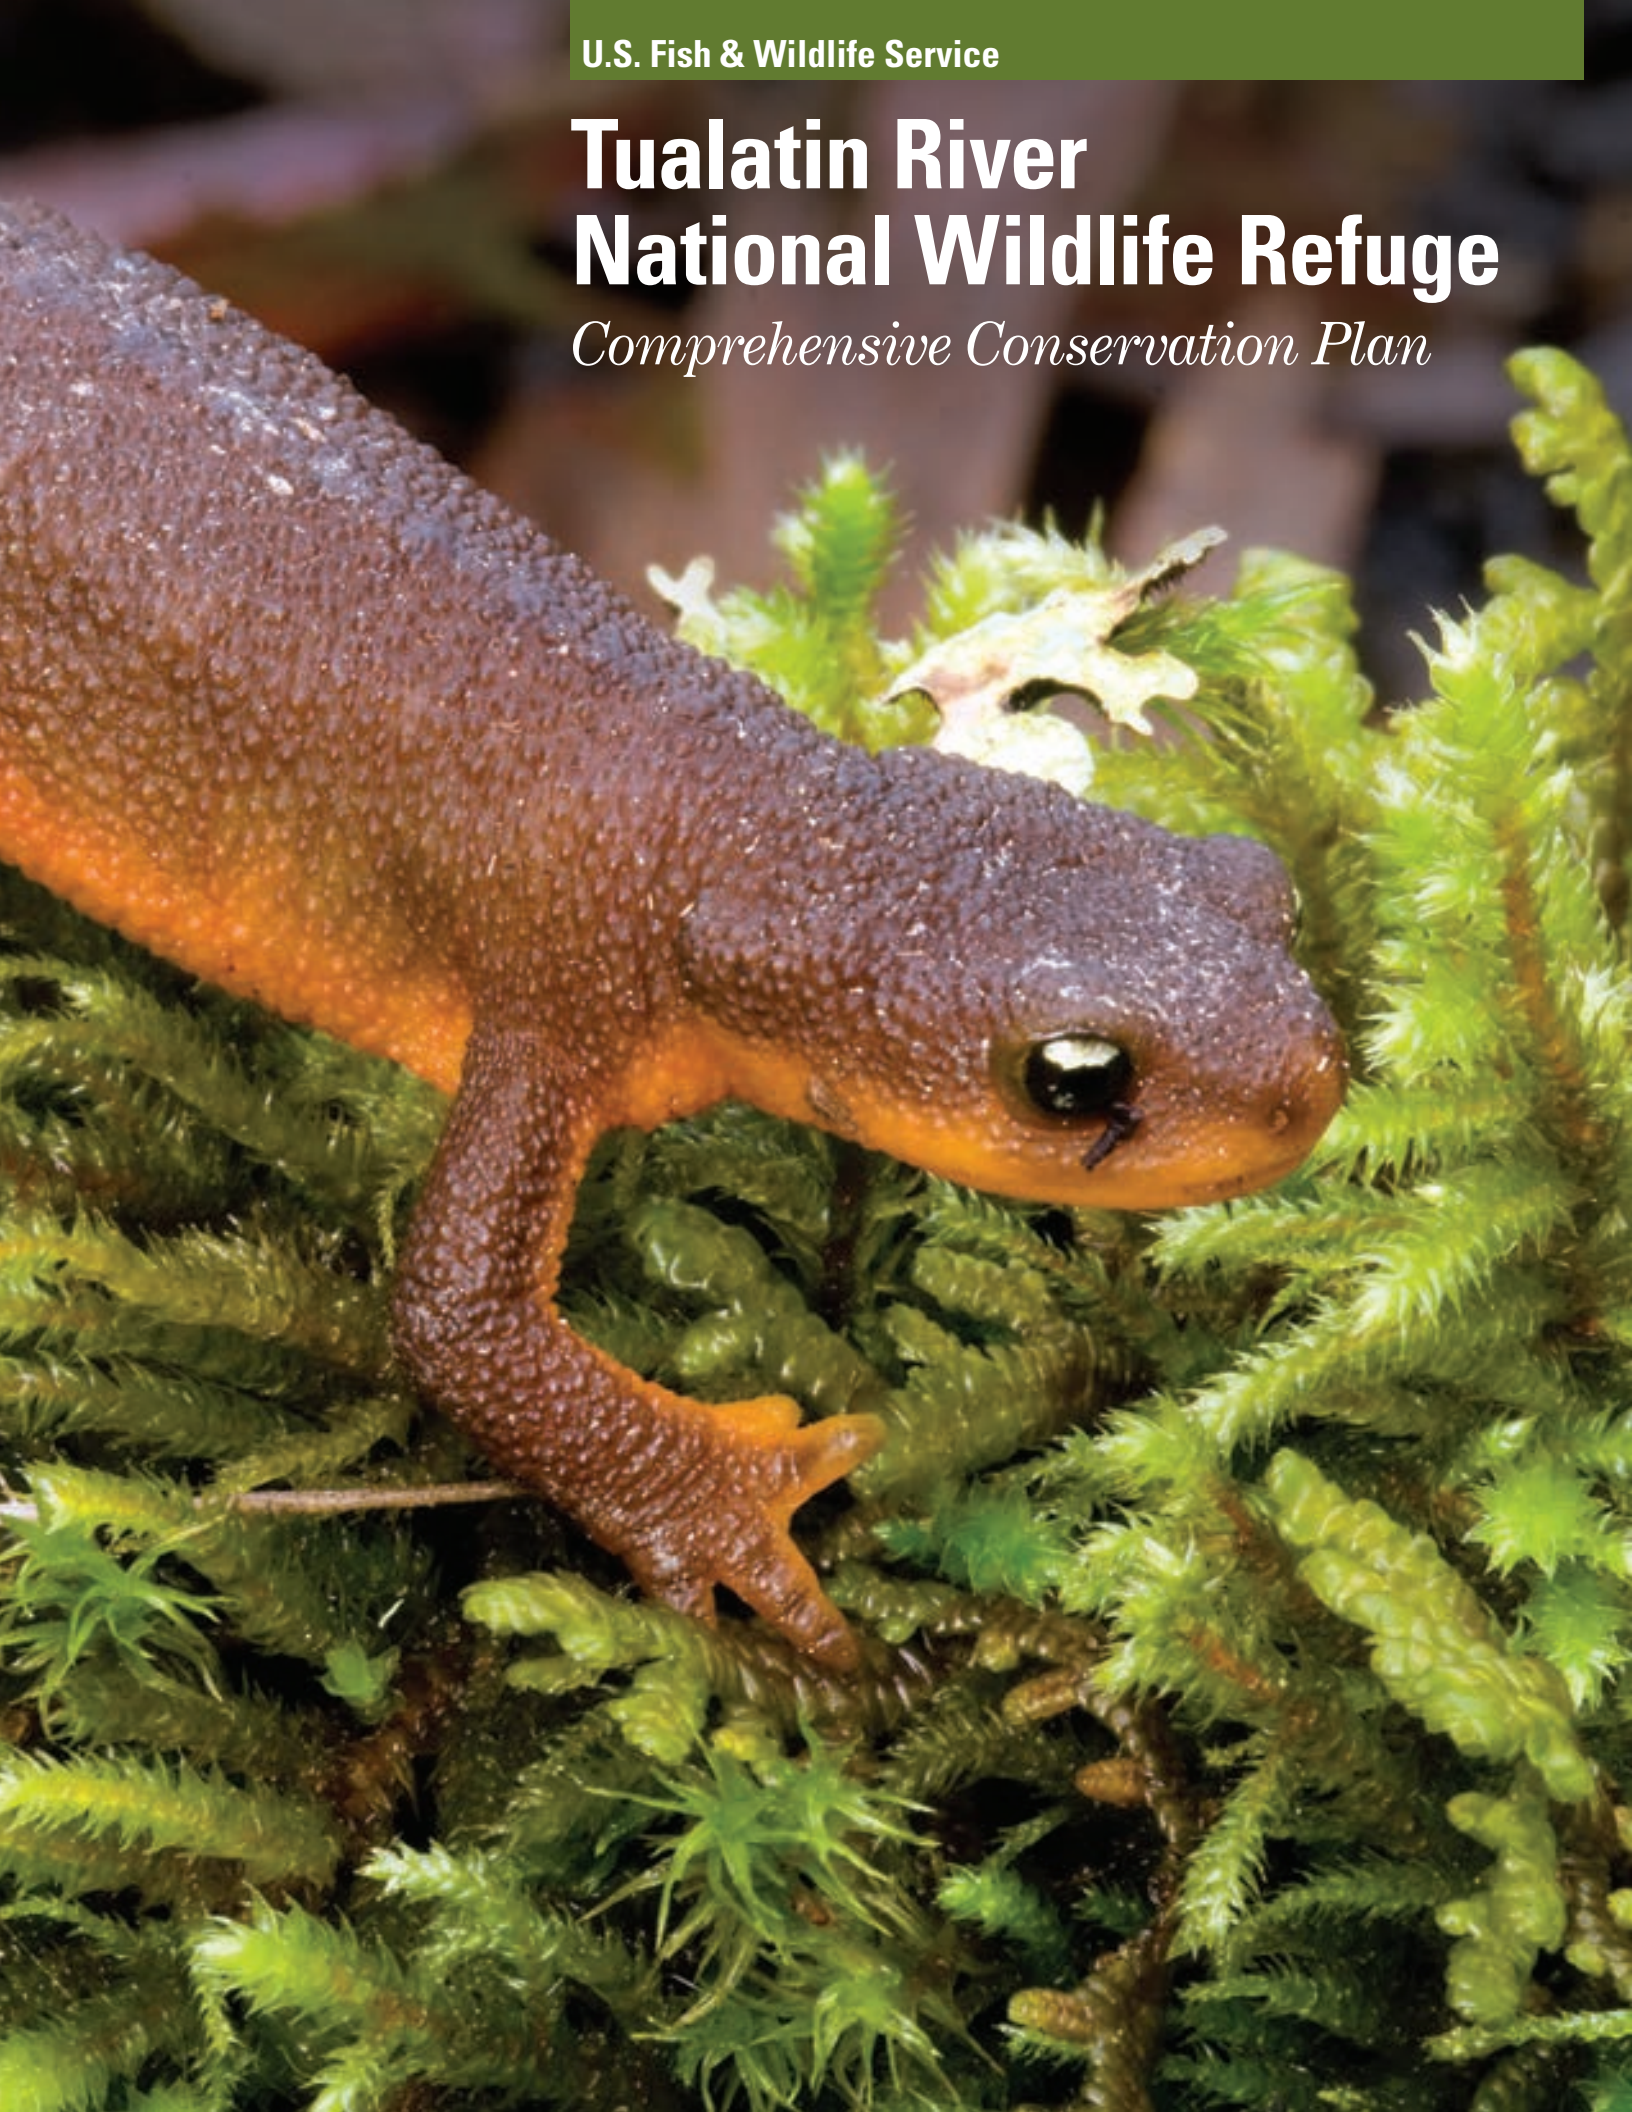
Affordable housing bond project locations



U.S. Fish & Wildlife Service

Tualatin River National Wildlife Refuge

Comprehensive Conservation Plan



An Image of the Future

Tualatin River National Wildlife Refuge is a natural treasure where an abundance of native wildlife thrive in a mosaic of wetland, prairie, forest and stream habitats characteristic of the Willamette Valley that the Atfalat'i people knew. The refuge is a sanctuary for both wildlife and people, a place where the ebb and flow of the river marks the natural rhythms of the refuge through the seasons. It's a special place, an icon where the stories of the refuge reflect the importance of the National Wildlife Refuge System. The refuge has a rich history of community vision where friends and neighbors helped create, and continue to care for, this urban refuge and the watershed that supports it. It's a model that combines excellence in landscape conservation, learning, and partnerships to strive for a healthy natural world. Tualatin River National Wildlife Refuge is a place where rich traditions, outdoor learning experiences, and discovery foster a love of and caring for nature that endures for generations to come.

Comprehensive Conservation Plans provide long-term guidance for management decisions and set forth goals, objectives, and strategies needed to accomplish refuge purposes and identify the Service's best estimate of future needs. These plans detail program planning levels that are sometimes substantially above current budget allocations and, as such, are primarily for Service strategic planning and program prioritization purposes. The plans do not constitute a commitment for staffing increases, operational and maintenance increases, or funding for future land acquisition.

Tualatin River National Wildlife Refuge
Comprehensive Conservation Plan
Approval Submission

In accordance with the National Wildlife Refuge System Administration Act, as amended, the U.S. Fish and Wildlife Service completed a Comprehensive Conservation Plan (CCP) for Ridgefield National Wildlife Refuge (Refuge). The purpose of this CCP is to specify a management direction for the Refuge for the next 15 years. The goals, objectives, and strategies for improving Refuge conditions—including the types of habitat we will provide, partnership opportunities, and management actions needed to achieve desired future conditions—are described in the CCP. The Service's preferred alternative for managing the Refuge is described in this CCP and the effects on the human environment were described in the Draft CCP and Environmental Assessment.

This CCP is submitted for the Regional Director's approval by:

Finding of No Significant Impact
for the
Tualatin River National Wildlife Refuge Comprehensive Conservation Plan

Washington and Yamhill Counties, Oregon

The U.S. Fish and Wildlife Service (Service) has completed a Comprehensive Conservation Plan (CCP) and Environmental Assessment (EA) for Tualatin River National Wildlife Refuge (Refuge). The CCP will guide management of the Refuge for 15 years. The CCP/EA describes our proposals for managing the Refuge and their effects on the human environment under four alternatives, including the no action alternative.

Decision

Based on our comprehensive review and analysis in the CCP/EA, we selected Alternative 2 for implementation, because it will guide management of the Refuge in a manner that:

- Achieves the mission of the National Wildlife Refuge System, and the purposes, vision, and goals of the Refuge.
- Maintains and restores the ecological integrity of the Refuge's habitats and populations.
- Addresses the important issues identified during the CCP scoping process.
- Addresses the legal mandates of the Service and the Refuge.
- Is consistent with the scientific principles of sound wildlife management and endangered species recovery.
- Facilitates priority public uses appropriate and compatible with the Refuge's purposes and the Refuge System mission.

Summary of the Actions to be Implemented

Implementing the selected alternative will have no significant impacts on the environmental resources identified in the CCP/EA. Refuge management under the selected alternative will protect, maintain, and enhance habitat for priority species and resources of concern, and improve the public's opportunities to enjoy wildlife-dependent recreation.

Under Alternative 2, our new Management Direction, there will be a balanced approach among meeting competing needs and issues that the refuge currently faces and is likely to experience in the next 15 years. This direction would combine the existing mosaic of fragmented habitats into larger contiguous blocks of native habitat types within the landscape and also restore relic or disappearing habitats. Using hydrological modeling, historic vegetation and soil information, the refuge will, over the next 15 years, restore and increase the acreage of riparian forest from 388 acres to 433 acres and mixed forest from 49 acres to 103 acres to continue efforts at increasing riparian corridor connectivity and to provide natural habitat for neo-tropical songbirds and other forest species. Relic oak habitats will be restored from 149 acres to 237 acres to provide habitat for imperiled oak dependent wildlife. Managed wetland ponds will be decreased from 294 acres to 193 acres to facilitate restoration of more natural wet prairie habitats consistent with historic vegetation and there will also be an increase in scrub-shrub wetlands. Over 2.7 miles of stream habitat would be restored to facilitate fish passage and benefits to other aquatic species. All of these habitats will provide foraging, resting, and breeding habitats for both migratory and

resident wildlife.

The refuge would expand on existing public use opportunities and offer new quality opportunities including hunting and fishing. On the Sherwood Units, the existing public use trails would remain the same, but an Environmental Education Off-Trail Study Area and a Nature Explore Area would be offered adjacent to those trails. To increase the opportunity for quality wildlife photography, an additional 1-3 photography blinds will be constructed to maximize the photography experience while minimizing disturbance to wildlife. A youth waterfowl hunting program will be developed. Close coordination with the State will determine the season, location of blinds, and other details as a hunt management plan is developed. Hunt program monitoring will occur to adjust the program as needed to facilitate a quality hunt experience while ensuring healthy habitat for waterfowl. A fishing program would be developed to expose first time anglers and youth to fishing. This would occur on the River Overlook and the fishing program would emphasize the experience of fishing and would accompany quality educational program that enhance the experience; such as programs led by the refuge.

Public Involvement and Changes Made to the Selected Alternative Based on Comments

We incorporated a variety of public involvement techniques in developing and reviewing the CCP/EA. This included two open houses, four planning updates, numerous meetings with partners, and public review and comment on the Draft CCP/EA. The details of our public involvement program are described in the CCP, in Appendix K.

Based on the public comments we received and considered, the Management Direction selected was a slightly modified Alternative 2 that incorporated some elements of Alternative 3. We added more riparian forest and mixed forest habitat to reflect more of a historic vegetation model, and eliminated some of the hunt details until a hunt plan is developed in coordination with the State.

Conclusions

Based on review and evaluation of the information contained in the supporting references, I have determined that implementing Alternative 2 as the CCP for Tualatin River National Wildlife Refuge is not a major Federal action that would significantly affect the quality of the human environment within the meaning of section 102(2)(c) of the National Environmental Policy Act of 1969. Accordingly, we are not required to prepare an environmental impact statement.

2.1 Development of Management Direction 2-1
2.2 Management Directions Considered but Eliminated from Detailed Study 2-1
2.3 Description of Management Direction 2-3
2.4 Goals, Objectives, and Strategies 2-18
Goal 1: Maintain, enhance, and restore bottomland riparian habitat consistent with the historical range of variability representative of the Willamette Valley ecosystem to support breeding and migratory landbirds and other native species. 2-19

Goal 2: Maintain, enhance, and restore mixed coniferous/deciduous forest habitat to a historical range of variability representative of the Willamette Valley ecosystem in order to support breeding and migratory landbirds and other native species. 2-21

Goal 3: Maintain, enhance, and restore oak habitats to a historical range of variability representative of the Willamette Valley ecosystem in order to support breeding and migratory landbirds and other native species. 2-23

Goal 4: Maintain, enhance, and restore native Willamette Valley wet prairie habitat, with an emphasis on management for rare and listed plant species. 2-27

Goal 5: Maintain, enhance, and restore a diversity of wetlands to support migratory landbirds, waterbirds, and shorebirds with special emphasis on wintering waterfowl. 2-29

Goal 6: Maintain, enhance, and, where feasible, restore streams and off-channel backwater slough habitats in order to benefit salmonids and other native aquatic species. 2-32

Goal 7: Cultivate and maintain croplands as an interim measure to control non-native invasive species. 2-34

Goal 8: Collect scientific information (surveys, scientific assessments, and research) necessary to support adaptive management decisions that are associated with Goals 1-7. 2-37

Goal 9: Protect and manage the refuge's unique cultural resources for their cultural, scientific, and educational values, while consulting with appropriate Native American groups and preservation organizations and complying with historic preservation legislation. 2-40

Goal 10: Provide visitors, local residents, volunteers, and partners with opportunities to understand and appreciate fish and wildlife conservation as well as the purpose, ecology, and management of the refuge and the Refuge System. 2-41

Goal 11: Provide students and educators from the greater Portland area with compatible and high-quality opportunities to participate in environmental education. 2-45

Goal 12: Provide refuge visitors with diverse, compatible, and high-quality opportunities to participate in wildlife-dependent recreation and interpretation. 2-48

Goal 13: Build a broad-based natural resource conservation constituency with a focus on urban audiences to create a conservation ethic within urban communities; increase relevance of habitat conservation, wildlife heritage, and the Refuge System in the eyes of urban citizens; and instill a sense of empowerment for urban communities to work together to actively support conservation, in both local and global settings. 2-52

Chapter 1
Introduction and Background

© Dennis Davenport

Chapter 1 Introduction and Background

1.1 Introduction

Just a few short miles from the center of Oregon's largest city, the honking of geese replaces the honking of cars. This special place is a refuge, a haven for wildlife and people. Born of a community's dream, and made possible by their support, a wildlife refuge now thrives in the backyard of a growing metropolis.

Located on the outskirts of Portland, Tualatin River National Wildlife Refuge (refuge) is one of a handful of urban national wildlife refuges in the country. Situated within the floodplain of the Tualatin River, the refuge comprises less than 1 percent of the 712-square-mile watershed (see Appendix P, Maps 1 and 3). Yet, due to its richness and diversity of habitats, it supports some of the most abundant and varied wildlife in the watershed. The refuge is home to nearly 200 species of birds, over 28 species of mammals, 14 species of reptiles and amphibians, and a wide variety of insects, fish, and plants. The refuge has also become a place where people can experience and learn about wildlife and the places they call home. Established in 1992 under the guidelines of the U.S. Fish and Wildlife Service's (USFWS's; Service's) Urban Refuge Policy (341 FW 1) (Smith 1991), Tualatin River National Wildlife Refuge has served nearly 110,000 visitors annually since it opened to the public in 2006. In 2007, the Wapato Lake Unit was established, more than doubling the size of the original acquisition boundary.

The Tualatin River National Wildlife Refuge, which includes the Wapato Lake and Sherwood Units (the Sherwood Units contain five subunits: Atfálat'i, Onion Flats, Riverboat, Rock Creek, and Tualatin River), is located in the northern portion of the Willamette Valley, in Washington and Yamhill Counties, Oregon (see Appendix P, Maps 4 and 5). The overall management focus cited in the Land Protection Plan (USFWS 1992a) is to "protect, enhance, and manage upland, wetland, and riparian habitats for a variety of migratory birds and resident fish and wildlife, as well as for the enjoyment of people." The Wapato Lake Unit serves a similar purpose and supports many of the same types of habitats found within the Sherwood Units. Currently, the established acquisition boundary of the refuge totals 7,370 acres, with 2,217 acres under management. The refuge may purchase lands within the boundary from willing sellers. Land currently owned or managed by the refuge is distributed among six management units: Riverboat (348 acres); Tualatin River (221 acres); Atfálat'i (555 acres); Onion Flats (139 acres); Rock Creek (75 acres); and Wapato Lake (879 acres). The refuge's landscape is predominately flat bottomland bordered by uplands. Habitats consist of rivers and streams; herbaceous and scrub-shrub wetlands; riparian forests; wet meadows; oak savanna; and mixed coniferous/deciduous forested uplands.

The refuge has a rich history in community involvement, beginning with the establishment of the refuge itself. In the late 1980s and early 1990s, many local residents and leaders recognized that the Tualatin River and its floodplain had been highly modified by both agriculture and urbanization. This recognition fueled a desire by local communities to preserve open green space and create an area where future generations could enjoy outdoor recreation and interpretation, while also leaving an educational legacy for children. This led a small group of citizens and local leaders to approach the Service to request having part of the 100-year floodplain, just north of Sherwood, be set aside as a national wildlife refuge. At the same time, the Service identified a need to protect and enhance floodplains, wetlands, riparian habitats, and upland buffers for a variety of wildlife and for the

enjoyment of people—in particular in urban areas. In 1992, grassroots and governmental support coalesced, and the Tualatin River National Wildlife Refuge became part of the National Wildlife Refuge System (Refuge System).

Photo 1-1. Entry to Tualatin River National Wildlife Refuge. USFWS.

1.2 Importance of the Refuge

Since the time of Euro-American settlement, habitats in the Willamette Valley have been converted to support a growing human population. Significant losses of habitat have occurred within the Portland/Vancouver metropolitan area and continue to occur (see Appendix P, Map 2). Commercial, agricultural, and residential encroachments into floodplains, which include wetlands, riparian forests, and uplands, have occurred during the past 150 years, resulting in lost habitat, increased pollution, increased human disturbance, and lower water quality. These habitats are important to resident, migrating, and wintering bird, mammal, fish, reptile, amphibian, and invertebrate species. Although these habitats are provided some degree of protection by Oregon's land-use planning process, the wildlife values of these habitats continue to be degraded.

Traditionally, fish and wildlife agencies have focused their efforts on management of lands and waters outside of urban areas where the majority of fish and wildlife resources occur. However, habitats of regional significance often occur in urban areas and are of great value to fish and wildlife. These habitats also provide important public benefits, such as open space, recreation, environmental education, aesthetics, flood control, and water quality enhancement. The proximity and availability of these public benefits are attributes for which the Portland/Vancouver metropolitan area is renowned. Many consider natural areas to be an essential component of the quality of life in this metropolitan area.

As an urban refuge, Tualatin River National Wildlife Refuge was established under the guidance of the Urban Refuge Policy and "may protect habitat of great significance to the conservation of fish and wildlife resources, including endangered and threatened species. However, the 'Primary

Purpose' for establishment of new urban refuges will be to foster environmental awareness and outreach programs to develop an informed, involved citizenry that will support fish and wildlife conservation … these refuges will provide public use benefits associated with fish and wildlife resources that include, but are not limited to, bird watching, fishing, scientific research, environmental education, open space in a urban setting, and protection of cultural resources" (Smith 1991).

Situated within the floodplain of the Tualatin River Valley, the refuge provides habitat for some of the most diverse and abundant wildlife in the valley. The refuge also provides a variety of recreational and educational activities focused on fish and wildlife and their habitats. Visitor facilities include a Wildlife Center, an environmental education shelter, trails, overlooks, an observation deck, a photography blind, environmental education study sites, and exhibit panels. Current visitation is approximately 110,000 people per year (USFWS 2011f).

1.3 Proposed Action

The Service manages wildlife refuges as part of the Refuge System. We propose to adopt and implement this Comprehensive Conservation Plan (CCP) for the refuge. A CCP sets forth management guidance for a refuge for a period of 15 years, as required by the National Wildlife Refuge System Administration Act (Administration Act), as amended by the National Wildlife Refuge System Improvement Act of 1997 (Improvement Act). The Improvement Act requires CCPs to identify and describe:

- The purposes of the refuge;
- The fish, wildlife, and plant populations, their habitats, and the archaeological and cultural values found on the refuge;
- Significant problems that may adversely affect wildlife populations and habitats and ways to correct or mitigate those problems; and

- Areas suitable for administrative sites or visitor facilities, and opportunities for fish- and wildlife-dependent recreation.

Refuge System planning policy (602 FW 3) states that the purpose of CCPs is to "describe the desired future conditions of a refuge and provide long-range guidance and management direction to achieve refuge purposes; help fulfill the Refuge System mission; maintain and, where appropriate, restore the ecological integrity of each refuge and the Refuge System; … and meet other mandates."

The Service developed and examined three alternatives for management of the refuge and disclosed anticipated effects for each alternative, pursuant to the National Environmental Policy Act of 1969 (NEPA), as amended. The goals, objectives, and strategies under Alternative 2 best achieve the purpose of the refuge and the need for the CCP, while maintaining balance among the varied management needs and programs. Alternative 2 represents the most balanced approach for achieving the refuge's purposes, vision, and goals; contributing to the Refuge System's mission; addressing relevant issues and mandates; and managing the refuge with sound principles of fish and wildlife management.

The preferred alternative was modified between the draft and final documents based on comments received from the public or other agencies and organizations. The Service's Regional Director for Region 1 made the final decision regarding which alternative will be implemented. For details on the specific components and actions constituting the chosen management direction, see Chapter 2.

1.4 Purpose of and Need for Action

The purpose of this CCP is to identify the role the refuge would play in supporting the mission of the Refuge System, and to provide the Service, the Refuge System, partners, and the public with long-term guidance for managing programs and activities. This will be a 15-year management plan for improving the refuge's habitat conditions and infrastructure for fish, wildlife, and public use. The CCP is needed to:

- Communicate with the public and other partners in efforts to carry out the mission of the Refuge System;
- Provide a clear statement of direction for managing the refuge;
- Provide neighbors, visitors, and government officials with an understanding of the Service's management actions on and around the refuge;
- Ensure that the Service's management actions support the goals and intent of the Administration Act;
- To the extent practicable, ensure refuge plans will be consistent with the fish and wildlife conservation plans of the state and the conservation programs within the ecosystem;
- Provide a basis for development of budget requests for the refuge's operation, maintenance, and capital improvement needs;
- Address habitat management concerns; and
- Address increasing visitor use needs.

1.5 Legal and Policy Guidance

1.5.1 U.S. Fish and Wildlife Service

The Service is the principal Federal agency responsible for fish, wildlife, and plant conservation. The Refuge System is one of the Service's major programs.

> *The mission of the Service is working with others, to conserve, protect and enhance fish and wildlife and their habitats for the continuing benefit of the American people.*

In the late nineteenth and early twentieth centuries, America's fish and wildlife resources were declining at an alarming rate, largely due to unrestricted market hunting. Concerned citizens, scientists, and hunting and angling groups joined together and generated the political will for the first significant conservation measures taken by the Federal government. These actions included the establishment of the Bureau of Fisheries in the 1870s, the passage of the first Federal wildlife law in 1900, the Lacey Act, which prohibited interstate transport of wildlife taken in violation of state laws, and the creation of wildlife refuges across the nation.

Over the next three decades, the United States ratified the Migratory Bird Treaty with Great Britain, and Congress passed laws to protect migratory birds, establish more new refuges, and create a funding source for refuge land acquisition. In 1940, the U.S. Fish and Wildlife Service was created within the Department of the Interior, and existing Federal wildlife functions including law enforcement, fish management, animal damage control, and wildlife refuge management were combined into a single organization for the first time.

Today, the Service enforces Federal wildlife laws; manages migratory bird populations; restores nationally significant fisheries; conserves and restores vital wildlife habitat; protects and recovers endangered species; helps other governments with conservation efforts; and connects people with nature through high quality education and recreation programs to foster a conservation constituency within the public.

1.5.2 National Wildlife Refuge System

In 1903, President Theodore Roosevelt designated the 5.5-acre Pelican Island in Florida as the nation's first wildlife refuge for the protection of native nesting birds. This was the first time the Federal government set aside land for wildlife. This small but significant designation marked the beginning of the Refuge System.

Over one hundred years later, the Refuge System has become the largest collection of lands in the world specifically managed for wildlife, encompassing more than 150 million acres within 560 refuges, 38 wetland management districts, and more than 3,000 waterfowl production areas providing breeding and nesting habitat for migratory birds. Today there is at least one refuge in every state as well as in Puerto Rico and the U.S. Virgin Islands.

The Tualatin River National Wildlife Refuge is managed as part of the Refuge System within a framework of legal and policy guidelines. The needs of wildlife and their habitats come first on refuges, in contrast to other public lands, which are managed for multiple uses. Refuges are guided by various Federal laws and executive orders, Service policies, and international treaties. The

mission and goals of the Refuge System and the designated purposes of the refuge as described in establishing legislation, executive orders, or other documents establishing, authorizing, or expanding a refuge are fundamental.

1.5.2.1 National Wildlife Refuge System Mission and Goals

The mission of the Refuge System is:

> *To administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans (National Wildlife Refuge System Administration Act of 1966, as amended).*

The goals of the Refuge System, as articulated in the Mission, Goals, and Purposes Policy (601 FW 1), are:

- Conserve a diversity of fish, wildlife, and plants and their habitats, including species that are endangered or threatened with becoming endangered.
- Develop and maintain a network of habitats for migratory birds, anadromous and inter-jurisdictional fish, and marine mammal populations that is strategically distributed and carefully managed to meet important life history needs of these species across their ranges.
- Conserve those ecosystems, plant communities, and wetlands of national or international significance, and landscapes and seascapes that are unique, rare, declining, or underrepresented in existing protection efforts.
- Provide and enhance opportunities to participate in compatible wildlife-dependent recreation (hunting, fishing, wildlife observation and photography, and environmental education and interpretation).
- Foster understanding and instill appreciation of the diversity and interconnectedness of fish, wildlife, and plants and their habitats.

1.5.2.2 National Wildlife Refuge System Administration Act

Of all the laws governing activities on national wildlife refuges, the Administration Act undoubtedly exerts the greatest influence. The National Wildlife Refuge Improvement Act of 1997 amended the Administration Act by including a unifying mission for all national wildlife refuges as a system, a new process for determining compatible uses on refuges, and a requirement that each refuge be managed under a comprehensive conservation plan, developed in an open public process. In addition to the Improvement Act providing the mission for the Refuge System, it also stated that the wildlife and habitat vision for each unit of the Refuge System shall maintain the following principles.

- Wildlife comes first.
- Ecosystems, biodiversity, and wilderness are vital concepts in refuge and district management.
- Habitats must be healthy.
- Growth of refuges and districts must be strategic.
- The Refuge System serves as a model for habitat management with broad participation from others.

The Administration Act states that the Secretary of the Interior shall provide for the conservation of fish, wildlife, and plants, and their habitats within the Refuge System as well as ensure that the biological integrity, diversity, and environmental health of the System are maintained. House Report 105–106 accompanying the Improvement Act states "… the fundamental mission of our System is wildlife conservation: wildlife and wildlife conservation must come first." Biological integrity, diversity, and environmental health are critical components of wildlife conservation. As later made clear in the Biological Integrity, Diversity, and Environmental Health Policy (601 FW 3), "the highest measure of biological integrity, diversity, and environmental health is viewed as those intact and self-sustaining habitats and wildlife populations that existed during historic conditions."

Under the Administration Act, each refuge must be managed to fulfill the Refuge System mission as well as the specific purposes for which it was established. The Administration Act requires the Service to monitor the status and trends of fish, wildlife, and plants in each refuge.

Additionally, the Improvement Act identifies six priority wildlife-dependent recreational uses for the Refuge System. These uses are hunting, fishing, wildlife observation and photography, and environmental education and interpretation. Under the Improvement Act, the Service is to grant these six wildlife-dependent public uses special consideration in the planning, management, establishment, and expansion of units of the Refuge System. The overarching goal of the wildlife-dependent public uses program is to enhance opportunities and access to quality wildlife-dependent visitor experiences on refuges while managing refuges to conserve fish, wildlife, plants, and their habitats. When determined compatible on a refuge-specific basis, these six uses assume priority status among all uses of the refuge in question. The Service is to make extra efforts to facilitate priority wildlife-dependent public use opportunities.

When preparing a CCP, refuge managers must re-evaluate all general public, recreational, and economic uses (even those occurring to further refuge habitat management goals) proposed or occurring on a refuge for appropriateness and compatibility. No refuge use may be allowed or continued unless it is determined to be appropriate and compatible. Generally, an appropriate use is one that contributes to fulfilling the refuge purposes, the Refuge System mission, or goals or objectives described in a refuge management plan. A compatible use is one that, in the sound professional judgment of the refuge manager, would not materially interfere with or detract from the fulfillment of the mission of the Refuge System or the purposes of the refuge. Updated appropriate use and compatibility determinations for existing and proposed uses for Tualatin River National Wildlife Refuge can be found in Appendices A and B of this CCP.

The Improvement Act also requires that, in addition to formally established guidance, the CCP must be developed with the participation of the public. Issues and concerns articulated by the public play a role in guiding alternatives considered during the development of the CCP, and together with formal guidance, can play a role in selection of the management direction. It is Service policy that CCPs be developed in an open public process, and the agency is committed to securing public input throughout the process. Public involvement details can be found in Appendix K of the CCP.

1.5.3 Other Laws and Mandates

Many other Federal laws, executive orders, Service policies, and international treaties govern Service and Refuge System lands. Examples include the Migratory Bird Treaty Act of 1918 (as amended), the Refuge Recreation Act of 1962 (as amended), the National Historic Preservation Act of 1966 (as amended), the Endangered Species Act of 1973 (as amended), and the Service Urban Refuge Policy

(341 FW 1) (Smith 1991). For additional information on laws and other mandates, a list and brief description of Federal laws of interest to the Service can be found in the Laws Digest at http://www.fws.gov/laws/Lawsdigest.html.

In addition, over the last few years, the Service has developed or revised numerous policies and Director's Orders to reflect the mandates and intent of the Improvement Act. Some of these key policies include the Biological Integrity, Diversity, and Environmental Health Policy (601 FW 3); the Compatibility Policy (603 FW 2); the Comprehensive Conservation Planning Policy (602 FW 3); Mission, Goals, and Purposes (601 FW 1); Appropriate Refuge Uses (603 FW 1); Wildlife-dependent Public Uses (605 FW 1); Wilderness-related Policies (610 FW 1-5); and the director's order for Coordination and Cooperative Work with State Fish and Wildlife Agencies (http://www.fws.gov/policy/). These policies and others in draft or under development can be found at: http://refuges.fws.gov/policymakers/nwrpolicies.html.

In 2011, the Service published the new vision for the National Wildlife Refuge System "Conserving the Future" (USFWS 2011c) which sets forth updated recommendations for conservation of wildlife and wildlands, for developing a conservation constituency within the public, and for emrbacing leadership competencies that will guide the Service into the future.

In developing a CCP, refuges must consider these broader laws and policies as well as Refuge System and ecosystem goals and visions. The CCP must be consistent with these and also with the refuge purpose.

1.6 Refuge Establishment and Purposes

1.6.1 Legal Significance of the Refuge Purpose

The purpose for which a refuge was established or acquired is of key importance in refuge planning. Purposes must form the foundation for management decisions. Refuge purposes are the driving force in the development of vision statements, goals, objectives, and strategies in a CCP and are critical to determining the compatibility of existing and proposed refuge uses.

The purposes of a refuge are specified in or derived from the law, proclamation, executive order, agreement, public land order, donation document, or administrative memorandum establishing, authorizing, or expanding a refuge, refuge unit, or refuge subunit.

Unless the establishing law, order, or other document indicates otherwise, purposes dealing with the conservation, management, and restoration of fish, wildlife, and plants, and the habitats on which they depend take precedence over other purposes in the management and administration of any refuge. Where a refuge has multiple purposes related to fish, wildlife, and plant conservation, the more specific purpose would take precedence in instances of conflict. When an additional unit is acquired under an authority different from the authority used to establish the original unit, the addition takes on the purpose(s) of the original unit, but the original unit does not take on the purpose(s) of the newer addition. When a conflict exists between the Refuge System mission and the purpose of an individual refuge, the refuge purpose may supersede the mission.

1.6.2 Purpose and History of Refuge Establishment

The Improvement Act of 1997 defines "purposes of the refuge" and "purposes of each refuge" as the purpose specified in or derived from the law or any of a number of specified documents that establish, authorize, or expand a refuge. This includes acquisition purposes in cases where land at a refuge has been acquired under authority other than the establishing authority.

The purposes of Tualatin River National Wildlife Refuge are defined as:

- " … the development, advancement, management, conservation, and protection of fish and wildlife resources … " 16 U.S. Code (U.S.C.) § 742f(a)(4) (Fish and Wildlife Act of 1956).
- " … the benefit of the United States Fish and Wildlife Service, in performing its activities and services. Such acceptance may be subject to the terms of any restrictive or affirmative covenant, or condition of servitude … " 16 U.S.C. § 742f(b)(1) (Fish and Wildlife Act of 1956).
- " … the conservation of the wetlands of the Nation in order to maintain the public benefits they provide and to help fulfill international obligations contained in various migratory bird treaties and conventions … " 16 U.S.C. § 3901(b) (Emergency Wetlands Resources Act of 1986).

Additionally, the refuge was established under the guidance of the Service's Urban Refuge Policy (341 FW 1) (Smith 1991) to foster environmental awareness and outreach programs to develop an informed, involved citizenry that will support fish and wildlife conservation.

1.6.3 Land Status and Ownership

Established in 1992 under the guidelines of the Service's Urban Refuge Policy, the Tualatin River National Wildlife Refuge became one of a handful of urban refuges in the country. The establishment of the refuge was in response to a growing concern in the community about urbanization replacing the rural way of life. Concerned about this urban growth, the community requested a study of the feasibility of creating a refuge. The need and endorsement for creating this refuge was officially approved on December 20, 1991, which then led to an Environmental Assessment (EA) that culminated in a decision to approve the refuge boundary on February 13, 1992 (USFWS 1992a). This EA approved acquiring and managing lands within an acquisition boundary of 3,058 acres by fee title purchase, conservation easements, and/or agreements. In 2004, an additional 2 acres were added, and more recently in 2007, the Wapato Lake Unit was established, adding an additional 4,310 acres to the acquisition boundary. Currently, the approved acquisition boundary incorporates 7,370 acres. Approximately 2,165 acres are under fee title or easement and are managed as a national wildlife refuge; and additional 50 acres are managed under agreement with Metro.

Numerous land parcels have been acquired since 1992 ranging from several acres to over 300 acres. These properties were purchased using different funding sources and under different authorities. Appendix J explains in further detail the acquisition history and authorities of individual tracts.

1.7 Relationship to Other Planning Efforts

When developing a CCP, the Service considers the goals and objectives of existing national, regional, state, and ecosystem plans and/or assessments. The CCP is expected to be consistent, as

much as possible, with existing plans and assist in meeting their conservation goals and objectives. This section summarizes some of the key plans reviewed by members of the core team while developing the CCP.

1.7.1 Regional Plans

The Nature Conservancy's Willamette Valley-Puget Trough-Georgia Basin Ecoregional Assessment: This report addresses the most important places for conserving native species and ecosystems in the Pacific Northwest. Using this assessment, The Nature Conservancy selected target species and communities that represented various habitat types. This assessment is a guide for providing the most conservation benefit for the lowest cost.

1.7.1.1 Migratory Birds Plans

Birds of Conservation Concern: Based on the efforts and assessment scores of three major bird conservation efforts (Partners In Flight [PIF], the U.S. Shorebird Conservation Plan, and the North American Waterbird Conservation Plan [NAWCP]), this report (USFWS 2002a) identifies, by Service region and by Bird Conservation Region (BCR), the bird species most in need of conservation attention. The Tualatin River National Wildlife Refuge is located within BCR Region 5, for which 27 species are listed; however, several of these are seabirds that do not use the refuge.

PIF: The primary goal of the *Conservation Strategy for Landbirds in the Lowlands and Valleys of Western Oregon and Washington* (Altman 2000) is to ensure long-term maintenance of healthy populations of native landbirds. Specific management activities and strategies are recommended.

North American Waterfowl Management Plan (NAWMP): This plan, first formulated in 1986, provides a strategy to protect North America's remaining wetlands and to conserve waterfowl populations through habitat protection, restoration, and enhancement. The plan was updated in 2004 with an emphasis on strengthening the biological foundation, using a landscape approach, and expanding partnerships. The 2004 update contains species-specific population objectives and evaluations of whether the continental population is currently above or below the target. There are also flyway goals for production by species, but the plan did not target population objectives for wintering or migratory waterfowl by area (NAWMP Committee 2004). Implementation of this plan is accomplished at the regional level by partnership, within 11 Joint Venture areas. Tualatin River National Wildlife Refuge is located within the area of the Pacific Coast Joint Venture. Many of the projects identified to achieve the NAWMP objectives are eligible for funding under the North American Wetlands Conservation Act (NAWCA). NAWCA authorizes congressional funding for projects fostering public/private partnerships that support the conservation and restoration of wetland habitats and associated wildlife resources. Given the extent of historical wetlands and ongoing public/private partnerships in the Willamette Valley, this Act has been (and continues to be) a tremendous resource for the conservation community in the region.

Pacific Flyway Plans: Flyway management plans are the products of Flyway Councils, developed to help state and Federal agencies cooperatively manage migratory game birds. Several flyway management plans pertain to Tualatin River National Wildlife Refuge, especially those for the western and cackling Canada goose (Pacific Flyway Council 1999, 2000) and tundra swans (Pacific Flyway Council 2001). In addition, the *Plan for Northwest Oregon/Southwest Washington Canada Goose Agricultural Depredation Control* (Pacific Flyway Council 1998) details specific strategies

and guidance by management area for reducing depredation by Canada geese within the Lower Columbia Region/Willamette Valley.

United States Shorebird Conservation Plan/Northern Pacific Coast Regional Shorebird Management Plan: These plans (Brown et al. 2001; Drut and Buchanan 2000) identify numerous landscapes within the northern Pacific coast that provide important habitat for shorebirds. The diversity of wetland habitat types in the Willamette Valley is specifically highlighted as being of regional importance for several species including dunlin, Wilson's snipe, and killdeer.

Pacific Coast Joint Venture Willamette Valley Implementation Plan: This plan (Roth et al. 2004) is intended to provide a strategic framework for site-specific habitat protection and restoration projects within the Willamette Valley. The plan's primary focus is on migratory birds and their habitats including waterfowl, shorebirds, waterbirds, and landbirds.

1.7.2 State Plans

There are numerous state plans available for management strategies and recommendations on habitat restoration and management, and on guidelines on species as well. The list below is by no means comprehensive and only reflects the plans the refuge most heavily relied on during the development of this CCP.

Oregon Conservation Strategy (OCS): This document, authored by the Oregon Department of Fish and Wildlife (ODFW) (2006), is an overarching strategy for conserving fish and wildlife within the State of Oregon. The strategy identifies specific Conservation Opportunity Areas where high-priority species and habitat conservation may be most efficiently addressed. Strategy (high-priority) habitats identified by the OCS within the Willamette Valley include grasslands, oak woodlands, riparian areas, and wetlands/wet prairies. Three mammals, 10 plants, five herptiles, four invertebrates, 23 fish species, populations, or segments, and 14 birds are listed as strategy (high-priority) species within the OCS; many of these are found within the Willamette Valley. The refuge lies within The Nature Conservancy's Conservation Opportunity Area #80, Tualatin River.

Oregon Elk Management Plan: This plan (ODFW 2003) outlines elk management guidelines within the State of Oregon. ODFW manages elk based on population management objectives for winter population size and post-season bull ratios in each Wildlife Management Unit in the state. The current population objective size for Roosevelt elk in the Willamette Valley is zero. Tualatin River National Wildlife Refuge will be working cooperatively with ODFW and the Willamette Valley National Wildlife Refuge Complex on a step-down elk management plan for the refuge.

State Comprehensive Outdoor Recreation Plan (SCORP): The 2008-2012 Oregon SCORP (Oregon Parks and Recreation Department 2008) includes a comprehensive overview of state recreational trends. The SCORP provides guidance, information, and recommendations for Federal, state, and local government as well as the private sector in making policy and planning decisions regarding outdoor recreation in Oregon.

1.7.3 Additional Plans

USFWS Recovery Plan for the Prairie Species of Western Oregon and Southwestern Washington: This plan (USFWS 2010b) outlines the main recovery areas, actions, and population objectives for five listed Willamette Valley plants and Fender's blue butterfly.

Oregon Chub Recovery Plan: This plan (USFWS 1998) outlines the main recovery areas, actions, and population objectives for Oregon chub.

Oregon Partners for Fish and Wildlife Program, Statewide Strategic Plan 2007-2011: This plan (USFWS 2007a) identifies the ecological importance of habitats that occur within the Willamette Valley Focus Area. Continued emphasis will be placed on conservation of rare and unique habitats that support declining species on private lands within the Willamette Valley through collaborative partnerships with private landowners, non-governmental organizations, and other agencies.

1.8 Special Designation Lands

1.8.1 Important Bird Areas

The Important Bird Areas (IBA) program is a global effort to identify the most important areas for maintaining bird populations and focusing conservation efforts on protecting these sites. Within the United States, the program has been promoted and maintained by the American Bird Conservancy (ABC) and the National Audubon Society (NAS). The ABC is coordinating the identification of nationally significant IBAs while NAS is working to identify sites in individual states. The NAS is working within each state to identify a network of sites across the United States that provide critical habitat for birds. This effort recognizes that habitat loss and fragmentation are the most serious threats to birds across North America and around the world. By working through partnerships, principally the North American Bird Conservation Initiative, to identify places that are critical to birds during some part of their life cycle (breeding, wintering, feeding, migrating), the hope is to minimize the effects that habitat loss and degradation have on bird populations. The IBA program has become a key component of many bird conservation efforts. Tualatin River National Wildlife Refuge is in the bird conservation area known as the Northern Pacific Rainforest region. The refuge was designated as an Important Bird Area due to high population numbers of wintering geese and northern pintails, in addition to shorebirds. More information is available at http://web4.audubon.org/bird/iba/index.html.

1.9 Planning Process and Issue Identification

1.9.1 Planning Process

The Service prepared this CCP in compliance with the Administration Act. The actions described within meet the requirements of the Council on Environmental Quality regulations for implementing NEPA. Figure 1-1 demonstrates the complete CCP planning process from conception to final document.

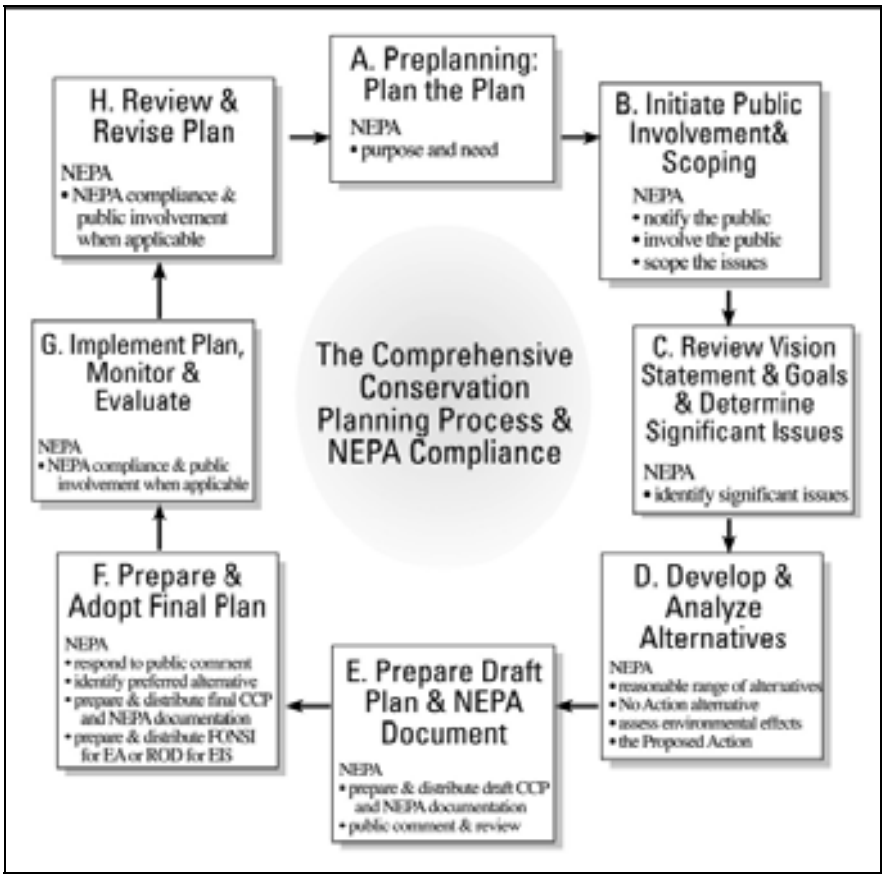

Figure 1-1. Overview of CCP planning process.

The Service began the pre-planning process in 2009 (Table 1-1) with the formation of the core planning team, which consists of refuge staff and a regional planner. The extended planning team included other Service employees, fisheries biologists, refuge law enforcement officers, and other Federal, regional, and state employees. Early in the planning process, both teams cooperatively identified priority species, groups, and communities for the refuge, and most of the biological emphasis of the CCP is focused on maintaining and restoring these targets. Public use planning centered on developing goals, objectives, and strategies around the "big six" wildlife dependent public uses and the role of an urban wildlife refuge. Big six uses include hunting, fishing, wildlife photography and observation, and environmental education and interpretation. Other non-wildlife-dependent uses that currently occur were also addressed.

Table 1-1. Summary of CCP Planning Process for Tualatin River National Wildlife Refuge

Date	Event	Outcome
December 15, 2009	Kick-off meeting and formation of core team	Planning team learned about the CCP process and discussed initial team list, mailing list, roles of team members, and planning schedule.
January 12-14, 2010	Wildlife and habitat review	Panel of wildlife and habitat

Table 1-1. Summary of CCP Planning Process for Tualatin River National Wildlife Refuge

Date	Event	Outcome
		experts from Federal, state, and regional agencies and other partners gathered to discuss and propose options for managing the refuge's wildlife and habitat resources.
October 14, 2010	Visitor services review	Panel of visitor services experts from Federal, state, and regional agencies met to discuss public use opportunities, issues, and concerns.
November 3, 2010	Notice of Intent publication	Notice of Intent to prepare CCP was published in the Federal Register.
November 2010	Planning Update #1 mailing	First update was sent to mailing list recipients; it described planning process and preliminary issues to be considered.
November 16, 2010	Interagency scoping meeting	Multiple agencies gathered to discuss issues, opportunities, and concerns.
November 30 and December 2, 2010	Public scoping meeting, Sherwood and Forest Grove, Oregon	Public attendees learned about CCP process and discussed issues and ideas for future management.
April 2011	Planning Update #2 mailing	Update discussed comments received from the public and summarized draft refuge goals.
May 2011-October 2012	Alternatives development and evaluation; objective and strategy development	Planning team developed alternatives, objectives, and strategies for refuge goals.
	Environmental consequences review	Team reviewed consequences of proposed alternatives.
	Map and figure review	Team discussed relevant maps and figures needed.
	Internal draft plan preparation	Planning team prepared draft CCP and EA, including maps. Document was prepared for editor to ready for internal review.

Table 1-1. Summary of CCP Planning Process for Tualatin River National Wildlife Refuge

Date	Event	Outcome
November 2011	Planning Update #3 mailing	Update #3 summarized the preliminary alternatives.
October 2012	Draft CCP distributed with Planning Update #4	Comment period opened for 30 days.
April 2013	Finding of No Significant Impact approved	CCP final.

During the pre-planning phase, refuge staff identified and evaluated the issues and concerns raised during public scoping. These issues are defined as matters of controversy, dispute, or general concern, or interest in resource management activities, the environment, land uses, or public use activities. Issues are important to the planning process because they identify topics to be addressed in the CCP, pinpoint the types of information to gather, and help define alternatives for the CCP. It is the Service's responsibility to focus planning and analysis on major issues. Major issues typically suggest different actions or alternative solutions, are within the refuge's jurisdiction, and have a positive or negative effect on the resource. Major issues influenced the decisions outlined in the CCP. Issues and goals that assisted in developing the management direction for the CCP are listed below.

1.9.2 Key Issues Addressed in the Comprehensive Conservation Plan

1.9.2.1 Restoration of Native Habitats and Natural Water Regimes

One of the primary goals of the Tualatin River National Wildlife Refuge is to protect, manage, and restore native habitats of the Tualatin River Basin and ensure that the refuge's efforts contribute to the much larger landscape outside of the refuge's boundary. Native habitat restoration requires understanding basic resources that ecosystems are dependent on to make sound scientific decisions. Local-scale knowledge of soils, hydrology, and topography are important attributes to consider when planning to restore a given habitat type. Additionally, it is just as important to determine what the land supported historically and identify changes from the historical condition that would help guide restoration options for a given area. Refuge management must be able to answer the most basic questions of "why" and "where" to support decisions. One of the key components in making restoration decisions is looking at the larger landscape both within and outside refuge boundaries. Habitats within the Tualatin River Basin are often fragmented into small, disconnected areas. Of primary concern is to provide larger contiguous blocks of a given habitat type, and maintain wildlife corridors to increase connectivity among habitat patches.

The Tualatin River is the "lifeblood" of the refuge, as a majority of refuge lands lie within its floodplain. Agricultural practices, development of dams, and urbanization have drastically altered hydrological patterns of the Tualatin River floodplain. Knowledge of current river functions is critical to support floodplain habitat restoration and support decisions to convert areas of the refuge to a more natural hydrologic-driven process.

One outcome of the CCP planning process was the development of computer modeling to help identify and map important floodplain habitat restoration opportunities using current land attributes and historical vegetation. The model will also help determine the historical, current, and future extent

of frequency and duration of Tualatin River flooding in order to identify floodplain restoration opportunities and show how current river hydrology could be integrated into habitat management.

1.9.2.2 Species Posing Management Challenges

The refuge is known for its natural features and diverse and abundant wildlife. However, as a refuge in an urban/rural interface, the space for wildlife is limited and the potential for conflicting use, use that disturbs wildlife both within and outside refuge boundaries, poses wildlife management challenges.

To date there have been no mosquito-borne human health disease issues documented near the refuge, but public concern for potential disease transmission from wildlife to humans have increased as human populations have grown around the refuge. The CCP will explore the refuge's role and appropriate responses to these concerns in cooperation with local agencies.

Invasive species are a major issue on public lands throughout the United States, and national wildlife refuges are no exception. Some invasive species are so well established that eradicating them completely using existing technology is impossible. The CCP, Chapter 4, will examine what the most appropriate strategies are for controlling invasive species in a variety of habitat types. Non-native invasive plant species include reed canarygrass, Himalayan blackberry, Bermuda grass, and common cocklebur. Efforts to control these and other species are ongoing.

Non-native animal populations that occur on refuge lands include nutria, bullfrogs, carp and other non-native fish species, and feral cats. These species degrade habitat and affect native wildlife populations directly or by displacement.

Some native species also pose management challenges. For example, beavers cause damage to water control structures and native vegetation; Canada geese numbers have increased significantly in the Willamette Valley and impact surrounding agricultural lands; ODFW has designated the Willamette Valley Management Unit as an elk de-emphasis area to minimize damage to agricultural crops—populations of elk reside less than a mile from the Wapato Lake Unit. The CCP will evaluate all wildlife management options and control strategies for these species to protect refuge resources.

1.9.2.3 Management of Special-status Species

The refuge has great potential to play a role in the protection and recovery of listed species, species of concern, and rare species occupying a variety of habitat types within the Willamette Valley. The CCP will explore management and landscape-level restoration actions that could include restoring riparian habitats to a more natural barrier-free system, providing wintering habitat for listed salmonids and other native fish. The conservation and restoration of rare and declining habitats such as wet prairie, oak savanna, and other habitat types would assist in the recovery of special-status species and possibly prevent future listings.

1.9.2.4 Refuge Public Access

Getting to and from the refuge as well as accessing areas within the refuge are important considerations for the CCP. Many transportation systems that bring visitors to the refuge either already exist, are planned, or have the potential to be implemented in the future. The CCP will explore whether the existing facilities within the refuge are sufficient to provide access to the range

of high-quality wildlife-dependent recreation opportunities, including those existing and those that may be implemented as an outcome of the CCP. Access must be considered through the lens of appropriateness and compatibility, evaluating disturbance/impacts to wildlife and their habitats, other compatible public uses, and refuge management programs.

1.9.2.5 Hunting and Fishing

Hunting and fishing are traditional recreational uses of renewable natural resources. The Administration Act, other laws, and the Service's policies permit hunting and fishing on a national wildlife refuge when it is compatible with the purposes for which the refuge was established and acquired.

National wildlife refuges exist primarily to safeguard wildlife populations through habitat preservation. The word "refuge" encompasses the idea of providing a haven of safety for wildlife, and as such, hunting might seem to be an inconsistent use of the Refuge System. However, habitats that normally support healthy wildlife populations produce populations that can sustain minor individual loss without impacting the population as a whole; therefore, the resource is renewable.

As practiced on refuges, hunting and fishing do not pose a threat to wildlife populations, and in some instances, are actually necessary for sound wildlife management. For example, on some wildlife refuges, deer populations will often grow too large for the refuge habitat to support. If some deer are not harvested, they destroy habitat for themselves and other animals and die from starvation or disease. The harvesting of wildlife on refuges is carefully regulated to ensure an equilibrium between population levels and wildlife habitat. The decision to permit hunting and fishing on national wildlife refuges is made on a case-by-case basis that considers biological soundness, economic feasibility, effects on other refuge programs, and public demand (USFWS 2011d).

Hunting and fishing are currently not offered at the Tualatin River National Wildlife Refuge. Hunting opportunities in the Portland metropolitan area are very limited, but there is potential to provide high-quality hunting and fishing opportunities on the refuge, in particular hunting at the Wapato Lake Unit and fishing at the Sherwood Units. Public scoping in 2010 revealed interest in offering hunting, including programs that offer youth hunts, and some interest in fishing. The CCP will examine what types of hunting and fishing could be offered, based on appropriateness, compatibility, sustainability, and feasibility.

1.9.2.6 Entrance and User Fees

Charging entrance fees (to visit the refuge) and user fees (to participate in a specific program or use specific facilities) are options to financially support visitor service operations, including facility maintenance and salaries for park rangers, fee collectors, or hunter check station operators. Several aspects of a potential fee program will be evaluated during the CCP. The cost of managing a fee program will be weighed against the revenue that is likely to be generated. The refuge will consider whether the income generated by a fee program would be worth the potential loss of visitors who would not come to the refuge if a fee were required.

1.9.2.7 Wapato Lake Management

In 1952, the Wapato Improvement District (WID) was established to coordinate the various water needs for agricultural operations and maintenance of Wapato Lake. The WID operated and

maintained two pumps, 5+ miles of levees, weirs, canals, bridges, and culverts associated with water management of the lake. The district consisted of all the landowners of the lake who paid assessments to WID to perform the necessary maintenance and operations to dewater the lake and deliver summer water to the lakebed landowners.

When the refuge first acquired lands within the Wapato Improvement District, it became a member of the WID and paid an assessment along with the other landowners to maintain the infrastructure. When the refuge became the majority landowner of the lakebed, the WID voted to no longer function as a district and in spring of 2012, the WID donated its assets to the Service. In the interim, until more detailed habitat management can be completed, the refuge will continue to dewater the lakebed to utilize cooperative farming to help manage invasive species and provide additional forage for waterfowl. Since it is inconsistent with refuge purposes and Service policies the refuge cannot take on the responsibilities of WID that relate to the irrigation responsibilities of the Tualatin Valley Irrigation District.

1.9.3 Issues Outside the Scope of the Comprehensive Conservation Plan

While CCPs are very comprehensive plans, no single plan can cover all issues. The planning team has compiled a list of issues that are currently considered to be outside the scope of this CCP.

Operations associated with raising of Scoggins Dam and raw water pipeline: At the Wapato Lake Unit, additional potential impacts to riverine and floodplain habitats and wildlife resources exist that are associated with a proposed raising of Scoggins Dam and the raw water pipeline project. Refuge and other Service staff will continue to be a part of this planning process.

Alignment of proposed I-5 and 99-W connection corridor: A new road development and associated right-of-way construction project has the potential to impact future acquisition needs and threaten refuge resources at several refuge unit locations. Alternative routes have been proposed that cross fee title refuge lands or are in close proximity to refuge parcels. Refuge staff will continue to monitor and comment on this planning process.

Washington County urban reserve planning process: As an urban refuge, the Tualatin River National Wildlife Refuge faces external threats that reflect the urbanization of the surrounding landscape. The City of Sherwood has been identified as one of the fastest growing cities in Oregon, with residential and commercial development continuing to expand at a high rate. Metro, the elected regional government for the Portland metropolitan area, has expanded the urban growth boundary since refuge establishment to accommodate growth of municipalities. Much of the habitat adjacent to the floodplain is now targeted for construction and development.

Hazardous material and contaminant issues: Land use surrounding the refuge includes a variety of operations that may adversely impact refuge resources, primarily through contamination of soils and waterways and urban-related runoff upstream and adjacent to the refuge. Examples of past and current operations include auto recycling facilities; landfills; abandoned and current industrial sites; quarries; and others. The Service will continue to engage and provide input on these types of concerns on a case-by-case basis, as appropriate and as authorized.

Willamette Valley Conservation Study Area: The Service has initiated a collaborative study of conservation opportunities within the Willamette Valley. The Willamette Valley Conservation Study Area is part of the America's Great Outdoors Initiative to develop twenty-first century conservation

and recreation solutions. The initiative takes as its premise that lasting conservation solutions should rise from the American people. This landscape-level study will be accomplished with our partners and other stakeholders to focus on several key points (USFWS 2011a):

- Conserving rare and declining habitats;
- Assisting in recovering endangered, threatened, and candidate species;
- Connecting people to nature through outdoor recreation and education opportunities;
- Enhancing habitat connectivity and wildlife corridors;
- Conserving rural working farms, ranches, and forest with wildlife habitat values through partnerships and incentives; and
- Assisting in achieving Pacific Flyway Canada goose and other migratory bird objectives.

1.10 Refuge Vision and Goals

1.10.1 Expanded Vision Statement: An Image of the Future

Tualatin River National Wildlife Refuge is a natural treasure where an abundance of native wildlife thrive in a mosaic of wetland, prairie, forest, and stream habitats characteristic of the Willamette Valley that the Atfálat'i people knew. It's a special place, an icon where the stories of the refuge reflect the importance of the National Wildlife Refuge System. The refuge has a rich history of community vision where friends and neighbors helped create, and continue to care for, this urban refuge and the watershed that supports it. It is a model that combines excellence in landscape conservation, learning, and partnerships to strive for a healthy natural world.

The refuge is a sanctuary for both wildlife and people, a place where the ebb and flow of the river marks the natural rhythms of the refuge through the seasons.

Spring is a time when the melody of songbirds echoes through the canopy of the riparian forest and prairies are washed in the vibrant colors of wildflowers in bloom. Nature is alive with the sights and sounds of animals as they fulfill their ancient ritual of courting and raising their young. Wetlands give way to mudflats as migrating shorebirds probe the mud for the insects and worms that will nourish them on their northward journey. The curiosity of school children is nurtured as they discover nature's surprises like a bird's nest, a vole tunnel, a duckling, a soaring hawk, or the slither of a snake.

The heat of summer dominates as wetlands dry and native plants continue to grow, setting the dinner table for the waterfowl that will arrive in fall. Turtles bask on logs, songbirds are fledging their young, the chorus of frogs resonates at sundown, and bats dart through the night sky eating insects on the fly. Volunteers and refuge staff are busy with the chores of caring for the refuge, while families explore the sunny expanse of tall meadow grasses and seek shelter in the cool shade of the green forest.

As fall approaches, the colors of the forest change to golden hues and the air fills with the sound of migrating geese and swans. Seasonal rains begin as the arriving waterfowl seek shelter and food in the wetlands that are beginning to flood. Deer and squirrels prepare for winter as they search for acorns under majestic oaks. Teachers gather at the refuge to learn how to share the sense of wonder that nature has to offer to their students.

Winter brings the awe of thousands of waterfowl, swirling overhead as they seek sanctuary. Rains pour down as ducks, geese, and swans forage in the wetlands, abundant with the seeds and roots that will nourish them through the cold season. People gather and marvel as bald eagles perch high atop leafless trees and patrol wetlands searching for a waterfowl meal. Fish migrate through rising rivers and streams, and seek shelter in the quieter waters of backwater sloughs. Late in the winter, the open water of the wetlands reflects the misty sunsets as waterfowl depart to their arctic breeding grounds.

Winter rains wane as the cycle begins anew in a place where rich traditions, outdoor learning experiences, and discovery foster a love of and caring for nature that endures for generations to come.

1.10.2 Condensed Vision: Summarizing the Core Values of the Refuge

Tualatin River National Wildlife Refuge is a natural treasure where an abundance of native wildlife thrive in a mosaic of wetland, prairie, forest, and stream habitats characteristic of the Willamette Valley that the Atfálat'i people knew. The refuge is a sanctuary for both wildlife and people, a place where the ebb and flow of the river marks the natural rhythms of the refuge through the seasons. It's a special place, an icon where the stories of the refuge reflect the importance of the National Wildlife Refuge System. The refuge has a rich history of community vision where friends and neighbors helped create, and continue to care for, this urban refuge and the watershed that supports it. It's a model that combines excellence in landscape conservation, learning, and partnerships to strive for a healthy natural world. Tualatin River National Wildlife Refuge is a place where wildlife, rich traditions, outdoor learning experiences, and discovery foster a love of and caring for nature that endures for generations to come.

1.10.3 Refuge Goals

Refuge management goals are descriptive, open-ended, and often broad statements of desired future conditions that convey a purpose, but do not define measurable units. Goals must support the refuge vision and describe the desired end result.

The CCP planning team has drafted a series of goals, objectives, and strategies to meet these goals and to address the concerns identified during scoping. Included below are the goals.

- Maintain, enhance, and restore bottomland riparian habitats consistent with the historical range of variability representative of the Willamette Valley ecosystem to support breeding and migratory landbirds and other native species.
- Maintain, enhance, and restore mixed coniferous/deciduous forest habitat to a historical range of variability representative of the Willamette Valley ecosystem to support breeding and migratory landbirds and other native species.
- Maintain, enhance, and restore oak savanna habitat to a historical range of variability representative of the Willamette Valley ecosystem to support breeding and migratory landbirds and other native species.
- Maintain, enhance, and restore native Willamette Valley wet prairie habitat, with an emphasis on management for rare and listed species.

- Maintain, enhance, and restore a diversity of wetlands to support migratory landbirds, waterbirds, and shorebirds with special emphasis on wintering waterfowl.
- Maintain, enhance, and, where feasible, restore streams and off-channel backwater slough habitats to benefit salmonids and other native aquatic species.
- Cultivate and maintain croplands as an interim measure to control non-native invasive species.
- Collect scientific information (surveys, scientific assessments, and research) as necessary to support adaptive management decisions that are associated with the goals of the refuge.
- Protect and manage the refuge's unique cultural resources for their cultural, scientific, and educational values, while consulting with appropriate Native American groups and preservation organizations and complying with historic preservation legislation.
- Provide visitors, local residents, volunteers, and partners with opportunities to understand and appreciate fish and wildlife conservation as well as the purpose, ecology, and management of the refuge and the Refuge System.
- Provide students and educators from the greater Portland area with compatible and high-quality opportunities to participate in environmental education.
- Provide refuge visitors with diverse, compatible, and high-quality opportunities to participate in wildlife-dependent recreation and interpretation.
- Build a broad-based natural resource conservation constituency with a focus on urban audiences to create a conservation ethic within urban communities; increase relevance of habitat conservation, wildlife heritage, and the Refuge System in the eyes of urban citizens; and instill a sense of empowerment for urban communities to work together to actively support conservation, in both local and global settings.

Chapter 2 Management Direction

2.1 Development of Management Direction

In developing the management direction for the Comprehensive Conservation Plan (CCP), the Tualatin River National Wildlife Refuge (refuge) reviewed and considered a variety of natural and cultural resource, social, economic, and organizational information, ideas, and concerns important for managing the refuge. Much of this information is more fully described in Chapters 3, 4, and 5. As is appropriate for a national wildlife refuge, biological resource considerations were paramount in designing the management direction. A U.S. House of Representatives report accompanying the Refuge System Improvement Act stated, ~~"~~the fundamental mission of our [Refuge] System is wildlife conservation: wildlife and wildlife conservation must come first."

The refuge planning team reviewed available scientific reports and studies to better understand ecosystem trends and the latest scientific recommendations for species, habitats, and public uses, including environmental and social effects of those uses. The planning team also identified refuge areas that, due to natural or cultural considerations, were especially sensitive to public uses and facilities, and identified refuge areas that provided special opportunities for public uses.

Refuge staff met with representatives from local, state, and Federal agencies and initiated contact with elected officials and the Confederated Tribes of Grand Ronde (Tribes) to ascertain issues, priorities, problems, and recommendations as perceived by others. Refuge staff also conducted scoping meetings with agencies and the general public to ensure that comments and ideas were considered from all interested parties during development of this CCP. These consultation, coordination, and public participation efforts are more fully described in Appendix K.

The refuge planning team considered all of the above information and input, and identified and described a range of reasonable alternatives. A reasonable alternative is one that is technically and economically practical or feasible, would fulfill the purpose of and need for action without violating minimum environmental standards, and could be implemented. Each alternative was then evaluated for environmental and social effects and how it addressed the CCP issues. The refuge then identified its preferred alternative—Alternative 2—which was labeled as the Proposed Action. Following public review and comment, the U.S. Fish and Wildlife Service (the Service; USFWS) selected this CCP alternative for implementation as the management direction.

2.2 Management Directions Considered but Eliminated from Detailed Study

During development of the management direction, the refuge planning team considered the actions discussed below. All of these actions were ultimately eliminated from further evaluation and inclusion for the reasons stated.

Expanding the refuge boundary. The refuge has been protecting habitat within the approved acquisition boundary through an active effort to acquire lands and waters for almost 20 years. The approved acquisition boundary was substantially increased in 2007 with the addition of the 4,310-acre Wapato Lake Unit (USFWS 2007b). As of June 2011, the refuge has acquired or has otherwise gained management authority over approximately 2,217 acres of the 7,370 acres within the approved

refuge acquisition boundary. Acquisition is from willing sellers through fee title or easements. Of those acres 2,167 acres are in fee title or easement and 50 acres are under memorandum of agreement with Metro for management. Refuge efforts now and into the foreseeable future are focused on securing the acreage yet to be acquired within the existing boundary from willing sellers. Therefore, expansion of the approved refuge acquisition boundary is not being considered as part of this CCP effort.

The Service has recently initiated a separate study of opportunities to conserve valuable fish, wildlife, and plant habitats throughout the Willamette Valley (USFWS 2011a). This new effort is part of the national America's Great Outdoors initiative and will involve collaboration among local communities, landowners, agencies, and organizations. Purposes of the study include conserving rare habitats; enhancing habitat connectivity; helping to recover and avoid listing species with declining populations; addressing goose management issues, including agricultural depredation; enhancing water quantity and quality; and increasing wildlife-dependent recreation and education opportunities. The study will evaluate voluntary conservation easements, private land incentives, potential expansion of existing or establishment of new national wildlife refuges; and other "land protection strategies that support local economies, conserve natural resources and provide increased outdoor recreation and education opportunities" (USFWS 2011a). One of the outcomes of this study may be the possibility of establishing the existing Wapato Lake Unit as its own national wildlife refuge. Several opportunities will be provided for the public to become involved in this new study. The refuge is participating in this Willamette Valley–wide conservation effort, but the initiative is not part of this CCP.

Cropland management for geese. In its plan to reduce goose depredation of private agricultural lands, the Pacific Flyway Council (PFC) recommended, among other things, that Federal refuges do "everything possible … to provide abundant, high quality goose forage" (PFC 1998). A task force created by the Oregon legislature in 2009 to evaluate this issue made similar recommendations and stated that, "Supplemental feeding of geese on … federal areas should be utilized when needed to reduce goose depredation on private farmlands" (Goose Depredation Task Force 2010). Although cooperative farming is used as an interim management tool prior to restoring acquired lands, the refuge planning team considered implementation of a permanent cropland management program on the refuge to provide winter forage for geese. This proposal was eliminated from further study for the following reason:

- Restoration and management of native habitat types on these refuge acreages support higher priority ecological values (i.e., remnant vegetation communities and wildlife species with declining populations) and directly support the purposes of the refuge.

Allowing certain nonwildlife-dependent uses. Uses found not appropriate have not been carried forward in the CCP process (see discussion of the Refuge Administration Act in Section 1.5, Legal and Policy Guidance). The refuge planning team considered the appropriateness of providing opportunities for a broad range of recreational and commercial uses of the refuge that were suggested during CCP scoping or at other times prior to the start of the CCP process. These uses include dog training/walking, bicycling/jogging, plant harvesting, trapping, boat access, and geocaching.

Each of these uses was evaluated and found to cause unacceptable levels of disturbance to wildlife, create unacceptable public safety issues, and/or interfere with users engaged in compatible wildlife-dependent uses. Therefore, these uses were found to be not appropriate on the refuge, and they are

not included in the management direction. These findings are documented in Appendix A, Appropriate Use Findings.

Providing boat access to the Tualatin River at the Wapato Lake Unit. Comments were made during public scoping and the public use review regarding the potential for boating access to the Tualatin River from the Wapato Lake Unit (SWCA Environmental Consultants 2010a, 2010b).

As it flows through the northern half of the Wapato Lake Unit, the Tualatin River is quite narrow and is bordered by strips of remnant riparian forest. As a result of flooding and natural tree fall, the river is regularly blocked by multiple brush and logjams. Maneuvering even a small human-powered craft through this reach of the river would require regular lifting of the craft over or around logjams, creating a potentially dangerous situation. If the refuge developed improved boat access to the river, the public would reasonably expect a relatively safe and enjoyable boating experience, which at this time, we are unable to provide. Additionally, large woody debris is often a valuable component of aquatic fisheries habitat, and logs are best left in place to facilitate wildlife benefits. For these reasons, this proposal was determined impractical and was not further evaluated as part of this CCP.

2.3 Description of Management Direction

As a unit of the National Wildlife Refuge System (Refuge System), the refuge is managed to conserve native fish, wildlife, plants, and their habitats, and to provide opportunities for compatible wildlife-dependent public uses. The refuge will continue to conduct core management programs.

A brief description of the management direction follows. It represents a balanced approach among the many competing needs and issues that the refuge currently faces and is likely to experience in the next 15 years. Table 2-1 summarizes the features of the management direction. Maps displaying the habitat types and visitor services features associated with the management direction can be found in Appendix P. Changes in habitat types and restoration objectives were derived from the philosophy of creating larger blocks of contiguous habitat types to reduce fragmentation and increase connectivity among habitat patches, and to restore and maintain rare habitat types. In some instances we plan to eliminate small patches of rare habitat in favor of another habitat type that will result in less fragmentation. We will then enhance and/or restore more of the rare habitat type in another location to achieve the same goal.

Adaptive management. Based upon the Service's Adaptive Management Implementation policy, refuge staff shall use adaptive management for conserving, protecting, and, where appropriate, restoring lands and resources. Adaptive management is defined as a system of management practices based upon clearly identified outcomes, where monitoring evaluates whether management actions are achieving desired results (objectives). The recently published *Adaptive Management Technical Guide* also defines adaptive management as a decision process that ~~"p~~promotes flexible decision making that can be adjusted in the face of uncertainties as outcomes from management actions and other events become better understood" (Williams et al. 2009). Adaptive management accounts for the fact that complete knowledge about fish, wildlife, plants, habitats, and the ecological processes supporting them may be lacking. The role of natural variability contributing to ecological resilience also is recognized as an important principle for adaptive management. It is not a ~~"tr~~ial and error" process; rather, adaptive management emphasizes learning while doing based upon available scientific information and best professional judgment considering site-specific biotic and abiotic factors on refuge lands.

Administration. Full implementation of the management direction, including increasing habitat restoration projects and public use opportunities, will require, at a minimum, six additional full-time permanent employees. The refuge will continue to pursue additional staff over the life of the CCP.

Appropriateness and compatibility. Consistent with relevant laws, regulations, and policies, prior to allowing any public use, including commercial use of the refuge, each such use would first need to be found appropriate and determined compatible. The Service made preliminary findings and determinations regarding the appropriateness and compatibility of each use included in the management direction. Prior to signature of a decision document for the CCP and its associated NEPA document, appropriateness findings and compatibility determinations were finalized for each public use included in the Service's management direction. Appropriateness and compatibility are further discussed in Appendices A and B.

Biological integrity. The Administration Act directs the Service to ~~"~~ensure that the biological integrity, diversity, and environmental health of the [Refuge System] are maintained for the benefit of present and future generations of Americans …." The policy is an additional directive for the Service to follow while achieving a refuge's purposes and the Refuge System's mission. It provides for the consideration and protection of the broad spectrum of native fish, wildlife, and habitat resources found on the refuge. When evaluating the appropriate management direction for the refuge (e.g., in compatibility determinations), the Service will use sound professional judgment to determine the refuge's contribution to biological integrity, diversity, and environmental health (BIDEH) at multiple landscape scales. Sound professional judgment will incorporate field experience, knowledge of refuge resources, an understanding of the refuge's role within the ecosystem, applicable laws, and best available science, including consultation with others both inside and outside the Service. The policy states that ~~"~~the highest measure of biological integrity, diversity, and environmental health is viewed as those intact and self-sustaining habitats and wildlife populations that existed during historic conditions."[1]

Climate change. The Service considers and analyzes climate change in its decisions, long-range plans, and other activities. Habitat conditions and wildlife populations are directly and indirectly sensitive to climatic conditions, namely precipitation and temperature. As described in greater detail in Chapter 3, the area's hydrology is not particularly sensitive to changes in climate because the refuge is located in a rain-dominant system. However, increasing temperatures increase the risk of fire, disease, pests, and invasive species throughout the Pacific Northwest, and these trends may affect the refuge's forest, riparian, and upland habitats and species and their management.

The combined changes (temperature, precipitation, and hydrology) can affect the refuge's habitats and species directly, such as the timing of migratory arrival and many other phenological responses, and indirectly, such as by added vulnerability to other stressors including invasive species and pathogens. Predicting biological response at the population level, however, requires complex research and information and sophisticated models that can be validated with field studies over time. This highlights the importance of monitoring both habitats and species to establish potential correlations and adaptation options.

[1] There is one caveat, however. Management for a refuge's purpose(s) is the highest priority, so maintenance and/or restoration of biological integrity, diversity, and environmental health cannot compromise or conflict with refuge purpose(s).

In summary, climate change has the potential to significantly impact the refuge's ability to achieve its purposes, goals, and objectives. Knowledge and monitoring of these regional and local trends will be used to assess potential changes or enhancements to the refuge's management actions and techniques and/or their timing, using the adaptive management approach described above. Most notably, the region's changing climate, specifically hotter and drier summer months, could challenge the refuge's goals and objectives for maintaining, enhancing, and restoring mixed coniferous/deciduous forest habitat to a historical range of variability, and for maintaining, enhancing, and restoring native Willamette Valley wet prairie and shrub-scrub wetland habitat.

The refuge will monitor wildlife corridor analyses, vulnerability assessments, vegetative and species response modeling, and other efforts, including those underway at a landscape scale, such as the Great Northern Landscape Conservation Cooperative (LCC). LCCs are formal science-management partnerships between the Service, Federal agencies, states, Tribes, nongovernmental organizations (NGOs), universities, and other entities to address climate change and other biological stressors in an integrated fashion. LCCs provide science support, biological planning, conservation design, research, and design of inventory and monitoring programs. As needed, objectives and strategies will be adjusted to assist in enhancing refuge resources' resilience to climate change and to potentially manage for new assemblages of species in the future.

Energy efficiency, sustainability, and other green building concepts were among the key principles used in the design and construction of the refuge's Wildlife Center, environmental education shelter, and administration building in the past decade (USFWS 2003a). The refuge will continue to take steps to mitigate effects of climate change and reduce its carbon footprint to help achieve the Service's national commitment to become carbon neutral by 2020 (USFWS 2010a). Habitat restoration efforts will help to sequester carbon. Most restoration efforts involve planting grasses, shrubs, or trees, each of which will remove atmospheric carbon dioxide and store it within the plant materials. In addition, forest and scrub-shrub habitat types will increase shading along waterways, contributing to decreased water temperatures. Restoring and maintaining large blocks of habitat may also provide extended life history needs, such as cooler forest areas, for fish and wildlife as climate change occurs.

Coordination with the State. The refuge will continue to routinely coordinate with state agencies such as Oregon Department of Fish and Wildlife (ODFW), Oregon Department of Environmental Quality (DEQ), and the Department of State Lands (DSL). Key subjects of mutual interest include water quality; wetlands; management of dusky Canada geese, cackling Canada geese, and other waterfowl; goose and elk depredation; management of wildlife-dependent recreation, including hunting and fishing; management of non-native and invasive species; and management of special-status species.

Coordination with the Confederated Tribes of Grand Ronde. The refuge will continue to coordinate and consult with the Tribes on subjects of mutual interest, including education and interpretation regarding cultural resources.

Cultural resources protection and National Historic Preservation Act (NHPA) compliance. The refuge will continue to uphold federal laws protecting cultural resources, including Section 106 of the NHPA. These laws also mandate consultation with Native American Tribes, the State Historic Preservation Office, and other preservation partners.

Facility management. The efficient and safe operation of refuge facilities is critical to achievement of refuge purposes, goals, and objectives, including conserving native fish, wildlife, plants, and their habitats, and providing compatible wildlife-dependent public use opportunities. The Service will continue to maintain, repair, upgrade, and/or replace refuge facilities as necessary and appropriate, consistent with available funding.

Fees. Some public lands, including national wildlife refuges, establish and use revenues generated by entrance and user fees to help support their programs. Federal law and policy requires the use of fee revenues to support visitor services programs, including maintenance and repair of visitor facilities. The refuge has received official approval to establish an entrance fee program (USFWS 2009a), but has not implemented one to date. The refuge will continue to evaluate the desirability of establishing entrance fees to supplement Federal appropriations, grants and other less reliable funding, and volunteer support.

Funding and staffing. As a result of inflation, implementation of current management will likely require increased funding just to maintain current operations. Full implementation of the management direction will require funding levels substantially above current budget allocations to support the identified habitat and wildlife management activities and enhanced public use programs.

Aspects of the refuge's habitat and wildlife program, such as habitat restoration projects, have been funded with grants and cost-share moneys, and through mitigation and other agreements with other agencies. A much greater proportion of the refuge's visitor services program has been funded with one-time grants, cost-share programs, and funding from other outside sources. In addition, as discussed elsewhere in this chapter, both programs are supported through numerous partnership and volunteer efforts. Future programs on the refuge will continue to rely on grants, cost-share moneys, partnerships, and volunteers.

As noted at the beginning of this document, the purpose of this CCP is to provide long-term guidance for management decisions; set forth goals, objectives, and strategies needed to accomplish refuge purposes; and identify the Service's best estimates of future needs. Selection of the management direction does not constitute a commitment for staffing increases, operational and maintenance increases, continued land acquisition, or construction of new projects. After the CCP is completed, actions and programs that are part of the management direction will be implemented over a period of 15 years, consistent with available funding and staffing.

Goose management. The refuge and partner agencies including ODFW are grappling with several issues regarding goose management. Issues of concern include reduced numbers of dusky Canada geese and the abundance of cackling Canada geese, the loss of goose foraging habitat, and goose depredation on private farmland (PFC 1998, 1999, 2008). There are also concerns with increasing populations of resident Western Canada geese.

The refuge lies within the Willamette Valley and Lower Columbia River area, has agricultural lands as neighbors, and supports wintering dusky Canada geese and cackling Canada geese; thus, goose management is an important issue for the refuge. The management direction includes winter surveys of refuge goose use and winter sanctuary areas that provide resting and foraging habitats for dusky Canada geese and other waterfowl.

Habitat and wildlife. The refuge is currently composed of a mosaic of fragmented habitats. The management direction will strive to combine some of these fragments into larger contiguous blocks

of native habitat types within the landscape and also restore relic or disappearing habitat types (see Appendix P, Map 9). It will benefit imperiled species that rely on prairie, scrub-shrub wetland, and oak savanna habitats. It will capitalize on opportunities to work with regional partners and increase the continuity of habitats as well as recreational connections beyond the boundaries of the refuge.

The management direction is largely driven by the typical hydrologic flows in the Tualatin River, with limited water control manipulation on the refuge. Prescribed fire will be added as an additional habitat management technique.

The habitat types of the Tualatin River, primarily riparian forest and herbaceous wetland, will not substantially change under the management direction. In the upland, oak savanna and ruderal habitats will convert to mixed forest. The oak savanna that is currently identified on the refuge is habitat where management efforts have been made to begin converting ruderal uplands to oak savanna primarily through the treatment of invasive species and by some planting. The habitat is not mature oak savanna. However, through this CCP, the refuge has identified some areas that would provide more benefit as mixed forest. The conversion of oak savanna to mixed forest would not result in a ~~"~~true" loss of oak savanna. The limited water manipulation on the Tualatin River Unit will continue. On the Rock Creek Unit, the ruderal wetlands will be converted to scrub-shrub wetland. Other actions included in the management direction intend to restore a mosaic of wetlands, riparian forests, oak savannas, prairies, and streams.

Habitats on the Riverboat Unit will largely remain the same as under current management, except that active water control management that maintains a 30-acre herbaceous wetland will be modified. The wetland will be allowed to evolve into a mixture of wet prairie and scrub-shrub wetland. Approximately 4 acres of riparian forest on this unit will convert to wet prairie.

At the Atfálat'i Unit, Chicken Creek will be restored to its historical footprint. The existing water diversion structure could be relocated to the east, allowing water management on approximately 158 acres of herbaceous wetland, 69 acres less than what is currently managed. These wetlands will be enhanced (e.g., recontouring ground surface and updating water control structures) to manage them more effectively. The remaining acres will be converted to a mixture of wet prairie, oak savanna, and scrub-shrub wetland.

Management of the Onion Flats Unit will take advantage of soils that are rare in the Willamette Valley and historically supported a rare scrub-shrub wetland type. Assuming further land acquisition occurs; Onion Flats Unit will convert from cooperative farming into a scrub-shrub wetland and oak savanna. These changes could benefit declining dusky Canada geese and the threatened Nelson's checker-mallow plant. The management direction also include restoring channelized Rock Creek to its historical footprint.

Management of the Wapato Lake Unit could include a mixture of free-flowing hydrology and intensive water control with the intention of a more natural hydrology being implemented over the long term. Actual management activities of the lake bed will be determined based upon a Wapato Lake water management planning study.

Integrated pest management (IPM). Non-native species, especially invasive species, and other pest plants and animals can disrupt native ecosystems and management of conservation lands. They can displace native plants and create monotypic habitats of little value to native fish and wildlife; they can prey upon native species; they can transmit diseases to other species, including humans; and they

can damage facilities used to manage habitats and provide public use opportunities. Species posing the greatest current threats to the refuge include Himalayan blackberry, English ivy, common carp, bullfrogs, nutria, Bermuda grass, and reed canarygrass. Species that have been detected on the refuge but were immediately removed include Japanese knotweed and purple loosestrife. In addition, snapping turtles have been documented in the Tualatin River, but have not been observed by refuge personnel. Species that pose a significant threat to the refuge, but have not been documented, include giant hogweed, zebra mussel, garlic mustard, and New Zealand mud snail. Control of such species is a high-priority refuge management activity. Because of their aggressive nature and high potential for harm, the refuge has zero tolerance for purple loosestrife and Japanese knotweed and will continue to take immediate action to remove these species from the refuge whenever they are found.

Other pest species, both native and non-native, such as beaver, feral cats, catfish, cocklebur, mosquito fish, poison hemlock, mosquitoes, sunfish, teasel, bull thistle, Canada thistle, velvetleaf, and tansy, can also limit the refuge's ability to provide high-quality habitats and public use programs. Appropriate management actions, including control efforts, will continue to be taken for these species, consistent with need and available funding.

An IPM approach will be used, where practicable, to eradicate, control, or contain pest and invasive species (herein collectively referred to as pests) on refuge lands. IPM will involve using methods based upon effectiveness, cost, and minimal ecological disruption, which considers minimum potential effects to nontarget species and the refuge environment. Pesticides may be used where physical, cultural, and biological methods or combinations thereof are impractical or incapable of providing adequate control, eradication, or containment. If a pesticide is needed on refuge lands, the most specific (selective) chemical available for the target species would be used unless considerations of persistence or other environmental and/or biotic hazards preclude it. Pesticide use will be further restricted because only pesticides registered with the U.S. Environmental Protection Agency (EPA) in full compliance with the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and as provided in regulations, orders, or permits issued by EPA may be applied on lands and waters under refuge jurisdiction.

Environmental harm by pest species refers to a biologically substantial decrease in environmental quality as indicated by a variety of potential factors such as declines in native species populations or communities, degraded habitat quality or long-term habitat loss, and/or altered ecological processes. Environmental harm may be a result of direct effects of pests on native species, including preying and feeding on them (e.g., bullfrogs eating native amphibians); causing or vectoring diseases; preventing them from reproducing or killing their young (e.g., pushing eggs out of nests); outcompeting them for food, nutrients, light, nest sites or other vital resources; or hybridizing with them so frequently that within a few generations, few if any truly native individuals remain. Environmental harm also can be the result of an indirect effect of pest species. For example, decreased waterfowl use may result from invasive plant infestations reducing the availability and/or abundance of native wetland plants that provide forage during winter.

See Appendix G for the refuge's IPM program documentation. Along with a more detailed discussion of IPM techniques, this documentation describes the selective use of pesticides for pest management on refuge lands, where necessary. Throughout the life of the CCP, most proposed pesticide uses on refuge lands will be evaluated for potential effects to refuge biological resources and environmental quality. These potential effects will be documented in ~~"c~~hemical profiles" (see Appendix G). Pesticide uses with appropriate and practical best management practices (BMPs) for habitat management as well as cropland/facilities maintenance would be approved for use on refuge

lands where there likely would be only minor, temporary, and localized effects to species and environmental quality based upon non-exceedance of threshold values in chemical profiles. However, pesticides may be used on refuge lands where substantial effects to species and the environment are possible (exceed threshold values) in order to protect human health and safety (e.g., to counter mosquito-borne disease).

Land acquisition and habitat protection. The approved refuge boundary for the Tualatin River National Wildlife Refuge totals 7,370 acres. As of February 2013, the Service had secured management authority over 2,217 acres. This authority was secured through fee title land acquisition, purchase of conservation easements, and management agreements. During the 15-year life of the CCP, the Service will continue actively securing management authority over lands and waters within the approved refuge boundary to protect habitat for native fish, wildlife, and plants and to provide opportunities for compatible wildlife-dependent public use. This high-priority effort will be accomplished with available funding under current management authorities, and will continue to be exclusively on a willing-seller basis.

The refuge currently has a land acquisition priority plan that was developed and outlines the five priority areas for land acquisition at the Sherwood Units. There is a focus on the top three areas for acquisition, and the plan includes maps and descriptions of each area. This plan is used extensively by refuge management to develop annual funding requests and work plans in cooperation with the realty program in the Regional Office. Most importantly, this plan provides a long-term guide for future planning. Ultimately, there is an opportunistic approach to acquisition as the Service will only purchase lands from willing sellers and timing often dictates property available for purchase.

Some residences and outbuildings acquired when lands were purchased for the refuge will be used to house refuge personnel, provide offices for Service personnel, and provide storage space. Outbuildings included with newly acquired lands will be opportunistically considered for reuse (e.g., to shelter environmental education activities or store equipment and supplies) or removed.

Partnerships. It is essential to partner with others to conduct programs and accomplish goals and objectives on national wildlife refuges. Tualatin River National Wildlife Refuge actively partners with a number of organizations, including other public agencies, nonprofit conservation organizations, schools, private businesses, and others to implement current programs. Partners provide funding, equipment and supplies, special expertise, and volunteers (see further discussion below). These partnerships will continue in the future.

Public uses and facilities in Atfálat'i Unit. At least the same types of public use opportunities and facilities currently available in the Atfálat'i Unit will continue to be available in the future.

Participation in planning and review of regional development activities. The Service will continue to participate in local planning and studies pertaining to future commercial, industrial, residential, and other urban development; transportation; recreation; contamination; and other potential concerns that may affect refuge resources. This includes maintaining relationships with local jurisdictions, other agencies, and private groups to stay abreast of ongoing planning, studies and current and potential developments. Outreach and education will continue to be used to raise awareness of refuge resources and their dependence on a healthy and functioning ecosystem.

Quality recreation programs. Refuge System policy provides specific criteria for managing compatible wildlife-dependent recreational uses (605 FW 1). This policy defines quality recreational programs as ones that:

- Are safe, accessible, and available to a diversity of citizens, and use facilities that blend into the environment;
- Promote responsible behavior and compliance with laws and regulations;
- Promote stewardship and conservation, understanding and appreciation of nature, and the refuge's role in resource management and conservation;
- Provide reasonable opportunities to experience wildlife;
- Minimize conflicts with fish, wildlife, and their habitats, other public uses, and neighboring landowners; and
- Use visitor satisfaction to define and evaluate programs.

Refuge programs will be developed and managed to ensure that high-quality opportunities are provided for all visitors.

Refuge revenue sharing. The Refuge Revenue Sharing Act provides a mechanism to make payments to counties in lieu of taxes. Lands acquired by the Service are removed from county tax rolls. However, this Act, amended in 1978, allows the Service to offset the tax losses by annually paying the county or other local units of government an amount that often equals or exceeds that which would have been collected from taxes if the lands had been in private ownership. This funding is based on congressional approval on an annual basis.

Regulatory compliance. Prior to implementation, all activities in the management direction will undergo appropriate reviews and consultations. Permits and clearances will be secured as necessary to comply with legal and policy requirements.

Response to mosquito-borne disease. Mosquito populations on refuge lands will continue to be allowed to fluctuate and function unimpeded unless they pose a threat to human health. Mosquitoes inhabiting the refuge's aquatic habitats are native invertebrates that provide a forage base for fish and wildlife, including migratory birds and anadromous fish. To protect human health, the state or a local vector control agency will be allowed to control mosquito populations on refuge lands. Pesticide treatments (larvicides, pupacides, or adulticides) will be allowed on refuge lands only if local, current population monitoring and/or disease surveillance data indicate refuge-based mosquitoes pose a health threat to humans. Mosquito treatments will be in accordance with IPM principles applicable to all pests. Pesticides proposed for mosquito control will use appropriate and practical BMPs, given potential effects documented in chemical profiles. Under Service policy, pesticides may be used on refuge lands for mosquito control even though substantial effects to species and the environment are possible (i.e., exceed threshold values) in order to protect human health and safety.

The mosquito management compatibility determination in Appendix B provides details regarding allowed mosquito population monitoring, disease surveillance, and treatments. As noted earlier, Appendix G, describes the refuge's IPM program, which is applicable to all pests, including mosquitoes.

Following adoption of this CCP, the refuge will develop a disease contingency plan (DCP) to address responses to mosquito-borne disease outbreaks on and/or adjacent to refuge lands. Much of the information contained in the compatibility determination for mosquito management will be

incorporated with additional specificity, where necessary, in the DCP. The DCP will also include information on the history of mosquito-borne diseases on and/or adjacent to the Refuge as well as measures to protect refuge visitors, Service-authorized agents, and Service employees when a health threat or emergency is identified by health officials.

Restoration of ruderal habitats. The refuge contains many tracts of land that consist of fallow farmland, undeveloped lands that contain mainly non-native vegetation, or lands that are otherwise not restored to native habitat types. These lands include both uplands and wetlands in degraded condition. On many of these tracts, the refuge has begun pretreatment work to restore native habitat types. Pretreatments may include mowing, discing, removal of non-native trees, application of herbicide to remove non-native plants, or other activities. These pretreatments are conducted with the expectation that the area will be restored to specific native habitat types as described in the habitat goals listed below in this chapter. There are currently 189 acres of ruderal upland and 74 acres of ruderal wetland that will be restored to native habitat types.

Site restrictions. Selected tracts of land within the refuge boundary are encumbered with legal restrictions that limit the manner in which those tracts can be managed for fish, wildlife, and public use (see Appendix J). These site-specific limitations originate with management agreements and mitigation requirements (USFWS 1992a, 2010d). These site restrictions will continue to apply under the management direction.

Sound professional judgment. Decisions regarding refuge management and actions taken to carry out these decisions will continue to be based on sound professional judgment. Federal regulations in 16 United States Code (USC) 668-668ee define sound professional judgment as ~~"~~a finding, determination, or decision that is consistent with principles of sound fish and wildlife management and administration, available science and resources, and adherence to the requirements of the National Wildlife Refuge System Administration Act of 1966 and other applicable laws. Included in this finding, determination, or decision is a refuge manager's field experience and knowledge of the particular refuge's resources."

Step-down management plans. This CCP provides broad, long-range guidance for overall management of the refuge and its principal programs. Further work, including more data gathering and more detailed analyses, would be needed to develop more specific guidance for selected programs and elements. In these cases, step-down management plans will be developed. Step-down management plans will satisfy NEPA requirements and other relevant compliance requirements, and the development of these plans will include appropriate opportunities for public involvement. The following plans are scheduled for development.

Disease contingency plan. This plan will be developed in partnership with mosquito abatement, public health, and animal health authorities from the State of Oregon, Washington County, and Yamhill County. This plan will describe mosquito abatement, avian influenza, and other public and wildlife health threats. It is scheduled for completion in 2015.

Elk management plan. This plan will be developed in partnership with the Willamette Valley National Wildlife Refuge Complex and ODFW. It will describe how elk will be managed on national wildlife refuges in the Willamette Valley. Consideration of elk viewing and/or hunting opportunities, as appropriate, will be included.

Facilities management plan. This plan will be developed within 5 years of the completion of the CCP. The plan will include: 1) preparation of a historic buildings assessment; 2) evaluation of quarters buildings to determine number needed, best locations, and maintenance costs; and 3) evaluation of potential locations for a small administrative and maintenance facility at the Wapato Lake Unit.

Fire management plan. The refuge's 2008 fire management plan has been revised and updated. This updated plan addresses the need for prescribed fire to support established habitat communities and was developed in consultation with DEQ. See Appendix O for the revised fire management plan.

Inventory and monitoring plan. The Refuge System Administration Act charges the Service to "monitor the status and trends of fish, wildlife, and plants in each refuge." The refuge will participate in development of an inventory and monitoring plan as part of a larger effort in the Willamette Valley. This plan will provide guidance for establishment of baseline inventories and subsequent monitoring activities to ensure they use common standards and are conducted with appropriate statistical rigor. These inventory and monitoring efforts will be designed to address refuge information needs for adaptive management. Data gathered will feed into efforts across larger geographic areas to detect ecological changes caused by pollution, development, climate change, and other major environmental stressors.

Support the protection and recovery of federally listed, state-listed, and other special-status species. The refuge is undertaking projects to enhance and restore native prairie and savanna habitat types that may support recovery of federally and state-listed plant species, such as Bradshaw's lomatium, Kincaid's lupine, Nelson's checker-mallow, Willamette daisy, and others. Whenever possible, as these projects proceed, planting and maintenance of these species will be conducted in accordance with applicable recovery plans to help facilitate downlisting or delisting. Restoration and maintenance of in-stream, off-channel, and other habitat types may benefit various native fish species including upper Willamette River Chinook salmon, Oregon chub, Pacific lamprey, coastal cutthroat trout, and upper Willamette River steelhead. In addition, most habitat types encountered on refuge lands could support some or all life phases of any number of listed or special-status species such as bald eagle, band-tailed pigeon, Fender's blue butterfly, streaked horned lark, northern red-legged frog, northwestern pond turtle, willow flycatcher, and others. When planning and implementing various restoration projects, consideration will be given to strategies that promote healthy populations of these species.

Urban refuge. The refuge is one of a handful of urban national wildlife refuges and was one of the first in the Refuge System specifically established under the Service's Urban Refuge Policy (Smith 1991; USFWS 1996). This policy states, in part, that the primary purpose for establishing urban refuges is to:

- "foster environmental awareness and outreach programs to develop an informed and involved citizenry that will support fish and wildlife conservation";
- "… provide public use benefits associated with fish and wildlife resources that include … bird watching, fishing, scientific research, environmental education, open space in an urban setting, and protection of cultural resources"; and
- include "education, interpretation and wildlife-oriented recreation … opportunities for partnerships with State and local governments, private individuals, or citizens groups … [and a] potential role of nonprofit or volunteer groups for management purposes."

In 2011, the Service published the new vision for the National Wildlife Refuge System –Conserving the Future" (USFWS 2011c) which, in part, sets forth updated recommendations for urban refuges. Recommendation 13 of the vision document –creates an urban refuge initiative that defines excellence in our existing urban refuges, establishes the framework for creating new urban refuge partnerships and implements a refuge presence in 10 demographically and geographically varied cities across America by 2015."

The refuge will continue in the future to be managed consistently with the guidance contained in the Urban Refuge Policy and strive to achieve the new standards of excellence that result from the new vision.

Visitor services. Existing visitor service programs will remain and new opportunities will be added (see Appendix P, Map 11). A youth waterfowl hunt program will be developed in the northern portion of the Riverboat Unit. Other expanded visitor services include: one to three additional wildlife photography blinds; an environmental education off-trail study area; a fishing program from the River Overlook; and a nature exploration play area. The refuge will explore opportunities to connect to regional trail projects.

At the Wapato Lake Unit, opportunities such as hunting and other compatible wildlife-dependent recreation and interpretation will be explored as adequate land and access are acquired and habitat restoration decisions are made.

Volunteers. With the exception of law enforcement, personnel management, contracting, and select other functions prohibited by law, volunteers are involved in almost all aspects of the refuge's habitat and wildlife, and visitor services programs. In fiscal year 2011, volunteers donated nearly 15,000 hours of support to the refuge (USFWS 2011f). This equals more than seven full-time personnel and is valued at nearly $327,000 (national volunteer value = $21.79/hour [Independent Sector 2011]).

As with partnerships, the level of volunteer involvement is essential to the variety, number, and quality of programs offered through the refuge. Volunteer contributions are especially valuable during times of static or declining budgets, and when grants and other funding are harder to secure. However, volunteers are not without cost. The success of the volunteer program relies heavily on management and oversight by the refuge's visitor services manager, the Friends of the Refuge, short-term interns, and grant-funded staff. Regardless, the refuge will continue in the future to encourage and support a large and active volunteer program.

Wapato Lake conceptual management. The Wapato Lake Unit was established in 2007 to restore the historic lake bed for the purpose of improving habitat conditions for a number of native species. The Wapato Lake Unit contains portions of the Tualatin River and tributary streams that may support listed fish species, as well as migratory birds including breeding landbirds and waterfowl species. It is the intent of the Service to restore the lake bed to protect, manage, and restore habitats for migratory birds, fish, and other native wildlife of the Willamette Valley (USFWS 2007b).

Management of this unit remains mostly conceptual as further analysis of the area is required before making specific management decisions on habitat restoration and public use opportunities. Future management decisions will support the purposes for which the Tualatin River National Wildlife Refuge was established as described in the 2007 *Tualatin River National Wildlife Refuge Proposed Wapato Lake Unit Land Conservation Plan and Environmental Assessment* (USFWS 2007b).

Key factors in establishment of the unit were to:

- Contribute to efforts across the Tualatin River Basin to improve watershed health and function;
- Protect patches of remnant rare native habitat such as herbaceous and scrub-shrub wetlands;
- Allow for the restoration of rare native habitat;
- Protect migratory bird habitat, especially wintering waterfowl and breeding neotropical songbirds;
- Improve and protect habitat for anadromous fish;
- Provide opportunities for people of all ages to enjoy wildlife-dependent recreation; and
- Enhance protection of cultural resources.

Currently, the Wapato Lake Unit is composed mostly of land that has been farmed since the late 1800s and early 1900s. The land is mostly agricultural fields that, when left alone, are invaded by reed canarygrass, which ultimately forms a monoculture. Reed canarygrass is an invasive plant that likes disturbed, moist soil conditions and prevents native plants from becoming established. It does this by overcrowding the site and taking essential nutrients from the soil and water that would otherwise be used by native plants. The levees that were constructed to facilitate delivery of water to the lake bed during summer months are overrun with Himalayan blackberry. The blackberry makes it nearly impossible to navigate the levees by foot, and they are also completely inaccessible by all-terrain vehicle (ATV) or other wheeled vehicles for maintenance purposes. The canals themselves are filled with water during the winter from the creeks and also during the summer months during irrigation. These canals may contain some fish species and invertebrates. The potential for restoring this area to a mixture of riparian forest, and scrub-shrub and herbaceous wetlands, is extremely high, and it is highly likely that there will be vast benefits to trust resources, including migratory birds and listed species. Restoration of this historic lake bed would lead to a diverse and rich area that would protect, restore, and provide a diversity of habitats for migratory birds, including songbirds, wading birds, shorebirds, wintering waterfowl, and resident and anadromous fish.

To help determine the level of restoration needed at Wapato Lake, the Service has engaged the United States Geological Survey (USGS) to conduct studies to assist with the refuge's planning efforts. Actual management activities of the Wapato Lake Unit will be determined based upon adaptive management and the outcome of the Wapato Lake water management planning study.

While there are many unknowns for the future of Wapato Lake, there are some things that will occur regardless of the restoration direction the Services chooses to take. Interim goals, as defined in the 2007 *Tualatin River National Wildlife Refuge Proposed Wapato Lake Unit Land Conservation Plan and Environmental Assessment*, reflect the core mission of the Service to protect wildlife resources and the purpose for which the Wapato Lake Unit was established. The refuge will provide public use and focus on habitat restoration.

Wapato Lake Water Management Planning Study. The Service is coordinating with the USGS's Oregon Water Science Center and others to conduct studies and evaluations to support planning for the Wapato Lake Unit (Buccola et al. ca. 2010). Results from these studies will allow the refuge to better define and evaluate the effects of water management and associated habitat restoration alternatives for Wapato Lake to benefit the habitat and species, as mentioned in the above section.

Interim water management at Wapato Lake. Water retention in and discharge from Wapato Lake will continue as they have in the recent past until a more detailed habitat management plan can be completed. That is, rain and naturally inflowing water will be allowed to fill the lake bed during the fall and winter. In the spring, the lake bed will be dewatered by pumping out and discharging water into the Tualatin River to allow cooperative farming to occur as an interim form of habitat management. Ongoing maintenance and repair of existing infrastructure will occur to the best of our ability and as appropriate, and no pumped discharges will be made with the large pump between May 1 and October 31 each year without prior approval of DEQ.

Although the Service recognizes the importance of irrigation water to the farming community, the delivery of irrigation water is not part of the Refuge System's mission or the official purposes for establishing the Tualatin River National Wildlife Refuge. Federal legislation mandates that, first and foremost, the mission of the Refuge System is wildlife conservation. In addition, before being allowed, any other use of a national wildlife refuge must first be determined compatible with the purposes for establishing the refuge. Regulations and policy establish specific guidance for making this determination.

Water quality. The Tualatin River is listed as a "water quality limited" waterway and as such was assigned a series of total maximum daily loads (TMDLs) for temperature, pH, chlorophyll a, bacteria, and dissolved oxygen. The existing TMDLs are currently being revised by DEQ. The refuge will continue to work with DEQ and other partners to address issues related to water quality and TMDLs in the Tualatin River.

Wilderness review. Service policy requires that a wilderness review be completed for each refuge as part of the CCP process. This review includes three phases: inventory, study, and recommendation. If the wilderness inventory determines that some refuge lands and/or waters satisfy minimum criteria for wilderness designation, wilderness study areas are designated and the review enters the second (study) phase. See Appendix D for more information on the refuge's wilderness review, which recommended that the refuge not undergo further study for inclusion into the wilderness system because it does not meet specific criteria required for wilderness designation.

Wildlife-dependent public uses. The Improvement Act identified six wildlife-dependent public uses. They are: hunting, fishing, wildlife observation and photography, and environmental education and interpretation. These six wildlife-dependent public uses are to be given special consideration in refuge planning and management, and opportunities to allow these six uses are to be considered in each refuge CCP.

It is expected that participation in refuge visitor service programs would instill a sense of wonder; cultivate a connection with nature; foster a lifelong relationship with the refuge and the Refuge System; encourage a conservation ethic; and enhance the public's understanding of and appreciation for fish, wildlife, plants, and their habitats, as well as of refuge management programs to conserve these biological resources.

Table 2-1. Summary of Management Direction

Key Indicators	Management Direction
Acres of Each Habitat Type Under Management Direction*	
Bottomland riparian forest	433
Mixed coniferous/deciduous forest	103
Oak savanna	147
Oak/pine woodland	43
Wet prairie	138
Herbaceous wetland	193
Scrub-shrub wetland	205
Crops and improved pastures	0
Ruderal uplands	0
Ruderal wetlands	0
Developed land (buildings, etc.)	60
Water (river)	24
Restored acres of undetermined native habitat types at Wapato Lake Unit	871
Total acres*	2,217
Miles of Each Habitat Type	
River frontage	7.2
Streams—maintain	1.4
Streams—restore	2.7
Backwater slough—maintain	0.9
Backwater slough—restore	1.6
Species Posing Management Challenges	
Non-native, invasive, and pest plants	Continue IPM, with prescribed fire. Immediate early detection and rapid response actions to eliminate purple loosestrife, giant hogweed, garlic mustard, and Japanese knotweed if found.
Non-native, invasive, and pest animals	Continue IPM, plus eliminate problem beavers, feral cats, and nutria. Immediate action to eliminate New Zealand mud snail, snapping turtle, red-eared slider, and zebra mussel if found.
Mosquitoes	Continue to allow mosquito populations on the refuge to fluctuate and function unimpeded unless they pose a threat to human health. Mosquito treatments will be in accordance with IPM principles. Develop mosquito component of disease contingency plan in cooperation with state and/or local vector control agencies.
Canada geese	Continue to provide wintering sanctuary. Work with partner agencies to implement regional plans and agreements.
Roosevelt elk	Work with partner agencies to develop elk management plan.
Management of Special-status Species	
Wetland, riparian, and upland habitats and species	Continue to support recovery of Nelson's checker-mallow and explore options to assist recovery of other listed species.
Aquatic habitats and species	Continue to maintain and operate weirs, fish passage, and fish screening structures. Where appropriate, remove culverts and other passage barriers during restoration efforts.

Table 2-1. Summary of Management Direction

Key Indicators	Management Direction
Wapato Lake Management	
Habitat management	Interim management: Existing lake bed infrastructure will be maintained. Lake water levels and downstream discharges will continue as in the past. Long-term management will include more natural, free-flowing hydrology.
Public Information and Outreach	
General program	Expand information and outreach materials to use broader range of techniques, more diverse use of social media, and aimed at a broader audience.
Facilities and Access	
Facilities—Sherwood Units	Expand facilities to include: 1-3 additional wildlife photography blinds, 1 off-trail nature explore/play area, 1 off-trail environmental education study area. Evaluate and develop facilities management plan.
Facilities—Wapato Lake Unit	As habitat restoration proceeds, explore opportunities for hunting and other compatible wildlife-dependent recreation and interpretive facilities.
Access—Sherwood Units	Expand access to trails, blinds, and study/explore areas. Explore connecting refuge to existing regional trail systems. Conduct transportation and safety studies for new and existing access points.
Access—Wapato Lake Unit	As habitat restoration proceeds, explore opportunities for public access to portions of the unit in support of compatible wildlife-dependent recreation and education.
Refuge entrance and user fees	Refuge continues to have no entrance or user fees, but will continue to explore desirability of establishing an entrance fee. Refuge will also explore desirability of user fees in support of waterfowl hunting, photo blind use, and special events and activities.
Environmental Education	
Number of students served annually on refuge	5,000
Number of students served annually off-site	1,750
Number of youth served in informal (non-classroom-based) education programs	2,000
Number of teacher workshops offered annually	2
Outreach to schools	Expand to include schools within a 10-mile radius of Sherwood and Gaston.
Number of volunteer naturalists trained annually in support of the education program	25
Education opportunities offered near the Wapato Lake Unit	Expand to offer teacher training, education materials to be housed at local schools, and education programs/events at locations within the

Table 2-1. Summary of Management Direction

Key Indicators	Management Direction
	community (e.g., schools, parks).
Hunting and Fishing	
Hunting—Sherwood Units	Youth hunt program will be developed on the Riverboat Unit. Includes 2 to 5 hunting blinds.
Hunting—Wapato Lake Unit	Explore opportunities for waterfowl hunting in concurrence with habitat restoration planning and implementation.
Fishing	Fishing program will be developed at the existing River Overlook on the Atfálat'i Unit.
Urban Refuge Initiative	
Information clearinghouse for natural resources management	Provide information exchange on natural resource issues to encourage collaborative sharing within communities and organizations; agencies; businesses; and others.
Information clearinghouse for environmental education	Provide information exchange and materials to educators, schools, and communities, including social science research supporting the benefits of nature-based education to people, with a focus on children.
Bring more urban citizens to the refuge to experience nature.	Identify barriers to connecting urban people to natural areas; hire youth in natural resource jobs; develop a transportation strategy to bring urban audiences to the refuge.
Increase relevance of natural resources to urban citizens	Provide outreach that supports the value of natural resources for communities—for human health, economic health, watershed health; provide education materials that address conservation and community issues such as invasive species, pollinators, urban wildlife, and climate change.

*All acreage figures are based on GIS analysis using the data shown in the maps in Appendix P.

2.4 Goals, Objectives, and Strategies

Goals and objectives are the unifying elements of successful refuge management. They identify and focus management priorities, resolve issues, and link to legal mandates (including refuge purposes) for managing a refuge, Service policies that step down from legal mandates (e.g., Improvement Act), and the Refuge System Mission.

A CCP describes management actions that help bring a refuge closer to its vision. A vision broadly reflects the refuge purposes, the Refuge System mission and goals, other statutory requirements, and larger-scale plans as appropriate. Goals then define general targets in support of the vision, followed by SMART (Specific, Measurable, Achievable, Results-oriented, Time-fixed) objectives that direct efforts into incremental and measurable steps toward achieving those goals. Strategies identify specific tools and actions to accomplish objectives.

The goals for Tualatin River National Wildlife Refuge for the life of the CCP are presented in the tables on the following pages. Each goal is followed by the objectives that pertain to that goal. Some objectives pertain to multiple goals and have simply been placed in the most reasonable spot. Similarly, some strategies pertain to multiple objectives.

The goal order does **not** imply any priority in this CCP. Priority actions are identified in the staffing and funding analysis in Appendix C.

Readers, please note the following:

Below each objective statement are the strategies that could be employed to accomplish the objectives. Symbols used in the following tables include:

% percent sign
> greater than
< less than
≥ greater than or equal to
≤ less than or equal to

Refer to Appendix P, Maps 8 through 11.

Goal 1: Maintain, enhance, and restore bottomland riparian habitat consistent with the historical range of variability representative of the Willamette Valley ecosystem to support breeding and migratory landbirds and other native species.

Objective 1.1 Enhance and maintain bottomland riparian forest
Throughout the life of the CCP, enhance and maintain 322 acres of bottomland riparian forest on Tualatin River National Wildlife Refuge for the benefit of breeding and migrating landbirds (e.g., Pacific slope flycatcher, yellow warbler) and a diverse assemblage of other native species (e.g., northern red-legged frog). Bottomland riparian forest is characterized by the following: • >60% overstory canopy cover of trees (e.g., Oregon ash, bigleaf maple, Douglas-fir, grand fir) that are >50 feet tall (Altman 2000) • >20% understory canopy cover of trees (e.g., willow, red-osier dogwood, Pacific yew, cascara, and hazel) that are ≥12 feet tall • Habitat patches >100 feet wide along streams (Altman 2000) • 30%-80% understory cover of shrubs (e.g., snowberry, sword fern) 3-12 feet tall (Altman 2000) • Herbaceous layer dominated by native grasses and forbs • >5 snags/acre >6 inches diameter at breast height (DBH) with at least 2 per acre >10 inches DBH and 6 feet tall (Altman 2000) • <20% cover of invasive plants (e.g., reed canarygrass, Himalayan blackberry, English ivy, English holly)
Strategies Applied to Achieve Objective:
Use IPM techniques, including mechanical/physical (e.g., mowing), chemical, cultural, and biological means, to control or eradicate invasive species (see Appendix G).
Map invasive plant distributions every 5 years, during the spring and summer months when most plants are easily identified.
Place protective tubes on naturally recruiting saplings/seedlings.
Establish a permanent biological technician position to conduct habitat maintenance and perform habitat inventory and monitoring such as vegetation parameters and wildlife species diversity and density.

Rationale: Bottomland riparian forest is a rare, native plant community in the Willamette Valley. It provides habitat for over 100 migrating and breeding landbird species (Roth et al. 2004) and summer habitat near wetlands for native amphibians. Enhancing and/or maintaining existing bottomland riparian forest will reduce additional habitat fragmentation that is occurring in the valley at large and is consistent with refuge purposes and the Service's BIDEH Policy. It provides habitat connectivity and movement corridors for many species. Riparian areas often serve as off-channel backwater habitat for outmigrating salmonid species during winter flooding. In addition, riparian areas help to slow, absorb, and filter rainwater and runoff. Riparian areas also provide shade and woody structure to adjacent streams, rivers, and wetlands. Some of the areas to be maintained under this objective were recently restored and will not reach a mature growth form for many years. They will not achieve the full attributes described above, but will provide a diversity of benefits as they continue to grow. Riparian areas are important to achieve purposes of the refuge to conserve fish and wildlife. Mapping invasive species will provide for a targeted approach to their removal or control, and provide a basis for adaptive management when evaluating efficacy of treatments. By using IPM techniques to maintain and enhance this habitat type the refuge will provide enhanced habitat for a myriad of fish and wildlife species. Placing tree protective tubes on naturally recruiting trees will help to both identify and protect trees during invasive species control, and protect them from herbivory by deer, voles, and other species. Bottomland riparian forest is a priority habitat type listed in the Oregon Conservation Strategy (ODFW 2006).

Objective 1.2 Restore bottomland riparian forest

By 2020, bottomland riparian forest will be restored from a mixture of ruderal upland and ruderal wetland habitat types. Then these 111 acres of bottomland riparian forest will be protected and maintained on the Tualatin River National Wildlife Refuge for the benefit of breeding and migrating landbirds (e.g., Pacific slope flycatcher, yellow warbler). Mature bottomland riparian forest is characterized by the following:

- >60% overstory canopy cover of trees (e.g., Oregon ash, bigleaf maple, Douglas-fir, grand fir) that are >50 feet tall (Altman 2000)
- >20% understory canopy cover of trees (e.g., willow, red-osier dogwood, Pacific yew, cascara, and hazel) that are ≥12 feet tall
- Habitat patches >100 feet wide along streams (Altman 2000)
- 30%-80% understory cover of shrubs (e.g., snowberry, sword fern) 3-12 feet tall (Altman 2000)
- Herbaceous layer dominated by native grasses and forbs
- >5 snags/acre >6 inches DBH with at least 2 per acre >10 inches DBH and 6 feet tall (Altman 2000)
- <20% cover of invasive plants (e.g., reed canarygrass, Himalayan blackberry, English ivy, English holly)
- Swales connecting to rivers or streams to provide backwater fish habitat and species diversity

Strategies Applied to Achieve Objective:

Pretreat for 1-2 years to exhaust non-native seed bank prior to restoration actions.
Plant native tree and shrub species at a high stocking density of 870-1,450 plants/acre.
Tube and mulch around planted saplings/seedlings to prevent girdling by small mammals and browsing by deer.
Seed native herbaceous species using local genotypes, where needed.
Where appropriate, construct swales using heavy equipment to increase plant diversity and connect with the river or nearby streams providing off-channel refugia for native fish.

Use IPM techniques, including mechanical/physical (e.g., mowing), chemical, cultural, and biological means, to control invasive species (see Appendix G).
Monitor survival and growth of planted woody species.
Map invasive plant distributions every 5 years, during the spring and summer months when most plants are easily identified.
Establish a permanent engineering equipment operator position to restore riparian forest.
Rationale: See rationale for Objective 1.1. Pretreatment is recommended for 1-2 years prior to planting native trees and shrubs in order to remove invasive plant seed sources in the soil. Pretreatments may consist of mechanical removal (e.g., mowing, discing) of invasive plant species, and/or application of Service-approved herbicide in accordance with the IPM plan (Appendix G). Planting trees and shrubs at a high density will ensure desired attributes of canopy and shrub cover are achieved while allowing for natural mortality of newly installed plants during the first few years. To ensure successful restoration, >70% survival of woody species is needed during the first year after planting. Tubing and mulching around newly planted trees and shrubs retain soil moisture, act as a weed barrier, and prevent girdling by small mammals. Where appropriate backwater swales can be constructed to provide floodplain connection with nearby streams or rivers. Backwater swales will enhance biodiversity of the flora and fauna in the area and provide enhanced habitat attributes for native resident and anadromous fish (Jeffres et al. 2008). Restoring this floodplain connection is one of the most critical areas to achieve benefit for aquatic, riparian, and upland species (ODFW 2006). Restored areas will not reach the full attributes described during the 15-year life span of the CCP, but management will be directed toward reaching those characteristics.

Goal 2: Maintain, enhance, and restore mixed coniferous/deciduous forest habitat to a historical range of variability representative of the Willamette Valley ecosystem in order to support breeding and migratory landbirds and other native species.

Objective 2.1 Enhance and maintain mixed coniferous/deciduous forest
Throughout the life of the CCP, enhance and maintain 52 acres of mixed coniferous/deciduous forest on the refuge for the benefit of breeding and migrating landbirds (e.g., orange-crowned warbler, Bewick's wren) and a diverse assemblage of other native species (e.g., black-tailed deer, northwestern salamander, little brown bat). Mixed coniferous/deciduous forest is characterized by the following: • 40%-60% canopy cover that is Douglas-fir–dominated with mixtures of grand fir, western red-cedar, western hemlock, bigleaf maple, Garry oak, Pacific dogwood, Pacific yew, and red alder • 10%-50% subcanopy trees (Spies and Franklin 1991) • >30% cover in understory layer <15 feet tall consisting of snowberry, hazel, sword fern, and other shrubs • >5 snags/acre >6 inches DBH with at least 2 per acre >10 inches DBH and 6 feet tall (Altman 2000) • <20% cover of non-native invasive plants (e.g., Himalayan blackberry, English ivy)
Strategies Applied to Achieve Objective:
Use IPM techniques, including mechanical/physical (e.g., mowing), chemical, cultural, and biological methods, to control or eradicate invasive species (see Appendix G).
Map invasive plant distributions every 5 years, during the spring and summer months when most plants

are easily identified.
Use common forest health practices including prescribed fire and mechanical removals to create variable age structure.
Create snags, where needed, using mechanical methods (e.g., girdling).
Rationale: Mixed coniferous/deciduous forests provide valuable habitat for breeding and migrating landbirds. Cavity-nesting birds such as woodpeckers benefit from snags and dying trees. Mannan and Meslow (1984) found higher abundance of bird species in forests with more and larger snags. Fallen trees and branches provide substrate for salamanders and nutrients for future plant growth. These habitats support a diversity of other native species (deer, bats, amphibians) to meet various life history requirements. Using common forest management strategies such as prescribed fire and mechanical manipulation will allow the refuge to create uneven age structures to support a variety of species needs. These strategies also address rising fire risks due to a changing climate, specifically hotter and drier summer conditions, which are projected to continue and accelerate into the future. Mapping invasive species will provide for a targeted approach to their removal or control, and provide a basis for adaptive management when evaluating efficacy of treatments.

Objective 2.2 Restore mixed coniferous/deciduous forest
By 2017, mixed coniferous/deciduous forest will be restored from ruderal uplands and oak savanna habitat types and then these 51 acres of mixed coniferous/deciduous forest will be protected and maintained on the refuge for the benefit of breeding and migrating landbirds (e.g., orange-crowned warbler, Bewick's wren) and a diverse assemblage of other native species (e.g., black-tailed deer, northwestern salamander, bat species). Mixed coniferous/deciduous forest is characterized by the following: • 40%-60% canopy cover that is Douglas-fir–dominated with mixtures of grand fir, western red-cedar, western hemlock, bigleaf maple, Garry oak, Pacific dogwood, Pacific yew, and red alder • 10%-50% subcanopy trees (Spies and Franklin 1991) • >30% cover in understory layer consisting of snowberry, hazel, sword fern, and other native shrubs • <20% cover of invasive plants (e.g., Himalayan blackberry, English ivy)
Strategies Applied to Achieve Objective:
See strategies for Objective 2.1.
Pretreat for 1-2 years to exhaust non-native seed bank prior to restoration actions.
Plant native tree and shrub species at a high stocking density of 870-1,450 plants/acre.
Tube and mulch around planted saplings/seedlings to prevent girdling by small mammals and browsing by deer.
Seed native herbaceous species using local genotypes, where needed.
Monitor survival and growth of planted woody species.
Map invasive plant distributions every 5 years, during the spring and summer months when most plants are easily identified.
Use IPM techniques, including mechanical/physical (e.g., mowing), chemical, cultural, and biological methods, to control invasive species (see Appendix G).
Use prescribed fire as appropriate to control invasive species and reduce the build-up of unwanted fuel.

Rationale: See rationale for Objective 2.1. Restoring mixed coniferous/deciduous forest near or adjacent to existing forest could create larger tracts of contiguous forest habitat beneficial to forest-dwelling species (songbirds), creating larger travel corridors, and helping to prevent invasion from edge species such as brown-headed cowbirds. These strategies fit into refuge purposes and Service policy of maintaining biological integrity and species diversity.

Pretreatment is recommended for 1-2 years prior to planting native trees and shrubs in order to remove invasive plant seed sources in the soils. Prescribed fire could be used to control invasives and clear understories of unwanted fuels. Tubing and mulching around newly planted trees and shrubs retain soil moisture, act as a weed barrier, and prevent girdling. Planting trees and shrubs at a high density will ensure desired attributes of canopy and shrub cover are achieved while allowing for natural mortality of newly installed plants during the first few years. To ensure successful restoration, >70% survival of woody species is needed during the first year after planting. Restored areas will not reach the full attributes described during the 15-year life span of the CCP, but management will be directed toward reaching those characteristics.

Goal 3: Maintain, enhance, and restore oak habitats to a historical range of variability representative of the Willamette Valley ecosystem in order to support breeding and migratory landbirds and other native species.

Objective 3.1 Enhance and maintain oak savanna

Throughout the life of the CCP, enhance and maintain 109 acres of oak savanna on the refuge for the benefit of breeding and resident landbirds (e.g., western bluebird, white-breasted nuthatch, acorn woodpecker) and a diverse assemblage of other native species (e.g., western gray squirrel, black-tailed deer). Oak savanna is characterized by the following attributes:

- Trees dominated by widely spaced (1/acre), mature Garry oak 16->40 inches DBH with cavities (Thilenius 1968)
- Native grass and forbs <3 feet tall in understory
- Few to no woody species in understory, where tree and shrub cover is <10%
- Viable and reproducing populations of listed plant species such as Nelson's checker-mallow
- <5% cover of invasive shrubs (e.g., Himalayan blackberry)
- <20% cover of non-native grasses (e.g., velvet grass) and <10% non-native forbs (e.g., Canada thistle, tansy)

Strategies Applied to Achieve Objective:

Use prescribed fire, with burn interval of 3-5 years, to reduce encroachment of woody species and to reduce thatch.

Plant listed species, as appropriate.

Use mechanical treatments (e.g., mowing) during late summer/early fall to promote native herbaceous ground cover.

Use IPM techniques, including mechanical/physical (e.g., mowing), chemical, cultural, and biological methods, to control invasive species (see Appendix G).

Use mechanical thinning to reduce density of oak with removals limited to trees <15 inches DBH.

Use mechanical thinning to remove encroaching conifers, as needed.

Rationale: Oak savanna is a rare and unique habitat in the Willamette Valley that has been reduced to <1% of its historic extent; it provides habitat for migratory birds that are high priority and specific to

purposes of the refuge. Oak savanna habitat in the Willamette Valley supports five federally listed species (USFWS 2010b) and along with prairie habitats supports the greatest number of rare upland animals in the Willamette Valley (Titus et al. 1996). Fire historically maintained oak savanna habitat by removing competing vegetation and stimulating regeneration of native fire-associated plants. Fire suppression has allowed shrubs and conifers to encroach into oak savanna (ODFW 2006). Mowing during the fall season promotes native plant response while reducing the growth of undesirable trees and shrubs. Mowing during the fall will also reduce impacts to migratory birds by avoiding disturbance during their nesting cycle. Late summer/early fall prescribed fire on a rotational basis could help reduce encroachment of woody species such as Himalayan blackberry and poison oak and invigorate soil for establishment of native plants. Using IPM techniques ensures the best control of pest species with the lowest possible impact to fish and wildlife resources (Appendix G). Planting listed species will support recovery of plant and butterfly species identified in the *Recovery Plan for the Prairie Species of Western Oregon and Southwestern Washington* (USFWS 2010b).

Objective 3.2 Restore oak savanna

By 2020, oak savanna will be restored from ruderal uplands and early successional riparian forest habitat types. These 38 acres of oak savanna will be protected and maintained on the refuge for the benefit of breeding and resident landbirds (e.g., western bluebird, chipping sparrow, grasshopper sparrow) and a diverse assemblage of other native species (e.g., coyote). Oak savanna is characterized by the following attributes:

- Scattered oaks (1/acre) of individual trees (Thilenius 1968) or tight small clusters
- 60%-80% ground cover composed of native grasses and forbs
- <5% cover of invasive shrubs (e.g., Himalayan blackberry)
- <20% cover of non-native grasses (e.g., velvet grass) and <10% non-native forbs (e.g., Canada thistle, tansy)

Strategies Applied to Achieve Objective:

Pretreat for 1-2 years to exhaust non-native seed bank prior to restoration actions.

Plant acorns, seedlings, and/or potted oaks in clusters of 10-100 at a spacing of 100-300 feet between clusters (5-50/acre).

Use tubing or other protection to protect seedlings and saplings from herbivores.

Plant native grasses and forbs.

Conduct supplemental watering during first year.

Plant appropriate listed species such as Nelson's checker-mallow and Willamette daisy.

Use prescribed fire during spring to control non-native species prior to initial planting.

Use prescribed fire during fall, with burn intervals of 3-5 years to reduce thatch and control invasive species.

Use IPM techniques, including mechanical/physical (e.g., mowing), chemical, cultural, and biological methods, to control invasive species (see Appendix G).

Monitor plantings to determine survival and growth; replant if below target level or thin if too dense.

Rationale: See rationale for Objective 3.1. Restoring oak savanna habitat is consistent with refuge purposes, the Service's mission to support the recovery of listed species associated with rare and unique habitat (e.g., Kincaid's lupine, Willamette daisy), and with Service policy of maintaining BIDEH. Pretreatment will involve mowing, burning, and spraying of invasive shrub and grass species to create

open grassland settings for the establishment of native forbs and grasses associated with this habitat type, and will thus be beneficial to listed species adapted to the oak savanna community.

Prescribed fire use in the spring will help purge invasive plant seed banks prior to planting native species. Planting at a higher than desired density allows for natural mortality and provides a larger volume of oak substrate for wildlife while slow-growing oaks are small in the sapling stage. Oaks can later be thinned to achieve the final desired spacing. Placing tree protective tubes on trees will help to both identify and protect trees during invasive species control, and protect them from herbivory by deer, voles, and other species. Planting native grasses and forbs (wild flowers) is essential to restore the full suite of native vegetation for this plant community. Fall fires will be used to reduce thatch build-up and promote the health of native grass and forb communities. Protecting seedlings for up to 15 years will allow them to gain important establishment on the refuge. Intensive pretreatment is necessary to ensure establishment of a diverse native community and, in turn, the long-term success of oak savanna restoration. Planting and maintenance of listed species will aid in their recovery (USFWS 2010b).

Objective 3.3 Enhance and maintain oak/pine woodland

Throughout the life of the CCP, enhance and maintain 23 acres of oak/pine woodland on the refuge for the benefit of breeding and resident landbirds (e.g., white-breasted nuthatch, acorn woodpecker) and a diverse assemblage of other native species (e.g., western gray squirrel, black-tailed deer). Oak/pine woodland is characterized by the following attributes:

- Oaks up to 24″ DBH occasionally with trees exceeding 36″ DBH with a density of up to 425 trees/acre (Thilenius 1968) and ponderosa pine
- 1%-2% ground cover composed of native grasses and forbs
- 10%-80% cover of low shrubs
- <10% cover of invasive shrubs (e.g., Himalayan blackberry)
- <20% cover of non-native grasses (e.g., velvet grass) and <10% non-native forbs (e.g., Canada thistle, tansy)

Strategies Applied to Achieve Objective:

Use IPM techniques, including mechanical/physical (e.g., mowing), chemical, cultural, and biological methods, to control or eradicate invasive species (see Appendix G).

Map invasive plant distributions every 5 years, during the spring and summer months when most plants are easily identified.

Use common forest health practices including prescribed fire and mechanical removals to create variable age structure.

Create snags, where needed, using mechanical methods (e.g., girdling).

Rationale: Maintaining oak/pine woodland habitat is consistent with refuge purposes and with Service policy of maintaining BIDEH. Maintaining an oak/pine woodland community will provide valuable habitat for breeding and migrating landbirds. Cavity-nesting birds such as woodpeckers benefit from snags and dying trees. Mannan and Meslow (1984) found higher abundance of bird species in forests with more and larger snags. Fallen trees and branches provide substrate for salamanders and nutrients for future plant growth. These habitats support a diversity of other native species (deer, bats, amphibians) to meet various life history requirements. Using common forest management strategies such as prescribed fire and mechanical manipulation will allow the refuge to create uneven age structures to support a variety of species needs. These strategies also address rising fire risks due to a changing climate, specifically hotter and drier summer conditions, which are projected to continue and accelerate into the future. Mapping invasive species will provide for a targeted approach to their removal or control, and provide a basis for adaptive management when evaluating efficacy of treatments.

Objective 3.4 Restore oak/pine woodland

By 2020, oak/pine woodland will be restored from ruderal uplands and oak savanna habitat types. These 20 acres of oak/pine woodland will be protected and maintained on the refuge for the benefit of breeding and resident landbirds (e.g., Swainson's thrush, spotted towhee, western tanager) and a diverse assemblage of other native species (e.g., coyote). Oak/pine woodland is characterized by the following attributes:

- Oaks up to 24″ DBH, occasionally with trees exceeding 36″ DBH, (Thilenius 1968) and ponderosa pine, with a density of up to 425 total trees/acre
- 1%-2% ground cover composed of native grasses and forbs
- 10%-80% cover of low shrubs
- <10% cover of invasive shrubs (e.g., Himalayan blackberry)
- <20% cover of non-native grasses (e.g., velvet grass) and <10% non-native forbs (e.g., Canada thistle, tansy)

Strategies Applied to Achieve Objective:

Pretreat for 1-2 years to exhaust non-native seed bank prior to restoration actions.

Plant native tree and shrub species at a high stocking density of 870-1,450 plants/acre.

Tube and mulch around planted saplings/seedlings to prevent girdling by small mammals and browsing by deer.

Seed native herbaceous species using local genotypes, where needed.

Monitor survival and growth of planted woody species.

Map invasive plant distributions every 5 years, during the spring and summer months when most plants are easily identified.

Use IPM techniques, including mechanical/physical (e.g., mowing), chemical, cultural, and biological methods, to control invasive species (see Appendix G).

Use prescribed fire as appropriate to control invasive species and reduce the build-up of unwanted fuel.

Rationale: Restoring oak/pine woodland habitat is consistent with refuge purposes and with Service policy of maintaining BIDEH. Pretreatment will involve mowing, burning, and spraying of invasive shrub and grass species for the establishment of native trees and shrubs associated with this habitat type, and will thus be beneficial to resident and migratory species adapted to the oak/pine woodland community.

Prescribed fire use in the spring will help purge invasive plant seed banks prior to planting native species. Planting at a higher than desired density allows for natural mortality and provides a larger volume of plant substrate for wildlife while plants are small in the sapling stage. Placing protective tubes on trees will help to both identify and protect trees during invasive species control, and protect them from herbivory by deer, voles, and other species. Protecting seedlings for up to 10 years will allow them to gain important establishment on the refuge. Intensive pretreatment is necessary to ensure establishment of a diverse native community and, in turn, the long-term success of oak/pine woodland restoration.

Goal 4: Maintain, enhance, and restore native Willamette Valley wet prairie habitat, with an emphasis on management for rare and listed plant species.

Objective 4.1 Enhance and maintain native wet prairie

Throughout the life of the CCP, enhance and maintain 27 acres of wet prairie habitat on the refuge for the benefit of migratory birds (e.g., Wilson's snipe, northern pintail, American kestrel, western meadowlark) and a diverse assemblage of other native species. Wet prairie habitats are characterized by the following:

- Diverse community of native sedges, rushes, native grasses (e.g., *Deschampsia* sp.) that may be >3 feet tall, and a diversity of native forbs (e.g., camas, blue-eyed grass, popcorn flower) (Titus et al. 1996; USFWS 2010b)
- Intermittent ponding of water and saturated soils from November to April (Titus et al. 1996)
- Very few scattered shrubs or trees (especially Garry oak) >66 feet apart
- <5% total canopy cover of shrubs and trees
- <20% cover of invasive plants (e.g., reed canarygrass, cocklebur, blackberry, Bermuda grass)

Strategies Applied to Achieve Objective:

Maintain/protect relic oaks at very low density.

Plant native grasses and forbs, where necessary, using local genotypes.

Plant appropriate listed species, such as Nelson's checker-mallow.

Use IPM techniques, including mechanical/physical (e.g., mowing), chemical, cultural, and biological methods, to control invasive species (see Appendix G).

Use prescribed fire at burn intervals of 3-5 years.

Conduct haying or mowing after Aug 1 to protect ground-nesting birds and reduce woody encroachment.

Evaluate the potential for prescription grazing during later growing season.

Rationale: With less than 1% remaining, prairie habitats are one of the rarest plant communities in the Willamette Valley and provide important habitat for breeding and migrating birds. Loss of prairie habitat is due in large part to conversion to agriculture and urbanization as well as fire suppression during the past 150 years. Enhancing and maintaining wet prairie will support the purposes of the refuge and BIDEH. Prairie habitats support federally listed plant species including Nelson's checker-mallow, and provide opportunities to contribute to recovery of other federally listed plants. Wet prairies generally occur in the floodplain on heavy, poorly drained soil (USFWS 2010b).

Prescription grazing, mowing, and haying will occur in late season after seed has set and migratory bird nesting is complete. Determination of which method to use will depend on best available science, objectives, and availability of resources. Generally, haying or mowing will occur only once per year. These techniques are necessary to set back succession of woody plant species, reduce thatch, control invasive plants, and stimulate new growth of native plants. Planting listed species will support recovery of plant and butterfly species identified in the *Recovery Plan for the Prairie Species of Western Oregon and Southwestern Washington* (USFWS 2010b). Historically, many habitats such as wet prairie were maintained by disturbance. The primary disturbance was fire, but also included flooding, wind, and storms (ODFW 2006). Regular disturbance regimes are essential to maintain prairie and prevent encroachment of woody species as well as to promote a diversity of native plant species. Burning can reduce thatch and stimulate growth and health of native plants. Timing of prescribed burns will depend on the objective of the burn (e.g., reduce thatch, address invasive species), weather, and plant response to burns, and may occur during spring, late summer, or fall. Mowing may be used in some years to control

the growth of woody species, but it does not reduce thatch. Mowing should be conducted after August 1 to protect ground-nesting birds. By August 1, most bird species have completed nesting and young have fledged.

Objective 4.2 Restore native wet prairie

By 2025, wet prairie will be restored from herbaceous wetland and early successional riparian forest habitat types. Then the refuge will protect and maintain 111 acres of wet prairie on the refuge for the benefit of migratory birds (e.g., Wilson's snipe, northern pintail, green-winged teal) and a diverse assemblage of other native species. Wet prairie habitat types are characterized by the following:

- Diverse community of native sedges, rushes, and native grasses (e.g., *Deschampsia* sp.) that may be >3 feet tall, and a diversity of native forbs (e.g., camas, blue-eyed grass, popcorn flower) (Titus et al. 1996; USFWS 2010b)
- Intermittent ponding of water, and saturated soils from November to April (Titus et al. 1996)
- Very few scattered shrubs or trees (especially Garry oak) >66 feet apart
- <5% total canopy cover of shrubs and trees
- <20% cover of invasive plants (e.g., reed canarygrass, cocklebur, blackberry, Bermuda grass)

Strategies Applied to Achieve Objective:

Pretreat (e.g., herbicide, discing) for 1-2 years to exhaust non-native seed bank prior to restoration actions.

Use prescribed fire during spring to control non-native species prior to initial planting.

Plant native grasses and forbs, where necessary, using local genotypes.

Maintain/protect relic Garry oaks at low density.

Plant listed species, as appropriate.

Use IPM techniques, including mechanical/physical (e.g., mowing), chemical, cultural, and biological methods, to control or eradicate invasive species (see Appendix G).

Where appropriate, construct swales using heavy equipment to increase plant diversity and connect with the river or nearby streams, providing off-channel refugia for native fish.

Use mechanical treatments to remove encroaching woody species.

Evaluate the potential to use prescription grazing during later growing season.

Evaluate the potential use of prescription grazing, mowing, and/or haying after Aug 1 to protect ground-nesting birds.

Use prescribed fire at burn intervals of 3-5 years.

Rationale: See rationale for Objective 4.1. Restoring wet prairie is consistent with refuge purposes and the Service's mission to support recovery of listed species associated with this rare and unique habitat, and it fits the Service policy of BIDEH. Pretreatment will involve a rotation of herbicide, discing, and prescribed fire over a 1-2 year period to exhaust non-native seed banks and reduce aggressive invaders like reed canarygrass. This will prepare sites and better ensure the establishment of a diverse native community and, in turn, the long-term success of wet prairie. Planting listed species will aid in the recovery efforts as described in the *Recovery Plan for the Prairie Species of Western Oregon and Southwestern Washington* (USFWS 2010b). Mechanical and chemical treatments such as mowing and spraying will reduce woody species and open up ground for native grasses and forbs. Periodic prescribed burns will maintain the integrity of the wet prairie, clearing thatch, encroaching non-natives, and invigorating growth of natives species.

Restoration sites will be selected considering connectivity with existing or to-be-restored prairie, both on and off refuge lands. Intensive pretreatment is necessary to ensure establishment of a diverse native community and, in turn, the long-term success of wet prairie restoration.

Goal 5: Maintain, enhance, and restore a diversity of wetlands to support migratory landbirds, waterbirds, and shorebirds with special emphasis on wintering waterfowl.

Objective 5.1 Enhance and maintain herbaceous wetland
Throughout the life of the CCP, enhance and maintain 193 acres of herbaceous wetland for the benefit of migrating and wintering waterfowl (e.g., northern pintail, cackling Canada goose, tundra swan) and a diverse assemblage of other native species (e.g., waterbirds, shorebirds). Herbaceous wetlands are characterized by the following: • Most wetlands with shallow water depths averaging 4-18 inches deep from October to June • Other wetlands with deeper water averaging 18-48 inches deep, sometimes year-round • >60% cover of desirable and/or native wetland plants including moist-soil annuals (e.g., smartweeds, wild millet, American slough grass), wapato, sedges, and rushes • In deeper water, >50% cover of submergent plants (e.g., *Potamogeton* sp., *Callitriche* sp.) • <20% cover of native emergent species (e.g., cattail, bulrush) that are >5 feet tall • <30% cover of undesirable/invasive plants including reed canarygrass • Presence of large woody debris • Minimal damage to wetland infrastructure by nutria
Strategies Applied to Achieve Objective:
Initiate flood-up to full pool from October through December.
Irrigate, as needed, during summer to stimulate early season wetland annual plants and/or control invasive species.
Initiate drawdown of 10%-20% of seasonal wetlands in early April to provide mudflats for migrating shorebirds.
Initiate drawdown of most seasonal wetlands between May and July to stimulate germination of moist-soil annual plants.
Allow selected wetlands to dewater by natural evapotranspiration to provide extended wet season for BIDEH species.
Use mowing and/or herbicides to remove encroaching woody vegetation.
Use IPM techniques, including mechanical/physical (e.g., mowing), chemical, water management, cultural, and biological methods, to control invasive species (see Appendix G).
Use mowing and discing as a disturbance regime to stimulate growth of desirable species.
Reconfigure water control structures and dikes/levees where necessary, to promote more precise water level management.
Install low-level berms, where necessary.
Work closely with National Oceanic and Atmospheric Administration (NOAA) Fisheries in the design and operation of flashboards, spillways, and other refuge water-control structures to enable proper operation to benefit water management without adversely affecting special-status fish species.
Use heavy equipment to recontour wetland basins to allow for complete drawdown and/or to promote water flow. Allowing for complete drainage will help reduce the presence of non-native species such as

reed canarygrass, bullfrogs, and carp.
Investigate the viability of using screens to exclude non-native species such as bullfrogs and carp from wetlands.
Use lethal control methods (e.g., shooting or trapping) to remove nutria and problem beaver.
Where necessary, plant trees along wetland boundaries to provide a buffer from disturbance such as hunting on neighboring lands.
Mow wetland margins prior to flood-up to provide waterfowl access to adjacent uplands.
Use prescribed fire to reduce extent of emergent plants and/or remove encroaching woody species (e.g., willow, ash).
Install logs, large trees, or root wads for turtle basking and waterfowl resting and preening.
Schedule strategic drawdowns to entrap invasive species such bullfrogs and carp.
Rationale: Historically, herbaceous wetlands were a dominant feature on the landscape within the Willamette Valley, but considerable wetland loss has occurred due to conversion to agriculture, urban development, and changes in hydrology such as dam building and channelizing streams and rivers (Taft and Haig 2003). A multitude of native fish and other animals use wetlands for at least part of their annual life cycles. Seasonal herbaceous wetlands are essential for providing moist-soil plant food resources for migratory waterfowl and waterbirds, and amphibians and reptiles. Flood-up/drawdown scenarios provide foraging substrate for spring and fall migratory shorebirds. Maintaining most wetlands with shallow water will benefit waterfowl, shorebirds, and wading birds. Using various water management scenarios (drawdown and irrigation) will set back Bermuda grass and cocklebur growth/expansion. Summer irrigation is used to both control certain invasive species (e.g., common cocklebur) and to stimulate growth of moist-soil plants. Maintaining some wetlands with deeper water in a permanent or semipermanent condition provides habitat for overwater nesters such as pied-billed grebes, marshbirds, turtles, etc. Many shallow wetland areas will naturally convert to forested areas if encroaching vegetation were not controlled. Mowing or herbicide application is periodically required to set back woody vegetation and reinvigorate annual plants. Reconfiguring water control structures and dikes/levees, and installing low-level berms, will provide greater water-level management flexibility for wetland habitat rotations. Heavy equipment can be used to recontour wetland basins for a more diverse topography and to allow complete drawdown. Allowing for complete drawdown will help control invasive species such as carp and bullfrogs. Removal of nutria will protect management infrastructure and habitat from degradation. Native turtles will benefit from basking logs placed in many of the refuge's wetlands.

Objective 5.2 Enhance and maintain scrub-shrub wetland
Throughout the life of the CCP, enhance and maintain 20 acres of scrub-shrub wetlands on the refuge for the benefit of breeding migratory birds (e.g., willow flycatcher, red-winged blackbird, common yellowthroat, sora) and a diverse assemblage of other native species (e.g., northern red-legged frog, northwestern salamander). Scrub-shrub wetlands are characterized by the following: • Water depths typically averaging 3-10 feet with some water remaining during most of the year • Vegetation dominated by willow species, rose, and Douglas spirea with some Oregon ash, red-osier dogwood, black cottonwood, and other species • Presence of large woody debris • <20% cover of invasive plants (e.g., reed canarygrass)
Strategies Applied to Achieve Objective:
Use IPM techniques, including mechanical/physical (e.g., mowing), chemical, cultural, and biological methods, to control invasive species (see Appendix G).

Map invasive plant distributions at least every 5 years.
Use prescribed fire to increase diversity in older stands.
Install logs, large trees, or root wads for turtle basking and waterfowl resting and preening structure.
Rationale: Scrub-shrub wetlands are a unique habitat type in the Willamette Valley, characterized mainly by peat soils. Scrub-shrub wetlands are important habitats for breeding and migrating landbirds and waterbirds. When breeding, native amphibians require these important habitats for egg mass attachment on emergent vegetation. Prescribed fire can be used to invigorate vegetation communities and to create mosaics of habitat patches where there are monotypic willow stands. Removing some willows will create openings and increase heterogeneity/diversity in habitat structure. In consideration of preserving peat soils, prescribed fire use will be timed with water inundation cycles. Changing climate, especially hotter and drier summer conditions, are projected to continue and accelerate. This could affect the ability of these wetlands to remain wet throughout the summer months, bringing potential new management needs. The refuge will monitor changing conditions and consider alternative strategies as needed, and practicable. Mapping invasive species will provide for a targeted approach to their removal or control, and provide a basis for adaptive management when evaluating efficacy of treatments.

Objective 5.3 Restore scrub-shrub wetland
By 2020, scrub-shrub wetlands will be restored from a mixture of ruderal wetlands, croplands, and herbaceous wetlands. The refuge will then protect and maintain 185 acres of scrub-shrub wetlands on the refuge for the benefit of breeding migratory birds (e.g., willow flycatcher, red-winged blackbird, common yellowthroat, sora) and a diverse assemblage of other native species (e.g., northern red-legged frog, northwestern salamander). Scrub-shrub wetlands are characterized by the following: • Water depths typically 3-10 feet with some water remaining during most of the year • Vegetation dominated by willow species, rose, and Douglas spirea with some Oregon ash, red-osier dogwood, and black cottonwood • Presence of large woody debris • <20% cover of invasive plants (e.g., reed canarygrass)
Strategies Applied to Achieve Objective:
Pretreat (e.g., herbicide, prescribed fire, discing) for 1-2 years to exhaust non-native seed bank prior to restoration actions.
Create swales using heavy equipment.
Install water control structures, spillways, levees, and/or low berms as necessary.
Plant cuttings, plugs, and potted plants of native shrubs and trees.
Use IPM techniques, including mechanical/physical (e.g., mowing), chemical, cultural, and biological methods, to control invasive species (see Appendix G).
Map invasive plant distributions at least every 5 years.
Establish a permanent refuge operations specialist position to oversee restoration and operations at the Wapato Lake Unit.
See also strategies under Objective 5.1.
Rationale: See rationale for Objective 5.2. Restoration of scrub-shrub wetlands will add and protect a significant amount of this unique habitat and associated species on the refuge in large contiguous tracts, helping to achieve refuge purposes and the Service policy of BIDEH.

Restoration of scrub-shrub wetlands in the Onion Flats Unit is dependent on further land acquisition. Without further acquisition any restoration efforts will impact neighboring lands and restrict the full spectrum of restoration desired.

Goal 6: Maintain, enhance, and, where feasible, restore streams and off-channel backwater slough habitats in order to benefit salmonids and other native aquatic species.

Objective 6.1 Enhance and maintain streams (in-channel) and backwater sloughs (off-channel)

Throughout the life of the CCP, enhance and maintain 7.2 miles of river frontage, 1.4 miles of streams, and 0.9 mile of backwater sloughs on the refuge for the benefit of salmonids (e.g., coastal cutthroat trout, steelhead), migratory birds (e.g., belted kingfisher), and a diverse assemblage of other native species (e.g., northwestern pond turtle, mink, Pacific lamprey).

In-channel stream is characterized by the following:

- Barrier-free river and stream channels
- Intact riparian areas along the banks with shade provided by large native trees
- Coarse woody debris inputs for in-stream structure

Backwater sloughs are characterized by the following:

- Temporary flooding and draining with a connection to nearby creek or river
- <20% cover of invasive plants (e.g., reed canarygrass, Canada thistle)
- Barrier-free sloughs with connections to stream or river channels providing for access and egress for native fish species during flood events
- Coarse woody debris for slough structure

Strategies Applied to Achieve Objective:

Where fish passage barriers exist, either remove or modify barriers to allow passage, for example on an unnamed creek at the Riverboat Unit and on Rock Creek at the Rock Creek Unit.

Plant cuttings, plugs, and potted plants for native shrubs and trees as necessary.

Use IPM techniques, including mechanical/physical (e.g., mowing), chemical, cultural, and biological methods, to control invasive species (see Appendix G).

Maintain structures that enhance fish passage in tributary streams.

Place woody debris as necessary to provide subsurface structure for native fish, and basking areas for native turtles and other wildlife.

Inventory and monitor freshwater mussels.

Where necessary install erosion control mats along river/stream banks.

Use BMPs with respect to the refuge cropland management program, including unfarmed buffers to ensure minimal runoff and erosion into streams and rivers.

Rationale: River and stream habitat at the refuge includes the mainstem of the Tualatin River, and Chicken and Rock Creeks at the Sherwood Units; the Tualatin River, Wapato, Ayers, Scoggins, Harris, and Hill Creeks at the Wapato Lake Unit; and many smaller tributary perennial and ephemeral streams. Functioning stream corridors provide access for upstream adult salmonid migration as well as downstream and off-channel migrating, foraging, and sanctuary habitat for outmigrating juvenile fish. In addition, headwater streams are important breeding areas both for salmonids and lamprey species. Intact riparian areas adjacent to river and stream channels serve many functions including providing water-

quality benefits, shade, organic matter via leaf fall, and coarse woody debris. A host of wetland-dependent wildlife species thrive along river and stream channels including beaver, mink, muskrat, belted kingfisher, and northwestern pond turtle. Removing barriers such as culverts in the Rock Creek and Riverboat Units will enhance fish passage.

Objective 6.2 Restore streams (in-channel)

By 2027, restore 2.7 miles of in-channel stream on the refuge for the benefit of salmonids (e.g., coastal cutthroat trout, steelhead), migratory birds (e.g., belted kingfisher), and a diverse assemblage of other native species (e.g., northwestern pond turtle, mink, Pacific lamprey).

In-channel stream is characterized by the following:

- Barrier-free river and stream channels
- Intact riparian areas along the banks with shade provided by large native trees
- Coarse woody debris for in-stream structure

Strategies Applied to Achieve Objective:

By 2017: Develop a restoration plan for Chicken Creek.

By 2020: Develop a restoration plan for Rock Creek.

Conduct topographic surveys to determine location and elevation of stream channel and backwater channels/sloughs.

Locate and reestablish the historic channels of perennial streams (e.g., Chicken Creek, Rock Creek).

Use heavy equipment to remove plugs to reconnect historic oxbows to channels.

Remove culverts and other fish passage barriers on tributary streams including on an unnamed stream at the Riverboat Unit and on the Rock Creek Unit.

Improve river and stream connectivity with the floodplain (e.g., through removal or relocation of levees, channelized reaches, or other features restricting seasonal inundation of the floodplain).

Plant cuttings, plugs, and potted plants for native shrubs and trees.

Maintain structures that enhance fish passage in tributary streams.

Use IPM techniques, including mechanical/physical (e.g., mowing), chemical, cultural, and biological methods, to control invasive species (see Appendix G).

Place woody debris as necessary to provide subsurface structure for native fish, and basking areas for native turtles and other wildlife.

Install gravel bars as necessary for native fish and mussel habitat.

Use BMPs with respect to the refuge cropland management program, including unfarmed buffers, to ensure minimal runoff and erosion into streams and rivers.

Rationale: See rationale for Objective 6.1. Removing culverts and other fish passage barriers directly supports the strategies outlined by the Willamette Restoration Strategy (Jerrick 2001). Stream restoration activities will require additional analysis and regulatory compliance.

Objective 6.3 Restore backwater sloughs (off-channel)

By 2020, restore 1.6 miles of backwater sloughs on the refuge for the benefit of salmonids (e.g., coastal cutthroat trout, steelhead), migratory birds (e.g., belted kingfisher), and a diverse assemblage of other native species (e.g., northwestern pond turtle, mink, northern red-legged frog).

Backwater sloughs are characterized by the following: • Temporary flooding and draining with a connection to nearby creek or river • <20% cover of invasive plants (e.g., reed canarygrass, Canada thistle) • Barrier-free sloughs with connections to stream or river channels • Coarse woody debris for slough structure
Strategies Applied to Achieve Objective:
Conduct topographic surveys to determine location and elevation of backwater channels/sloughs.
Use heavy equipment to remove plugs to reconnect historic oxbows to channels, and to create new backwater areas in conjunction with other restoration activities (See Objectives 1.2, 4.2, and 5.3).
Improve river and stream connectivity with the floodplain (e.g., through removal or relocation of levees, channelized reaches, or other features restricting seasonal inundation of the floodplain).
Use IPM techniques, including mechanical/physical (e.g., mowing), chemical, cultural, and biological methods, to control invasive species (see Appendix G).
Place woody debris as necessary to provide subsurface structure for native fish, and basking areas for native turtles and other wildlife.
Use BMPs with respect to the refuge cropland management program, including unfarmed buffers, to ensure minimal runoff and erosion into backwater sloughs.
Rationale: Off-channel backwater areas have been shown to be important for spawning and juvenile rearing of native fish (Colvin et al. 2009). Henning et al. (2007) found that oxbow habitats were dominated by Coho salmon. Jeffres et al. (2008) found that Chinook salmon experienced higher growth rates in off-channel habitats than in perennial habitats. These ephemeral habitats may also provide breeding and foraging sites for amphibians such as northern red-legged frogs and northwestern salamanders. Backwater sloughs also provide a diversity of plant growth as they dry out in summer, providing a variety of benefits for native wildlife.

Goal 7: Cultivate and maintain croplands as an interim measure to control non-native invasive species.

Objective 7.1 Cultivate small cereal grain crops and green pasture at the Wapato Lake Unit
Prior to initiating restoration activities in the Wapato Lake lake bed and surrounding areas, use small grain croplands and green pastures as an interim measure to provide wildlife habitat while controlling weeds on acquired lands. Benefitting species include migrating and wintering waterfowl (e.g., tundra swan, northern pintail), raptors (e.g., northern harrier, red-tailed hawk), and landbirds (e.g., western meadowlark, savanna sparrow). Small grain croplands are characterized by the following: • Crops such as corn, wheat, barley, and oats • 70% harvested, 30% left standing • May have standing water or be completely flooded during rainy season Green pastures are characterized by the following: • Green forage crops such as clover and grass hay • Tall grasses during spring • Short grasses during fall and winter • May have standing water or be completely flooded during rainy season

Strategies Applied to Achieve Objective:
Use IPM techniques, including mechanical/physical (e.g., mowing), chemical, water management, cultural, and biological methods, to control invasive species (Appendix G).
Conduct cooperative farming to grow and harvest small grain crops.
Leave 30% of small grain crops standing for winter waterfowl forage.
Conduct cooperative farming to grow and harvest green pasture.
Harvest 100% of green pasture during spring/summer.
Mow green pasture to <4 inches during late summer/early fall to provide forage for migrating and wintering waterfowl.
Explore the feasibility of refuge staff conducting farming operations on part or all refuge lands in a temporary cropping program.
Rationale: Growing cereal grains and green pasture on refuge lands as an interim measure helps reduce invasive plant species infestations prior to initiating restoration measures and provides benefits for migrating and wintering waterfowl, and other species. Selecting cereal grains versus green pasture is usually a decision based on market economics—which crops are most valuable to local farmers. Cooperative farming should benefit both the refuge in terms of wildlife value and the farmer in terms of economic value. Maintaining crops on the land prior to restoration helps control non-native invasive plant species such as reed canarygrass and Himalayan blackberry. Farming activities may include mowing, discing, application of approved herbicide, and planting of small grain crops, clover, or grass. Cooperative farming will be phased out as restoration efforts continue throughout the refuge. Acreage numbers presented in the management direction (0-871 acres) reflect the uncertainty of restoring the entire lake basin during the 15-year life span of the CCP. The range of acres suggested for restoration is due to the uncertainty of the direction of the Wapato Lake Unit restoration. Restoration will be dependent, in part, on the outcome of a hydrology study currently being conducted by the USGS. Conversion of croplands to native habitat types should benefit native species in the long term. Species using this area will likely transition as restoration is completed and new native habitats mature. Native fish species such as steelhead, coho, and lamprey will benefit from reconnecting the Wapato Lake lake bed with the Tualatin River and nearby tributary streams, while a host of waterfowl will benefit from restoration of herbaceous wetlands, and marsh birds and songbirds will use restored scrub-shrub wetlands. Cooperative farming is conducted by local growers who incur all costs associated with growing and harvesting crops. The cooperator is responsible for all aspects of farming including site preparation, seeding, application of any fertilizers or herbicides, harvesting, and any follow-up work necessary to remove the crop or prepare the field for the following year. Cooperators are required to leave a share of crops as determined by a cooperative agreement. For additional information see the compatibility determination in Appendix B. Harvesting green pasture is usually conducted during spring, and a follow-up cutting is conducted in fall to provide forage for wintering geese. Refuge staff may also conduct farming operations; however, all costs will be incurred by the refuge and all crops will be left for the benefit of wildlife.

Objective 7.2 Cultivate small cereal grain crops and green pasture at the Onion Flats Unit

Use small grain croplands and green pastures as an interim measure to provide wildlife habitat while controlling weeds on acquired lands. The long-term goal for this property will be to restore native habitat types. Benefitting species include migrating and wintering waterfowl (e.g., Canada goose, northern pintail), raptors (e.g., northern harrier, red-tailed hawk), and landbirds (e.g., western meadowlark, savanna sparrow).

Small grain croplands are characterized by the following:

- Crops such as corn, wheat, barley, and oats
- 70% harvested, 30% left standing
- May have standing water or be completely flooded during rainy season

Green pastures are characterized by the following:

- Green forage crops such as clover and grass hay
- Tall grasses during spring
- Short grasses during fall and winter
- May have standing water or be completely flooded during rainy season

Strategies Applied to Achieve Objective:

Use IPM techniques, including mechanical/physical (e.g., mowing), chemical, water management, cultural, and biological methods, to control invasive species (see Appendix G).

Conduct cooperative farming to grow and harvest small grain crops.

Leave 30% of small grain crops standing for winter waterfowl forage.

Conduct cooperative farming to grow and harvest green pasture.

Harvest 100% of green pasture during spring/summer.

Mow green pasture to <4 inches during late summer/early fall to provide forage for migrating and wintering waterfowl.

Explore the feasibility of refuge staff conducting farming operations on part or all refuge lands in a temporary cropping program.

Rationale: Growing cereal grains and green pasture on refuge lands as an interim measure helps reduce invasive plant species infestations prior to initiating restoration measures and provides benefits for migrating and wintering waterfowl, and other species. Due to the nature of the Onion Flats basin, restoration of Rock Creek (see Objective 6.2) and restoration of scrub-shrub wetland (see Objective 5.3) cannot proceed until sufficient interest in land (e.g., fee title, easement, or management agreement) is secured so that neighboring landowners are not impacted by refuge actions. The acreage numbers presented in the management direction (0-105 acres) reflect the uncertainty of acquiring an interest in land and restoring the basin during the 15-year life span of the CCP.

Conversion of croplands to native habitat types should benefit native species in the long term. Species using this area will likely transition as restoration is completed and new native habitats mature. Native fish species such as cutthroat trout and lamprey would benefit from restoration of Rock Creek, while a host of marsh birds and songbirds would use restored scrub-shrub wetlands.

Selecting cereal grains versus green pasture is usually a decision based on market economics—which crops are most valuable to local farmers. Cooperative farming should benefit both the refuge, in terms of wildlife value, and the farmer, in terms of economic value.

Maintaining crops on the land prior to restoration helps control non-native invasive plant species such as reed canarygrass and Himalayan blackberry. Farming activities may include mowing, discing, application of approved herbicide, and planting of small grain crops, clover, or grass. Cooperative farming will be phased out as restoration efforts continue throughout the refuge.

Cooperative farming is conducted by local growers who incur all costs associated with growing and harvesting crops. The cooperator is responsible for all aspects of farming including site preparation, seeding, application of any fertilizers or herbicides, harvesting, and any follow-up work necessary to remove the crop or prepare the field for the following year. Cooperators are required to leave a share of crops as determined by a cooperative agreement. For additional information see the compatibility determination in Appendix B.

Harvesting green pasture is usually conducted during spring, and a follow-up cutting is conducted in fall to provide forage for wintering geese.

Refuge staff may also conduct farming operations; however, all costs will be incurred by the refuge and all crops will be left for the benefit of wildlife.

Goal 8: Collect scientific information (surveys, scientific assessments, and research) necessary to support adaptive management decisions that are associated with Goals 1-7.

Objective 8.1 Inventory and monitoring surveys

Throughout the life of the CCP, conduct high-priority inventory and monitoring surveys that evaluate resource management and public use activities to facilitate adaptive management as well as provide baseline data. These surveys contribute to the protection, enhancement, restoration, use, and management of wildlife populations and their habitats on and off refuge lands. Specifically, they can be used to evaluate achievement of resource management objectives identified under Goals 1-7 in the CCP. These surveys will have the following attributes:

- Data collection techniques will likely have minimal animal mortality or disturbance and minimal habitat destruction
- Scale and accuracy of assessments will be appropriate for development and implementation of refuge habitat and wildlife management actions
- Minimum number of samples to meet statistical analysis requirements will be used to minimize long-term or cumulative impacts
- Proper cleaning of investigator equipment and clothing as well as quarantine methods, where necessary, will be required to minimize the potential spread or introduction of invasive species
- Projects will adhere to scientifically sound protocols for data collection, where available and applicable

Strategies Applied to Achieve Objective:

The following is a list of survey activities to support resource management decisions on the refuge. This list is not in order of priority.

Work with the Friends of the Refuge and other volunteers to conduct inventory and monitoring surveys.

Map invasive plant distributions throughout the refuge.

Monitor water levels in managed wetland basins.

Monitor survival and growth of planted woody species to evaluate restoration success as needed.
Conduct forest monitoring to assess snag density every 5 years.
Inventory and monitor restored wet prairies to gather baseline life history data and evaluate changes over time.
Monitor wetland and other vegetation types to determine management effectiveness as needed.
Monitor wintering waterfowl weekly from September 15 to March 15.
Monitor shorebirds weekly from April 1 to September 30.
Conduct monthly point count surveys for songbirds from April 1 to June 30.
Conduct songbird banding from May 1 to August 15 following Monitoring Avian Productivity and Survivorship (MAPS) protocol.
Monitor reptiles and amphibians (e.g., frogs, salamanders, turtles) as needed.
Monitor mammals as appropriate.
Inventory freshwater mussels in streams.
Monitor for listed fish species as appropriate (e.g., salmonids, lamprey).
Monitor water quality entering, within, and at discharge points of refuge wetlands.
Conduct periodic assessments to evaluate current habitat conditions.
Rationale: The Improvement Act requires the Service to ~~"~~monitor the status and trends of fish, wildlife, and plants in each refuge." Surveys will be used primarily to evaluate resource response to assess progress toward achieving refuge management objectives (under Goals 1-7 in this CCP) derived from the Refuge System mission, refuge purposes, and maintenance of BIDEH. Determining resource status and evaluating progress toward achieving objectives is essential to implementing adaptive management on Department of Interior lands. Specifically, results of surveys will be used to refine management strategies, where necessary, over time in order to achieve resource objectives. Surveys will provide the best available scientific information to promote transparent decision-making processes for resource management.

Objective 8.2 Research
Conduct high-priority research projects that provide the best science for habitat and wildlife management on and off refuge lands. Scientific findings gained through these projects will expand knowledge regarding the life history needs of species and species groups as well as identify or refine habitat and wildlife management actions. Research also will reduce uncertainty regarding wildlife and habitat responses to refuge management actions, which will help achieve desired outcomes reflected in resource management objectives and facilitate adaptive management. These research projects will have the following attributes: • Data collection will adhere to scientifically defensible protocols, where available and applicable, in order to develop the best science for resource management • Data collection techniques will likely have minimal animal mortality or disturbance and minimal habitat destruction • The minimum number of samples will be collected to meet statistical analysis requirements for identification and/or experimentation to minimize long-term or cumulative impacts • Proper cleaning methods will be used on investigator equipment and clothing, as well as quarantine methods, where necessary, to minimize the potential spread or introduction of

invasive species • Research projects will produce a summary report containing methods, results, and discussion of findings • Projects will often result in peer-reviewed articles in scientific journals and publications and/or symposiums
Strategies Applied to Achieve Objective:
The following is a list of research projects to support resource management decisions on the refuge. This list is not comprehensive and is not in order of priority.
Conduct soil and topographic surveys and hydrological modeling to determine surface water interactions between river levels and floodplain elevations, with an outcome of frequency and duration of flooding within the Tualatin River floodplain to support saturation requirements for Objectives 4.1, 4.2, 5.3, 5.4, 6.1, and 6.2.
Conduct detailed topographic survey of Wapato Lake and surrounding areas to use in restoration planning and evaluation.
Conduct hydrologic survey of Wapato Lake and the surrounding watershed to use in restoration planning and evaluation.
Conduct studies to determine water quality parameters within refuge impoundments, and the effects to water quality on streams and the Tualatin River.
Conduct study to evaluate timing of prescribed fire to best promote native herbaceous cover and control invasive plants.
Conduct studies to determine practical techniques (grazing, haying, mowing, herbicide application) for habitat management.
Conduct studies to determine BMPs for eradicating or controlling non-native invasive species.
Conduct studies of disturbance to wildlife from public use activities to determine compatibility and recommend any necessary modifications to reduce disturbance.
Investigate methods for reducing competition from non-native fish species in stream and floodplain habitat types.
Investigate species and habitat sensitivity to changing climate trends and climate vulnerability assessments; monitor results of climate modeling by University of Washington and others.
Partner with universities and other academic institutions to conduct scientific research.
Partner with USGS, other Federal and state agencies, and nongovernmental organizations to conduct research studies.
Rationale: Research projects on refuge lands will address a wide range of natural and cultural resource as well as public use management issues. Examples of research projects include habitat use and life history requirements for specific species/species groups, practical methods for habitat management and restoration, extent and severity of environmental contaminants, techniques to control or eradicate pest species, effects of climate change on environmental conditions and associated habitat/wildlife response, identification and analyses of paleontological specimens, modeling of wildlife populations, and assessing response of habitat/wildlife to disturbance from public uses. Projects may be species-specific or refuge-specific, or they may evaluate the relative contribution of the refuge to issues and trends affecting the larger landscape (e.g., ecoregion, region, flyway, national, international). Like monitoring, results of research projects would expand the best available scientific information and potentially reduce uncertainties to promote transparent decision-making processes for resource management over time on refuge lands. In combination with results of surveys, research will promote adaptive management on refuge lands. Scientific publications resulting from research on refuge lands will help increase the visibility of the Refuge System as a leader in the development of the best science for resource conservation and management.

Goal 9: Protect and manage the refuge's unique cultural resources for their cultural, scientific, and educational values, while consulting with appropriate Native American groups and preservation organizations and complying with historic preservation legislation.

Objective 9.1 Inventory, evaluate, monitor, and protect cultural resources to improve cultural resource management
Continue and improve cultural resource management that meets the requirements of the National Historic Preservation Act (NHPA), including consultation, identification, inventorying, monitoring, and protection of cultural resources.
Strategies Applied to Achieve Objective:
Through partnerships, expand on current cultural resource inventories in high probability areas on existing lands and newly acquired lands.
Develop partnership with the Tribes for cultural resource inventory, evaluation, and project monitoring, consistent with the regulations of the NHPA. Protect all identifiable archaeological sites by avoiding disturbance within the area.
Evaluate sites for eligibility for the National Register of Historic Places (NRHP).
Continue to identify cultural resources that coincide with existing and planned roads, facilities, public use areas, habitat projects, and research projects. Plan and implement activities to avoid or mitigate impacts as necessary.
Complete a comprehensive cultural review of the refuge and compile all site surveys, work requests, and reports for easy access by managers.
When funding is limited, low priority and unsafe buildings should be cataloged and considered for removal.
Monitor known archaeological and historical sites, as needed.
Provide refuge staff with training on managing historic, archaeological, and cultural resources.
Develop and implement a museum management plan (including inventory, storage, and use) for existing and new property.
Collect and catalog oral histories from local community members.
Rationale: Various Federal historic preservation laws and regulations, such as the Archaeological Resources Protection Act of 1979 and the NHPA, require the Service to implement the kind of program described under this objective. The refuge has currently identified numerous historic structures and archaeological sites throughout the refuge related to pioneer agriculture. The refuge has also been identified as a long-term occupation area of the Kalapuyan Tribe, and several prehistoric sites have also been discovered. This objective will serve to protect these important cultural resources. Developing a partnership with the Tribes would foster greater understanding of not only the refuge's cultural heritage, but the greater Willamette Valley region as well.

Objective 9.2 Provide interpretive and educational programs on the refuge's cultural resources
Expand education and interpretation for cultural resources through programs and materials that highlight the rich cultural heritage of the Tualatin River watershed and the Willamette Valley. Encourage understanding and appreciation of the relationships of past and present human interactions with wildlife and their habitats.
Strategies Applied to Achieve Objective:
Develop and strengthen partnership with the Tribes in order to provide high-quality educational and interpretive programs with a focus on natural and cultural resources of the refuge and the Tualatin River

watershed.
Consult with the Tribes and other preservation partners to identify the type of cultural resources information appropriate for public interpretation.
Expand the Wildlife Center exhibits to include exhibits highlighting Native American history and Euro-American land use.
Develop interpretive media (e.g., pamphlets, signs, and exhibits) that relate to cultural resources and the refuge.
Rationale: Preservation and protection of our cultural resources requires attention not only from the refuge but the public as well. Interpretation of these resources can raise public interest and appreciation for the rich history of the peoples who lived in the valley in earlier times and how they shaped the landscape the refuge now manages. This appreciation can lead to public support for the conservation, maintenance, identification, and protection of archaeological and historic sites.

Goal 10: Provide visitors, local residents, volunteers, and partners with opportunities to understand and appreciate fish and wildlife conservation as well as the purpose, ecology, and management of the refuge and the Refuge System.

Objective 10.1 Provide visitors with clear and accurate information
Visitors will be provided with clear and accurate information that will: • Describe what areas are open to the public • Articulate activities that are allowed and those that are prohibited and why • Describe how to safely and ethically experience the refuge • Be presented in a variety of graphic and written formats
Strategies Applied to Achieve Objective:
Provide informational signs and brochures, regulatory information, and trail maps.
Partner with others to keep the refuge Wildlife Center open a minimum of 5 days a week.
Maintain a refuge website that meets Service web standards.
Provide at least annual training for Wildlife Center volunteers and volunteer rovers to ensure they provide quality service and are well informed about the refuge, its resources, and rules and regulations.
Maintain all existing public use facilities.
Explore opportunities for one or two informational kiosks at or near the Wapato Lake Unit.
Hire a full-time, permanent law enforcement officer to provide both visitor and resource protection.
Rationale: Kiosks, signs, publications, and contact with refuge staff and volunteers are effective communication tools to welcome and orient visitors. These steps are necessary to provide a safe and enjoyable visit that both meets visitor needs and communicates what public use opportunities and facilities are available at the refuge. In addition, clear regulations and guidance promotes protection of refuge resources, reduces law enforcement violations, and maintains compatibility. A full-time law enforcement officer will provide greater protection of visitors and natural and cultural resources.

Objective 10.2 Conduct outreach and special events
Conduct outreach and special events that: • Describe the refuge and its place as part of the Refuge System • Promote understanding of the refuge's role in enhancing natural resources, protecting habitats and water quality, and providing educational and economic benefits to the community • Describe how the refuge is different from local parks • Focus on local residents, with an emphasis on serving urban and underserved populations, and families and youth that may not otherwise have opportunities to engage in programs about or activities on national wildlife refuges
Strategies Applied to Achieve Objective:
Partner with Friends of the Refuge and others to offer special programs and events to draw neighbors, area residents, and community partners to the refuge. Examples of events include Tualatin River Bird Festival, National Wildlife Refuge Week, and Spring Break Exploration Days.
Maintain a presence at community events where there is a high potential for delivering refuge messages. Examples include local county fairs, nature festivals, city events, and farmers' markets.
Develop a volunteer speakers' bureau to deliver presentations to local groups.
By 2015, investigate and develop a plan to use new/social media to expand refuge outreach.
Regularly use media like newspapers, television, magazines, and radio. Focus on news venues, as well as specialty outdoor, commerce, and travel venues.
Rationale: The area surrounding the refuge is becoming increasingly developed, and the population is expanding. The refuge opened to the public in 2006 and is still relatively unknown to many area residents and businesses. Outreach is needed for these new and growing audiences, in order to build interest in the refuge, bring visitors to the refuge, and build support for refuge programs and fish and wildlife conservation.

Objective 10.3 Plan for continuing and new public use opportunities
Plan for continuing and new public use opportunities that: • Emphasize the role that national wildlife refuges have in the conservation of fish and wildlife and their habitats • Prescribe a wide range of techniques and media that appeal to culturally and ethnically diverse audiences and can adapt to changing trends • Allow visitors to experience a variety of refuge habitats and associated wildlife • Ensure that public uses are accessible and adhere to the guidelines set forth in the Architectural Barriers Act
Strategies Applied to Achieve Objective:
By 2016, develop primary refuge interpretive, outreach, and educational themes.
By 2016, identify target audiences through a variety of means including demographic studies.
Use the Refuge System's visitor survey (USFWS and USGS, OMB #1018-0145) or other valid and approved method to gather information about visitors and their expectations and experiences. Use data to identify areas of growing public interests and to provide the information necessary to exercise adaptive management.
Use the Refuge System Visitor Estimation Workbook (USFWS 2005a), traffic counters, and program

attendance to estimate numbers of visitors participating in public use activities.
At least every 5 years, conduct an evaluation using *Visitor Services Standards: A Handbook for Evaluating Visitor Service Programs* (USFWS 2009b) for all visitor services programs of the refuge. Conduct evaluations of new programs within 1 year of implementation.
Every 3 years, invite an organization such as Access Recreation in Portland to conduct a courtesy accessibility evaluation of public use facilities. Develop and implement a plan to make needed corrections or improvements based on this evaluation.
By 2017, develop a comprehensive visitor services plan that prescribes all public use facilities and programs at both the Sherwood Units and the Wapato Lake Unit. Complete all relevant appropriateness and compatibility determinations.
Rationale: Established under the Urban Refuge Policy, the Tualatin River National Wildlife Refuge has a special role in sharing the mission of the Refuge System, how refuges are managed throughout the Refuge System, and how citizens can learn more about and support the Refuge System as a whole. Public use opportunities need to be designed and planned in a way that is aligned with primary messages. Opportunities that do not support primary messages should be eliminated from consideration. A comprehensive visitor services plan will use primary refuge messages and themes to prescribe long-term wildlife-dependent public use programs and the facilities that will support those programs. Examples of programs could include, but may not be limited to, wildlife observation areas, trails, interpretive exhibits, signs, photography blinds, auto tour routes, education study sites, and hunting and fishing facilities.

Objective 10.4 Improve and enhance public access to, from, and within the refuge
Improve and enhance public access to, from, and within the refuge in a manner that: • Is safe, well marked, and accessible where feasible • Promotes the use of alternative transportation to visit the refuge, thereby helping to reduce the refuge's carbon footprint • Poses minimal conflict with wildlife and habitat objectives • Promotes stewardship and conservation • Is coordinated with local communities and agencies planning transportation corridors near the refuge
Strategies Applied to Achieve Objective:
Continue to work with regional and local organizations to connect the refuge to existing and proposed land-based and water-based trail systems, such as Sherwood's Cedar Creek Trail (Otak 2009), Metro's Tonquin Trail, and Tualatin Riverkeepers' Tualatin River Water Trail, where feasible and compatible at existing refuge access points.
Partner with interested parties/organizations to identify potential locations for one public river access for nonmotorized boats in or near the refuge.
By 2015, partner with Oregon Department of Transportation (ODOT), local counties, TriMet, and the Western Federal Lands Highway Division of the Federal Highway Administration to conduct transportation access and safety studies for the existing refuge access from Highway 99W and Roy Rogers Road and any proposed new access points to the Sherwood Units.
If determined necessary, partner with transportation agencies to improve safety of existing access points.
Rationale: The demand for increased, enhanced, and improved public access to the refuge was a common theme of many public comments during scoping for the CCP. These comments also reflect a desire for improved public access within the refuge and for connectivity with existing and proposed land and water trails.

At present, public access to the refuge is primarily by automobile along Highway 99W and Roy Rogers Road, and by TriMet bus along Highway 99W. Of particular concern, the Highway 99W entrance was constructed in 2006 without a deceleration lane. This current entrance design was required by ODOT specifications and permit conditions, and the entrance resides within ODOT's right-of-way. Refuge visitors continue to express concern that the Highway 99W entrance is unsafe. This entrance warrants further evaluation and potential remedy.

Objective 10.5 Maintain a volunteer and internship program

Maintain a volunteer and internship program that:

- Assists with the habitat, biological, public use, maintenance, and administrative programs of the refuge
- Provides opportunities for citizens to engage in, learn about, and conduct the work of conservation
- Builds capacity to recruit, train, manage, and retain volunteers over the long term
- Fosters the development of conservation professionals

Strategies Applied to Achieve Objective:

Hire a full-time, permanent volunteer coordinator to manage current and expanding refuge-wide volunteer program.

Develop and conduct an annual refuge-wide volunteer needs assessment.

Develop a package of position descriptions that clearly define the responsibilities and roles of volunteers in all relevant refuge programs.

Continue to provide opportunities for young adults to gain work experience in natural and cultural resources planning and management, as well as visitor services management, and to explore career options in conservation fields. These opportunities may include programs such as internships, AmeriCorps placements, student employment and work/study programs, Youth Conservation Corps, and other youth employment initiatives.

Develop written training programs, manuals, and other resource training for volunteers.

Establish an advisory committee of volunteers that helps the refuge with oversight and day-to-day management of volunteer activities.

Construct a new bunkhouse and two recreational vehicle (RV) pads (with hookups) on the Tualatin River Unit near the maintenance facility to house volunteers.

Host annual volunteer appreciation event.

Rationale: Volunteers are necessary to meet the operational needs of the refuge. In fiscal year 2011, volunteers donated nearly 15,000 hours of support to the refuge (USFWS 2011f). This equals more than seven full-time personnel and is valued at nearly $327,000 (national volunteer value = $21.79/hour [Independent Sector 2011]). Expansion of the current volunteer program to fully meet the needs of the refuge over the life of the CCP will require a full-time volunteer coordinator. This need could be met through direct hiring of USFWS staff or by partnering with Friends of the Refuge to hire personnel.

It is critical for the Service to attract and nurture the future workforce in natural resource conservation. This priority is also reflected in the Department of Interior's Youth in the Great Outdoors initiative.

Objective 10.6 Maintain a close working relationship with the Friends of the Refuge
Maintain a relationship in which the Friends of the Refuge: • Assist with the refuge's habitat, biological, public use, and maintenance programs • Seek grants, funding, and sponsorships to support refuge programs
Strategies Applied to Achieve Objective:
Work with the Friends of the Refuge to establish a chapter that will provide support for the developing Wapato Lake Unit.
Continue to provide the Friends of the Refuge with office and storage space to successfully conduct their activities.
Maintain the current memorandum of understanding between the Service and the Friends of the Refuge.
Rationale: The Friends of Tualatin River National Wildlife Refuge is a nonprofit 501(c)(3) organization whose mission is to "support the Tualatin River National Wildlife Refuge." It is "dedicated to the protection and restoration of the refuge for the benefit of fish and wildlife, and for public education and recreation" (Friends of the Tualatin Refuge 2011). The Friends provide critical support to the refuge, supporting programs and activities that would otherwise not be feasible to conduct. The refuge maintains a memorandum of understanding with the Friends of the Refuge, partially under the authority of the Refuge System Volunteer and Community Partnership Enhancement Act of 1998.

Goal 11: Provide students and educators from the greater Portland area with compatible and high-quality opportunities to participate in environmental education.

Objective 11.1 Increase participation in the refuge's environmental education program
The goals for the refuge's environmental education program are to: • Remain of high quality • Not exceed capacity of refuge public use facilities • Coordinate with other regional natural areas and organizations that offer environmental education
Strategies Applied to Achieve Objective:
Hire a permanent, full-time environmental education specialist to manage all refuge education and interpretation programs.
Throughout the life of the CCP, increase the number of students participating in educator-led field trips from an average of 1,900 to at least 5,000 per year.
Throughout the life of the CCP, increase the number of students reached at off-site activities and events from an average of 700 to at least 1,750 per year.
Throughout the life of the CCP, increase the number of volunteers trained in support of the environmental education program from an average of 10 to at least 25 per year.
Offer programs that are tailored to youth outside of the traditional classroom (e.g., scouts, clubs). Increase the numbers of youth participating in these programs from an average of 800 to at least 2,000 per year.
Increase outreach about the refuge's environmental education program to teachers and administrators at schools within a 10-mile radius of Sherwood and of Gaston.
Continue to require teacher workshops prior to educators bringing class field trips to the refuge. Offer a

minimum of two teacher workshops annually.
By 2013, identify one off-trail area that students can use, when approved as part of a field trip registration and supervised by volunteers, to conduct educational activities.
By 2018, design and construct one off-trail nature exploration area that engages young children to experience unstructured outdoor play.
Rationale: Environmental education activities promote appreciation and knowledge of natural resources, foster a conservation ethic, and aid in understanding the important role people have in the environment. Ultimately, the highest goal of environmental education is to foster an aware and involved citizenry that takes an active role in conservation efforts. As such, environmental education is identified as one of the priority public uses of the Refuge System and, as an urban national wildlife refuge, is one of the top goals for the Tualatin River National Wildlife Refuge. Expanding the current environmental education program will reach more students and educators and foster integration into local school curricula. The current education program is carried primarily through internships, grants, and volunteers, and maintaining its current capacity is dependent on soft funding, which is funding that may or may not be available each year. Permanent maintenance of the current program and future increase in participation is dependent on hiring a full-time professional environmental education coordinator. Nature explore areas provide opportunities for children to experience nature first-hand through unstructured outdoor play. Richard Louv identified the importance of first-hand unstructured experience in nature and the prevalence of ~~"~~nature deficit disorder" as a serious issue in his book *Last Child in the Woods* (Louv 2005). Research supports Louv's arguments demonstrating that children's positive encounters with nature can lead to development of an environmental ethic (Chawla 1988; Palmberg and Kuru 2000; Wilson 1997).

Objective 11.2 Expand the environmental education program to include the Wapato Lake Unit
Same as Objective 11.1.
Strategies Applied to Achieve Objective:
By 2013, provide teacher training and curricula to educators within the schools and communities surrounding the Wapato Lake Unit.
By 2013, provide environmental education materials to educators in schools and communities surrounding the Wapato Lake Unit.
Explore the potential to partner with the City of Gaston to provide space and/or facilities for environmental education programs to occur at Brown Park.
By 2014, annually host at least two environmental education programs with the Tribes at the Wapato Lake Unit, both for tribal students and surrounding communities.
Rationale: Schools close to the Wapato Lake Unit offer a new audience that has yet to participate in refuge environmental education programs. The community, especially Gaston, has expressed a desire to have students learn about and experience the refuge. Although there are currently no public use facilities at the Wapato Lake Unit, the refuge can offer high-quality environmental education activities at schools, within the local community, and at the Atfálat'i Unit of the refuge.

Objective 11.3 Ensure that the environmental education program is high quality

The environmental education program should:

- Align with grade-level curricula and be age appropriate
- Correlate with national and state educational standards
- Use current and widely accepted techniques
- Appeal to a broad range of learning styles and provide interdisciplinary opportunities that link natural resources through all academic subject areas
- Incorporates landscape-level conservation issues (e.g. climate change, invasive species) in ways that are relevant to students and are presented in an age-appropriate manner
- Serve students across a range of economic, social, cultural, and ethnic diversity
- Be conducted to minimize impacts to fish, wildlife, plants, and their habitats; other compatible public uses; and refuge management programs and facilities
- Involve local communities, Friends of the Refuge, volunteers, and other partners
- Incorporate the importance of the Refuge System and the purposes, goals, and objectives of the refuge
- Provide experiences that are hands-on and integrate the resources of the refuge

Strategies Applied to Achieve Objective:

Conduct at least one training per year to ensure volunteers use high-quality and appropriate educational methods, techniques, and tools.

Loan educators and schools relevant supplies and materials such as binoculars, field guides, lesson kits, and water testing kits to support on-site field activities for environmental education.

Develop a training program for parent chaperones who accompany student field trips to the refuge.

Align refuge education materials, curricula, and techniques with the Oregon Environmental Literacy Plan, as appropriate. (Oregon Environmental Literacy Task Force 2010).

At least every 5 years, conduct a comprehensive evaluation of the environmental education program using the Guidelines for Excellence established by North American Association for Environmental Education ([NAAEE] 2004).

Explore the potential to extend the teacher-training program from 1-day workshops to long-term, one-on-one coaching with individual teachers.

Maintain memberships in organizations such as NAAEE, Environmental Education Association of Oregon, Portland's Regional Environmental Education Network, and Metro's Intertwine.

Rationale: Environmental education opportunities in the greater Portland area are plentiful, although few provide natural areas with facilities that accommodate student field trips (with shelter, classroom, and study areas) while also providing quality wildlife-oriented education opportunities. In addition, the past and projected population boom in proximity to the refuge may continue to create a larger demand for nature-based education programs within a short bus trip from local schools. However, several key factors limit schools' abilities to offer environmental education without the assistance of outside resources such as the refuge. At this time, environmental education is not mandated by the State of Oregon; teachers are increasingly pressured to meet current mandates and may not have the time to build skills, learn curricula, and seek out environmental education activities. Declining school budgets often limit teachers in their ability to provide transportation, cover substitute fees, purchase materials, and defray other costs associated with off-site field trips. By maintaining a high-quality education program, the refuge can offset these limitations in order to meet our environmental education goal. Education programs will be effective and offered in a way that will both attract educators and meet the learning mandates and objectives that schools are responsible for providing. The refuge can provide environmental education teaching materials (binoculars, field guides, water test kits, study skins, etc.) that schools would likely not have access to. In addition, the refuge can offer programs for youth outside the formal classroom (such as scouts and after-

school clubs) that are more affordable and not subject to daily limitations of the school day. Ensuring the long-term quality of the environmental education program, through evaluation and adaptive management, is dependent on the hiring of a full-time professional environmental education coordinator.

Goal 12: Provide refuge visitors with diverse, compatible, and high-quality opportunities to participate in wildlife-dependent recreation and interpretation.

Objective 12.1 Provide high-quality wildlife observation and wildlife photography opportunities
Provide high-quality wildlife observation and photography opportunities that: • Focus on major wildlife species and groups of wildlife species, including migratory birds • Incorporate a diversity of habitats found on the refuge • Use various types of facilities to view/photograph wildlife and their habitats • Are emphasized on a year-round basis • Satisfy a range of skill sets, from casual and beginning observers/photographers, to advanced and expert observers/photographers
Strategies Applied to Achieve Objective:
Enhance and maintain the existing seven wildlife observation structures, 1.1 miles of year-round trails, 3.1 miles of seasonal trails, one wildlife photography blind, and two restrooms.
Maintain seasonal trail closure from October 1 to April 30 on the Atfálat'i Unit to provide sanctuary for wintering waterfowl and maintain quality viewing opportunities.
Improve habitat conditions and maintain viewing "lanes" in close proximity to wildlife observation/photography facilities. These improvements could include items such as snag/log placements; removal of branches, trees, or other encroaching vegetation; and control of non-native vegetation within wetlands.
Explore the possibility of adding a material or substance to trail surfaces to both reduce the sound of footsteps on the trail and reduce weed encroachment.
Improve 400 feet of existing year-round trail to avoid winter flooding.
Explore adding trees and/or other vegetation along busy road corridors to reduce noise and create a more natural setting.
By 2016, construct and maintain one to three additional wildlife photography blinds and associated access trails on the Atfálat'i Unit of the refuge. Manage use through a reservation system.
Partner with the Friends of the Refuge, Tualatin River Photographic Society, and local wildlife organizations to assist with the funding, design, construction, maintenance, and management of new and existing wildlife observation and photography facilities.
Explore the desirability of user fees to help operate the wildlife observation and photography program, and maintain and repair associated facilities.
Maintain wildlife "Discovery Packs" for visitors to check out at the Wildlife Center. Packs will contain binoculars, field guides, and activities for outdoor nature exploration.
Maintain an up-to-date and accurate Watchable Wildlife leaflet and checklist of birds, mammals, reptiles, and amphibians.
Partner with Friends of the Refuge, Tualatin River Photographic Society, local wildlife organizations, agencies, and/or universities to offer regular programs on the Refuge oriented to increasing the knowledge and skills of wildlife observers and photographers. Evaluate the potential for revenue from a modest program-specific fee to support such programs.

At least every 5 years, conduct an evaluation of the wildlife observation and photography program using the Refuge System Birder Friendly Refuge criteria (USFWS 2008a).
Rationale: Opportunities to participate in wildlife observation and photography in the greater Portland area are plentiful. However, many areas lack the diversity and abundance of wildlife and the expanses that the refuge offers. The refuge also provides a relatively unique location for high-quality wildlife observation and photography by limiting nonwildlife-dependent activities such as biking, jogging, dog walking, and other activities that may otherwise conflict with and disturb wildlife. Wildlife observation and photography programs are designed to provide a diversity of wildlife viewing opportunities in a manner that minimizes disturbance to wildlife. Many of the various wildlife observation facilities provide excellent photography opportunities. In addition, the refuge has one existing photography blind that can be reserved on a first-come, first-served basis, on Wednesdays, Saturdays, and Sundays throughout the year. The 0.2-mile spur trail to the photography blind is closed to all other users during the winter seasonal trail closure period. Demand for the blind is growing. Wildlife photographers have expressed concern that the blind does not offer a consistent quality experience because it faces south and photographs must be taken toward the sun most times during the day. Opportunities may exist to offer additional photography blinds that do not face the sun. A 400-foot section of the year-round trail, located between the River Overlook and the riparian forest, floods during most winters—sometimes with water up to 16 inches deep. Pedestrians are forced to walk around the puddles and cause substantial trampling of vegetation. This section is impassable by strollers or wheelchairs when flooded. The trail section could be improved by relocating the trail farther toward the river, by building a boardwalk, or by raising the trail surface. Maintaining the existing public use seasonal trail closures from October 1 to April 30 would help provide needed sanctuary for wintering waterfowl, and other wildlife such as the bald eagles, in support of refuge purposes.

Objective 12.2 Provide high-quality interpretive programs
Provide high-quality interpretive programs that: • Follow the basic tenets of interpretation as defined in the Interpretive Process Model (Larsen 2003) • Incorporate a variety of materials and technology into interpretive materials, such as signs, publications, exhibits, and direct contact with staff and volunteers • Appeal to a variety of learning styles and facilitate self-discovery • Convey the key messages and purposes of the refuge • Explore interconnection of the natural and human environments • Empower individuals to adopt conservation-minded lifestyles • Emphasize first-hand experiences on the refuge
Strategies Applied to Achieve Objective:
Maintain existing interpretive facilities, including signs, exhibits, overlooks, and kiosks.
Annually, provide interpretive training for volunteer naturalists and participating refuge staff and partners.
By 2018, develop a partnership with the National Association for Interpretation to train refuge staff and long-term volunteers as Certified Interpretive Trainers and/or Certified Interpretive Guides.
Develop and publish an annual calendar of refuge presentations, special programs, and events. This will include volunteers and guest speakers who conduct a variety of interpretive programs on topics that support refuge messages and themes.

Partner with the Tribes to provide interpretive programs at the refuge that focus on Native Americans' traditional uses of the refuge and surrounding areas; uses of native fish, wildlife, and plants; and other indigenous knowledge.
Every 10 years, partner with Certified Interpretive Trainer(s) to conduct an audit or review of the refuge's interpretive programs to measure adherence to the Interpretive Process Model (Larsen 2003).
Rationale: Interpretation is a communication method whereby visitors and program participants forge emotional and intellectual connections between their own interests and the significance of refuge resources, and management of the refuge and the Refuge System. Interpretation differs from formal education in that participants are self-motivated, have a choice as to whether or not to participate, and are not part of a formal class seeking an educational objective. The refuge currently documents 90,000 annual visitors, only 4,000 of whom participate in formal education programs. Most of the remaining visitors come in small groups, with their families, or alone. Interpretation is a key method to connect the public with the primary messages of the refuge.

Objective 12.3 Provide opportunities for youth to participate in high-quality waterfowl hunting on the Riverboat Unit of the refuge

Waterfowl hunting on the Riverboat Unit should:

- Place a priority on safety (hunters are spaced appropriately, spatial separation exists between hunt areas and areas open to other recreational use, law enforcement presence is adequate, etc.)
- Include clear and concise regulations that are readily available
- Pose minimal conflict with wildlife and habitat objectives
- Pose minimal conflict with other priority public use activities
- Pose minimal conflict with neighboring lands
- Promote stewardship and conservation
- Provide youth with quality hunting experiences that include hunter education and mentorships in coordination with ODFW
- Promote understanding and appreciation of natural resources
- Provide reliable/reasonable opportunity to experience wildlife
- Use accessible facilities that blend into the landscape

Strategies Applied to Achieve Objective:
By 2015, complete all requirements to open the Riverboat Unit of the refuge to waterfowl hunting for youth.
Work closely with ODFW, local sporting organizations, and local hunters to develop a youth waterfowl hunt plan that includes hunter safety and mentorships.
By 2016, construct and maintain two to five hunting blinds and associated access trails on the Riverboat Unit. Manage use through a reservation and/or lottery system.
Explore the potential for local sporting organizations to provide volunteers, funding, and other resources needed to operate the youth hunting program, and maintain and repair associated facilities.
Rationale: Opportunities to hunt in the greater Portland area are increasingly scarce due to an ever-growing population, urbanization, and a relative lack of public lands open to these uses. Hunting (both for and against) was the subject of more letters and e-mails received during scoping for the CCP than any other topic. In particular, the community has expressed a very strong interest in sharing hunting traditions with youth. Opening the refuge to waterfowl hunting will provide youth an opportunity to hunt in proximity to the urban area, in uncrowded and in relatively natural environments. In addition, youth hunts will reinforce ODFW programs that expose young people to hunting heritage, education, and mentorships. Refuge

hunting opportunities will be consistent with state hunting regulations, and with management plans for applicable game species and the PFC's plans for cackling Canada geese (PFC 1999) and dusky Canada geese (PFC 2008).

Objective 12.4 Provide opportunities for high-quality fishing in the Tualatin River

Fishing opportunities in the Tualatin River should:

- Include clear and concise regulations that are readily available
- Pose minimal conflict with wildlife and habitat objectives
- Pose minimal conflict with other ~~"b~~big six" priority public uses
- Pose minimal conflict with neighboring lands
- Promote stewardship and conservation
- Focus on youth, families, and disabled persons
- Promote understanding and appreciation of natural resources
- Provide reliable and reasonable opportunities to experience wildlife
- Use the existing River Overlook on the Atfálat'i Unit of the refuge

Strategies Applied to Achieve Objective:

By 2016, complete all requirements to open the refuge to fishing on the Atfálat'i Unit.

Work closely with ODFW, local sporting organizations, and local anglers to develop a fishing plan.

Explore the desirability of user fees to help operate the fishing program, and maintain and repair associated facilities.

Explore the potential for local sporting organizations to provide volunteers, funding, and other resources needed to operate the fishing program, and maintain and repair associated facilities in lieu of or to offset user fees.

By 2017, offer at least one special fishing event annually on the refuge and/or elsewhere in the local community. This could be a Take Me Fishing event, could coincide with Oregon's free fishing day(s) or National Fishing and Boating Week, and/or could be a separate local event at an area such as Henry Hagg Lake.

Work with partners to support and/or promote other fishing opportunities that are not on but near the refuge and/or within the Tualatin River watershed.

Rationale: Fishing opportunities on the Tualatin River, especially for families and disabled persons, are scarce. Opening the refuge to fishing will provide the public an opportunity to fish in proximity to the urban area, in an uncrowded and natural environment, and at a reasonable cost. Special emphasis will be placed on family-oriented and accessible fishing opportunities in order to introduce fishing to urban audiences who may otherwise not regularly experience this high-priority wildlife-dependent activity.

As part of an earlier planning and evaluation effort, fishing was determined compatible on the Atfálat'i Unit (USFWS 2003a). Refuge fishing opportunities will be consistent with state fishing regulations.

Objective 12.5 Explore opportunities to offer high-quality waterfowl hunting at the Wapato Lake Unit

As land acquisition progresses and habitat restoration is completed on the Wapato Lake Unit, explore opportunities to offer high-quality waterfowl hunting that:

- Place a priority on safety (hunters are spaced appropriately, spatial separation exists between hunt areas and areas open to other recreational use, law enforcement presence is adequate, etc.)
- Include clear and concise regulations that are readily available

- Pose minimal conflict with wildlife and habitat objectives
- Pose minimal conflict with other priority public use activities
- Pose minimal conflict with neighboring lands
- Promote stewardship and conservation
- Provide the public with quality hunting experiences that include hunter education and mentorship in coordination with ODFW
- Promote understanding and appreciation of natural resources
- Provide reliable/reasonable opportunity to experience wildlife
- Use accessible facilities that blend into the landscape

Strategies Applied to Achieve Objective:

Concurrent with habitat restoration research and planning (see Objective 8.2), explore the feasibility of providing safe parking and access to hunting facilities, such as blinds and associated trails.

If hunting is determined feasible, complete all requirements to open the Wapato Lake Unit of the refuge to waterfowl hunting within 2 years after restoration planning is completed.

Work closely with ODFW, local sporting organizations, and local hunters to develop a waterfowl hunt plan.

Concurrent with restoration, construct hunting blinds and associated access trails on the Wapato Lake Unit. Implement and maintain a hunting program. Manage use through a reservation and/or lottery system.

Explore the desirability of user fees to help operate the hunting program, and maintain and repair associated facilities.

Explore the potential for local sporting organizations to provide volunteers, funding, and other resources needed to operate the hunting program, and maintain and repair associated facilities in lieu of or to offset user fees.

Rationale: Opportunities to hunt in the greater Portland area are increasingly scarce due to an ever-growing population, urbanization, and a relative lack of public lands open to these uses. Hunting was the subject of more letters and e-mails received (both for and against) during scoping for the CCP than any other topic.

Opening the refuge to waterfowl hunting will provide the public an opportunity to hunt in proximity to the urban area, in uncrowded and relatively natural environments, and at a reasonable cost. The habitat and wildlife objectives for Wapato Lake Unit are very likely to support quality waterfowl hunts. Refuge hunting opportunities will be consistent with state hunting regulations, and with management plans for applicable game species and the PFC's plans for cackling Canada geese (PFC 1999) and dusky Canada geese (PFC 2008).

Goal 13: Build a broad-based natural resource conservation constituency with a focus on urban audiences to create a conservation ethic within urban communities; increase relevance of habitat conservation, wildlife heritage, and the Refuge System in the eyes of urban citizens; and instill a sense of empowerment for urban communities to work together to actively support conservation, in both local and global settings.

Objective 13.1 Serve as a gathering place and clearinghouse for natural resource conservation–related information and resources to be shared among community organizations, agencies, educators, businesses, urban planners and builders, and other stakeholders

Serve as a gathering place and clearinghouse for natural resource conservation–related information and resources to be shared among community organizations, agencies, educators, businesses, urban planners

and builders, and other stakeholders that: • Provides an information exchange location for conservation partner resources as well as Refuge System information • Encourages a collaborative approach to information sharing • Is accurate, current, scientific, credible, and responsive to public requests and needs
Strategies Applied to Achieve Objective:
Develop a guide to sustainable land management and construction practices employed by the refuge, and share with interested partners such as urban planners, developers, and individuals.
Develop a self-guided walking tour of the refuge's sustainability features. This may include leaflets, exhibits, and/or technology-based information such as podcasts and QR codes.
Develop a reference library of natural resource/conservation education curricula, techniques, and materials. Provide access to formal and informal educators, parents, schools, and youth clubs.
Provide a resource library of land conservation incentives, and cost-sharing and financial assistance opportunities through organizations such as UFSWS Partners for Fish and Wildlife; Natural Resources Conservation Service; ODFW; Oregon Watersheds Enhancement Board; soil and water conservation districts; and watershed councils.
Engage refuge staff and Friends of the Refuge leadership in urban land use and open space planning in communities surrounding the refuge to encourage development that favors wildlife corridors, watershed protection, and high-quality nature-based recreation.
Provide technical assistance and/or subject matter experts to local communities for both wildlife and habitat restoration and management, and nature-based recreation and education.
Host one open house per year that highlights urban refuge–related conservation challenges, progress, opportunities, research, and initiatives.
In cooperation with Intertwine, use the refuge's Wildlife Center to host and facilitate dialogue regarding conservation-related urban planning efforts.
Establish a conservation leadership program that encourages urban youth aged 18 to 25 to contribute to community conservation needs.
In cooperation with the Service Natural Resources Program Center's Branch of Social Science, collect scientific literature, research, and materials supporting social values of connecting people with nature. Provide this information to partners and the public.
Rationale: As an urban refuge, Tualatin River National Wildlife Refuge can be a catalyst for building a natural resource conservation constituency among urban dwellers. The refuge is strategically located near more than 2 million people in the Portland-Salem metropolitan area and is accessible to countless local and regional jurisdictions, schools, agencies, nonprofit organizations, and commercial organizations. Conservation information is plentiful, but there are few places where information is centrally accessible. While the refuge cannot provide comprehensive conservation information, the refuge can partner with entities such as the Intertwine Alliance (www.theintertwine.org), ODFW, USFWS Partners for Wildlife Program, and others to leverage collective resources. In addition, the refuge can serve as an example of wildlife habitat restoration and sound land management techniques, as well as high-quality nature-based recreation and education. The USFWS ―Conserving the Future" vision document (USFWS 2011c) states that ―As leaders, partners, and role models in conservation efforts, we can seek to inspire others to work with us …."

Objective 13.2 Provide urban people tangible opportunities to experience nature and actively participate in the work of conservation

Provide urban people tangible opportunities to experience nature and actively participate in the work of conservation in a way that:

- Appeals to and reflects the diverse communities and people of the Portland-Salem metropolitan area. (Diversity may be measured in economic, educational, cultural, ethnic, and language terms)
- Builds comfort for those unfamiliar with or lacking experience in nature
- Focuses on urban citizens, with an emphasis on families and children
- Incorporates standards of excellence for urban refuges as defined in recommendation 13 of the USFWS "Conserving the Future" vision document (USFWS 2011c)
- Uses the refuge's land base to connect people with nature

Strategies Applied to Achieve Objective:

Incorporate objectives and strategies for public activities as defined for Goals 10, 11, and 12.

Become a partner in national and regional outreach organizations such as Children in Nature Network, Nature Rocks, Intertwine Alliance, and other similar groups.

Hire urban youth (ages 18-25) through direct hires or through partnerships with organizations such as Northwest Youth Corps, Confluence Environmental Center, and Youth Conservation Corps of Oregon. Youth would participate in the work of habitat conservation on the refuge and in the community.

By researching literature and relevant publications, identify barriers to connecting the Portland-Salem metropolitan area's urban population with nature. Use results to adapt refuge outreach, education, and interpretation programs as appropriate.

Use the refuge's nature explore area (see Objective 11.1) to promote development of similar play areas in urban communities.

Develop a transportation outreach strategy for letting urban audiences know how to access the refuge using existing and future planned infrastructure (bus stop, bike lanes, and regional trail systems).

Rationale: Many organizations are recognizing an increasing disconnect between people (especially children) and the natural world. In addition, our society is more ethnically and socially diverse and increasingly more urban, with 80% of Americans living in urban or suburban areas. Nature therefore seems to be, or is, farther away from the majority of Americans than ever before. As urban dwellers have competing priorities, technology is replacing place-based opportunities, and natural places may be harder to access, people have fewer experiences in nature (USFWS 2011c). The Oregon Parks and Recreation Department (OPRD) recognizes several demographic and social changes, including fewer youth learning outdoor skills, a (lack of) physical activity crisis, and an increasingly diverse Oregon population (OPRD 2008). These types of changes have led to an increased disconnect between people and the natural world, to the detriment of physical and mental health, as well as decreasing understanding, awareness, and support of conservation efforts. It is critical to provide nature-based facilities and programs to provide opportunities for diverse urban publics to reconnect with their natural environment, for the benefit of both wildlife and people. Key to the effort is providing nature-based experiences starting in childhood to prepare youth with a foundation for facing future environmental challenges (Chawla 1988; Palmberg and Kuru 2000).

Objective 13.3 Share how the conservation of natural resources is relevant to urban communities

Share how the conservation of natural resources is relevant to urban communities in a way that:

- Builds support for conservation of the refuge and other natural spaces
- Reaches a demographic that mirrors the diversity of the Portland-Salem metropolitan area
- Promotes dialogue and partnerships to further identify connections between the value of the

natural world and the well-being of people • Increases environmental literacy of citizens (see Rationale for definition of environmental literacy)
Strategies Applied to Achieve Objective:
Complete an economic benefits study demonstrating the refuge's economic contribution to local community, and share with local jurisdictions, tourism organizations, city planners, and community leaders.
Partner with local health care providers and organizations to promote the value of nature-based activities in support of mental and physical health for community members.
Identify and/or develop projects in and near the refuge, such as a water quality monitoring station or bioswale, to measure and demonstrate the value of natural systems to improving watershed health.
Develop outreach and interpretive materials to address landscape-level conservation issues/challenges that affect habitats and wildlife, as well as agriculture areas and communities. Examples of topics may include: the value of pollinators for native landscapes and for agricultural crops and urban gardens; the threats of non-native and invasive species; the ever-increasing interaction with wildlife in urban neighborhoods; and the effect of climate change.
Seek partner(s) to develop traveling exhibit and/or outreach materials demonstrating the value of natural spaces for improved mental and physical health. Display at local libraries, museums, schools, hospitals, other urban refuges or natural areas, and other urban community centers.
Rationale: Increasing the relevance of natural systems to urban people will build increased awareness of and support for conservation and, therefore, human well-being. The National Park Service (NPS), through its "Healthy Parks Healthy People US" strategic plan states that "human health is dependent upon the health of all species and the planet we share" (NPS 2011). Even more traditional nonprofit organizations such as The Nature Conservancy and Trust for Public Lands recognize the need for an increasing urban focus to stay viable in the minds of citizens (Grist.org 2012; Trust for Public Lands 2003). The Nature Conservancy's chief scientist is quoted as saying "Conservation is facing a crisis of irrelevance—it is an enterprise that is not urgent to most people…. If conservation is to build the support it needs, it must energize young urban dwellers, who now make up most of the world. The best way to get city people to care about conservation is to do conservation where they live, so that nature is seen as relevant and connected to modern life" (Grist.org 2012). Also critical to gaining this support is an increased need for people to understand the interrelationship between environment, society, and economy. In 2009, the State of Oregon passed into law the "No Oregon Child Left Inside Act" (HB2544), which created a task force that, in 2010, defined environmental literacy as "an individual's understanding, skills and motivation to make responsible decisions that consider his or her relationships to natural systems, communities and future generations" (Oregon Environmental Literacy Task Force 2010). Through the strategies listed above, the refuge can increase relevance to people's everyday lives through their food sources, water sources, and personal health, as well as increase environmental literacy of citizens to behave in a way that contributes to conservation.

Chapter 3 Physical Environment

3.1 Climate

3.1.1 General Climate

Tualatin River National Wildlife Refuge (the refuge) is located in Washington and Yamhill Counties in northwestern Oregon (see Appendix P, Map 1). The refuge is located at the northern end of the Willamette Valley in the Tualatin River watershed, between the Coast Range mountains and the Willamette River (see Appendix P, Map 1). Much of the refuge lies within the Tualatin River floodplain. Major tributaries that drain into the refuge include Chicken and South Rock Creeks in the Sherwood Units (see Appendix P, Map 6), and Wapato, Hill, Ayers, Harris, and Scoggins Creeks at the Wapato Lake Unit (see Appendix P, Map 7). Many smaller perennial and ephemeral streams also drain into the basin. Elevation within the Sherwood Units ranges from about 105 feet to 300 feet. Elevation at the Wapato Lake Unit varies from about 160 to 240 feet, with the majority of the lake bed at about 170 feet. The Tualatin River Valley consists of low foothills, terraces, alluvial fans, and floodplains. The floodplains are subject to frequent flooding during winter and spring. However, changes due to agriculture, urbanization, and flood control projects have altered historic flooding patterns.

Photo 3-1. Frozen wetlands on the Atfálat'i Unit, January 2008. Peter Schmidt/ USFWS.

The northern Willamette Valley exhibits a general maritime climate with cool, wet winters and warm, dry summers. Temporal patterns of climate variability in Oregon are primarily influenced by the Pacific Ocean, namely the El Niño/Southern Oscillation (Oregon Climate Change Research Institute [OCCRI] 2010). Precipitation averages about 42 inches per year (Table 3-1) and occurs mainly from November through March. Average temperatures are lowest from December through February and highest on average during July and August (Table 3-1). Severe weather events are rare

but may include summer temperatures above 100°Fahrenheit (F), winter snow and ice storms, flooding of the Tualatin River and tributaries, high winds, and periods of subfreezing weather. Flooding of the river and tributaries typically occurs during December and January when the ground has become saturated and rainfall increases (Figure 3-1).

Table 3-1. Monthly Average Temperatures and Monthly Rainfall April 2008-March 2009

Month	Average Temperature*	Average Precipitation**
January	40.0	6.74
February	41.3	3.63
March	45.3	4.36
April	48.5	2.95
May	58.9	2.59
June	61.8	1.15
July	68.8	0.21
August	69.6	0.74
September	65.2	1.01
October	53.5	3.62
November	49.2	7.12
December	37.5	8.23
Total		42.35

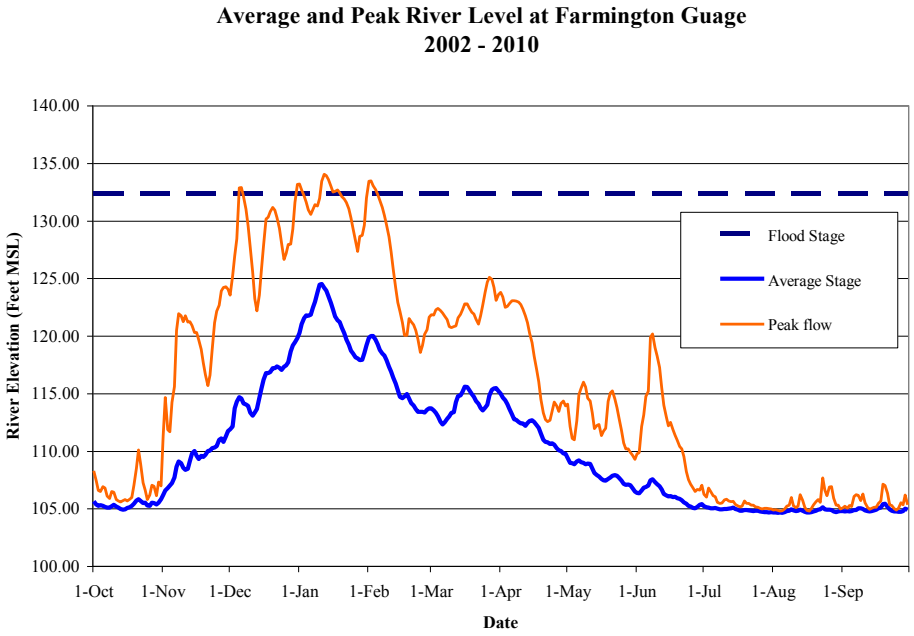

Figure 3-1. Average and peak river levels measured in feet above mean sea level (MSL) at Farmington gauge approximately 8 miles upstream from the westernmost parcel in the Sherwood Units.

3.1.2 Climate Change

As stated in U.S. Department of the Interior (USDOI) Secretarial Order 3226 (USDOI 2009) and the Service's climate change strategic plan (USFWS 2010c), the Service considers and analyzes climate change in its decisions, long-range plans, and other activities. Also, refuge efforts contribute to carbon sequestration through habitat restoration and protection efforts. A 1999 U.S. Department of Energy report, *Carbon Sequestration Research and Development* (U.S. Department of Energy 1999), concluded that ecosystem protection is important to carbon sequestration and may reduce or prevent loss of carbon currently stored in the terrestrial biosphere. The report defines carbon sequestration as "the capture and secure storage of carbon that would otherwise be emitted to or remain in the atmosphere."

Greenhouse gases (GHG) occur naturally in the Earth's atmosphere, but are also added by human activities. This happens primarily through the burning of fossil fuels, such as coal, oil, and natural gas, which release carbon dioxide into the atmosphere. Over the past century, atmospheric carbon dioxide (as measured from ice cores) has increased due to human activities, and the average Earth temperature has increased approximately 0.7°Celcius (C) or about 1.3°F (NOAA 2011a; OCCRI 2010) (Figure 3-2), and it continues to increase.

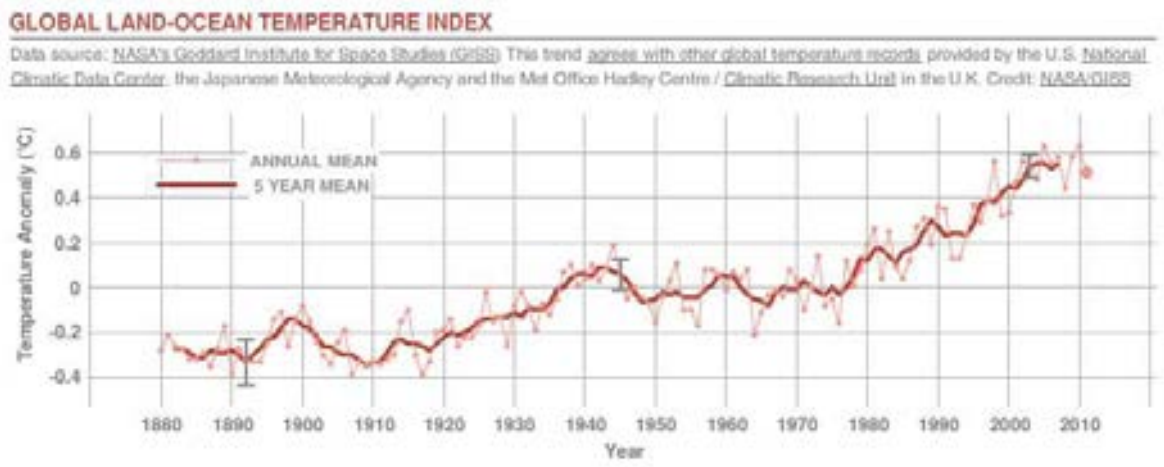

Figure 3-2. Global surface temperature (NASA 2012).

The greenhouse effect is a natural phenomenon that assists in regulating and warming the temperature of our planet. Just as a glass ceiling traps heat inside a greenhouse, certain gases in the atmosphere, called greenhouse gases, absorb heat from sunlight. The primary GHGs occurring in the atmosphere include carbon dioxide, water vapor, methane, and nitrous oxide. Carbon dioxide is produced in the largest quantities, accounting for more than half of the current impact on the Earth's climate.

The terms "climate" and "climate change" are defined by the Intergovernmental Panel on Climate Change (IPCC). "Climate" refers to the mean and variability of different types of weather conditions over time, with 30 years being a typical period for such measurements, although shorter or longer periods also may be used (IPCC 2007b:78). The term "climate change" thus refers to a change in the mean or variability of one or more measures of climate (e.g., temperature or precipitation) that persists for an extended period, typically decades or longer, whether the change is due to natural variability, human activity, or both (IPCC 2007b:78).

Scientific measurements spanning several decades demonstrate that changes in climate are occurring, and that the rate of change has been faster since the 1950s. Examples include warming of the global climate system, and substantial increases in precipitation in some regions of the world and decreases in other regions. (For these and other examples, see *Climate Change 2007: The Physical Science Basis. Contribution of Working Group I to the Fourth Assessment Report of the Intergovernmental Panel on Climate Change* [IPCC 2007a:30] and *Technical Summary* [Solomon et al. 2007:35-54, 82-85].) In the Pacific Northwest, increased GHGs and warmer temperatures have resulted in a number of physical and chemical impacts. These include changes in snowpack, stream flow timing and volume, flooding and landslides, sea levels, ocean temperatures and acidity, and disturbance regimes such as wildfires, insects, and disease outbreaks (United States Global Change Research Program [USGCRP] 2009). All of these changes will cause major perturbations to ecosystem conditions, possibly imperiling species that evolved in response to local conditions.

Results of scientific analyses presented by the IPCC show that most of the observed increase in global average temperature since the mid-twentieth century cannot be explained by natural variability in climate, and is "very likely" (defined by the IPCC as 90 percent or higher probability) due to the observed increase in GHG concentrations in the atmosphere as a result of human activities,

particularly carbon dioxide emissions from use of fossil fuels (IPCC 2007b:5-6, Figures SPM.3 and SPM.4; Solomon et al. 2007:21-35). Further confirmation of the role of GHGs comes from analyses by Huber and Knutti (2011:4), who concluded it is extremely likely that approximately 75 percent of global warming since 1950 has been caused by human activities.

Looking toward the future, the University of Washington Climate Impacts Group (CIG) has projected changes in mean annual temperature and precipitation for the Pacific Northwest based on "statistical downscaling" an ensemble of 20 global climate models and two carbon emissions scenarios for each model run (Mote and Salathé 2009, 2010). The CIG also performed projections using two regional climate simulations with the same two emissions scenarios (Salathé et al. 2010). These two approaches provide the projected changes described below.

3.1.2.1 Temperature: Historical Trends and Projections

The Pacific Northwest experiences wide temperature variability based on geography (for example, the Olympic, Coast, and Cascade mountain ranges enhance a moderating maritime influence west of the Cascades) and seasonal and year-to-year variability (e.g., associated with the El Niño-Southern Oscillation) (Salathé et al. 2010). In the Pacific Northwest, regionally averaged temperature rose 1.5°F between 1920 and 2000, slightly more than the global average. Warming was largest for the winter months of January through March. Minimum daily temperatures have increased faster than maximum daily temperatures (Mote et al. 2005).

Historical climate data for Tualatin River National Wildlife Refuge are available from the United States Historical Climatology Network (USHCN), a high-quality data set of daily and monthly records of basic meteorological variables from 1,218 observing stations across the 48 conterminous states. The data have been corrected to remove biases or heterogeneities from non-climatic effects such as urbanization or other landscape changes, station moves, and instrument and time-of-observation changes.

The USHCN Forest Grove, Oregon, station is the station closest to the refuge, and temperature data are shown in Figure 3-3. There has been a statistically significant increase of 1.36°F ($p = 0.001$) in average annual temperature from 1925 to 2010 at the Forest Grove station, similar to the regional average. Much of the increase is due to the increase in minimum temperature (increase of 1.53°F, $p = 0.000$) rather than maximum temperature (increase of 1.1°F, $p = 0.025$). In the past 30 years, temperature increases have been particularly pronounced during summer months (Table 3-2).

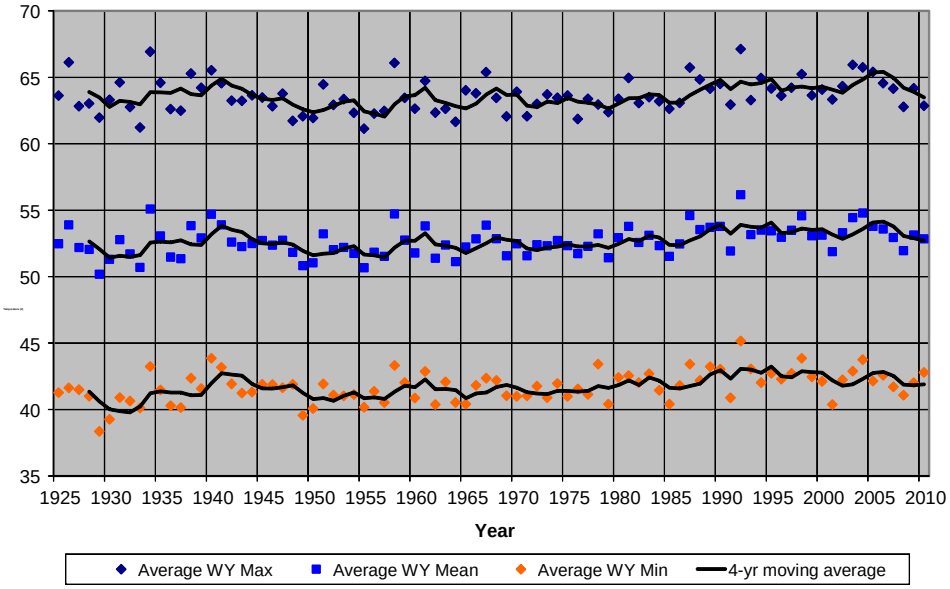

Figure 3-3. Water year temperature 1925-2010. USHCN Station: Forest Grove, Oregon (352997).

Table 3-2. Seasonal Temperature Trends, 1981-2010 (Monthly Records)

	Monthly Absolute Change		
	Temp. Max	**Temp. Avg.**	**Temp. Min.**
Winter (Dec-Feb)	+0.54°F	+0.18°F	−0.21°F
Spring (march-May)	−0.23°F	−0.44°F	−0.64°F
Summer (Jun-Aug)	+1.36°F	+1.07°F	+0.79°F
Fall (Sept-Nov)	−0.36°F	−0.41°F	−0.48°F

* Forest Grove, Oregon United States Historical Climatology Network Observation Station

Looking to future projections, researchers have refined global circulation models so that they are useful at a regional scale, in our case, for the Pacific Northwest. One approach involves statistical downscaling of 20 global climate models, which projects that average annual temperature would increase by 2.0°F by the decade of the 2020s for the Pacific Northwest, 3.2°F by the decade of the 2040s, and 5.3°F by the decade of the 2080s, relative to the 1970-1999 average temperature (Mote and Salathé 2009, 2010). This is substantially greater than the 1.5°F increase in average annual temperature observed in the Pacific Northwest during the twentieth century. Seasonally, summer temperatures are projected to increase the most. One important note is that actual global emissions of GHGs in the past decade have exceeded even the highest emissions scenario (the A2 scenario), a scenario that was not modeled by Mote and Salathé in 2009 and 2010, or Salathé et al. in 2010 (discussed below). The authors used more moderate emissions scenarios. If these emission trends continue, temperature increases could turn out to be much greater than projected.

Another approach involves two regional climate simulations (Salathé et al. 2010). These findings support the warming increases described above, with small variations. West of the Cascades, both regional climate change models predict warming in all seasons (when compared to current average air temperatures) (Salathé et al. 2010). Increases in air temperature are forecasted to be the greatest in summer and spring (including increased frequency of heat waves, which are three or more consecutive days with a daily heat index of over 89.6°F or 32°C), while increased marine cloudiness in fall and winter may dampen temperature increases during those seasons (Salathé et al. 2010).

It should be noted that these projections are not intended to be predictions of actual conditions on any given date. Models represent the average response over climatological timescales (i.e., on a multi-decadal timescales) rather than precise behavior at exact dates. As discussed above, the Pacific Northwest's long-term climate includes a high degree of interannual and decadal variability, and this is projected to continue. However, long-term trends and projections indicate that overall temperatures are increasing and will continue to do so.

3.1.2.2 Precipitation: Historical Trends and Projections

Longer-term precipitation trends in the Pacific Northwest are more variable than temperature and vary with the period of record selected for analysis (Mote et al. 2005). The Pacific Northwest experiences this wide precipitation variability due to geography (e.g., the Olympic, Coast, and Cascade mountain ranges cause orographic, or upward, lift of air masses and precipitation) and seasonal and year-to-year variability (e.g., variation associated the El Niño Southern Oscillation and other longer-term oscillations) (Salathé et al. 2010). Looking at the period 1920 to 2000, precipitation has increased almost everywhere in the region, though not in a uniform fashion. Most of that increase occurred during the first part of the record (Mote et al. 2005).

The Forest Grove USHCN station (the closest station to the refuge) provides historical precipitation data, shown in Figure 3-4. There is no statistically significant trend, but note the year-to-year variability, such as flood risk during El Niño years in the late 1990s, which can provide management challenges for the refuge.

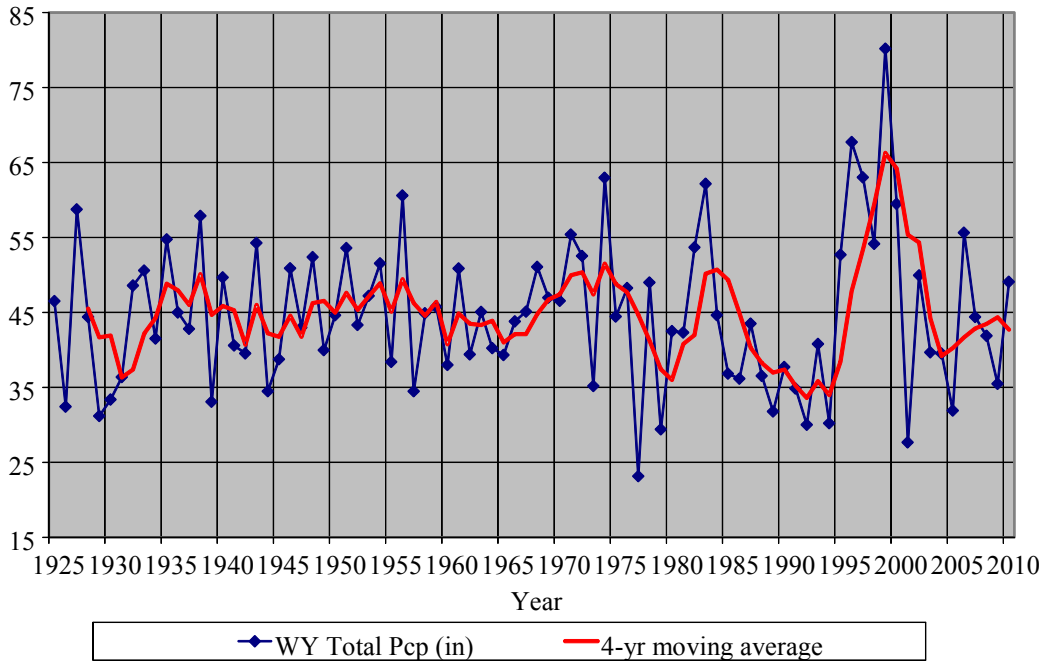

Figure 3-4. Water year total precipitation 1925-2010. USHCN Station: Forest Grove, Oregon.

The other significant trend found from the Forest Grove USHCN observation station is a 37 percent decline in summer precipitation in the last 30 years (Figure 3-5).

Figure 3-5. Summer (Jun-Aug) total precipitation, 1925-2010. USHCN Station: Forest Grove, Oregon (352997).

West of the Cascades, projections of future precipitation levels vary by model, with a majority of models projecting an annual increase in precipitation (Mote and Salathé 2010) and some models projecting a decrease relative to current observations (Leung et al. 2004). A strong seasonal pattern in altered precipitation relative to current levels is foreseen, as well as increases in the number of extreme precipitation events (daily precipitation exceeding the twentieth-century 95th percentile) (Salathé et al. 2010). Seasonal increases in precipitation are projected for fall, winter, and spring, and little change or a slight decline in precipitation for summer (Salathé et al. 2010). Regional climate change models project conflicting results for the spring season, with one model showing a substantial decline in precipitation while the second shows increases in precipitation (Salathé et al. 2010).

3.1.2.3 Stream Flow Changes

In addition to changes in the amount of precipitation, a major concern in the Pacific Northwest is change in the form of winter precipitation expected due to warmer temperatures. The CIG has modeled changes in current and future peak snowpack versus October through March precipitation for watersheds in the Columbia River Basin and the coastal watersheds of Oregon and Washington. Generally, there is a large shift in the form of winter precipitation from snow to rain, with lower elevation basins affected before upper elevation basins (Elsner et al. 2010). As these changes occur, there would likely be a tendency for higher winter flows and possible increased risk of flooding in transition watersheds (those not dominated by snow processes and those not rain-dominant), earlier snowmelt and runoff from peaks, and lower summer stream flows (Hamlet and Lettenmaier 2007). The Tualatin River watershed is a rain-dominant system, and these changes may not be significant to the refuge.

3.2 Hydrology

3.2.1 Regional Hydrology

The refuge lies within the Tualatin River watershed, which is a part of the Willamette River Basin (see Appendix P, Map 3). The Tualatin River is one of the most northern tributaries in the Willamette River watershed and is about 80 miles long (Tualatin River Watershed Council [TRWC] 1998). The river flows roughly eastward from the Coast Range mountains in Washington County, Oregon, to its confluence with the Willamette River in Clackamas County, Oregon, near the City of West Linn. The elevation at the headwaters of the Tualatin River is approximately 1,980 feet, and there are four large elevation drops in the river before it enters the Tualatin Valley plain at an elevation of 240 feet. Where the Tualatin River meets Wapato Lake, the elevation is about 170 feet, and where the Tualatin River meets the Willamette River, it is 58 feet in elevation. The Tualatin River drainage basin is approximately 43 miles long and 29 miles wide, covering an area of 712 square miles (TRWC 1998). Annually, more than 1.1 million acre-feet of water flow out of this watershed into the Willamette River. Nearly 85 percent of this flow is discharged during November through March.

The river can be characterized in four distinct reaches with varying degrees of flows and gradients (Table 3-3).

Table 3-3. Approximate Reaches of the Tualatin River As it Flows from the Coast Range Mountains (river mile 80) to its Confluence with the Willamette River (river mile 0)

Reach	Description	River mile	Elevation Gradient (feet/mile)	Description
1	Mountain	80-58	80.4	Forested, fast-moving mountain streams, rock channels
2	Meander	58-33	2.8	Transition from timberland to farmland, major floodplain storage, logjams
3	Reservoir	33-3.4	0.2	Flat, "reservoir like" flow with heavy sedimentation, recreational use
4	Riffle	3.4-0.0	10.1	Steep gradient, short series of shallow pools and riffles

The first reach of the river starts in the mountains and is characterized by forested, fast-moving mountain streams with rock channels. As the river flows through the basin, it slowly transitions from forested areas into more open habitat, and the flow changes from fast to slow flowing. The Tualatin River has five major and numerous minor tributary streams. Streams entering the river within the refuge include Wapato, Ayers, Hill, Harris, and Scoggins Creeks in the Wapato Lake Unit, and Chicken and Rock Creeks in the Sherwood Units. Average daily flow rate in the Tualatin River measured at the West Linn gauging station, approximately 1.7 miles from the confluence with the Willamette River, ranged from a low of 80 cubic feet per second (cfs) to a high of 4,150 cfs between 1928 and 2010 (Figure 3-6). These figures do not include water that is diverted upstream of this gauging station into Oswego Lake.

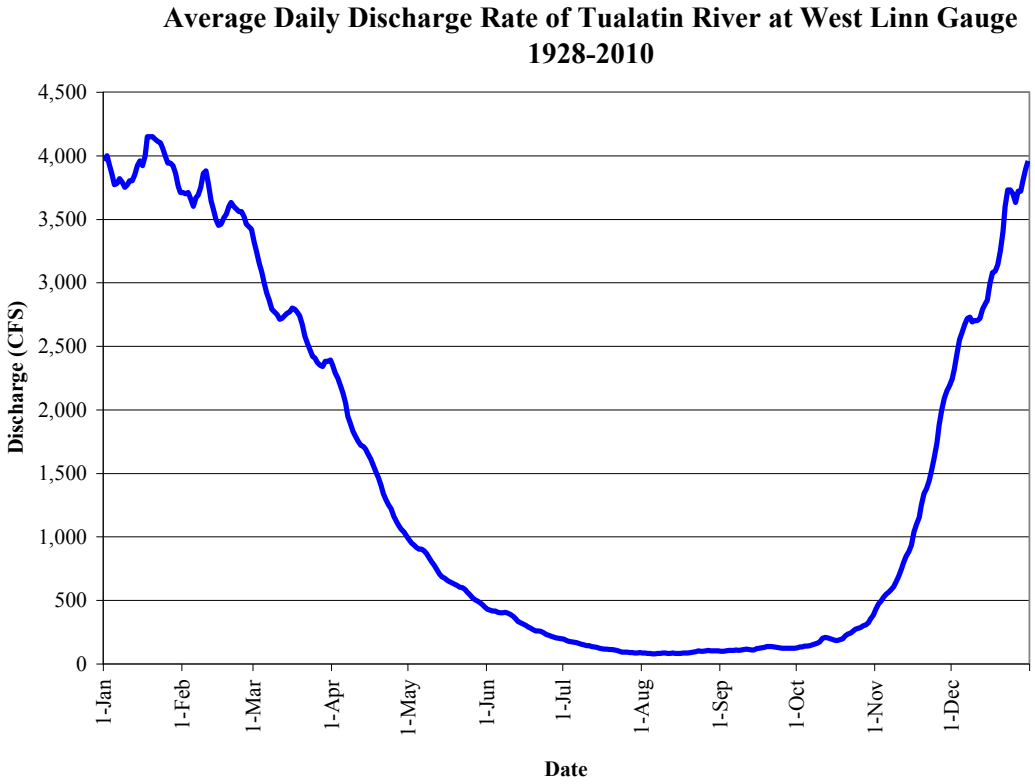

Figure 3-6. Average daily discharge rate (cfs) measured on the Tualatin River at the West Linn gauging station.

In general, stream flow in the Tualatin River Basin reflects patterns of precipitation with high winter and low summer flows (Figure 3-6). River elevation measured at the Farmington gauge is typically at summer flows (<110 feet) from late April or early May until late October when precipitation begins to fill the river basin). Flooding in tributary streams is typically more prevalent during short-term heavy rainfall after the surrounding watershed is saturated by early season rainfall. In particular, the Chicken Creek watershed, which includes Cedar Creek, flows from the City of Sherwood and experiences heavy flooding. The population of Sherwood has increased from about 3,000 in 1990 to over 18,000 in 2010, and this has led to an increase in urban development (U.S. Census Bureau 2011). This change has created increased impervious surfaces (e.g., roads, rooftops) and has led to an increase in runoff and higher peak flows in Chicken Creek that flow into the refuge.

Photo 3-2. Chicken Creek flooding. Peter Schmidt/USFWS.

There are two dams affecting water flows within the basin: Scoggins dam on Scoggins Creek, creating Henry Hagg Lake, and the Lake Oswego diversion dam, which shunts water to Oswego Lake. In addition, Barney Reservoir on the Trask River diverts water to the Tualatin River during summer to augment flows. Henry Hagg Lake has a capacity of 53,600 acre-feet of water and is managed by the Bureau of Reclamation (USDOI 2011). A large part of refuge lands, both in the Sherwood Units and the Wapato Lake Unit, lie within the jurisdictional boundary of the Tualatin Valley Irrigation District. This district was formed to deliver irrigation water associated with the Henry Hagg Lake project. As members of the district with attached water rights, the refuge is required to pay approximately $14,500 a year for irrigation on lands that fall within the district.

3.2.2 Refuge-specific Hydrology

Water Rights: The refuge has a complex system of irrigation ditches, springs, creeks, and water control structures for moving water within the refuge to fill the various wetland cells and for irrigation purposes in the cooperative farming program. The refuge has 51 water rights with priority dates ranging from 1890 to 2000. Sources of water include wells, ditches, unnamed creeks, springs, overland flow and runoff, Chicken Creek, Hill Creek, Rock Creek, Scoggins Creek, and the Tualatin River. The purposes of the water rights are primarily for irrigation and wildlife use, and to ensure that water is diverted for use on approximately 1,157 acres of wet prairie, scrub-shrub, and herbaceous wetlands at the Sherwood Units and the lake bed at the Wapato Lake Unit. In addition, the Service voluntarily selected 15 irrigation water rights for in-stream leases, which aids in restoration and protection of over 4 cfs of stream flow in Rock Creek and the Tualatin River.

Table 3-4 summarizes the water rights of the refuge.

Source: USFWS 2012.

The main season of water use is usually between November and May at select locations. This varies with water conditions as determined by annual precipitation. Adequate water is important to provide habitat for migratory birds and for irrigation of habitat restoration sites. During the winter, most wetland cells (including the Wapato Lake Unit lake bed) are kept full to provide water for both resident and wintering species.

Photo 3-3. Tualatin River flooding at the Tualatin River Unit, December 2007. Peter Schmidt/USFWS.

Sherwood Units: The floodplain of the Tualatin River is the dominant feature within the Sherwood Units (see Appendix P, Map 6). The Atfálat'i Unit is bordered by the Tualatin River, but water for wetlands in much of this unit comes from a diversion on Chicken Creek. The diversion allows gravity flow to fill five managed wetland cells in the unit. One additional wetland cell is filled by rain water and is managed as a permanent wetland with no outlet structure. Another wetland cell is also filled with rain water and overland runoff, but is managed as a seasonal wetland with a water control structure at the outlet.

On the Tualatin River Unit there are five wetland impoundments that normally fill with rain and overland runoff, but the largest wetland also has a pump with a fish screen in the Tualatin River that may be used to conduct early season flood-up or to augment rainfall during periods of drought. On the Riverboat Unit there are four impoundments, with a seasonal wetland filled using a water control structure to back up overland flow from springs and rainfall and, frequently, floods from high water in the Tualatin River. In addition, the seasonal wetland has a series of three low-capacity wells that are sometimes used to augment overland flow in early fall. There is also a scrub-shrub wetland, which is a closed water body and is filled by rainfall alone. During extreme flooding of the Tualatin River, the scrub-shrub wetland becomes a flow channel for river water. This unit has extensive floodplain connections to the river and is often saturated through the winter.

The Onion Flats Unit is a low-lying basin bisected by Rock Creek. The creek is channelized and straightened through this unit and is deeply incised. This area floods frequently as the Tualatin River water backs up Rock Creek, and also during periods of heavy rain. The Rock Creek Unit features its

namesake creek and is also largely channelized. This is a relatively small creek through this unit and rarely causes any major flooding.

During winter as the Tualatin River begins to reach bank full stage (elevation 128 above mean sea level), many backwater areas in riparian forest and wetland habitats begin to flood. Vegetation communities in these areas are adapted to frequent winter flooding, and fish and wildlife species use these areas for foraging and sanctuary. Inundation in these areas is typically intermittent and of short duration

Wapato Lake Unit: The Tualatin River bisects the Wapato Lake Unit acquisition boundary. Inputs to Wapato Lake proper were historically from Wapato, Ayers, and Hill Creeks, and from the river backing up into the lake (see Appendix P, Map 7). The historical Wapato Lake lake bed was severely altered during the late 1800s and early 1900s with the beginning of onion farming that required an extensive network of levees, ditches, canals, and a pump station to dewater the lake bed in late winter for spring planting. When the infrastructure was originally constructed by the landowners, Wapato, Ayers, and Hill Creeks were diverted around the outside of the levees to connect with the Tualatin River later. During fall and winter, the lake was allowed to fill with rain water, and it was pumped out in early spring for farming. In 1950s, the landowners of the lake bed supported the formation of the Wapato Improvement District (WID), a state-sponsored irrigation and drainage district. The WID was tasked with the maintenance and operations of the 5.5 miles of levees around the lake, a lift pump station, and interior ditches to continue facilitation of drainage of the lake for farming. In 2012, the WID voted to dissolve and all assets were donated to the Service. Currently the refuge has a cooperative farming program that uses much of the same infrastructure. In the northern part of the acquisition boundary, Scoggins and Harris Creeks are tributaries to the Tualatin River.

3.3 Topography and Bathymetry

The refuge area lies in the northwestern corner of the Willamette Valley, southwest of Portland, Oregon (see Appendix P, Map 1). Elevations on the refuge range from about 105 feet to 300 feet. The Tualatin River floodplain is relatively flat, with gradually sloping sides leading to upland forest types, agricultural lands, and developed areas. Major mountain features include the Coast Range to the west of the Wapato Lake Unit and Chehalem Ridge rising to 1,629 feet (Oregon Parks and Recreation Department 2011) between the Wapato Lake and Sherwood Units. The Tualatin River channel is deeply incised with steep banks throughout most of its length. Henry Hagg Lake is a 1,110-acre reservoir (ODFW 2011a) approximately 3 miles west of the Wapato Lake Unit.

Many refuge land parcels have had detailed topographic surveys completed prior to initiation of restoration projects. In the Sherwood Units, surveys were conducted on the Atfálat'i, Tualatin River, and Riverboat Units. The refuge is currently working with U.S. Geological Survey (USGS) and other partners to conduct a hydrogeomorphic survey at the Wapato Lake Unit that will provide a digital elevation model for the lake bed and surrounding area, as well as a water budget for future restoration planning.

3.4 Geology and Geomorphology

3.4.1 Origins and Development

During the Oligocene epoch roughly 35 million years ago (MYA), a line of sea floor subduction, which had run in a northeast direction from west of the Klamath Mountains to the Blue Mountains, moved to its current position several hundred miles to the west on its northern end. This change left a slab of what had been subducting sea floor attached to the continental margin and also moved the line of volcanic activity associated with remelting oceanic crust. Part of this slab, covered by shallow seas, ultimately became the floor of the Willamette River basin. Although volcanic eruptions had started building the southern Cascade Mountains millions of years earlier in the Eocene epoch, the northern Cascades lie on top of the slab and arose as volcanoes. Volcanic rocks in the western Cascades date from two principal periods of volcanic activity, one occurring 20 to 30 MYA and the other in the Miocene, 10 to 15 MYA; both periods included the entire length of the Cascades (Branscomb 2002). The Tualatin River Basin is underlain by 9,000-12,500 feet of sedimentary and volcanic rock (Popowski 1996; Wilson 1998). On top of this layer lie up to 900 feet of Columbia River basalt and another 1,200 feet of sediments from the late Miocene to Pleistocene.

The Coast Range arose as continental sediments carried eastward by the subducting oceanic plate were forced under the western edge of the slab, pushing it upward. The rise proceeded from south to north, the northern Coast Range not appearing until roughly 15 MYA. During this process, the area of the future Willamette Valley also rose, becoming dry land and draining its embayment by about 20 MYA. Although the direction of sea floor spread is southeastward toward the Oregon coast, the entire Pacific plate, including the spreading and subduction zones, is moving northward. The net effect for the Oregon Coast Range appears to be a slow movement north, evidence for which may be seen in the roughly 50-mile northward offset of the Columbia River at Portland and the sharply curved Olympic Mountains in western Washington State, where movement of the Coast Range encountered the more deeply rooted Vancouver Island. This northward tearing of the Coast Range may also have contributed to the formation of the Willamette Valley, the floor of which is now composed of multiple fault blocks. In contrast to its south end, the valley is spreading more in the north, possibly due to the thinner crust and reduced linkage with the subducting sea floor present there (Branscomb 2002).

3.4.2 Recent Geologic Events

Defining the northern limit of the Willamette River Basin, the Columbia River has reestablished its course from multiple dams created by slides, basalt flows, and ice. Reaching their maximum 13 MYA, basalt floods from the enormous Grande Ronde volcano in northeast Oregon flowed down the Columbia channel all the way to the river's mouth and into the Willamette Valley. In the Pliocene (3 to 11 MYA), western Oregon was a desert, and gravels produced during that time eroded into and covered the spreading valley floor.

Work performed by J. Harlan Bretz in the 1920s revealed that between 15,500 and 13,000 years ago, ice periodically dammed the Clark Fork River in Idaho east of Spokane, Washington, forming a lake in the present-day Missoula Valley of Montana covering some 3,100 square miles and containing 500 cubic miles of water. In a typical release occurring over less than two weeks, a quantity of water equal to half the present volume of Lake Michigan, more than the modern annual volume of all the

world's rivers, poured down the Columbia channel. These floods were known as the Missoula Floods. Backwater from these floods carried ice-rafted "erratic" rocks from Montana repeatedly into the Willamette Valley, filling it to about 400 feet above current sea level. Evidence in the geologic record suggests that these floods entered the Tualatin River Valley at least 22 times during this time period (Wilson 1998). This vigorous overflow southward across the divide between the Willamette River and Tualatin River Basins scoured multiple channels in the basaltic bedrock, dug small rock-bound basins, and left rock knobs barren of soil, forming a topography in the Rock Creek area just east of the City of Sherwood that is a miniature replica of the well-known scablands in eastern Washington. The sediments left by these floods form much of the present valley floor (Branscomb 2002). In the Tualatin River Basin, these overlying sediments have been classified as the Hillsboro Formation (Wilson 1998) and consist of about 900 feet of fluvial and lacustrine sediment overlying 95 feet of lateritic soil and weathered basalt of the Columbia River Basalt Group. This area is still geologically active as evidenced by the 1980 eruption of Mount Saint Helens 65 miles to the northeast.

3.5 Soils

Within the refuge boundaries there are 64 soil types described (U.S. Department of Agriculture [USDA] 1982). These can roughly be broken down into the following six categories: 1) clay, 2) loam, 3) silt loam, 4) silty clay loam, 5) stony silt loam, and 6) Xerochrepts. A majority of refuge lands in the floodplain contain clays, silty clay loams, and silty loams. Most of these lands were in agricultural production prior to purchase by the Service. On areas outside the floodplain, most of the soils are loams and silty loams that are well drained and primarily support mixed upland forest types.

There are two areas of particular historical interest—Onion Flats and Wapato Lake. These areas contain Labish Mucky Clay, a rare organic peat soil type that historically supported scrub-shrub and other wetland types. It is heavy, poorly drained soil, usually associated with old concave lake beds. These areas were drained for farming in the early twentieth century and continue to be cooperatively farmed by the refuge at present. The major crop in these areas was onion, but with a shift in economics, these areas now support small grains such as oats, corn, wheat, barley, and grass and clover crops.

Another area of interest is the Tonquin scablands along the Rock Creek drainage. This area contains soils of stony loam to Xerochrepts deposited by the ancient Missoula Floods, and is an area of rocky basalt outcrops and deep gravel. This soil varies greatly from highly porous, well-drained soil to highly impermeable rock creating perched wetlands. Much of the area surrounding refuge lands in the Rock Creek area is extensively mined for rock and gravel. Any organic soil existing within this area is relatively shallow, but still supports abundant native plant growth.

3.6 Fire

3.6.1 Historic Activity

For thousands of years prior to European settlement, fire played an important role in maintaining various habitat types within the Willamette Valley and in Oregon as a whole. Whether ignited by lightning or set by Native Americans, fire helped to maintain native habitat types by preventing woody species from encroaching into prairie habitat types, preventing build-up of volatile fuels in

forested areas, creating a mosaic of habitat types and successional stages, and recycling nutrients (ODFW 2006). Since at least the 1850s, fire suppression actions began to change the landscape of the Willamette Valley, and have resulted in a host of unintended consequences for ecological health, wildlife populations, and people.

In more open habitat types such as prairies and oak savanna, fires were essential for removing encroaching woody species (especially conifers), reducing thatch left by annual and perennial grasses and forbs, and providing habitat for wildlife, such as elk, acorn woodpeckers, and white-breasted nuthatch, dependent on open habitat types. Native Americans often burned open habitat types to promote food plants such as camas and tarweed, provide for more open travel corridors, and provide forage for elk, deer, and other game species that they hunted (ODFW 2006). In part, due to fire suppression, less than 1 percent of these habitats remain in the valley, as woody species, such as Douglas-fir, have moved in and changed the landscape.

Photo 3-4. Kalapuya people ignited fires to manage habitats for their needs. USFWS.

In forested areas, fires played an important role in maintaining a diversity of habitat structure. Drier forests historically experienced frequent fires (usually at less than 25-year intervals) that mainly burned understory plants, but left larger trees undamaged. In wetter forests such as those in the Coast Range, fires were less frequent (on the order of once every 100 years), but often burned the entire stand, setting the stage for early successional plant growth.

3.6.2 Recent Activity

In forested areas, fire suppression has increased the likelihood of wildfires that are unusually large and severe (ODFW 2006). In the late nineteenth and early twentieth centuries, logging operations combined with fire suppression throughout the Pacific Northwest created conditions for catastrophic fires. Vegetation composition within forests has also changed as a result of fire suppression. Historically, conifer-dominated forests had little undergrowth because of the shade imposed by the closed canopy and frequent fires that cleared brush and downed woody debris. However, with the onset of widespread fire-suppression activities, debris was allowed to accumulate, and brush and eventually understory trees began to grow and provide “ladder” fuels that led to canopy fires when a fire did occur.

In prairie and savanna habitat types, fire suppression often led to a complete change in vegetation structure as woody species such as shrubs and conifers invaded and shaded out other species. In addition to fire suppression, these open habitat types were often the first to be converted to agriculture or developed as home and town sites, thus exacerbating their decline.

Photo 3-5. Prescribed fire can be used to manage native habitats. Scott Swanson/ USFWS.

3.6.3 Current Conditions

The refuge currently has a fire management plan (USFWS 2002b) in place that covers wildland fire events and pile burning, but does not address prescribed fire. This plan states that all wildland fires, whether human-caused or lightning-induced, will be suppressed. Brush and debris piles that result from management activities will be burned by fully trained and equipped Service fire crews in accordance with national and regional policies. The refuge has updated the fire management plan, which now proposes the use of prescribed fire; this information can be found in Appendix O of the Comprehensive Conservation Plan (CCP).

Many of the habitat types on the refuge are fire-dependent vegetation communities. In the absence of prescribed fire, these habitat types are maintained with surrogates for fire such as mowing and discing. The introduction of non-native and invasive plant species such as reed canarygrass, velvet grass, cocklebur, and Bermuda grass during the past century have complicated maintenance of these native habitat types. Use of prescribed fire to maintain native habitat types may or may not address some of these issues.

3.7 Environmental Contaminants

In 1992, prior to formal establishment of the refuge, the Service conducted a pre-acquisition contaminant survey (USFWS 1992b) to assess possible contaminants affecting proposed refuge lands. The survey found that there were " …a variety of contaminant sources on and adjacent to the refuge including container nurseries, a tannery, a potato processing plant, an abandoned town dump, nonpoint source pollution from highways and industrial areas, agricultural runoff, dairy farms, auto

wrecking yards, electrical power lines, and possible hazardous wastes from farming and industrial operations."

In the Rock Creek drainage within the refuge acquisition boundary, but on lands not owned by the refuge, is the 33-acre site of a former tannery and battery company. The Frontier Leather Company (Frontier) began operating a tannery at the site in 1947. Two 3-acre sedimentation lagoons were constructed and placed in service in 1965. Frontier discharged wastewater to the sedimentation lagoons intermittently between 1965 and 1982. Between 1971 and 1974, chromium-treated hides were both stockpiled and buried at the facility. Frontier landfilled an estimated 21,000 cubic yards of chromium-containing wastes including chromium-treated hides and chromium-containing vacuum filter sludge. Some of the hides were later covered with approximately 2 feet of soil, but a large percentage of the landfill was not adequately consolidated and capped to control possible direct contact or surface water runoff. Landfilling of hides was discontinued in 1973 after analytical results from hide samples collected by the Department of Environmental Quality (DEQ) suggested that the hides could adversely impact soil, groundwater, or surface water quality (DEQ 2011c). Additionally, contaminants found in surface soil samples included antimony, trivalent chromium, lead, and mercury (DEQ 2011b). In addition to contaminants from the tannery, there are also contaminants from lead acid batteries at the tannery site, including lead, sulfuric acid, and battery casings (DEQ 2011b).

DEQ uncovered records from the former tannery indicating that tannery wastes were land-applied to pasture land at Ken Foster Farm (KFF) during the 1960s. The former KFF 40-acre farm site is on Murdock Road, in Sherwood, outside the refuge acquisition boundary, but adjacent to and upslope of the Rock Creek Unit. Investigations of the KFF confirmed the presence of high concentrations of chromium in surface soils consistent with land application of the tannery wastes. These contaminants could have migrated into the Rock Creek drainage, which flows through the refuge. In 2007, the U.S. Environmental Protection Agency (EPA) published findings from their assessment of the former KFF site confirming that several heavy metals, primarily chromium, lead, and mercury were present at elevated concentrations in site soils. Sampling performed to date indicates lead and chromium in site soils are attributable to historical land application of tannery wastes at the site (DEQ 2011a). Additional work at the KFF site is warranted, including completion of a comprehensive remedial investigation and risk assessment, feasibility study, and implementation of remedial action as necessary (DEQ 2011b).

3.8 Air Quality

The EPA has lead responsibility for the quality of air in the United States; through the 1990 Clean Air Act, the agency sets limits on the amount of pollutants that can be discharged into the air. More than 170 million tons of pollution are emitted annually into the air within the United States, through either stationary sources (such as industrial or power plants) or mobile source (such as automobiles, airplanes, trucks, buses, and trains). There are also natural sources of air pollution such as fires, dust storms, volcanic activity, and other processes. The EPA has identified six principal pollutants that are the focus of its national regulatory program: carbon monoxide, lead, nitrogen dioxide, ozone, particulate matter, and sulfur dioxide.

The Oregon DEQ is responsible for protecting Oregon's air quality. DEQ monitors air pollution to ensure that communities meet national ambient air quality health standards (DEQ 2011c). There are three main pollutants that are of greatest concern in Oregon. These are:

- Ground-level ozone, commonly known as smog;
- Fine particulate matter (mostly from wood smoke, other combustion sources, cars, and dust) known as PM2.5 (2.5 micrometers and smaller in diameter); and
- Hazardous air pollutants (also called air toxics).

According to a 2010 DEQ report (DEQ 2011c), the PM2.5 level was below the Federal health level throughout Oregon. Ground-level ozone (smog) exceeded the Federal standards twice in Portland and once in Salem. They did not violate the standard, which requires four exceedance days. Forest fire smoke was light in 2010 and did not exceed the Federal health standard anywhere DEQ monitored. Air toxins, such as benzene and acetaldehyde, remain near or above the health benchmarks. The health benchmarks are concentration levels at which, if exposed over a lifetime, an individual's risk of getting cancer is increased by one in one million. Carbon monoxide and PM10 (particulate matter 10 micrometers in diameter and smaller) remained far below the Federal health standard. The pollutants have been trending down in the past 10 to 15 years.

According to Creative Methods (2011), Washington and Yamhill Counties received poor grades for air quality based on tons of emissions per square mile of the following pollutants (Table 3-5): carbon monoxide, lead and lead compounds, nitrogen oxides, volatile organic compounds, PM10, PM2.5, ammonia, sulfur dioxide, total hazardous air pollutants, and two particular hazardous air pollutants, diesel emissions and acrolein emissions.

Table 3-5. Letter Grades* of Selected Air Quality Measures Based on Tons Emission per Square Mile

County	CO	Pb	NOx	VOC	PM10	PM2.5	NH_3	SO_2	HAP	Diesel	Acrolein
Washington	F	C	D	D	D	F	C	D	D	F	D
Yamhill	D	D	C	D	D	D	C	C	C	C	D

*The grade "A" represents the best/cleanest emission densities in the United States, and "F" the worst/dirtiest in the United States.

CO: Carbon dioxide
Pb: Lead
NOx: Nitrogen oxides
VOC: Volatile organic compounds
PM10: Particulate matter less than or equal to 10 micrometers
PM2.5: Particulate matter less than or equal to 2.5 micrometers
NH_3: Ammonia
SO_2: Sulfur dioxide
HAP: Hazardous air pollutants

However, in actual tests of ambient air quality, only Yamhill County exceeded any air quality parameters. Based on these tests, EPA levels for quarterly levels of lead were exceeded (Creative Methods 2011).

As discussed in Section 3.6 above, prescribed fire can be a useful management tool, but smoke management is a concern and is governed in part by Oregon Administrative Rules (OARs) (OAR 2011).

3.9 Water Quality

3.9.1 Overview—Tualatin River Basin

The Tualatin River watershed lies almost completely within Washington County but also crosses Multnomah, Clackamas, Yamhill, Tillamook, and Columbia Counties. This watershed, or subbasin, is part of the larger Willamette River Basin. The Tualatin River drains more than 700 square miles of land on the west side of Portland's metropolitan area; its headwaters are in the Coast Range and it flows in an easterly direction to the confluence with the Willamette River. The Tualatin River Basin supports a growing population of more than 450,000 people and a wide range of urban, agricultural, and forest-derived activities (DEQ 2011d). The discharge of the river reflects seasonal rainfall, and most precipitation occurs between November and March. Seasonal stream flow is typically highest from December through April and lowest from July through October (USGS 2008). The low flow period occurs during the summer from May through October. Streams entering the river within the refuge include Wapato, Ayers, Hill, Harris, and Scoggins Creeks in the Wapato Lake Unit, and Chicken and Rock Creeks in the Sherwood Units.

The Oregon DEQ is the agency responsible for ensuring that the streams and rivers of Oregon are within standards set forth by the Federal Clean Water Act of 1972. In the past, as human activity increased in the subbasin, the Tualatin River experienced many water quality problems including algal blooms. Many streams in the Tualatin River subbasin do not meet Oregon water quality standards as these streams have high water temperatures and low dissolved oxygen levels that can harm fish and other aquatic life. Some water bodies have bacteria counts that are higher than Oregon's water quality standards recommend (DEQ 2011d). In response to these streams not meeting water quality standards, DEQ listed the Tualatin River as a "water-quality limited" stream. The term "water-quality limited" is used in the Clean Water Act to define streams that do not meet established water quality standards even after the implementation of standard controls. In 1984 and 1986, Tualatin River was listed due to low dissolved oxygen concentrations and nuisance levels of algae. Once a river has been designated as water-quality limited, the Clean Water Act requires that the DEQ develop thresholds for the amount of pollutants to be released in the river (USGS 2008).

Since the 1970s, DEQ has worked with other agencies and organizations to ensure actions are taken to improve water quality in the Tualatin River. These actions include closure of several water treatment plants that historically discharged high concentrations of ammonia and phosphorous, upgrades at remaining treatment facilities, implementation of management plans by agencies that address potential sources of pollutants, tree plantings along streams to facilitate cooler water temperatures, and the release of water from Henry Hagg Lake by Clean Water Services (CWS) during the critical summer months when water flow is low. All of these actions have contributed to improvement in the water quality of the Tualatin River.

CWS has worked further with DEQ to improve water quality in the Tualatin River. Water is released by CWS from Henry Hagg Lake and Barney Reservoir to improve the river's water quality. In 2004, CWS received a watershed-based permit from DEQ that provided a mechanism to offset a portion of the thermal loads from their wastewater treatment facilities with releases of stored water from the reservoirs. Reservoir releases during July and August are used to mitigate part of the thermal impacts from wastewater treatment facilities. CWS offsets the remainder of its thermal impact by planting riparian areas along tributaries, either directly within its service area or through a partnership with the Tualatin Soil and Water Conservation District on rural lands. During the rest of the summer, the

water is released to offset the effect of sediment oxygen demand on the dissolved oxygen levels in the river. Dissolved oxygen levels in the river downstream of the wastewater treatment facilities determine the ammonia limits for wastewater treatment facilities. The higher the dissolved oxygen levels, the more operational flexibility the wastewater treatment facilities have (CWS 2011).

Low dissolved oxygen levels can be a water quality issue in the lower Tualatin River. During the early parts of the summer, photosynthetic production of oxygen by algae effectively offsets the oxygen consumed by the decaying substances in the sediment of the river (sediment oxygen demand). In the fall, however, oxygen production by algae is reduced as the days become shorter and it no longer offsets the oxygen consumption by sediment oxygen demand. This can lead to low dissolved oxygen levels. Increasing stream flow reduces oxygen consumption by sediment oxygen demand because it shortens the contact time between the river water and the river sediments (CWS 2011).

In addition to the above actions, DEQ developed total maximum daily loads (TMDLs) as required by the Clean Water Act. The TMDLs are developed to meet established water quality standards. They define the amount of heat, bacteria, phosphorous, and ammonia that can be added while still being protective of the river (DEQ 2011d). DEQ first released TMDL loads (or amounts) in the 1980s for various sources in the Tualatin River Basin. There has been a revision of these TMDLs, and they are currently undergoing public review at the time of this writing. The establishment of TMDLs in the Tualatin River Basin prompted many management agencies to take actions to meet the load allocations set forth by the TMDLs.

3.9.2 Refuge-specific Water Quality

There are some data available on several creeks that enter the Tualatin River through the refuge. Chicken Creek, which supplies most of the water to the managed wetlands on the Atfálat'i Unit, enters the refuge through a diversion point from which water is then diverted to several different ponds using an irrigation canal. Over the years, as more urban development occurs upstream, the refuge has observed higher stream flows at the diversion. Higher flows have caused extra management responsibility and burden on the refuge to divert the water to the river to avoid flooding or damage to refuge infrastructure. In response to the increases in high flows, the refuge has installed some new infrastructure, including an emergency spillway to facilitate water reaching the river. In addition to high water flows, another concern of the refuge is the water quality of Chicken Creek, due to the runoff from urban development that occurs in the watershed. However, CWS has been monitoring the water quality for upper and lower Chicken Creek and as of date, all standards of temperature, dissolved oxygen, pH, and toxics are below applicable water quality criteria.

3.10 Visual Quality

The scenic beauty of the refuge plays in sharp contrast to the surrounding urban development of homes and roads. All features of visitor and administrative facilities have been designed and constructed to complement the natural refuge environment. Buildings are placed to welcome visitors at the entry point of the refuge, but not detract from wildlife observation. Where possible, structures are set into the landscape and/or provide views through or around the structure itself. Overlooks, kiosks, benches, signs, and railings are all low profile and colored to match the environment. This careful planning allows the visitor to experience the refuge without distractions.

3.11 Surrounding Land Use

The region surrounding the refuge is primarily a mix of urban and agricultural lands (see Appendix P, Map 2). The City of Sherwood in Oregon (population 17,930) abuts the southern and western boundaries of the Sherwood Units (U.S. Census Bureau 2011), the City of Tualatin (population 26,745) is to the east, and King City (population 2,965) is northeast of the refuge. The City of Gaston, Oregon (population 792), is adjacent to the west boundary of Wapato Lake Unit, and Forest Grove (population 21,448) is north of the refuge boundary by approximately 2 miles. Oregon's largest metropolitan center with Portland at its core is approximately 12 miles from the Sherwood Units and 23 miles from the Wapato Lake Unit. The population of Portland is 566,143; the population including its surrounding metropolitan area is approximately 2,260,000 (Portland Business Journal 2011). The population of Sherwood has increased by more than five times from 3,093 in 1990 (U.S. Census Bureau 2011) to the current level, and other cities in the surrounding area are also experiencing rapid population growth. In fact, some land within the refuge acquisition boundary has already been developed with housing and businesses.

The western part of the Sherwood Units and Wapato Lake Unit are characterized by a more rural nature, with active agriculture as well as scattered patches of potential wildlife habitat. Dominant agricultural practices include growing of nursery and greenhouse stock; field crops such as winter wheat, corn, grass hay, and clover and grass seed; orchards of fruit and nuts; wine grapes; berry crops; and row crops such as potatoes and onions. In 2009, Washington County produced $4,106,865 in agricultural products (Oregon State University 2011). Yamhill County is a more rural county with high production of both agricultural commodities and timber products. Yamhill County is the nation's leader in production of hazelnuts and the fifth-largest producer of grass seed; it has the third-largest acreage of rhubarb, and is number five nationally for llama production (Oregon Department of Agriculture 2012). Active timber harvest occurs both east and west of the Wapato Lake Unit in the Chehalem Ridge area and in the Coast Range, respectively.

Within the Tualatin River Basin there are a number of public and private lands managed for habitat and wildlife. The regional Metro government has an active green spaces program and has acquired and restored several land parcels. CWS maintains several land parcels that benefit wildlife, and other county and public entities maintain suitable wildlife habitat within the basin. In addition, private landowners maintain waterfowl hunting clubs throughout the area that benefit fish and wildlife. Other private landowners maintain habitat in a natural condition that also benefits fish and wildlife.

The lower reaches of the Tualatin River are navigable with small boats, and many recreationists take advantage of the river using canoes and kayaks. Fishing opportunities are limited; however, a few people use motor boats to fish for warm-water species during summer, and at least one person fishes for crayfish commercially on the river.

Chapter 4 Biological Environment

4.1 Overview

4.1.1 Historic Land Use and Conditions

The Willamette Valley is an area of extremely fertile and rich soils that when mixed with the abundant rainfall and relatively mild temperatures of the region provide an ideal system for healthy natural ecosystems (see Appendix P, Map 1). With the presence of people, these natural ecosystems changed (see Appendix P, Map 2). Prior to European settlement in the 1850s, the Kalapuya were the first people of the valley, and one band, the Atfálatʻi, made their home here. At that time, much of the valley was covered by native grasses and forbs, with riparian forests and wet prairies along the rivers. The Atfálatʻi observed the benefits of lightning-strike fires and emulated those benefits by manually setting fires to serve their needs. Each year, they burned different parts of the valley to control insect pests and to keep woody plants from moving into uplands of grasslands and oak savannas. Fire also cleared foraging ground for elk and deer. This method of prescribed burning added nutrients into the soil and stimulated plant growth. However, with European settlement, fire ceased to exist on a consistent and rotational basis, thereby allowing woody plant species to invade the grasslands and resulting in less than 1 percent of this habitat remaining in the valley.

Historically, the Willamette Valley was home to large ungulates such as deer and elk. However, by 1898 elk populations had diminished to the point that the Oregon Legislature prohibited elk hunting until 1910 (a ban that was later extended to 1933). Bears and wolves were present, and bighorn sheep lived nearby in the Columbia River Gorge.

Sturgeon, steelhead, salmon, and other native fish were numerous in most rivers and streams; however, by 1898 fish stocks were declining and hatchery operations were underway (Oregon Department of Fish and Wildlife [ODFW] 2011b). Beaver, mink, and other wetland-dependent mammals found an abundant food source in the riparian forest of the Tualatin River. Trapping was in high demand here in the early 1800s, but declined as the demand for farmland increased. In 1899, a moratorium on beaver trapping was imposed, but it was lifted 20 years later. In 1931 beaver season was again closed as habitat conditions declined, and fish and wildlife resources continued to take a downward turn.

By the 1850s, the grasslands and prairies had been claimed by settlers for grazing and town sites. This left riparian forest for farmers who were beginning to move west. To use the land, the farmers cut, burned, and plowed riparian forest for farmlands. Widespread burning of habitats was eliminated to protect infrastructure and farmlands. Lack of periodic fire allowed succession of shrubs and trees into remaining prairie, woodland, and savanna habitat types, which eventually changed many of them to Douglas-fir-dominated forest.

Other habitats also saw modifications. Wetlands were drained for farming, and rivers and streams were channelized as flood control measures. Some areas were frequently flooded and were too wet to farm or develop and therefore were left as intact habitats. The flora and fauna of the valley began to change and support different species. This change continues as exotic species invade and once common native species decline. Christy et al. (2006) reported 1,404 plant species in the Portland area in 2006, and noted “today there are about half as many common native taxa as there were in 1925, and the number of rare natives has increased eleven-fold. Since 1925, the number of common exotic

taxa has nearly tripled, while the number of rare exotics has increased by 71. This trend is to be expected in an urbanizing environment, and as time goes on, more native species will become rare while the ranks of common exotic species will continue to increase."

Currently the Tualatin River Basin is a highly altered system with almost all the land within the watershed affected, at least to some degree, by timber harvest, agriculture, urbanization, dams, diversions, and stream channel alteration. However, many organizations and individuals are working to restore natural processes and habitats. Many species of native plants, fish, and wildlife still thrive in the basin, and opportunities exist to enhance and restore additional habitat for greater resource enrichment.

4.1.2 Biological Integrity, Diversity, and Environmental Health

The National Wildlife Refuge System Improvement Act of 1997 directs the U.S. Fish and Wildlife Service (Service; USFWS) to ensure that the biological integrity, diversity, and environmental health of the National Wildlife Refuge System (Refuge System) are maintained for the benefit of present and future generations of Americans. To meet this mandate, the Service developed a Biological Integrity, Diversity, and Environmental Health (BIDEH) Policy to provide implementation guidance. Elements of BIDEH are represented by native fish, wildlife, plants, and their habitats as well as those ecological processes that support them. The Refuge System policy on BIDEH provides guidance on consideration and protection of the broad spectrum of fish, wildlife, and habitat resources that represent BIDEH on refuges and in associated ecosystems. This policy provides refuges with a process for evaluating the best management direction to prevent the additional degradation of environmental conditions and to restore lost or severely degraded environmental components. It also provides guidelines for dealing with external threats to the BIDEH of a refuge and its ecosystems.

Maintaining and perpetuating the ecological integrity of the Tualatin River National Wildlife Refuge (the refuge) fits well within this policy. By providing for the full range of natural processes and native floral and faunal diversity, the refuge will be implementing this policy.

To preserve BIDEH, we examined priority habitat types and determined the species that were the best indicators of the health of those plant communities.

4.2 Selection of Priority Resources of Concern

4.2.1 Analysis of Priority Resources of Concern

Wildlife and habitat goals and objectives were designed directly around the habitat requirements of species designated as "priority resources of concern" (ROC). ROCs are called conservation targets in conservation planning methodologies used by other agencies and nongovernmental organizations (NGOs). In developing objectives, the comprehensive conservation plan (CCP) planning team followed the process outlined in the Service‟s *Writing Refuge Management Goals and Objectives: A Handbook* (Handbook) (Adamcik et al. 2004).

As defined in the Service‟s policy on habitat management plans, ROCs are "all plant and/or animal species, species groups, or communities specifically identified in refuge purpose(s), System Mission, or international, national, regional, state, or ecosystem conservation plans or acts. For example, waterfowl and shorebirds are a resource of concern on a refuge whose purpose is to protect

„migrating waterfowl and shorebirds.“ Federal or State threatened and endangered species on that same refuge are also a resource of concern under terms of the respective endangered species acts (620 FW 1.4G).” The Handbook goes on to say that “Habitats or plant communities are resources of concern when they are specifically identified in refuge purposes, when they support species or species groups identified in refuge purposes, when they support NWRS [Refuge System] resources of concern, and/or when they are important in the maintenance or restoration of biological integrity, diversity, and environmental health.” Therefore, ROCs for a refuge may be a species or species group, or the habitat/plant community that supports a priority species/species group.

In developing a list of ROCs, the planning team selected not only species mentioned in establishing documents for the refuge, but also species that captured the ecological attributes of habitat types required by larger suites of species (see Appendix E, Biological Resources Of Concern). The ecological attributes of habitats were analyzed with regard to the life history requirements of ROCs and are critical to sustaining the long-term viability of the ROC and other benefitting species. Ecological attributes of habitats include vegetation structure, species composition, age class, and patch size and/or connectivity with other habitat types; hydrologic regime; and disturbance events (e.g., flooding, fire). From the ROC list, we developed a list of focal species to represent each habitat type on the refuge. These provide measurable indicators that strongly correlate with the ability of a plant community to support a given species or group. The descriptions of habitat types on the refuge incorporate “desired” conditions that are based on scientific literature review and team members“ professional judgment. These desired conditions for specific ecological attributes were used to help design habitat objectives, as presented in Chapter 2.

Limiting factors were also considered in developing objectives. A limiting factor is a threat to, or degradation of, the natural processes responsible for creating and maintaining plant and animal communities. In developing objectives and strategies, the team gave priority to mitigating limiting factors that presented a high risk to ROCs. In many cases, limiting factors occur on a regional or landscape scale and are beyond the control of individual refuges. Therefore, objectives and strategies may seek to mimic, rather than restore, natural processes. For example, pumps and water control structures may be used to control water levels in wetlands in areas where natural hydrology has been altered. Also, the structure of plant communities used by ROCs can be created, rather than restoring the original native species composition. For example, mowing and/or grazing may be used to maintain a desirable vegetation structure in restoring native grassland communities when prescribed fire is impractical. With the consideration of BIDEH, the refuge will maintain all appropriate native habitat types and species. Table 4-1 lists the focal and benefitting species that were considered using the following criteria:

- The resource must be reflective of the refuge“s establishing purposes and the Refuge System mission;
- The resource must include the main natural habitat types found at the refuge;
- The resource must be recommended as a conservation priority during preplanning efforts; or
- The resource must be federally or state listed, be a candidate for listing, or be a species of concern.

Other criteria that were considered in the selection of the ROCs included:

- Species groups and/or refuge features of special management concern; or
- Species contributing to the biological diversity, integrity, and environmental health of the ecosystem or community.

Table 4-1. Focal Species and Other Benefitting Species for Each Priority Habitat Type

Habitat Type	Focal Species	Other Benefitting Species
Bottomland riparian forest	Pacific slope flycatcher	Yellow warbler, song sparrow, willow flycatcher, and rufous hummingbird
	Swainson‟s thrush	Beaver, northern red-legged frog, anadromous fish, yellow-breasted chat, and black-capped chickadee
	Brown creeper	Chestnut-backed chickadee, anadromous fish, downy woodpecker, and pileated woodpecker
	Western wood pewee	Wood duck, yellow warbler, warbling vireo, western screech owl, spring Chinook, winter steelhead, chorus frog, and hooded merganser
Mixed coniferous/deciduous forest	Orange-crowned warbler	Bewick‟s wren, spotted towhee, downy woodpecker, olive-sided flycatcher, and pileated woodpecker
Oak savanna	Western bluebird	Chipping sparrow, coyote, grasshopper sparrow, mourning dove, rufous hummingbird, and western meadowlark
	White-breasted nuthatch	Western gray squirrel, acorn woodpecker, black-tailed deer, and lesser goldfinch
Wet prairie	Wilson‟s snipe	American bittern, savanna sparrow, western meadowlark, northern harrier, dusky Canada goose, migrating and wintering waterfowl, and Nelson‟s checker-mallow
Herbaceous wetland	Northern pintail	Tundra swan, cackling Canada goose, wintering waterfowl, river otter, mink, northwestern pond turtle, bald eagle, and peregrine falcon (foraging)
	Greater yellowlegs	Least sandpiper, dunlin, killdeer, lesser yellowlegs, long-billed dowitcher, spotted sandpiper, tree swallow, and great blue heron
	Virginia rail	Wintering waterfowl, American bittern, sora, common yellowthroat, common garter snake, and chorus frog
Shrub-scrub wetland	Willow flycatcher	American bittern, sora, Virginia rail, red-winged blackbird, common yellowthroat, northern red-legged frog, and northwestern salamander
Rivers, streams, and backwater sloughs	Coastal cutthroat trout, winter steelhead	Northwestern pond turtle, mink, beaver, belted kingfisher, spring Chinook, and Pacific lamprey
Cropland	Cackling Canada goose	Tundra swan, dusky Canada goose, northern pintail, American wigeon, northern harrier, and western meadowlark

4.3 Habitat Types

4.3.1 Bottomland Riparian Forest

4.3.1.1 Overview

There are currently about 388 acres of riparian forest on the refuge supporting a myriad of breeding and migrating songbirds, amphibians and reptiles, resident mammals, and anadromous fish. Mature bottomland riparian forests are characterized by Oregon ash, bigleaf maple, scattered grand and Douglas-fir, and western red-cedar in the overstory, with sword fern, snowberry, and willow in the understory. There are many acres of this habitat type on the refuge that have been recently restored and would not have all these attributes yet. This forest type typically occurs in floodplains and other areas with moist soils. Plants here are adapted to winter and spring flooding and may be inundated or experience saturated soil for several months of the year. This habitat type is a priority habitat in the Oregon Conservation Strategy (ODFW 2006). It typically occurs along streams and rivers and provides movement corridors for wildlife among habitat patches.

Photo 4-1. Riparian forest during winter flooding. Peter Schmidt/USFWS.

4.3.1.2 Regional Distribution, Conditions, and Trends of Bottomland Riparian Forest

Bottomland riparian forest in the greater Willamette Valley has been severely reduced since historic times due to draining and timber harvest, conversion to agricultural and urban uses, and stream alterations. Riparian forest within the Tualatin River Basin is highly fragmented. Metro, Clean Water Services, and others are working to restore riparian forest on many of their land holdings within the basin. The refuge has also engaged in restoration of bottomland riparian forest on several sites within the Sherwood Units.

4.3.1.3 Key Species Supported

Bottomland riparian forest supports a host of bird species and guilds including warblers, woodpeckers, raptors, flycatchers, and hummingbirds. Amphibians such as northern red-legged frogs, salamanders, and rough-skinned newts may spend part of their life cycles in riparian forests. Reptiles such as western pond turtles and garter snakes frequently use these habitats to aestivate over winter or to escape the hot summer sun. Mammals such as beaver, mink, black-tailed deer, and bats use this habitat type for foraging, resting, and finding escape cover. Anadromous fish such as steelhead and Pacific lamprey migrate up rivers and creeks shaded by riparian forest. In winter, juvenile salmonids may benefit from riparian forests for foraging and escape during flood events.

4.3.1.4 Refuge Management Activities

In existing stands of riparian forest, management activities are typically limited to controlling non-native invasive plant species. Plants such as English ivy, nightshade, and Himalayan blackberry crowd out native plants, to which native wildlife are adapted. Non-native trees such as cherry, English hawthorn, and English holly are removed or girdled and treated with herbicide following integrated pest management (IPM) methods, to create snags.

In areas of new riparian forest restoration, native trees and shrubs are planted and maintained for several years to ensure successful establishment. Trees are typically planted and protected with tubes to prevent browsing by deer and other herbivores, and girdling by voles and other rodents. Grasses and non-native plants are mowed and/or sprayed with Service-approved herbicide between shrubs and trees to reduce competition and shading until the desired plants are of sufficient size to compete on their own. After 5 to 10 years, once the trees have reached sufficient size and girth to resist damage from herbivores, tree tubes are removed.

In some areas where natural recruitment of native plants is strong, management activities include placing tubes on naturally established trees and mowing non-native plants and grasses until the trees are tall enough to compete on their own.

4.3.2 Mixed Coniferous/Deciduous Forest

4.3.2.1 Overview

There are currently about 49 acres designated as mixed coniferous/deciduous forest on the refuge. This habitat type is typically above the floodplain on drier, well-drained soils. This forest type is dominated by Douglas-fir, with grand fir, western red-cedar, western hemlock, bigleaf maple, red alder, Pacific yew, and Pacific dogwood. The understory contains sword fern, snowberry, hazel, cascara, vine maple, and various other shrubs and forbs. Snags are an important habitat component in a mature forest. Snags provide foraging substrate and nesting cavities for a variety of bird species. This upland forest type supports a host of bird species and other wildlife.

Photo 4-2. Mixed coniferous/deciduous forest in the Rock Creek Unit. Peter Schmidt/USFWS.

4.3.2.2 Regional Distribution, Conditions, and Trends of Mixed Coniferous/Deciduous Forest

Historically, upland forest was the dominant habitat type in the greater Portland area (Christy et al. 2006). By the time the General Land Office surveys were undertaken in the 1850s, much of this habitat type was already burned or logged. In the area surrounding the refuge, there is no old-growth forest remaining, but there are some tracts of mature second growth with intact native understory plants and few invasives. The forests surrounding the refuge were logged during the late nineteenth and early twentieth centuries to provide lumber for an expanding population and to provide more agricultural land. Currently, remaining forest tracts occur in areas too steep to farm or build effectively, or on land managed for timber production. Some tracts of remaining forest are found on conservation lands such as those recently purchased and protected by Metro and others. This forest type has also expanded into areas that were historically oak woodland, oak savanna, or prairie, as a result of fire suppression.

4.3.2.3 Key Species Supported

A myriad of species spend all or part of their life cycles in mixed forest habitat types. A host of resident and migratory birds such as woodpeckers, owls, wood warblers, and corvids use mixed forests for foraging, resting, and nesting. Small mammals such as squirrels, shrews, and mice are abundant in mixed forest habitat types, and bats often roost in cracks and cavities of larger trees. Larger mammals such as black-tailed deer and coyotes are also present in smaller numbers. Reptiles and amphibians such as common garter snakes and chorus frogs also use this habitat type.

4.3.2.4 Refuge Management Activities

Management activities for this habitat type are similar to activities carried out in riparian forest. In established forest, management of invasive species is the primary activity, while maintenance of

planted trees and shrubs will be the focus in restoration areas. In addition, prescribed fire may be a management tool employed to manage fuel and provide a diversity of habitat structure.

4.3.3 Oak Habitat

4.3.3.1 Overview

There are currently about 149 acres of oak habitat on the refuge. This land is in various stages of restoration. Restored areas have been planted with oaks, ponderosa pine, native grasses, and other native species during the past 12 years. The oaks in these areas are in the sapling stage and range from 3 to 20 feet in height; they have not reached a mature stage. In some areas the ponderosa pines have grown quickly and may be reaching 30 feet in height and almost 12 inches DBH. Only a few relic oaks over 100 years old remain on refuge lands. Mature oak savanna is characterized by large single or a very small cluster of Garry oaks, generally widely scattered throughout a grassland with few to no shrubs and abundant native wildflowers. Oak/pine woodland is characterized by more densely growing trees with a scattering of shrubs in the understory. Snags may be present in small numbers, and areas of bare ground may also be present. Native grass species may include California oatgrass, California brome, meadow barley, Roemer‟s fescue, and blue wildrye. Native forb species include blue-eyed grass, tiger lily, tarweed, and pearly everlasting. Overall grass height is usually less than 3 feet. Sites are typically dry, but may have saturated soils for a short duration during winter. This habitat type was historically maintained by frequent, low-intensity fire, which prevented most shrubs and encroaching species, especially conifers, and maintained a low density of oaks. Currently the refuge manages this habitat type by annual mowing. However, mowing does not remove accumulated thatch, which may inhibit growth of some species of wildflowers. Spot spraying of herbicides is also employed to control invasive species such as Himalayan blackberry and Canada thistle. This habitat type is a priority habitat in the Oregon Conservation Strategy (ODFW 2006).

Photo 4-3. Garry oaks. © Ed Bustya.

4.3.3.2 Regional Distribution, Conditions, and Trends of Oak Savanna

Oak savanna is a rare habitat type in the Willamette Valley. Noss et al. (1995) reported a loss of 99.5 percent of this habitat type in the Willamette Valley since Euro-American settlement. Metro and other organizations are conserving and restoring this habitat type; however, few large areas with mature oaks remain in the Tualatin River Valley and distribution is fragmented. Restoration efforts may take up to 100 years before the habitat can support a full range of species.

4.3.3.3 Key Species Supported

Oak savanna supports a variety of species, especially grassland bird species, oak specialists, invertebrates, and listed plant species. Grassland birds such as western meadowlark and savanna sparrow nest and forage in grassland communities. Oak specialists such as acorn woodpecker, Lewis‟ woodpecker, white-breasted nuthatch, and western gray squirrel use oaks for nesting and foraging. Invertebrates such as Fender‟s blue butterfly rely on native savanna and prairie plants for survival. Listed plant species native to oak savanna habitats include Kincaid‟s lupine, Willamette daisy, and golden paintbrush (USFWS 2010b). Western pond turtles frequently use this habitat type for aestivating and overwintering.

4.3.3.4 Refuge Management Activities

The refuge has undertaken several oak savanna restoration projects and annually maintains these areas by mowing to reduce encroachment of woody species and by applying Service-approved herbicides, following IPM practices, to control non-native and invasive species. As land has been acquired, restoration activities have included cooperative farming as a means of purging weeds

through tilling and application of herbicide. Further application of herbicide is usually necessary prior to planting of native seed. Native seed may be drilled in using a no-till drill or may be broadcast following discing. Typically, native grasses are planted first and allowed to become established while using a broad-leaved-specific herbicide to control invasive species. Once native grass is established, native forbs are seeded. Research is still needed to determine best management practices for establishing native oak savanna plants in this area because restoration of this habitat type is still in its infancy.

4.3.4 Wet Prairie

4.3.4.1 Overview

Wet prairie covers about 27 acres on the refuge. Wet prairie is dominated by native herbaceous plants such as sedges, rushes, grasses, and forbs that are generally less than 3 feet tall. There are few to no trees or shrubs. Wet prairie is characterized by generally poorly drained soils that may be saturated or have standing water from November through April. These habitat types on the refuge are typically inundated by either back flooding of the river onto floodplain areas or by ponding of rainwater in shallow basins. There are currently two areas of wet prairie restoration on the refuge. One was planted in 2001-2002 with native grasses, oaks, and ponderosa pine. Plants in this area are well established. The other area was restored in 2005, but is currently being rehabilitated to remove invasive reed canarygrass. This habitat type is a priority habitat in the Oregon Conservation Strategy (ODFW 2006).

Photo 4-4. Wet prairie habitat, Atfálatʻi Unit. Kim Strassburg/USFWS.

4.3.4.2 Regional Distribution, Conditions, and Trends of Wet Prairie

Similar to oak savanna, this habitat type has undergone a dramatic decline since Euro-American settlement due to conversion to other uses and lack of fire, which has allowed the encroachment of woody species, thus changing the vegetation community. Noss et al. (1995) state that 99.9 percent of

all prairie habitats in the Willamette Valley have been lost. Much of the habitat that remains is in degraded condition due to the influence of invasive and non-native species and lack of periodic fire to properly maintain function. Further, restored sites are confounded by a lack of available native seed types to foster adequate diversity. However, more native seed and plant varieties are becoming available as more entities embark on restoration of wet prairies. As with other rare habitat types, Metro, Natural Resources Conservation Service, and other organizations are conducting restoration and enhancement of this habitat type throughout the Tualatin River Valley. As these projects proceed, knowledge is gained and shared about methods and tools used to effectively manage wet prairie habitats.

4.3.4.3 Key Species Supported

Wet prairie supports a number of listed plant species (Bradshaw's lomatium, Willamette daisy, Nelson's checker-mallow) and species of concern (upland larkspur, peacock larkspur, Sierra horkelia, Columbian whitetop aster) (USFWS 2010b). A number of other species use wet prairies during all or part of their life cycles. Chorus frogs, northern red-legged frogs, northwestern and long-toed salamanders, and rough-skinned newts breed and lay eggs in shallow, vegetated wet areas in spring; wading birds such as great blue herons and great egrets also forage in the shallow pools or dry margins of wet prairies. Wilson's snipe nest in the wet grasses of the prairie. Black-tailed deer forage on grasses and forbs, while mink hunt for birds and rodents. In winter, large numbers of waterfowl rest and forage on the numerous seeds and plants in the flooded prairie.

4.3.4.4 Refuge Management Activities

Refuge management includes restoration, enhancement, and maintenance of wet prairie. As with other habitat types, restoration usually begins with efforts to purge non-native and invasive plant species using mechanical means (mowing and discing) and/or application of Service-approved herbicide, following IPM practices. Plants may be installed as pots or plugs, or seeded using a no-till drill or broadcast method. Areas requiring enhancement may have plants installed as mentioned above and invasive species removed using mechanical means or spot spraying with herbicide. Current maintenance includes annual mowing to prevent encroachment of woody species and/or spot spraying with herbicide to control non-native and invasive species.

4.3.5 Herbaceous and Scrub-shrub Wetlands

4.3.5.1 Overview

There are currently about 294 acres of herbaceous wetland and 20 acres of scrub-shrub wetland habitat on the refuge. The herbaceous wetlands have all been restored, but the scrub-shrub wetlands are in various early stages of restoration. According to Christy et al. (2006), prior to Euro-American settlement, there were historically few wetlands in the vicinity of the refuge. Wetlands that existed at the time of Euro-American settlement were often drained by ditching, diversions, channelizing streams, and installing drain tiles to facilitate farming and development. The floodplain in the northern part of the Riverboat Unit had extensive scrub-shrub and herbaceous wetlands that were likely drained by the early twentieth century. Likewise, the majority of the Wapato Lake basin consisted of various wetland types. Even though they represent a small fraction of the landscape, wetlands play a vital role in the ecosystem, providing habitat for a variety of wetland-dependent plants and wildlife, and native resident and anadromous fish.

Herbaceous wetlands are characterized by areas with heavy, poorly drained clay soils. Wetlands may be saturated or flooded for a large part of the year, usually from the first fall rains until early to mid-summer. Water depths may range from just a few inches to 3 feet or more, with an average of 4 to 18 inches. The extent and depth of water is dynamic, changing throughout the season and year to year as periods of rain and flooding from creeks and rivers come and go. Plant composition includes perennial species such as sedges, rushes, wapato, common cattail, and softstem bulrush, and a large variety of annual plants such as smartweed, beggars tick, and wild millet.

Scrub-shrub wetlands are characterized by a somewhat more stable hydrological regime. Soils may range from heavy clay to organic peat soil, and water may be present year-round. Water is typically deeper than on herbaceous wetlands and may range from 1 to 10 feet deep at times. Plants include woody species dominated by willow, as well as Douglas spirea, swamp rose, red-osier dogwood, and emergent species such as cattails and softstem bulrush. Fewer annual plants would be expected in this habitat type. This habitat type is a priority habitat in the Oregon Conservation Strategy (ODFW 2006).

Photo 4-5. Herbaceous wetland plants provide habitat and food for wintering waterfowl. Kim Strassburg/USFWS.

4.3.5.2 Regional Distribution, Conditions, and Trends of Herbaceous and Scrub-shrub Wetlands

As noted above, considerable effort was historically expended to convert wetlands to human-oriented uses. However, the value of wetlands for many beneficial uses, and their intrinsic value, has been recognized, and substantial work has been accomplished to restore or create wetlands throughout the Tualatin River Basin for the benefit of both human endeavors and wildlife needs. Wetlands currently exist on every unit of the refuge. Many of these wetlands are intensively managed to mimic historic conditions by using water control structures, diversions, pumps, canals, and levees. Managing and maintaining these systems is expensive and time consuming, but provides a level of certainty that habitat would be available no matter what the seasonal climate might provide. Other wetlands are not managed and depend on seasonal rain to fill and evaporation to naturally draw down in summer.

In addition to wetlands on the refuge, Metro, Clean Water Services, local duck hunting clubs, and others have worked to restore or create wetlands in the Tualatin River Basin. These wetlands provide a host of benefits such as groundwater recharge, water quality benefits, dissipation of flood waters, and habitat for fish and wildlife.

4.3.5.3 Key Species Supported

Wetlands support a number of fish and wildlife species throughout their annual cycle. Marsh birds such as sora and Virginia rail, and songbirds such as common yellowthroat and marsh wren nest in or near wetlands. Mammals such as mink, muskrat, and beaver use wetlands. Amphibians such as chorus frogs, northern red-legged frogs, and salamanders use wetlands for breeding. Reptiles such as common garter snake and western pond turtle use wetlands during part of their annual life cycle. Migratory shorebirds such as least and western sandpipers, greater yellowlegs, and black-bellied plovers forage on wetland mudflats and margins. Waterfowl such as northern pintails and cackling Canada geese forage and rest on wetlands. Raptors such as bald eagles and peregrine falcons prey on waterfowl that use wetlands.

4.3.5.4 Refuge Management Activities

Of all habitat types encountered on the refuge, wetlands require the most management and maintenance. During fall and winter, water is managed to fill and maintain wetlands. Fish screens are maintained to allow water passage and to prevent both native and non-native fish from entering wetlands from diversions. Pumps are sometimes operated to begin filling wetlands prior to fall rains. Water control structures such as flashboard risers are managed to precisely control water levels in some wetlands. Supplemental planting of woody species such as willow is conducted in newly restored scrub-shrub wetlands. During spring, water levels in managed wetland basins are drawn down to stimulate growth of desirable wetland plant species. Invasive species may be controlled by timing of flooding, mechanical means such as mowing or discing, or application of Service-approved herbicide. In late summer, some wetland basins are mowed to reduce vegetation height at the wetland margin to allow waterfowl access to adjacent uplands. Some wetlands are periodically disced to stimulate growth of annual plants dependent on a disturbance regime. In newly restored scrub-shrub wetlands, mowing is conducted around woody species to reduce competition with invasives such as reed canarygrass.

4.3.6 Rivers, Streams, and Backwater Sloughs

4.3.6.1 Overview

The Tualatin River and several tributary streams run through or are adjacent to refuge lands (see Appendix P, Maps 6 and 7). In addition, several areas back up with water during periods of flooding or high water. These waterways have been impacted by alterations since the time of Euro-American settlement. Stream banks were fortified to prevent flooding; adjacent lands were drained and ditched, causing increased runoff and erosion; vegetation along stream banks was removed, reducing the amount of shade and resulting in increased water temperatures, reducing woody input, and causing additional erosion; timber harvest, farming activities, and urbanization caused increased runoff, chemical and trash inputs, and reduced groundwater recharge; and water diversions for industrial, agricultural, and municipal uses caused a reduction in water flow.

Tributary streams such as Chicken Creek and South Rock Creek in the Sherwood Units were channelized in the early twentieth century to facilitate drainage and farming of adjacent lands. Under the management direction, the refuge will restore at least parts of these creeks to their natural meandering channels. In addition, construction and/or reconnection of backwater sloughs will be explored on some refuge units. This habitat type is a priority habitat in the Oregon Conservation Strategy (ODFW 2006).

4.3.6.2 Regional Distribution, Conditions, and Trends of Rivers, Streams, and Backwater Sloughs

The Tualatin River and its tributaries have total maximum daily loads (TMDL) listed by the Oregon Department of Environmental Quality (DEQ) for several water quality parameters including temperature, dissolved oxygen, phosphorus, and bacteria (DEQ 2001). Efforts have been underway for several years in the Tualatin River Basin to reverse some of the negative effects that have taken place over the past 150 years. Many organizations have been promoting stewardship of the watershed and are engaged in restoration and enhancement projects that have greatly improved conditions in the river and local streams. The Service has partnered with the U.S. Geological Survey (USGS) and others to conduct a water quantity and quality study at Wapato Lake that will help inform and guide future refuge management activities at that unit. A few small backwater areas on the refuge have been enhanced to provide benefits to anadromous fish during flood events and provide benefits to native wildlife.

Photo 4-6. Backwater flooding along the Tualatin River. Peter Schmidt/USFWS.

4.3.6.3 Key Species Supported

Rivers, streams, backwater sloughs, and their streamside vegetation support a vast array of fish, wildlife, and plant species. Native resident and anadromous, and non-native fish species, may be found in local waters. Resident native fish include coastal cutthroat trout, rainbow trout, western brook lamprey, and three-spined stickleback. Native anadromous fish include steelhead and Pacific

lamprey. Non-native fish include a number of sunfish species, bass, catfish, mosquito fish, and carp. Coho salmon, which were not historically present in the Tualatin River system because they could not get over Willamette Falls during the fall when they migrate, were introduced into the system as mitigation for Scoggins Dam. The coho stocking program ended in 1998, but coho are still present and reproducing with help from fish ladders at the falls (ODFW 2011c).

Wildlife also abounds in and along waterways. Mammals such as beaver, mink, and muskrats are water-dependent furbearers. Birds of all types are associated with streams and rivers including mergansers, wood ducks, belted kingfishers, and ospreys. Many warblers and flycatchers are associated with streamside riparian habitats. Reptiles such as western pond turtles and painted turtles use the slow-moving lower reaches of the Tualatin River, often basking on logs in spring and summer. Amphibians such as rough-skinned newts are abundant in all waters of the refuge.

Many plant species thrive in and around refuge streams. Submergent vegetation such as pondweeds and wigeon grass grow in the slow-moving waters of the river and adjacent sloughs. Trees and shrubs commonly associated with streams include willow, Oregon ash, red-osier dogwood, Oregon grape, and Douglas spirea.

4.3.6.4 Refuge Management Activities

One of the major management activities related to streams is operation of a water diversion structure on Chicken Creek on the Atfálatʻi Unit. A portion of the water in Chicken Creek is diverted year-round to supply water to managed wetlands. In summer, a small maintenance flow is diverted to maintain freshwater flow to a minimal number of wetland acres. In fall and winter, more water is diverted to fill and maintain approximately 226 acres of wetlands. There is a fish passage structure associated with the diversion structure that was designed prior to listing of upper Willamette salmon and steelhead, and it may no longer be adequate based on current standards. There are fish screens on the structure to help prevent fish from entering the wetland system and becoming entrapped. Upstream and downstream of the diversion, the creek was channelized decades ago and runs straight to the Tualatin River. Under the management direction, Chicken Creek will be at least partially returned to its historical channel and a new diversion structure will be constructed in a different location and designed to current fish passage standards.

Similar to Chicken Creek, South Rock Creek is channelized through both the Rock Creek and Onion Flats Units. Under the management direction, this creek will also be restored.

Management of water in the Wapato Lake Unit is another important activity. Currently the refuge is maintaining cooperative farming operations in the lake bed and using the pumps in place to dewater the lake during spring. Until restoration begins, it is anticipated that this practice will continue.

Other management actions along streams include planting native vegetation, and controlling non-native and invasive species including reed canarygrass, English holly, and Himalayan blackberry.

4.3.7 Croplands

4.3.7.1 Overview

Cropland management is used as a tool when lands are acquired to provide wildlife habitat and control invasive species until restoration of the property to native habitats can commence. Croplands

are currently managed under cooperative farming agreements with local farmers who plant, maintain, and harvest select crops. A share of the crop is left for wildlife use. Crops grown include cereal grains, such as corn, wheat, barley, and oats. In the case of cereal grains the grower is required to leave 30 percent of crops standing as forage for wildlife. Another crop grown is green forage, such as pasture grass for hay or clover for seed. In this case, the grower harvests all the crop and then mows the area in late summer or early fall to provide green forage primarily for geese.

The refuge currently has cooperative farming agreements on the Onion Flats and Wapato Lake Units. Crops on the Onion Flats Unit are naturally flooded as fall rains begin and standing water accumulates or as the Tualatin River backs up into this area. Similarly, Wapato Lake starts to fill following fall and early winter rainy periods. Typically waterfowl will wait until rains begin before they begin foraging in grain fields, but they will begin to use green forage as soon as they arrive in fall. During periods of drought, when fields may not become flooded, waterfowl will begin to forage in dry grain fields after other sources of food in the vicinity have been depleted.

4.3.7.2 Regional Distribution, Conditions, and Trends of Croplands

The refuge is surrounded by a mixture of urban and rural land uses. There are many farms in the area supporting a variety of crop types including small grains and green forage. The primary difference in private management is that most small grains are tilled under after harvest in early fall to prepare for the next crop and green forage areas may also be tilled under if on a rotational schedule. However, many fields retain forage values for wildlife whether tilled or not. Many farmers rotate crops from year to year, and some crops may not be attractive to wildlife. Landowners may also convert field crops to orchards, berry crops, or nursery stock, which have different values for wildlife.

4.3.7.3 Key Species Supported

Croplands primarily support foraging for waterfowl such as dabbling ducks and grazers such as Canada geese and American wigeons. Other birds commonly observed in this habitat type include great blue herons, shorebirds, and grassland songbirds. Many small rodents such as Oregon voles reproduce here, providing a prey base for coyotes and raptors such as northern harriers, red-tailed hawks, and American kestrels.

4.3.7.4 Refuge Management Activities

Management activities are typically limited to overseeing cooperative farming activities and, in the case of the Wapato Lake Unit, managing water levels necessary for planting and irrigation.

4.3.8 Ruderal Lands

4.3.8.1 Overview

Currently there are approximately 181 acres of ruderal uplands and 68 acres of ruderal wetlands on the refuge. Ruderal uplands are lands that are typically above the annual floodplain but may experience occasional flooding from extreme events. These lands have been fallow for some time and typically are dominated by non-native vegetation. Ruderal wetlands are lands typically within the annual floodplain, or they are saturated or inundated during some part of the year. These lands were often former pasture lands used for summer grazing.

4.3.8.2 Regional Distribution, Conditions, and Trends of Ruderal Lands

Ruderal lands in the surrounding area are usually limited to farm field edges or transitions between habitat types that remain unmanaged. Occasionally, growers will abandon a field or orchard and weeds will invade, creating a ruderal condition. If the field is left unmanaged for some time, native species may pioneer into the area and begin to transform the tract to a mix of native and non-native species.

4.3.8.3 Key Species Supported

Ruderal lands may support a number of species such as great blue herons, sparrows, and grassland songbirds. Many small rodents such as Oregon voles reproduce here. Raptors such as red-tailed hawks and American kestrels may forage here.

4.3.8.4 Refuge Management Activities

Many of these lands have undergone pretreatment activities prior to restoration. Pretreatment activities may include removal of non-native trees, mowing, discing, or application of herbicide. It is the refuge‟s intention to convert ruderal lands to native habitat types.

4.4 Major Species Groups

A wide variety of fish and wildlife use refuge habitats during all or part of their life. Appendix E contains a listing of ROCs that inhabit the refuge, and Appendix N is a listing of all known plants, fish, and wildlife that have been documented on the refuge. Large numbers of waterfowl use refuge wetlands during fall and winter, and some remain to breed during spring and summer. Shorebirds and marsh birds use the refuge to some extent year-round, but peak numbers typically occur during spring. Some species in these guilds breed on refuge lands or nearby, while others are migrants. Both resident and migrating songbirds use all refuge habitat types. Many species of neotropical migrant songbirds breed here during spring and summer, and many species of raptors use the refuge during most seasons of the year. Mammals, amphibians, and reptiles are present on the refuge year-round, but some of these species are secretive and may not be readily observed during most of the year. Many species of fish, some of which are migrants, inhabit waterways on and adjacent to the refuge.

4.4.1 Waterfowl

Providing high-quality habitat for waterfowl has been one of the priorities on the refuge since its establishment. Waterfowl are primarily associated with wetlands; however, they also use upland grasslands and croplands. Detailed weekly winter waterfowl surveys have been conducted on the refuge since 2000, and the area surveyed has increased over time as land has been acquired and/or restored. Surveys are conducted from September through at least February each year. Typically, few numbers and species of waterfowl breed on the refuge and surrounding areas. A limited number of western Canada geese, mallards, gadwalls, cinnamon teal, hooded mergansers, and wood ducks annually raise a few broods. Buffleheads, northern shovelers, and blue-winged teal are rare breeders here. In early fall, waterfowl numbers remain low as migration begins (Figure 4-1); their numbers then increase sharply during November. Numbers remain relatively high to the end of January when waterfowl hunting season ends, and then birds tend to disperse to nearby private lands before migrating north near the end of March. The refuge lies in the Pacific Flyway, where birds migrate

primarily from breeding grounds in Alaska, British Columbia, Alberta, the Yukon, and Northwest Territories, and to a lesser extent from Saskatchewan. For many of these birds, the refuge is an important stopover to wintering areas in California and Mexico, and for others it is their southern terminus, where they spend the winter.

Photo 4-7. Waterfowl. Gary Kramer/USFWS.

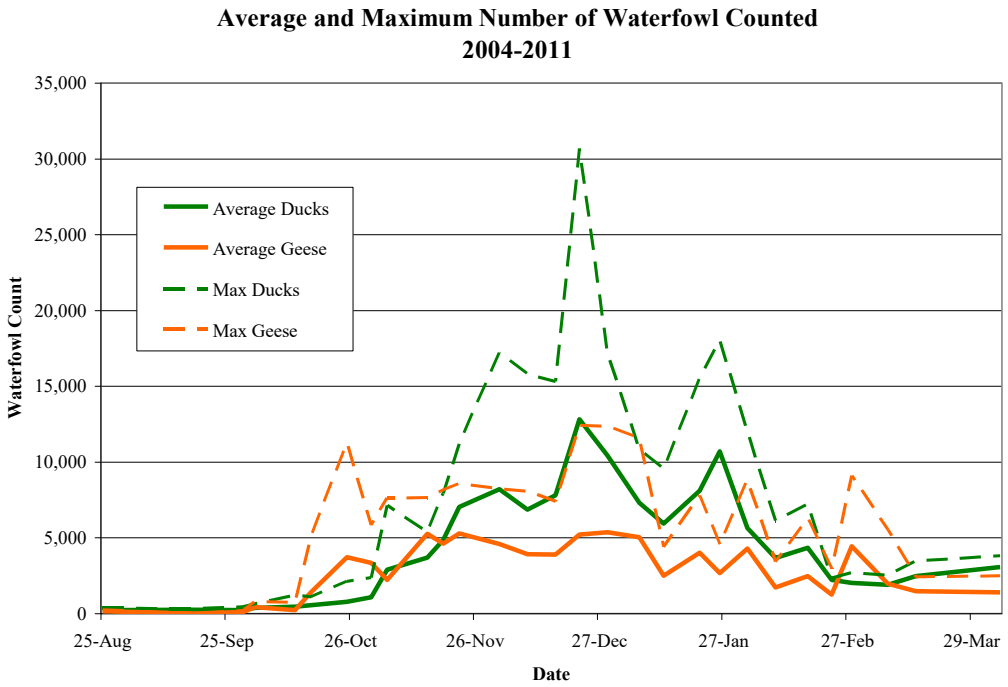

Figure 4-1. Average and maximum number of waterfowl counted on refuge lands during regular weekly surveys from 2004-2011.

Note: On December 16, 2010, a maximum of 71,601 ducks were counted, but this data point was removed to make the chart more readable.

4.4.2 Songbirds

The refuge supports a host of both resident and migratory songbirds that use all of the habitat types represented here. About 100 songbird species have been identified on the refuge and many of those species breed here. Point count surveys have been conducted to identify species using the refuge, and a bird banding program has been established under the Monitoring Avian Production and Survival protocol to assess productivity and survival of locally breeding birds. These surveys will help to determine long-term trends in songbird populations on both a local and regional scale.

4.4.3 Shorebirds

There are relatively few shorebirds that use the refuge, and species diversity is low. Twenty-one species have been recorded, but many of those are one-time or rare sightings. Killdeer, spotted sandpipers, and Wilson‟s snipe are among the most numerous; all of them breed at the refuge. Least and western sandpipers, dunlin, lesser yellowlegs, and long-billed dowitchers are also commonly sighted during migration. Regular weekly surveys are conducted from April through September on several of the Sherwood Units. Weekly counts average fewer than 50 individuals, but may number several hundred on rare occasions. Although some shorebirds do breed here, the majority of shorebirds are migrants, passing through during spring and late summer and fall. Typically, mudflats in wetland margins are available for shorebird foraging from early spring through summer as managed wetlands are drawn down on their annual cycle.

Photo 4-8. Long-billed dowitcher. © Ed Bustya.

4.4.4 Marsh Birds and Waders

Marsh birds use both herbaceous and scrub-shrub wetlands, and to a lesser extent adjacent uplands. Surveys for sora, Virginia rail, American bittern, American coot, and pied-billed grebe are conducted using recorded calls from April through June each year. Breeding has been verified on the refuge for each of these species, although they occur in relatively low numbers. Early spring drawdown of wetlands to meet other management objectives may have a negative effect on these species. The first

confirmed breeding of American bitterns on the refuge was observed at a recent scrub-shrub wetland restoration site.

Wading birds such as great blue herons, great egrets, and green herons are surveyed in conjunction with shorebird and waterfowl surveys. Great blue herons and great egrets are present nearly year-round on the refuge, while green herons are usually only observed during summer.

4.4.5 Raptors

At least 18 species of raptors have been recorded on the refuge including eagles, hawks, falcons, and owls. Bald eagles, red-tailed hawks, American kestrels, and great horned owls are year-round residents. Other species such as peregrine falcons are usually only present during winter when waterfowl populations are high. Some species are regular summertime visitors, such as ospreys that forage on fish as wetlands are drawn down. Raptors are specialized in the habitat types that they use and may be observed in most habitat types on the refuge. Eagles and peregrine falcons use wetlands for hunting waterfowl. Great horned owls hunt rodents in the forest at night while Cooper"s hawks hunt in the forest during daylight in search of songbirds. Northern harriers hunt in the uplands, croplands, and wetlands during the day, while barn owls hunt open fields during the night and evening. The refuge has installed American kestrel nesting boxes and will monitor these from time to time to determine nesting success. There are no other surveys that specifically target raptors, although raptors are recorded during songbird point count surveys.

Photo 4-9. American kestrel. Robert Burton/USFWS.

4.4.6 Mammals

Many mammal species, large and small, use the various habitat types on the refuge. Large mammals such as black-tailed deer and the occasional elk are observed on the refuge. Smaller mammal species such as coyote, river otter, bobcat, raccoon, beaver, muskrat, and mink are present on the refuge, but are less frequently observed. No regular surveys are conducted for the above-mentioned groups of

mammals. Smaller, yet more numerous, are squirrels, voles, mice, and shrews. Bats are also known to use refuge lands, but no surveys have been conducted to determine species present. From 2003 to 2005, a small mammal survey was conducted, which identified 14 species on one parcel. By far the most numerous species in this study was deer mouse.

Photo 4-10. Black-tailed deer at Atfálatʻi Unit. Peter Schmidt/USFWS.

4.4.7 Fish

Numerous fish species have been noted using the waters in and adjacent to refuge lands. The refuge has conducted fish trapping in refuge wetlands following river flood events to determine if salmonids were entering wetlands from the river and subsequently escaping as water levels receded. No salmonid species were detected during any surveys. Several species of both native and non-native fish were detected during these surveys. Native species included western brook lamprey, three-spined stickleback, and sculpin. Non-native species included carp, mosquito fish, and bluegill. From 1999 to 2001, ODFW conducted fish surveys in the Tualatin River Basin (Leader 2001) and recorded 16 species of fish from seven families. The survey noted that only 0.16 percent of the total sample were non-native fish.

Upper Willamette River steelhead were listed as threatened species in August 1999 (Federal Register 1999a) and Chinook salmon were listed as threatened species in March 1999 (Federal Register 1999b), and critical habitat was designated in 2005 (Federal Register 2005) in the upper Tualatin River Basin (roughly defined as the Tualatin River and its tributaries upstream of Highway 219 near Hillsboro), excluding North Rock Creek. Leader (2001) identified both rainbow trout (genetically identical to steelhead) and Chinook salmon in the Tualatin River system. Coho salmon, while not native to the Tualatin River system, were introduced and are now a self-sustaining population in the basin.

Non-native fish such as carp, bass, catfish, and sunfishes are disruptive to and can outcompete native species. Carp uproot and consume submergent vegetation important to native species and cause

turbidity, thus inhibiting further growth of vegetation. Bass, catfish, and sunfishes directly consume native species, such as red-legged frogs, and also indirectly affect native species by consuming food such as invertebrates that native species forage upon.

Native fish species such as lampreys, sculpin, and three-spined sticklebacks have also been recorded in refuge waters and are an important part of the aquatic community. The presence of lampreys is a good indicator of water quality as they will not persist in poor-quality habitats. Three-spined sticklebacks, which were numerous in our sampling, may be beneficial in removing mosquito larvae from slow-moving waterways (Sharp 2000).

4.4.8 Reptiles

Reptiles observed on the refuge include western pond, painted, and non-native red-eared slider turtles, alligator lizards, rubber boa, and various varieties of garter snakes. Non-native snapping turtles have been documented in the Tualatin River but have not been observed by refuge staff or volunteers. Turtles are commonly observed basking on logs in the river or on herbaceous wetlands. Garter snakes are observed in most open habitat types throughout spring and summer. No surveys for reptiles are currently being conducted.

Photo 4-11. Garter snake. © Ed Bustya

4.4.9 Amphibians

Many species of amphibians have been documented on the refuge including chorus frogs, red-legged frogs, and non-native bullfrogs; long-toed and northwestern salamanders; and rough-skinned newts. These species breed in refuge wetlands and use adjacent uplands for part of their life cycles. Surveys for amphibian egg masses were conducted in late winter and spring during 2010 and 2011 on several refuge wetlands. Results showed red-legged frogs, chorus frogs, and long-toed salamanders were breeding in refuge wetlands.

4.5 Threatened, Endangered, and Other Special Status Species

One goal of the Refuge System is "to conserve, restore where appropriate, and enhance all species of fish, wildlife, and plants that are endangered or threatened with becoming endangered." In the policy clarifying the mission of the Refuge System, it is stated, "We protect and manage candidate and proposed species to enhance their status and help preclude the need for listing." In accordance with this policy, the CCP planning team considered species with Federal or state status, and other special-status species, in the planning process.

Currently there is one plant species (Nelson‟s checker-mallow) that is federally listed as threatened, and two fish species (upper Willamette River run Chinook, and upper Willamette River run steelhead) that are federally threatened and occur or could occur on the refuge. These three species are also state-listed as threatened. Meadow checker-mallow is a state-listed candidate plant species that occurs on several areas of the refuge. Birds considered species of concern that have been observed on the refuge are olive-sided flycatcher, yellow-breasted chat, acorn woodpecker, Lewis‟ woodpecker, and band-tailed pigeon. Reptiles and amphibians considered species of concern include western pond turtle and northern red-legged frog. Fish species considered species of concern that may occur in refuge waters are Pacific lamprey and coastal cutthroat trout.

Photo 4-12. Nelson‟s checker-mallow. Jeff Dillon/USFWS.

In February 2008, Nelson‟s checker-mallow was planted in seven plots on three of the Sherwood Units: Atfálat‟i, Tualatin River, and Riverboat. Nelson‟s checker-mallow was known to occur on one parcel of the Atfálat‟i Unit prior to this planting effort. In 2010, additional plants were added to the plots on the Atfálat‟i and Riverboat Units. The plants have experienced good survival since installation and will continue to be monitored.

4.6 Invasive and Nuisance Species

Refuge personnel expend considerable resources in terms of funding and staff and volunteer time managing invasive and nuisance species each year to provide quality habitat for native species. Management of invasive and non-native species follows the practices set forth and described in the IPM Plan in Appendix G. This plan describes priorities for response by the refuge and the various methods used to manage these species. The refuge has and will continue to follow the practice of "Early Detection and Rapid Response" (EDRR). Preventing the introduction of invasive species is the first line of defense in the battle against new invasions. However, it is inevitable that new introductions will occur. The next best line of defense is to manage these invasions through EDRR. EDRR is the principle of targeting noxious weed infestations when they first arrive in a given area, while their populations are small and localized. This effort greatly increases the likelihood that new invasions are addressed immediately, before the species can become established and widespread.

Table 4-2 lists the target non-native and invasive species for the refuge; however, this list is not comprehensive. Plant species are by far the most problematic, but non-native fish and wildlife species also have important direct and indirect impacts to native habitat types, native fish and wildlife, and refuge infrastructure.

Table 4-2. Common and Scientific Names of Target Non-native Invasive Species on Refuge

Common Name	Scientific Name	State Noxious Weed*
Plant Species		
Bermuda grass	*Cynodon dactylon*	
Bull thistle	*Circium vulgare*	B
Canada thistle	*Circium arvense*	B
Cocklebur	*Xanthium strumarium*	B
Cut leaf teasel	*Dipsacus fullonum*	B
English holly	*Ilex aquifolium*	
English ivy	*Hedera helix*	B
Field bindweed	*Convolvulus arvensis*	B
Himalayan blackberry	*Rubus discolor*	B
Japanese knotweed	*Polygonum cuspidatum*	B
Poison hemlock	*Conium maculatum*	B
Purple loosestrife	*Lythrum salicaria*	B
Red hawthorn	*Crataegus monogyna*	
Reed canarygrass	*Phalaris arundinacea*	
Scotch broom	*Cytisus scoparius*	B
Tansy	*Tanacetum vulgare*	
Velvet grass	*Holcus lanatus*	
Velvetleaf	*Abutilon theophrasti*	B
Wildlife Species		
Bullfrog	*Rana catesbeiana*	
Nutria	*Myocastor coypus*	
Feral cat	*Felis catus*	
Red-eared slider (turtle)	*Trachemys scripta elegans*	

Table 4-2. Common and Scientific Names of Target Non-native Invasive Species on Refuge

Common Name	Scientific Name	State Noxious Weed*
European starling	*Sturnus vulgaris*	
House sparrow	*Passer domesticus*	
Fish Species		
Bass	*Micropterus* sp.	
Catfish	*Ameiurus* sp.	
Common carp	*Cyprinus carpio*	
Mosquito fish	*Gambusia affinis*	
Sunfish	Family Centrarchidae	

*State B-listed plants are those defined as "a weed of economic importance which is regionally abundant, but which may have limited distribution in some counties" (ODA 2012).

There are species such as reed canarygrass listed in Table 4-2 that are not on the state"s list of noxious weeds but are very problematic for the refuge because of their aggressive nature, difficulty of control, and abundant distribution. This list is not presented in priority order, and some plant species may be treated more aggressively in one season than another depending on staff availability, extent of distribution, or threat presented to native wildlife or habitats. The invasive plant species listed above often form a monoculture and compete with native plants. Many species of native wildlife have evolved with native plants and either cannot use non-native plants or have reduced benefits from them. Many plants such as Himalayan blackberry form very dense thickets that may actually hinder wildlife movement. Reed canarygrass invades wetlands, forming dense monocultures and preventing beneficial native plants from growing. Both purple loosestrife and Japanese knotweed have been found on the refuge and have been vigorously removed before they could become established. Invasive tree species such as English holly and red hawthorn crowd out native species and spread prolifically by means of thousands of seeds annually per tree. These trees are removed as time allows in established habitat types and are vigorously controlled in new restoration areas.

Invasive wildlife regularly observed on the refuge include nutria and bullfrogs. Nutria, a native of South America, were introduced for fur farming and escaped or were released as fur prices dropped. They are well established in our area, and eradication efforts would only be successful if adopted on a regional basis. Climate change may contribute to their spread if winter climate becomes more favorable for breeding and survival. Nutria directly affect wetland and adjacent habitat types by foraging on native plants, and they also affect native wildlife such as muskrats by direct competition and displacement. They affect refuge infrastructure such as levees and water control structures by burrowing into levees, causing leakage through the levees and/or causing cave-ins of dens presenting safety hazards to vehicles traveling on levees; they also burrow along the side of culverts, causing a "piping" effect whereby water leaking along the outside of the pipe erodes the earthen material and causes a washout of the pipe. Lethal means such as shooting and trapping, wherever feasible, are used to control nutria.

Bullfrogs, which are native to the southeastern United States, eat native frogs and many other wildlife species such as ducklings. Bullfrogs thrive in wetlands that retain water year-round and can be at least partially controlled by completely drawing down wetlands during summer. The refuge contains managed wetlands that cannot be completely drawn down due to either incorrectly situated water control structures or incorrectly contoured basins that do not allow for complete drainage.

European starlings are cavity nesters and displace and sometimes kill native cavity nesters such as Western bluebirds, American kestrels, and white-breasted nuthatches.

Photo 4-13. Non-native nutria. Peter Schmidt/USFWS.

The Tualatin River watershed contains many species of non-native fish. These species were either brought in for sport fishing, as commercial species, or were accidentally introduced. Non-native fish displace and compete directly with native species by preying on native species, and/or disrupting native plant growth. Sunfish may eat larval amphibians and native fish, carp eat submergent vegetation important to wildlife species and cause turbidity, which further reduces plant growth, and bass eat native fish and wildlife species. Completely drawing down wetlands in summer may help reduce these species on a site-specific basis, but they likely will not be eradicated in the watershed as a whole. As mentioned above in the discussion on bullfrogs, drawing down the wetlands completely would help reduce non-native fish on a localized basis but is not a likely scenario. Screening water diversions from creeks and the river would help reduce the presence of non-native as well as native fish in wetland areas.

Nuisance species on the refuge may include such native animals as beavers, elk, Canada geese, and others, depending on circumstances. Beavers are native and are encouraged in most areas. However, they can become problematic by plugging up water control structures on a daily basis or cutting down trees in restoration areas. Sometimes it is necessary to control beavers using lethal means. Relocation is seldom successful as most suitable beaver habitat is already occupied and problem beavers are likely to return to their original capture site. Elk have not been a problem on the refuge to date, but with acquisition and restoration of large tracts of land in the Wapato Lake Unit this may be an issue in the future. ODFW considers the Willamette Valley an “elk de-emphasis zone” to prevent conflicts with agricultural interests. A population of elk residing on refuge lands and foraging on neighboring agricultural lands would cause conflict with neighboring landowners. In addition, elk crossing Highway 47 or Springhill Road to and from refuge property would create a safety hazard to vehicles.

4.7 Wildlife and Habitat Research, Inventory, and Monitoring

There are several regular inventory and monitoring surveys, and occasional research studies, conducted on the refuge. Table 4-3 lists the regular surveys that are conducted almost every year to determine habitat conditions, restoration/enhancement response to management activities, and wildlife response and population trends. In addition, research is conducted by refuge staff or outside organizations such as universities and USGS to help inform management decisions.

Table 4-3. Regular Surveys Conducted on Refuge Lands and Their Usual Timetables

Habitat Type or Guild	Survey Type	Timetable
American kestrel	Nest box	Spring/early summer
Amphibians	Egg mass	Late winter/spring
Fish	Trapping/identification	Winter/flooding
Marsh birds	Recorded call-back	April-June
Nelson‟s checker-mallow	Inventory	June-July
Shorebirds	Instantaneous scan	April-September
Songbirds	Point count	April-June
Songbirds	Monitoring Avian Production and Survivorship mist netting	May-August
Tree and shrub	Fixed plots: survival and growth	Summer/early fall
Wading birds	Instantaneous scan	Year-round
Waterfowl	Instantaneous scan	September-February
Western bluebird	Nest box	Spring/summer
Wetlands	Transects: plant species/density	Summer/early fall

In addition to surveys listed in Table 4-3, other surveys are conducted periodically by refuge staff and others:

- Mosquito larvae surveys were conducted during summer for several seasons and revealed very low numbers of larvae in refuge wetlands.
- A feasibility study was conducted in 2004 to determine if boxes for cavity nesting waterfowl would be beneficial. The study revealed adequate natural cavities existed on the refuge and brood water was limited.
- A survey for freshwater mussels was conducted in 2009 and revealed the presence of native western pearlshell mussels in Chicken Creek.
- USGS conducted a survey for non-native crayfish and found none in waters in and adjacent to the refuge.
- University researchers conducted a study over a three-year period to inventory small mammals and determine prevalence of hanta virus.
- Extensive surveys have been conducted by qualified volunteers to identify, collect, and catalog plant species throughout the refuge.

- Refuge staff and volunteers have undertaken a project to map invasive plant species throughout the refuge using global positioning system (GPS)/geographic information system (GIS).
- In 2011 the refuge began a collaborative study with USGS and other partners to obtain a detailed topographic survey and water quantity/quality study at the Wapato Lake Unit to guide future restoration efforts.

Chapter 5
Human Environment

USFWS

Chapter 5 Human Environment

5.1 Cultural Resources

Archaeological and other cultural resources are important components of our nation's heritage. The U.S. Fish and Wildlife Service (Service; USFWS) is committed to protecting valuable evidence of plant, animal, and human interactions with each other and the landscape over time. An example of an interaction would be the importance of specific plants to Kalapuya Indians, or the use of fire to burn open spaces that then provided habitat for elk and deer. These interactions may include previously recorded or yet undocumented historic, cultural, archaeological, and paleontological resources as well as traditional cultural properties and the historic built environment. Protection of cultural resources is legally mandated under numerous Federal laws and regulations. Foremost among these are the National Historic Preservation Act (NHPA) as amended, the Antiquities Act, the Historic Sites Act, the Archaeological Resources Protection Act (ARPA) as amended, and the Native American Graves Protection and Repatriation Act (NAGPRA). The Service's Native American Policy of 1994 articulates the general principles guiding the Service's relationships with Tribal governments in the conservation of fish and wildlife resources (USFWS 1994). Additionally, the Tualatin River National Wildlife Refuge (the refuge) seeks to maintain a working relationship and consult on a regular basis with the Tribes that are or were traditionally tied to lands and waters within the refuge.

Since cultural resources encompass many elements and time periods, the following simple temporal divisions were used to distinguish and categorize this brief review of the following resources.

- Pre-recorded history
- Pre-contact Native American traditions
- Post-contact traditions (Native American, Early British, and United States)
- Recent U.S. settlement and economic development period
- Historic and prehistoric sites on the refuge

Cultural resources can be of significant cultural, scientific, and educational importance. It is essential that the Service look beyond compliance with cultural resource laws to ensure protection of these nonrenewable resources. Of critical importance is the development of close working relationships with those that express affinity with the refuge's cultural resources, such as Native Americans, historians, and educators.

There are seven recorded prehistoric sites and six recorded historic sites within the refuge boundaries. Other historic sites and features may exist on the refuge that have not been recorded. Several prehistoric and historic sites and/or features have been recorded within 1 mile of the refuge.

Two of the historic sites within refuge boundaries have been evaluated and determined ineligible to the National Register of Historic Places (NRHP). One site has been determined eligible to the NRHP. It is highly probable that additional archaeological sites will be exposed by human actions or natural causes in future.

5.1.1 Prehistoric and Ethnographic Resources

5.1.1.1 Prehistoric and Ethnographic Setting of the Refuge Region

The meandering Tualatin River and its banks are home to native fish, beaver, deer, raptors, songbirds, and plants, all of which have been impacted as their habitats have been altered due to agriculture, urban development, and changes in land use practices. Yet these resources were abundant when the Atfálat'i (At-fahl-a-ti) Tribe of Kalapuya Indians lived, hunted, and gathered food on the Tualatin River floodplain.

Archaeological research on the refuge has revealed a history of humans hunting and gathering that dates back over 2,000 years. Camas, tarweed, and wapato were some of the most important plant foods. Long before the Wapato Lake Unit of the refuge was turned into an irrigated agricultural area by settlers in the late nineteenth century, it was an important place where all the villages of Atfálat'i Kalapuya gathered in autumn to harvest wapato. The Kalapuya routinely burned the valley floor for a variety of benefits: to increase grazing for game animals such as elk and deer, to maintain and spread camas habitat, to increase production of acorns, and to prepare for tarweed harvest, to name a few.

As Zenk (1976:358) reported:

> … each Tualatin winter-village group had its own tarweed-producing area within which individuals (at least, we would presume, wealthy individuals) owned their own sub-plots. These areas were set on fire about August. Women then went out with rawhide buckets and paddles; the seeds were beaten from the plants into the buckets. It is stated that each "lot" (individually owned plot) might produce 10-20 bushels of seeds.

Understanding these past land uses by the valley's original inhabitants offers critical lessons and has important ramifications regarding habitat restoration and management decisions on the refuge today. What food or tools they could not obtain along the river and its environs, the Kalapuyans obtained via trade with their neighbors. Obsidian, a volcanic rock used to make arrow points, has been found from as far away as the east side of the Cascades. Historical accounts (Zenk 1976) suggest that the Tualatin River Valley, including the area of the refuge, supported at least 20 native winter villages.

Wapato Lake was a major habitation location for the Tualatin Indians, also known as the Wapato Lake Indians, one of approximately 13 groups of Kalapuya people. The territory of the Kalapuyans extended throughout most of the Willamette River Valley as far south as the Umpqua River. Named for the wapato plant that grew in and was harvested from it, Wapato Lake served as a seasonal community gathering place for the bands of Kalapuyans.

The first recorded contact between Euro-Americans and the Kalapuyans occurred in 1812, when the Kalapuyan population may have been as great as 10,000 people. From 1812 to the 1840s, Kalapuyans had many contacts with fur traders. Though it occurred even before recorded contact, the smallpox epidemic of 1782-1783 and the later malaria epidemic of the 1830s had dramatic impacts on the Kalapuyan population, and on other native groups. Other new illnesses soon followed. By the 1850s there were few Atfálat'i left to claim their traditional lands, and the survivors were ultimately removed to the Grand Ronde Reservation.

Euro-American settlers began arriving in the 1840s, displacing the native population and turning the fertile Tualatin River bottomlands to agricultural purposes. Land clearing and the construction of

farming infrastructure such as dikes and ditches drained Wapato Lake and changed the landscape from one of riparian forest to agricultural fields. Towns grew up around the homes of the earliest settlers, intensified by the development of a Portland-to-Corvallis railroad that began in the late 1860s. Many towns bear the names of their founders or influential early landowners (e.g., Gaston, Seghers, Dilley).

Photo 5-1. For thousands of years, the Kalapuya people called Willamette Valley their home. Smithsonian Library (Wilkes 1845:223).

5.1.1.2 Known Prehistoric Sites

There are seven prehistoric archaeological sites recorded on the refuge. These sites are located throughout the refuge on both the Sherwood (three sites) and Wapato Lake (four sites) Units. In addition to the prehistoric sites, there is also a collection of artifacts donated to Portland State University by a private landowner. These artifacts came from property within and immediately adjacent to the refuge. Currently, the status and location of the collection is unknown. Table 5-1 summarizes the sites and surveys.

Table 5-1. Prehistoric Resources within Refuge Boundaries

Site#	Unit	Date Recorded	Site Type	Materials	NRHP Eligibility	Notes
35WN17	Wapato Lake	1977		Recorded based on informants' descriptions	Potentially eligible	State Historic Preservation Office (SHPO) report 11951 (testing)
35WN19	Wapato Lake	1977		Recorded based on informants' descriptions	Potentially eligible	SHPO report 9734 (survey)
35WN29	Wapato Lake	1982	Lithic scatter	Pestle, projectile points, fire-cracked rocks (FCR), charcoal	Potentially eligible	
35WN30	Wapato Lake	1982	Lithic scatter	Obsidian flake, FCR, basalt debitage	Potentially eligible	
34WN43	Atfálat'i	1997	Lithic scatter/FCR/artifact concentration	Period III (40000 BC-250 BC) and Period IV (250 BC-AD 1700)	Eligible	Tested
34WN44	Atfálat'i	1997	Lithic scatter/FCR/artifact concentration		Potentially eligible	
35WN46	Atfálat'i	2001	Lithic scatter		Eligible	Tested

5.1.2 Historic Resources

5.1.2.1 Known Historic Sites

Parcels acquired within the approved boundaries of the Tualatin River National Wildlife Refuge often come with standing structures associated with the area's agricultural history. After being acquired, several of these historic farm complexes and/or residential structures have been

documented and evaluated by the Service's Cultural Resources Branch (Table 5-2). Upon evaluation and determination of noneligibility to the NRHP, the subject buildings may be slated for removal through demolition and salvage if they pose a risk to humans or wildlife. In one case, a historic structure was determined eligible, and the necessary documentary steps were taken to mitigate its removal in compliance with the NHPA.

Photo 5-2. Onion barns are part of the historic structure of the refuge. Nick Valentine/USFWS.

Table 5-2. Historic Resources within Refuge Boundaries

Site Name	Site Type/Features/ Materials/Notes	Condition (integrity)	NRHP Eligibility
Cranfield Homestead	Estimated located as per 1852 General Land Office (GLO) map (GLO 1952)	Some brick/ceramic/glass observed	N/A
McKinney Field	Estimated located as per 1852 GLO map	No existing evidence	N/A
White-Ditmman Onion Barn	Onion barn reflecting agricultural function. A memorandum of agreement (MOA) was prepared to document it before demolition	Demolished	Eligible
Naujock House	Built in 1891 by emigrants from Germany who arrived in the area in 1876. Replaced earlier log house	In use, modified	Not eligible
Naujock Barn and	Gambrel roof barn, built in	Not in use	Not eligible

Table 5-2. Historic Resources within Refuge Boundaries

Site Name	Site Type/Features/ Materials/Notes	Condition (integrity)	NRHP Eligibility
Granary	1930s along with brick building (granary and potato cellar). SHPO recommended retaining or if necessary, salvaging site		
Cereghino Farm Complex	Onion drying barn, house, and outbuildings associated with onion farm complex. House is used for office space and other buildings are used for storage or are vacant		Not evaluated

5.2 Refuge Facilities

There are numerous refuge facilities that require upkeep and maintenance, which are performed by one maintenance employee and volunteers, as available. These facilities serve both the visitor services and biological programs, and range from boundary fencing to residences to public use facilities. In addition, there are structures that serve as offices for other Service programs, such as the Cultural Resources Program Office.

5.2.1 Boundary Fences and Markers

There are approximately 8.4 miles of boundary fence around various tracts of the refuge. The majority of the fencing is around tracts on the Riverboat Unit.

5.2.2 Entrance and Access Points

The primary public entrance to the refuge, opened in 2006, is from Oregon State Highway 99W, between Sherwood and King City. This entrance is allowed through a permit issued by the Oregon Department of Transportation (ODOT) and was constructed according to ODOT specifications, which do not include a deceleration lane from the highway to the refuge or an acceleration lane from the refuge to the highway. This has caused some safety concerns for visitors. Four state highway recreation signs direct visitors into the refuge. A secondary public entrance off of Washington County's Roy Rogers Road provides access to the west side of the Atfálat'i Unit and the Wayside Overlook (see Figure 5-1 and Appendix P, Map 10). There are no other public access points to the refuge. The refuge has provided input to a number of regional trail planning projects that have the potential of connecting to refuge access points. These include Tonquin Trail planning by Metro, a tri-county regional government that serves Multnomah, Clackamas, and Washington Counties; Cedar Creek Trail planning by the City of Sherwood; and West Bull Mountain Concept Plan by Washington County.

Figure 5-1. Public use facilities and regulations.

5.2.3 Administrative Facilities

Administrative facilities are located on the Atfálat'i Unit of the refuge. The 4,058-square-foot refuge headquarters, completed in 2007, includes staff offices and other work area amenities consisting of a documents work area, conference room, reception area, and space for volunteers. New facilities, including the refuge headquarters, Wildlife Center, environmental education shelter, fee collection booth, and parking lots have all been designed and constructed to meet sustainable design standards of the silver level of LEED (Leadership in Energy and Environmental Design). There is a fire suppression pump and a water storage building that serves the public use facilities and refuge headquarters.

There are other refuge buildings being used by Service Regional Office employees as offices including the Cultural Resources Program Office located at the Onion Flats Unit.

The shop area on the Tualatin River Unit contains facilities that include a 3,750-square-foot shop containing the maintenance office, vehicle/equipment repair bays, and tool storage. There are another six buildings located at the shop area that support refuge maintenance functions. These include three pole barns used for equipment storage, a hazardous materials storage building, a wooden lean-to for equipment implement storage, and a storage shed for environmental education materials.

The refuge has numerous barns, outbuildings, and homes (houses and mobile homes) that came with the land when property was acquired. Many of these buildings are in poor condition and need to either be demolished or undergo a complete overhaul to be functional. There are seventeen barns and outbuildings scattered throughout the Sherwood Units and four at the Wapato Lake Unit. Along with the barns and outbuildings, there are two houses and one manufactured trailer on the Sherwood Units, and two homes and one manufactured trailer at the Wapato Lake Unit. Altogether, there are 31 buildings on the refuge.

5.2.4 Roads, Trails, and Parking Areas

Tualatin River National Wildlife Refuge opened its Atfálat'i Unit to the public in 2006 after two years of construction that provided access from adjacent highways and a variety of outdoor wildlife recreation and education features. Roads and parking features include: a 0.3-mile headquarters entrance road and bus turnaround with parking for 60 cars plus three buses/recreational vehicles (RVs); a 0.1-mile wayside entrance road with parking for six cars and one RV; and five bicycle racks. In the fall of 2010, both entry roads and parking lots were upgraded from gravel to a combination of pervious paver parking stalls and asphalted driving lanes—all stormwater flows into a bioswale in the center of the parking areas. The bioswale is designed to both slow the rate of stormwater runoff and provide natural filtration and water quality treatment.

Trail features include: a 1.1-mile year-round trail; a 0.2-mile photography blind spur trail; two foot bridges; a 3.1-mile seasonal trail, which is part of a gravel refuge road used by staff; a plaza overlook; a bioswale overlook; a wetland observation deck; a wayside overlook; a river overlook; a wildlife photography blind; and five environmental education study sites. All trail features were opened with the refuge in 2006, except for the bioswale overlook, which was completed in 2011. Numerous informational, regulatory, and directional signs are located throughout the refuge's public use areas. The refuge is open daily from dawn to dusk. To provide these high-quality facilities and maintain compatible wildlife-dependent recreation, dense riparian vegetation plantings were planted

in 2004 and 2005 along the planned trail corridor. These screens now provide "natural blinds" where visitors can observe wildlife while minimizing disturbance to the wildlife they are enjoying.

There are roads and parking areas that are not open to the public and serve solely administrative functions. Parking lots for the various residences and other structures include tracts on the Riverboat Unit (Harmon and Naujock tracts), Onion Flats Unit (Cereghino tract), Riverboat Unit (Dennis tract), and Wapato Lake Unit (Losey and Beecher tracts) and total 64,826 square feet of gravel and asphalt lots. Administrative roads throughout the refuge total 11.5 miles and are used to access areas for habitat management and maintenance. These roads are mostly gravel and require regular maintenance and upkeep. There is also a concrete road bridge that crosses Chicken Creek on the Atfálat'i Unit.

Photo 5-3. Wetland observation deck. USFWS.

5.2.5 Visitor Facilities

Outdoor facilities are complemented by a state-of-the-art, sustainably built Wildlife Center, which opened in 2008. The Wildlife Center encompasses 6,316 square feet, and includes an exhibit room, environmental education field laboratory, information desk, a Friends of the Refuge nature store, an indoor viewing area, and a multipurpose room. The center is currently open Tuesday through Sunday year-round. The center is typically closed on major holidays and for one to two weeks spanning the New Year holiday. Friends of the Refuge help staff the daily operation of the center by recruiting and training volunteers. The environmental education shelter, designed primarily to provide cover and education space for students visiting the refuge, was completed in the fall of 2010. The shelter can accommodate up to 65 students at a time. Approximately 25 percent of refuge visitors and students visit the Wildlife Center and/or environmental education shelter annually.

Photo 5-4. Wildlife Center. Kim Strassburg/USFWS.

5.2.6 Easements and Agreements

There is an intergovernmental agreement in place between the Service and Metro that has established a framework for the refuge to manage a portion of a property owned by Metro known as the Heritage Pine Natural Area. The property is approximately 50 acres in size, and the Service is performing restoration of a mixture of bottomland riparian forest, herbaceous wetland, and wet prairie habitats. Additionally, the Service is responsible for all funding, restoration, management, operations, and maintenance of the property. This agreement is for 10 years, with the option to extend upon agreement by both parties.

In 1992, the Service purchased a voluntary conservation easement on what is now the Wapato Lake Unit to manage the land for the purpose of habitat restoration. In agreement with the landowner, the refuge has the right to establish or reestablish habitat through various management tools. The purposes of this easement are the preservation and maintenance of wetland and floodplain areas as well as protection and enhancement of plant and animal habitat and populations. Easements are a cost-effective method of conservation, allowing us to work with landowners to protect the habitat on their land.

There are also several access easements that allow staff to access refuge property via private property. These are located at the Onion Flats, Riverboat, and Wapato Lake Units.

Photo 5-5. Water control structure. USFWS.

5.2.7 Dikes, Irrigation, Water Control Structures, and Pump Houses

The refuge manages herbaceous wetlands on several units. To manage these wetlands, the refuge manipulates water levels using a system of dikes, levees, water control structures, and pump houses. For the Steinborn tract on the Atfálat'i Unit, the main source of water is Chicken Creek, which was channelized to facilitate farming and is diverted to an irrigation canal to allow further diversion into specific wetland impoundments. At the point where Chicken Creek enters the refuge, there are fish ladders that were installed to facilitate fish movement past the diversion structure from the river to headwaters. There is also a fish screen in place to prevent fish from moving into the irrigation canal. To move the water through the five impoundments totaling 234 acres, a system of 15 water control structures and 2.23 miles of levees and dikes are used. There is a dilapidated pump that was used prior to refuge acquisition for farming and irrigation purposes. The refuge does not use the pump for its habitat management purposes.

The other tract on the Atfálat'i Unit that has managed wetlands is the Heritage Pine Natural Area, which is managed by the Service under a cooperative agreement with Metro, as described in Section 5.2.6. This unit has one herbaceous wetland of 6 acres that is managed by one water control structure, and receives water only from rainfall.

On the Tualatin River Unit, there are five wetland impoundments totaling 35 acres on the Dennis tract. Four of these are seasonal and rely on rainfall as their source of water. The main impoundment is also seasonal and is fed primarily by rainfall supplemented by a pump that uses water from the Tualatin River. The system for this unit contains one water control structure, the aforementioned pump, and 0.40 mile of levees and dikes.

On the Riverboat Unit, 48 acres make up four wetland impoundments that are managed by a system of two water control structures, three low-capacity wells, and 0.10 mile of levees and dikes. All four

wetlands received their water primarily from rainfall; however, the main wetland unit can also get limited water pumped from the wells.

There is a concrete pumphouse located on the Onion Flats Unit that was historically used for irrigation purposes prior to refuge acquisition. This pumphouse has fallen into disrepair and is not used by the refuge for habitat management purposes.

5.3 Public Use Overview

5.3.1 Public Use Program History

One of Tualatin River National Wildlife Refuge's current management priorities is to "provide high quality opportunities for wildlands and wildlife-dependent recreation and environmental education to enhance public appreciation, understanding, and enjoyment of the refuge's fish, wildlife, habitats, and cultural resources, with emphasis towards urban residents" (USFWS 2003a). This stems from the refuge's establishment under the guidelines of the Service's Urban Refuge Policy (341 FW 1) (Smith 1991), which strives to connect large populations of people to the concept of national wildlife refuges. In addition, the communities surrounding the refuge have expressed a desire for the refuge to provide a natural legacy where future generations can enjoy and learn about the outdoors. This foundation has led to a robust public use program at the refuge. The overarching goals of the visitor services program closely mirror national efforts to implement one of the six highest priorities of the Service, namely "Connecting People with Nature—Ensuring the Future of Conservation" (USFWS 2008b).

5.3.1.1 Visitor Experience

The protection of fish and wildlife and their habitats on the refuge provides the public with high-quality wildlife-oriented recreation, education, and interpretation opportunities. Visitors of all ages can experience the beauty of the Tualatin River Valley, view abundant wildlife, and discover how this urban national wildlife refuge represents the National Wildlife Refuge System (Refuge System). The Wildlife Center serves as a springboard by introducing the public to the refuge and its purposes, helping visitors hone their wildlife observation skills, and encouraging visitors to get outside and experience first-hand the wildlife wonders of the refuge. Throughout their visit, whether walking on trails, participating in an education program, or enjoying exhibits, visitors are reminded that they play a role in the health and future of the refuge, the watershed, the Refuge System, and ultimately of fish and wildlife conservation.

5.3.2 Open and Closed Areas

The Atfálat'i Unit is open year-round during daylight hours for wildlife-dependent recreation and education. Access within this unit is limited to defined public use areas. Most of the use originates from the headquarters parking area and Wildlife Center, and is concentrated along the year-round trail and its associated features (see Figure 5-1 and Appendix P, Map 10). The spur trail to the wildlife photography blind is open year-round by registration only. From May 1 through September 30, visitors are permitted to walk on 3.1 miles of service roads. From October 1 through April 30, these service roads are closed to all public entry to provide sanctuary for wildlife.

All other areas of the refuge are currently closed to public use.

5.3.3 Annual Visitation

Demand for interpretive and educational programs has soared, and visitation has been increasing steadily since the refuge opened to the public in 2006. Current visitation is approximately 100,000 people per year, 4,000 of whom participate in formal, curriculum-based education programs (USFWS 2010a). Since the Wildlife Center opened in 2008, it has received as many as 25,000 annual visitors. Projections indicate that refuge public facilities could serve an estimated 200,000 to 300,000 visitors annually (USFWS 2003b).

5.3.4 Entrance and User Fees

In 2009, the refuge received official approval to establish an entrance fee program, but it has not implemented one to date (USFWS 2009a). Implementation of a fee program remains a possibility in the future and has been described in Chapter 2, Section 2.3, "Description of Management Direction."

A fee booth was constructed in 2008, but is currently unused. Each of the three trailhead kiosks include a fee canister and a sign explaining a potential future fee program.

5.3.5 Accessibility of Recreation Sites and Programs to Disabled Persons

Except as noted below, all refuge public use facilities are accessible to disabled visitors and conform to standards set forth in the Architectural Barriers Act (42 U.S. Code 4151 et seq.).

The exceptions are:

- The 200-yard spur trail to the Ridgetop Overlook reaches a maximum grade of 20 percent, but is designed to be wheelchair-accessible in all other respects.
- The 3.1 miles of service roads open to seasonal public use consist of uneven gravel surfaces.

5.3.6 Volunteers

The refuge has a robust volunteer program that is essential to maintaining current refuge operations. With the exception of law enforcement, personnel management, contracting, and select other functions prohibited by law, volunteers are involved in almost all aspects of the refuge's visitor services and habitat and wildlife programs. In fiscal year 2010, volunteers donated over 15,000 hours of support to the refuge (USFWS 2010a). This equals more than seven full-time personnel and is valued at more than $327,000 (national volunteer value = $21.79/hour [Independent Sector 2011]). Over 75 percent of the hours contributed were in support of wildlife-dependent public uses.

Photos 5-6 and 5-7. Volunteers assist with many aspects of refuge operations. USFWS.

5.4 Wildlife-dependent Public Uses

5.4.1 Hunting

Currently, hunting is not offered on the refuge.

5.4.2 Fishing

Currently, fishing is not offered on the refuge.

5.4.3 Wildlife Observation and Photography

The refuge provides a variety of facilities and programs that support high-quality wildlife observation and photography. Both the year-round and seasonal trails offer overlooks and observation points. For a complete description of trail lengths and features, refer to Section 5.2.4, "Roads, Trails, and Parking Areas." Nearly 70,000 pedestrians used the trails in fiscal year 2010. In addition, the refuge is a stop along the Willamette Valley Birding Trail and has been designated by the Audubon Society as an Important Bird Area.

The wildlife photography blind can be reserved at no charge on Wednesdays, Saturdays, and Sundays. The blind can accommodate two photographers at a time. Wildlife observation supporting materials are available to visitors, and include a spotting scope (indoor viewing area), Discovery Packs (loaner field guides and binoculars at no charge), wildlife sightings register, and refuge Watchable Wildlife checklist. In addition, numerous interpretive signs along the trail and within the Wildlife Center are designed to help visitors develop wildlife observation skills and learn about the specific wildlife and habitats of the refuge. The Wildlife Center also includes a gallery hall with a picture hanging system that primarily highlights refuge wildlife and nature photographs from photography contests, calendar entries, and student projects. Nearly 1,800 people participated in wildlife photography activities in fiscal year 2010.

Programs offered for wildlife observation and photography activities include partner-led bird walks, Friends of the Refuge's Tualatin River Photographic Society (workshops, trainings, monthly meetings, and nature photography contests), plant walks led by a volunteer botanist, and others as staff/volunteers are available. Additionally, Volunteer Trail Rovers welcome, meet, and interact with visitors along the trail, report wildlife sightings and visitor contacts, and help ensure visitor compliance with refuge rules.

Photo 5-8. Sunset wildlife watcher. Kim Strassburg/USFWS.

5.4.4 Environmental Education

The refuge, in coordination with local educators, has developed a robust curriculum-based environmental education program that is blossoming into a metropolitan resource for teachers, students, youth group leaders, and families. The environmental education program is a key focus of refuge public use activities.

In 2005, the refuge and Friends of the Refuge partnered with a team of elementary and middle school teachers to develop and implement an environmental education program that would be in place by 2006, when the refuge was to open to the public. The result was a written curriculum called *Rhythms of the Refuge: Open Your Eyes to Wildlife*. This curriculum includes a field trip guide and pre-visit, on-site, and post-visit lessons for kindergarten through eighth-grade students. The refuge also supports the use of and offers workshops for national curricula such as *Project Wild*; *Project Flying Wild; Project Learning Tree*; *Growing Up Wild*; *Project Aquatic Wild*; *and 4H Wildlife Stewards*. Modeled after other national wildlife refuge programs, the curriculum is paired with required teacher workshops that prepare educators to bring their students to the refuge, relying on teachers to lead field trips and refuge volunteer naturalists to assist and accompany class visits. The day-to-day coordination of the education field trip program is generally managed by interns, grant-funded short-term staff, and volunteers. Environmental education training for staff/volunteers consists of a four-day class for volunteer naturalists; on-the-job shadowing for interns; coaching by refuge staff and long-term volunteers; online college courses for staff/interns; and regional workshops/trainings with partners. The emphasis on training has resulted in a high-quality program that follows national and statewide standard practices for environmental education.

The refuge offers facilities and equipment specifically in support of the environmental education program. These include a classroom and student patio that accommodates 36 students; the environmental education shelter, which accommodates 65 students; trailhead restrooms; five study sites along the year-round trail, each of which accommodates 15 students at a time and provides exposure to different habitat types on the refuge; learning materials (e.g., study skins, microscopes, craft supplies); and field investigation equipment (e.g., binoculars, field guides, water quality test kits).

The education program has developed strong partnerships within the community that facilitate quality education. Examples of partners include Friends of the Refuge, Oregon Natural Resources Education Program (Oregon State University), Sherwood School District, 4-H (Oregon State University), Tualatin Riverkeepers, Sherwood Foundation for the Arts, and YMCA of Sherwood.

On-site programs: In fiscal year 2010, the refuge provided teacher workshops for 280 educators. Those who attend the workshops can register their classes to visit the refuge for a field trip. A maximum of 70 students, plus required chaperones, can be accommodated at any given time. In fiscal year 2010, 1,306 students participated in on-site field trip programs. Although no formal program is offered for high school and college students, the refuge will tailor a visit based on the needs of the students/classes. Local schools occasionally transport physically and learning-disabled students to the refuge for short walks and/or visits to the Wildlife Center. No programs currently exist for these students; however, volunteers will welcome and orient groups as needed. The refuge also draws youth groups for whom learning occurs outside the formal school day. Examples include boy/girl scouts, after-school clubs, summer youth programs and day camps, and pre-school. In fiscal year 2010, 917 students attended informal youth programs.

Off-site programs: The refuge participates in off-site programs when funding and staff are available. Examples of such programs include school-based nature festivals/events, outdoor schools, career days, and special requests. In fiscal year 2010, 1,665 students participated in off-site environmental education programs.

Photo 5-9. Students explore and learn at the refuge. USFWS.

5.4.5 Interpretation/Outreach

The refuge has a variety of interpretive and informational media and programs that strive to accomplish a number of objectives, such as welcoming and orienting visitors; conveying the importance of native wildlife, their habitats, and the interconnectedness of lands and waters; encouraging nature exploration and appreciation; exploring the refuge's cultural history; describing the refuge's resources; introducing the Refuge System; and describing ways in which people are part of and can help care for the natural environment. All interpretive approaches follow the basic tenets of the Service's Interpretive Development Model (605 FW 7, Interpretation). Staff and volunteers are offered training in interpretive techniques.

Interpretive facilities include a 1,200-square-foot exhibit hall within the Wildlife Center; numerous outdoor interpretive panels, kiosks, sculptural elements, and trailside signs; temporary exhibits in the atrium of the Wildlife Center; and publications such as general leaflets and trail maps. Outreach tools include the refuge website; online and printed calendar postings by local partners such as Washington County Visitors Association and Metro Greenscene; newspaper articles and radio spots; flyers; complementary online media such as the Friends of the Refuge website and Facebook page; and the Tualatin River Bird Festival website.

A number of "in-person" interpretive programs are typically offered throughout the year, generally led by staff, volunteers, and partners. These are scheduled opportunistically depending on staff and volunteer availability and expertise. Nearly 2,500 people attended interpretive programs in fiscal year 2010. These programs included owl prowls; nature tours; plant identification walks; birding tours;

Puddle Stompers pre-school program; and workshops (e.g., rain gardens, birding). Oftentimes, other organizations bring visitors in large groups to either participate in refuge-led activities or to participate in wildlife-dependent activities on their own (e.g., senior groups, Audubon Society outings, walking clubs). The refuge requires that groups larger than 15 people but not exceeding 50 people register ahead of their visit, and while at the refuge, follow a certain set of requirements. Key requirements include breaking large groups into groups of 15 or fewer people and staggering these smaller groups along the trail; encouraging carpooling; and not charging participants commercial guiding fees. The refuge does acknowledge that group organizers may recover operating costs, such as transportation, for visits to the refuge.

Several on-site special events occur on the refuge. The primary event, held annually in May, is the Tualatin River Bird Festival, which is hosted in partnership with Friends of the Refuge. Starting in May 2011, the event grew from a one-day festival with an average of 700 attendees to a three-day festival that attracted over 3,500 participants. Other smaller events, offered less frequently, include National Wildlife Refuge Week, Spring Break Exploration Days, Family Adventure Days, and a native plant sale, attracting 100 to 200 participants each. Refuge staff and/or volunteers attend local off-site special events as schedules and funding allow. Common off-site venues include nature festivals and health fairs, reaching 300 to 500 people annually.

Photo 5-10. Interpretive programs connect visitors to refuge resources. Bjorn Fredrickson/USFWS.

5.5 Non-wildlife-dependent Recreation

Non-wildlife-dependent recreation activities are not permitted on the refuge. Kiosks, brochures, and informational and regulatory signs articulate prohibited activities.

5.6 Illegal Uses and Law Enforcement

Law enforcement issues that currently occur on the refuge are primarily trespass in closed areas, presence of dogs, jogging and bicycling, and other non-wildlife-dependent uses. Other illegal uses

include low-flying aircraft, trash dumping, theft (vehicle break-in, stolen gas and tools), and using the refuge facilities to access and steal from neighboring business. These illegal uses persist due to lack of public knowledge and support as well as limited law enforcement capability. Currently there is a zone law enforcement officer stationed at the refuge, but their duties require them to be frequently off-site.

5.7 Area Outdoor Recreational Opportunities and Trends

5.7.1 Nearby Recreational Opportunities

The refuge lies just 15 miles southwest of downtown Portland and is located within the Portland metropolitan area, which is known for its natural areas and parks. Metro boasts over 16,000 acres of protected lands, most of which are open to the public. In addition, the greater Portland area is home to thousands of acres of local/city parks, gardens, arboretums, state and local wildlife areas, state parks, nature centers, multi-use trails, and the 5,000+ acre Forest Park. Many of these areas are connected by bike, pedestrian, and boat corridors. These nearby facilities provide a wide range of recreational opportunities such as hiking, bicycling, wildlife observation, fishing, hunting, picnicking, environmental education, interpretation, guided nature tours, outdoor photography, nature festivals, camping, canoeing/kayaking/rafting, sports, and agritourism sites (e.g., vineyards and "u-pick" produce and tree farms). Portland sits at the mouth of the Columbia River Gorge Scenic Area and is the closest major city to Mount Hood and Willamette National Forests. The highways that skirt the refuge are major corridors providing access to the Oregon coast.

5.7.2 Outdoor Recreation Trends and Demographics

Participation in wildlife-associated recreation has been measured by the Service to determine trends and economic impacts, both at national and state levels. The latest survey, completed in 2006, found that 87.5 million (over 38%) of U.S. residents 16 years and older participated in wildlife-related recreation. During that year, 30.0 million people fished, 12.5 million hunted, and 71.1 million participated in at least one type of wildlife-watching activity such as observing, feeding (e.g., backyard bird feeders), or photographing fish and other wildlife in the United States. Participation by Oregonians is higher than the national average. In 2006, 53 percent of Oregonians participated in wildlife-associated recreation, both within and outside of Oregon. More specifically, 44 percent of Oregonians participated in wildlife-watching and 19 percent in hunting and fishing (U.S. Department of the Interior [USDOI] et al. 2007).

Oregon Parks and Recreation Department (OPRD) is responsible for providing guidance, information, and recommendations to Federal, state, and local units of government, as well as the private sector, in making policy and planning decisions regarding outdoor recreation in Oregon. They do this in the Statewide Comprehensive Outdoor Recreation Plan (SCORP). The latest SCORP is a five-year plan covering outdoor recreation in Oregon from 2008 through 2012 (OPRD 2008).

The OPRD began the SCORP planning process in September 2005. The agency took a proactive approach in addressing a limited number of previously identified and defined issues. Key findings from the 2008-2012 SCORP and the 2005-2014 statewide trails planning efforts identified a number of important demographic and social changes specifically facing outdoor recreation providers in the coming years, including: 1) a rapidly aging Oregon population, 2) fewer Oregon youth learning outdoor skills, and 3) an increasingly diverse Oregon population. An additional identified issue

related to human health is the physical inactivity within the population. Key findings especially relevant to the Service regarding these issues are summarized below.

A Rapidly Aging Oregon Population

- On average across all activities, respondents expect to spend 28 percent more days recreating 10 years from now than they currently do.
- The most popular outdoor recreation activities for Oregonians between the ages of 42 and 80 included walking, picnicking, sightseeing, visiting historic sites, and ocean beach activities. A comparison across age categories for the top five activities by the level of participation leads to the following conclusions: Walking is the top activity across all age categories (40-79); jogging is a top activity between the ages of 40-59, but is also popular for those in their 70s; bicycling is a top activity between the ages of 40-64; sightseeing is a top activity between the ages of 45-74; bird watching is a top activity between the ages of 55-79; and RV/trailer camping is a top activity between the ages of 55-74.
- The top five activities in terms of future participation intensity 10 years from now included walking, bicycling, jogging, bird watching, and day hiking.
- Ensuring clean and well-maintained parks and facilities was the most important management action leading to a large increase in recreation, followed by developing walking/hiking trails closer to home and providing more free-of-charge recreation opportunities.
- Over a third of Oregon Boomers, people born between 1946 and 1964, and Pre-Boomers, who were born between 1926 and 1945, volunteered in their community, with an average time commitment of 5.3 hours per week. Of those who volunteered, 43 percent expect future changes in their volunteer activities, with most of the changes involving greater volunteerism: more time, more projects at current volunteer opportunities, and new volunteer opportunities.

Fewer Oregon Youth Learning Outdoor Skills

- The most popular outdoor activities for parents were walking, viewing natural features, and relaxing/hanging out. For children, the most popular were walking, followed by outdoor sports/games, relaxing/hanging out, and general play at neighborhood parks/playgrounds.
- The more a parent engages in an outdoor recreation activity, the more their child does. Participation varies across child age, with both the number of activities and the number of activity-days peaking among 12 to 14 year olds and decreasing for 15 to 17 year olds.
- Rural children spend more days, on average, in outdoor activities relative to urban and suburban children. Suburban children spend the least amount of days engaged in outdoor activities. Outdoor abilities have decreased more, on average, among urban and suburban households.
- Outdoor sports programs and day camps were the most popular types of outdoor recreation programs with respect to past participation. Many parents indicated that it was very likely their children would participate in outdoor sports programs (62%), multiday camps (49%), outdoor adventure trips (45%), and day camps (45%) in the future.

An Increasingly Diverse Oregon Population

- Walking for pleasure was the most common favorite activity for both Hispanics and Asians, with fishing and soccer being the next most common for Hispanics and hiking and fishing the next most common for Asians.
- Both Hispanic and Asian study respondents most commonly did their favorite activity with members of their immediate family. Asians were more likely than Hispanics to do activities alone, as were older respondents relative to younger respondents.
- The most common location for Hispanic and Asian respondents to do their favorite activity was in a park or other area outside their town or city. Males were more likely than females to engage in their favorite activity further from home.
- Survey results suggest that both the Hispanic and Asian populations in Oregon engage in outdoor recreation less than the general population.
- Walking for pleasure was also the activity respondents spent the most days engaged in during the past year. Hispanics engage more intensely than Asians in jogging/running, day hiking, picnicking, fishing, viewing natural features, visiting nature centers, and visiting historic sites.
- The most common activities respondents would like to do more often, or start doing, were walking for Asians and walking and camping for Hispanics. The factor that would most help make this happen is availability of partners, followed by more time.
- For the Hispanic population, being in the outdoors, relaxing, and having fun were the most important motivators or reasons for participating in outdoor activities. For the Asian population, relaxing, fitness, and having fun were the top motivators.
- Ensuring clean and well-maintained parks and facilities were the most important management action, followed by keeping parks safe from crime and providing more free-of-charge recreation opportunities and expanded facilities.

Several management recommendations from the SCORP are relevant to the types of outdoor recreation Tualatin River National Wildlife Refuge provides; relevant recommendations from the SCORP are as follows:

- Develop accessible trails in remote settings in close proximity to urban areas of the state.
- Create a statewide interagency volunteer information website or other communications medium to match Boomer volunteers with recreation or natural resource projects in Oregon.
- Greater priority for trail acquisition and development projects in OPRD-administered grant program (Multnomah, Clackamas, and Washington Counties are considered “high priority” based on increase in aging population).
- Develop a statewide youth outdoor programming framework and funding source to focus youth programming efforts across Oregon to address a specific set of key measurable objectives.
- Create a new Outdoor Recreation Section within Oregon Recreation and Park Association addressing the areas of outdoor recreation and environmental education.
- Provide funding and assistance for innovative park designs to connect youth with nature in high-priority counties and communities … in OPRD-administered grant programs (Multnomah, Clackamas, and Washington Counties are considered “high priority” based on increase in youth population).
- Encourage organizational cultural change within public recreation agencies/organizations to effectively address the diversity issue.

- Develop recommendations for addressing language barriers to encourage underrepresented population use of outdoor recreation facilities and programs
- Create a customer service training module related to serving the outdoor recreation needs of an increasingly diverse population.
- Develop and implement a regional youth framework to encourage underrepresented youth participation in outdoor recreation activities through partnerships and investments in school-based recreation clubs.

5.8 Socioeconomic Environment

5.8.1 Population and Area Economy

Oregon's population (3,782,991) ranks twenty-seventh in the nation. State land area covers 95,997 square miles compared to 3,537,438 square miles (United States), with a population density of 40 persons per square mile compared to 87 nationwide. Located in Washington and Yamhill Counties, Tualatin River National Wildlife Refuge is a 30-minute drive from downtown Portland and only minutes away from the Cities of Sherwood, Tigard, Tualatin, Newberg, Forest Grove, and Hillsboro.

The greater Portland metropolitan area, including Washington, Multnomah, Clackamas, Yamhill, and Marion Counties, is the economic hub for the refuge. Table 5-3 shows the population and area economy. Between 1999 and 2009, the population of Oregon increased 11 percent compared with a 10 percent increase for the United States as a whole. Employment for Clackamas, Marion, and Yamhill Counties increased at a greater rate (see Table 5-3) compared to the rest of Oregon (8 percent) and the United States (8 percent). Only Yamhill and Marion Counties exceeded the increase in per capita income compared with Oregon and the United States as a whole (USFWS 2011b).

Table 5-3. Tualatin River National Wildlife Refuge Summary of Area Economy, 2009

	Population		Employment		Per Capita Income	
	2009	Percent change 1999-2009	2009	Percent change 1999-2009	2009	Percent change 1999-2009
Clackamas County	386.1	15%	219.2	18%	$44,362	−1%
Marion County	318.0	13%	173.2	10%	$33,415	5%
Multnomah County	726.9	11%	560.5	4%	$41,154	3%
Washington County	537.3	23%	284.1	6%	$40,112	−3%
Yamhill County	99.0	17%	44.0	13%	$33,434	9%
Oregon	3,825.7	11%	2,202.7	8%	$36,785	4%

Table 5-3. Tualatin River National Wildlife Refuge Summary of Area Economy, 2009

	Population		Employment		Per Capita Income	
	2009	Percent change 1999-2009	2009	Percent change 1999-2009	2009	Percent change 1999-2009
United States	307,006.6	10%	173,809.2	8%	$40,285	9%

Appendix A. Appropriate Use Findings

Introduction

The Appropriate Refuge Uses Policy (603 FW 1), finalized in 2006, outlines the process that the U.S. Fish and Wildlife Service (USFWS; Service) uses to determine when general public uses on refuges may be considered. Priority public uses, previously defined as wildlife-dependent uses under the National Wildlife Refuge System Improvement Act of 1997 (hunting, fishing, wildlife observation and photography, environmental education and interpretation), are generally exempt from appropriate use review. Other exempt uses include situations where the Service does not have adequate jurisdiction to control the activity and refuge management activities. Other existing, proposed, or requested public uses are required to undergo the appropriateness screening.

The policy provides refuge managers with a consistent procedure to screen and document decisions concerning public uses, with the use of the following questions:

a) Do we have jurisdiction over the use?
b) Does the use comply with applicable laws and regulations (federal, state, tribal, and local)?
c) Is the use consistent with applicable executive orders and Department and Service policies?
d) Is the use consistent with public safety?
e) Is the use consistent with goals and objectives in an approved management plan or other document?
f) Has an earlier documented analysis not denied the use or is this the first time the use has been proposed?
g) Is the use manageable within available budget and staff?
h) Will this be manageable in the future within existing resources?
i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?
j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality, compatible, wildlife-dependent recreation into the future?

Uses marked "no" for questions (a) or (b) are not evaluated further. Uses that are illegal, inconsistent with existing policy, or unsafe ("no" to (b), (c), or (d)) may not be found appropriate. When a use is determined to be appropriate, a refuge manager must then decide if the use is compatible before allowing it on a refuge.

The following forms show which uses have been determined appropriate and which determined not appropriate. Narrative answers for negative findings follow the forms.

Appropriate Use Justification, Attachment 1

FINDING OF APPROPRIATENESS OF A REFUGE USE

Refuge Name: Tualatin River National Wildlife Refuge

Use: Bicycling/Jogging

This form is not required for wildlife-dependent recreational uses, take regulated by the State, or uses already described in a refuge CCP or step-down management plan approved after October 9, 1997.

Decision Criteria:	YES	NO
(a) Do we have jurisdiction over the use?	✓	
(b) Does the use comply with applicable laws and regulations (Federal, State, tribal, and local)?	✓	
(c) Is the use consistent with applicable Executive orders and Department and Service policies?	✓	
(d) Is the use consistent with public safety?	✓	
(e) Is the use consistent with goals and objectives in an approved management plan or other document?		✓
(f) Has an earlier documented analysis not denied the use or is this the first time the use has been proposed?		✓
(g) Is the use manageable within available budget and staff?		✓
(h) Will this be manageable in the future within existing resources?		✓
(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?		✓
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?	✓	

Where we do not have jurisdiction over the use ("no" to (a)), there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ("no" to (b), (c), or (d)) may not be found appropriate. If the answer is "no" to any of the other questions above, we will **generally** not allow the use.

If indicated, the refuge manager has consulted with State fish and wildlife agencies. Yes ___ No ✓

When the refuge manager finds the use appropriate based on sound professional judgment, the refuge manager must justify the use in writing on an attached sheet and obtain the refuge supervisor's concurrence.

Based on an overall assessment of these factors, my summary conclusion is that the proposed use is:

Not Appropriate ✓ Appropriate ____

Refuge Manager: Eric Palmer Date: 4/23/13

If found to be **Not Appropriate**, the refuge supervisor does not need to sign concurrence if the use is a new use.

If an existing use is found **Not Appropriate** outside the CCP process, the refuge supervisor must sign concurrence.

If found to be **Appropriate**, the refuge supervisor must sign concurrence.

Refuge Supervisor: _____ Date: 4/23/13

A compatibility determination is required before the use may be allowed.

FWS Form 3-2319
02/06

Refuge: Tualatin River National Wildlife Refuge (the refuge)

Use: Bicycling/jogging on the refuge

Summary: Jogging and bicycling are currently not allowed on the refuge. However, the refuge gets occasional requests to allow these uses, including opportunities to connect the refuge with regional trail systems. These uses have been determined to be not appropriate at the current time.

Further explanation of the answers from US. Fish and Wildlife Service (USFWS) Form 3-2319 is provided below:

(e) These uses are not consistent with the goals and objectives of the comprehensive conservation plan (CCP) due to the potential for joggers and bicyclists to disturb wildlife or interfer with other priority wildlife-dependent public uses.

(f) While the 2003 refuge environmental assessment (EA) (USFWS 2003a) for the Wildlife Center and visitor services facilities addressed several activities and limited trail use to foot traffic only, it did not specifically address jogging or bicycling.

(g) and (h) Due to the urban nature of the refuge, the potential demand for these uses would be very high. The amount of oversight needed to adequately carry out this activity would require additional resources that are not available with current resources.

(i) The uses present no benefits to the refuge's natural or cultural resources and are not thought to contribute to the public's understanding or appreciation of those resources.

(j) Currently, these uses cannot be accommodated without impairing existing wildlife-dependent recreational uses. Animals show greater flight response to humans moving unpredictably than to humans following a distinct path. Also, rapid movements by joggers and cyclists are more disturbing to wildlife than slower moving hikers. Burger (1981) examined the effects of human activity on roosting and migrating birds at a coastal bay refuge along the Atlantic coast. Human activities that involved rapid movements or close proximity to roosting birds, such as jogging, even on pathways, caused the birds to flush; in comparison, slow-walking bird watchers and people walking on paths around ponds did not usually cause birds to flush.

However, as stated under Objective 10.4 of this CCP (Chapter 2), we will explore opportunities with partners to connect with regional trails while ensuring the uses minimize disturbance. At that time, we would re-evaluate the appropriateness of the uses.

Appropriate Uses Justification, Attachment 2

FINDING OF APPROPRIATENESS OF A REFUGE USE

Refuge Name: Tualatin River National Wildlife Refuge

Use: Boat Access

This form is not required for wildlife-dependent recreational uses, take regulated by the State, or uses already described in a refuge CCP or step-down management plan approved after October 9, 1997.

Decision Criteria:	YES	NO
(a) Do we have jurisdiction over the use?	✓	
(b) Does the use comply with applicable laws and regulations (Federal, State, tribal, and local)?	✓	
(c) Is the use consistent with applicable Executive orders and Department and Service policies?	✓	
(d) Is the use consistent with public safety?	✓	
(e) Is the use consistent with goals and objectives in an approved management plan or other document?		✓
(f) Has an earlier documented analysis not denied the use or is this the first time the use has been proposed?		✓
(g) Is the use manageable within available budget and staff?		✓
(h) Will this be manageable in the future within existing resources?		✓
(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?	✓	
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?	✓	

Where we do not have jurisdiction over the use ("no" to (a)), there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ("no" to (b), (c), or (d)) may not be found appropriate. If the answer is "no" to any of the other questions above, we will **generally** not allow the use.

If indicated, the refuge manager has consulted with State fish and wildlife agencies. Yes ___ No ✓

When the refuge manager finds the use appropriate based on sound professional judgment, the refuge manager must justify the use in writing on an attached sheet and obtain the refuge supervisor's concurrence.

Based on an overall assessment of these factors, my summary conclusion is that the proposed use is:

Not Appropriate ✓ **Appropriate** ____

Refuge Manager: Eric Hake Date: 4/23/13

If found to be **Not Appropriate**, the refuge supervisor does not need to sign concurrence if the use is a new use.

If an existing use is found **Not Appropriate** outside the CCP process, the refuge supervisor must sign concurrence.

If found to be **Appropriate**, the refuge supervisor must sign concurrence.

Refuge Supervisor: [signature] Date: 4/25/13

A compatibility determination is required before the use may be allowed.

FWS Form 3-2319
02/06

Refuge: Tualatin River National Wildlife Refuge

Use: Boat access

Summary: Access to or from the refuge by boat is currently not allowed. However, the refuge receives occasional requests to allow this use, including opportunities to connect the refuge with future planned water trail systems. This use has been determined to be not appropriate at the current time.

Further explanation of the answers from USFWS Form 3-2319 is provided below:

(d) No safe facilities currently exist for providing boat access to and/or from the refuge. River banks are steep and slippery and create a significant safety risk, especially when rainy or when river levels are running high.

(f) An assessment for provision of a boat launch facility off of Roy Rogers Road was conducted in the refuge environmental assessment for the Wildlife Center and visitor services facilities (USFWS 2003a). This use was examined but eliminated from further study for a number of reasons, including considerable resource damage that would occur to construct a boat launch that was safe and accessible; impacts to fish and riparian species; and the potential of other jurisdictions to provide nearby river access points.

(g) and (h) Due to the urban nature of the refuge, the potential demand for this use would be very high. The amount of oversight needed to adequately carry out this activity would require additional resources that are not available now or in future budget and staff projections. Also, construction would need to occur to develop a boat launch and this most likely would cause direct resource damage.

(j) Currently the use cannot be accommodated without impairing existing wildlife-dependent recreational uses. However, as stated under Objective 10.4 in this CCP, the refuge will "partner with interested parties/organizations to identify potential locations for one public river access for nonmotorized boats in or near the refuge." At that time, if a location is identified on the refuge, refuge staff would re-evaluate the appropriateness of the use.

Appropriate Uses Justification, Attachment 3

FINDING OF APPROPRIATENESS OF A REFUGE USE

Refuge Name: Tualatin River National Wildlife Refuge

Use: Commercial or Recreational Trapping

This form is not required for wildlife-dependent recreational uses, take regulated by the State, or uses already described in a refuge CCP or step-down management plan approved after October 9, 1997.

Decision Criteria:	YES	NO
(a) Do we have jurisdiction over the use?	✓	
(b) Does the use comply with applicable laws and regulations (Federal, State, tribal, and local)?	✓	
(c) Is the use consistent with applicable Executive orders and Department and Service policies?	✓	
(d) Is the use consistent with public safety?	✓	
(e) Is the use consistent with goals and objectives in an approved management plan or other document?		✓
(f) Has an earlier documented analysis not denied the use or is this the first time the use has been proposed?	✓	
(g) Is the use manageable within available budget and staff?		✓
(h) Will this be manageable in the future within existing resources?		✓
(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?		✓
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?	✓	

Where we do not have jurisdiction over the use ("no" to (a)), there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ("no" to (b), (c), or (d)) may not be found appropriate. If the answer is "no" to any of the other questions above, we will **generally** not allow the use.

If indicated, the refuge manager has consulted with State fish and wildlife agencies. Yes ___ No ✓

When the refuge manager finds the use appropriate based on sound professional judgment, the refuge manager must justify the use in writing on an attached sheet and obtain the refuge supervisor's concurrence.

Based on an overall assessment of these factors, my summary conclusion is that the proposed use is:

Not Appropriate ✓ **Appropriate** ____

Refuge Manager: Eric Halmay Date: 4/23/13

If found to be **Not Appropriate**, the refuge supervisor does not need to sign concurrence if the use is a new use.

If an existing use is found **Not Appropriate** outside the CCP process, the refuge supervisor must sign concurrence.

If found to be **Appropriate**, the refuge supervisor must sign concurrence.

Refuge Supervisor: [signature] Date: 4/23/13

A compatibility determination is required before the use may be allowed.

FWS Form 3-2319
02/06

Refuge: Tualatin River National Wildlife Refuge

Use: Commercial or recreational trapping

Summary: Commercial and/or recreational trapping does not contribute to the goals of the refuge and would require more oversight from staff than is currently available. This use was determined to be not appropriate.

Further explanation of the answers from USFWS Form 3-2319 is provided below:

(e) There are no refuge management plans that address commercial or recreational trapping. This use is not consistent with the goals and objectives as written in the CCP. The use would significantly conflict with wildlife.

(g) and (h) Current limited budget and staff time would be diverted from priority wildlife-dependent public use and management activities to administer commercial or recreational trapping activities. Future management of commercial or recreational trapping would not be achievable with existing resources. Providing appropriate oversight of the use would exceed existing and future projections of budget and staff.

(i) Commercial or recreational trapping would not contribute to the public's understanding and appreciation of cultural or natural resources.

Appropriate Uses Justification, Attachment 4

Finding of Appropriateness of a Refuge Use

Refuge Name: Tualatin River National Wildlife Refuge
Use: Commercial Visitor Services

This form is not required for wildlife-dependent recreational uses, take regulated by the State, or uses already described in a refuge CCP or step-down management plan approved after October 9, 1997.

Decision criteria:	YES	NO
(a) Do we have jurisdiction over the use?	✓	
(b) Does the use comply with applicable laws and regulations (federal, state, tribal, and local)?	✓	
(c) Is the use consistent with applicable executive orders and Department and Service policies?	✓	
(d) Is the use consistent with public safety?	✓	
(e) Is the use consistent with goals and objectives in an approved management plan or other document?	✓	
(f) Has an earlier documented analysis not denied the use, or is this the first time the use has been proposed?	✓	
(g) Is the use manageable within available budget and staff?	✓	
(h) Will this be manageable in the future within existing resources?	✓	
(i) Does the use contribute to the public's understanding and appreciation of the Refuge's natural or cultural resources, or is the use beneficial to the Refuge's natural or cultural resources?	✓	
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D. for description), compatible, wildlife-dependent recreation into the future?	✓	

Where we do not have jurisdiction over the use ("no" to (a)), there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ("no" to (b), (c), or (d)) may not be found appropriate. If the answer is "no" to any of the other questions above, we will generally not allow the use.

If indicated, the refuge manager has consulted with State fish and wildlife agencies. Yes ___ No _X_

When the refuge manager finds the use **appropriate** based on sound professional judgment, the refuge manager must justify the use in writing on an attached sheet and obtain the refuge supervisor's concurrence.

Based on an overall assessment of these factors, my summary conclusion is that the proposed use is:

Not Appropriate____ Appropriate__X___

Refuge Manager: Eric Hake Date: 4/23/13

If found to be **Not Appropriate**, the refuge supervisor does not need to sign concurrence if the use is a new use.

If an existing use is found **Not Appropriate** outside the CCP process, the refuge supervisor must sign concurrence.

If found to be **Appropriate**, the refuge supervisor must sign concurrence.

Refuge Supervisor: Date: 4/23/13

A compatibility determination is required before the use may be allowed. **FWS Form 3-2319 02/06**

Refuge: Tualatin River National Wildlife Refuge

Use: Commercial visitor services

Summary: Commercial visitor services on the refuge cover a broad range of wildlife-dependent recreation and education activities that are led by any organization or individual that charges a fee to participate in the activity. Activities could include, but are not limited to: birding tours, plant identification, wildlife photography, art, interpretive programs, guided trail walks, training workshops, summer youth camp, nature classes, and other similar non-consumptive uses. These uses will occur in areas and facilities that are open to the public and will support the identified wildlife-dependent public uses of the refuge. Organizations conducting commercial visitor services will require a Special Use Permit (SUP), except for the Friends of Tualatin River Refuge (Friends) for which commercial activities are governed by statute under an existing Memorandum of Understanding.

Further explanation of the answers from USFWS Form 3-2319 is provided below:

(c) As defined in federal regulations (50 Code of Federal Regulations [CFR] 29.1), a commercial recreational use is a use that generates revenue or that results in a commodity that is or can be sold for income or revenue.

The Appropriate Use policy (603 FW 1) specifically references commercial uses of this kind. The policy states that "Commercial uses of a refuge may be considered appropriate if they are a refuge management economic activity (see 50 CFR 25.12), if they directly support a priority general public use, or if they are specifically authorized by statute."

(d) Through SUP review and/or coordination with the Friends of the Refuge group, the refuge will ensure that each approved activity is consistent with public safety. If necessary, stipulations to ensure public safety will be included in the project's SUP.

(e) The use is consistent with Goals 10, 11, and 12 of the CCP. Requests will be approved in instances where they can provide meaningful public appreciation of natural resources in support of the refuge's wildlife-dependent recreation and education programs.

(j) The refuge will ensure that the activities do not impair existing or future wildlife-dependent recreational use of the refuge during individual project review, prior to issuing SUPs and/or approvals.

Appropriate Uses Justification, Attachment 5

FINDING OF APPROPRIATENESS OF A REFUGE USE

Refuge Name: Tualatin River National Wildlife Refuge

Use: Cooperative Farming

This form is not required for wildlife-dependent recreational uses, take regulated by the State, or uses already described in a refuge CCP or step-down management plan approved after October 9, 1997.

Decision Criteria:	YES	NO
(a) Do we have jurisdiction over the use?	✓	
(b) Does the use comply with applicable laws and regulations (Federal, State, tribal, and local)?	✓	
(c) Is the use consistent with applicable Executive orders and Department and Service policies?	✓	
(d) Is the use consistent with public safety?	✓	
(e) Is the use consistent with goals and objectives in an approved management plan or other document?	✓	
(f) Has an earlier documented analysis not denied the use or is this the first time the use has been proposed?		✓
(g) Is the use manageable within available budget and staff?	✓	
(h) Will this be manageable in the future within existing resources?	✓	
(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?	✓	
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?	✓	

Where we do not have jurisdiction over the use ("no" to (a)), there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ("no" to (b), (c), or (d)) may not be found appropriate. If the answer is "no" to any of the other questions above, we will **generally** not allow the use.

If indicated, the refuge manager has consulted with State fish and wildlife agencies. Yes ___ No ✓

When the refuge manager finds the use appropriate based on sound professional judgment, the refuge manager must justify the use in writing on an attached sheet and obtain the refuge supervisor's concurrence.

Based on an overall assessment of these factors, my summary conclusion is that the proposed use is:

Not Appropriate____ Appropriate ✓

Refuge Manager: Eric Hahn Date: 4/23/13

If found to be **Not Appropriate**, the refuge supervisor does not need to sign concurrence if the use is a new use.

If an existing use is found **Not Appropriate** outside the CCP process, the refuge supervisor must sign concurrence.

If found to be **Appropriate**, the refuge supervisor must sign concurrence.

Refuge Supervisor: Date: 4/23/13

A compatibility determination is required before the use may be allowed.

FWS Form 3-2319
02/06

Refuge: Tualatin River National Wildlife Refuge

Use: Cooperative farming on the refuge

Summary: Cooperative farming is currently allowed on the refuge. Seventy percent of small grain croplands (corn, wheat, barley, and oats) are harvested, while 30 percent are left standing, and green pastures (clover and hay grass) are harvested and mowed at less than 4 inches in the fall for grazing waterfowl. Cooperative farming is an interim management tool used to control invasive plant species. This use has been determined to be appropriate.

Further explanation of the answers from USFWS Form 3-2319 is provided below:

(e) Cooperative farming is consistent with Goal 7 in Chapter 2 of the CCP. Cultivating and maintaining small croplands helps control non-native invasive species such as reed canarygrass and Himalayan blackberry prior to restoration of native habitats.

(f) The use is ongoing on the Onion Flats and Wapato Lake Units of the refuge as an interim management tool prior to restoring acquired lands.

(g) Cooperative farming is conducted by local growers who incur all costs associated with growing and harvesting crops. The cooperator is responsible for all aspects of farming including site preparation, seeding, application of any fertilizers or herbicides, harvesting, and any follow-up work necessary to remove the crop or prepare the field for the following year. Cooperators are required to leave a share of crops as determined by a cooperative agreement.

(i) As mentioned in the description of the management direction in Chapter 2 of this CCP, cooperative farming contributes to the public's understanding and appreciation of the refuge's natural resources by providing public use and focus on habitat restoration.

Appropriate Uses Justification, Attachment 6

FINDING OF APPROPRIATENESS OF A REFUGE USE

Refuge Name: Tualatin River National Wildlife Refuge

Use: Dog walking and training

This form is not required for wildlife-dependent recreational uses, take regulated by the State, or uses already described in a refuge CCP or step-down management plan approved after October 9, 1997.

Decision Criteria:	YES	NO
(a) Do we have jurisdiction over the use?	✓	
(b) Does the use comply with applicable laws and regulations (Federal, State, tribal, and local)?	✓	
(c) Is the use consistent with applicable Executive orders and Department and Service policies?	✓	
(d) Is the use consistent with public safety?	✓	
(e) Is the use consistent with goals and objectives in an approved management plan or other document?		✓
(f) Has an earlier documented analysis not denied the use or is this the first time the use has been proposed?	✓	
(g) Is the use manageable within available budget and staff?	✓	
(h) Will this be manageable in the future within existing resources?	✓	
(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?		✓
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?		✓

Where we do not have jurisdiction over the use ("no" to (a)), there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ("no" to (b), (c), or (d)) may not be found appropriate. If the answer is "no" to any of the other questions above, we will generally not allow the use.

If indicated, the refuge manager has consulted with State fish and wildlife agencies. Yes ___ No ✓

When the refuge manager finds the use appropriate based on sound professional judgment, the refuge manager must justify the use in writing on an attached sheet and obtain the refuge supervisor's concurrence.

Based on an overall assessment of these factors, my summary conclusion is that the proposed use is:

Not Appropriate ✓ Appropriate ____

Refuge Manager: Eric Hahn Date: 4/23/13

If found to be **Not Appropriate**, the refuge supervisor does not need to sign concurrence if the use is a new use.

If an existing use is found **Not Appropriate** outside the CCP process, the refuge supervisor must sign concurrence.

If found to be **Appropriate**, the refuge supervisor must sign concurrence.

Refuge Supervisor: [signature] Date: 4/23/13

A compatibility determination is required before the use may be allowed.

FWS Form 3-2319
02/06

Refuge: Tualatin River National Wildlife Refuge

Use: Dog walking and training

Summary: Dog walking and training have been determined to be not appropriate due to wildlife disturbance and lack of a contribution to the refuge's cultural or natural resources. This use is not considered a wildlife-dependent use.

Further explanation of the answers from USFWS Form 3-2319 is provided below:

(e) The amount of disturbance that would be created by these uses is considered inconsistent with other goals and objectives in the CCP.

(i) These uses are not likely to contribute to public understanding of the refuge's natural or cultural resources. The uses are not likely to be beneficial to the refuge's natural or cultural resources, and could be detrimental to those resources.

(j) It is likely that these uses would degrade the quality of the visitor experience and would impair existing wildlife-dependent uses. Dogs elicit a greater response from wildlife than people on foot alone (Hoopes 1993; MacArthur et al. 1982). The presence of dogs may flush incubating birds from nests (Yalden and Yalden 1990), disrupt breeding displays (Baydack 1986), disrupt foraging activity in shorebirds (Hoopes 1993), and disturb roosting activity in ducks (Keller 1991). For mule deer in Colorado, the presence of a dog resulted in a greater area of influence, alert and flush distance, and distance moved than when a pedestrian was alone (Miller et al. 2001). Many of these authors indicated that dogs with people, dogs on leash, or loose dogs provoked the most pronounced disturbance reactions from their study animals. Indirectly, domestic dogs can also potentially introduce diseases and transport parasites into wildlife habitats (Sime 1999).

(g) Is the use manageable within available budget and staff?		
(h) Will this be manageable in the future within existing resources?		
(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?		
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?		

Where we do not have jurisdiction over the use ("no" to (a)), there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ("no" to (b), (c), or (d)) may not be found appropriate. If the answer is "no" to any of the other questions above, we will **generally** not allow the use.

If indicated, the refuge manager has consulted with State fish and wildlife agencies. Yes ___ No ✓

When the refuge manager finds the use appropriate based on sound professional judgment, the refuge manager must justify the use in writing on an attached sheet and obtain the refuge supervisor's concurrence.

Based on an overall assessment of these factors, my summary conclusion is that the proposed use is:

Not Appropriate ✓ **Appropriate** ____

Refuge Manager: Eric Hahus Date: 4/23/13

If found to be **Not Appropriate**, the refuge supervisor does not need to sign concurrence if the use is a new use.

If an existing use is found **Not Appropriate** outside the CCP process, the refuge supervisor must sign concurrence.

If found to be **Appropriate**, the refuge supervisor must sign concurrence.

Refuge Supervisor: _____ Date: 4/23/13

A compatibility determination is required before the use may be allowed.

FWS Form 3-2319
02/06

Refuge: Tualatin River National Wildlife Refuge

Use: Geocaching

Summary: Geocaching, also known as letterboxing, is an outdoor activity in which participants use a global positioning system (GPS) device or other navigational technique to hide and seek containers called "geocaches" or "caches." When physical placement is not involved and instead participants take a photograph of themselves in front of the defined feature or record some information about such a feature, the use is known as "virtual geocaching." This appropriate use determination covers only physical geocaching.

Further explanation of the answers from USFWS Form 3-2319 is provided below:

(b) According to 50 CFR 27.93, abandoning, discarding, or otherwise leaving any personal property in any national wildlife refuge is prohibited.

Due to the negative finding on (b), the use was not evaluated further and is considered inappropriate.

Appropriate Uses Justification, Attachment 8

FINDING OF APPROPRIATENESS OF A REFUGE USE

Refuge Name: Tualatin River National Wildlife Refuge

Use: Mosquito and disease vector management

This form is not required for wildlife-dependent recreational uses, take regulated by the State, or uses already described in a refuge CCP or step-down management plan approved after October 9, 1997.

Decision Criteria:	YES	NO
(a) Do we have jurisdiction over the use?	✓	
(b) Does the use comply with applicable laws and regulations (Federal, State, tribal, and local)?	✓	
(c) Is the use consistent with applicable Executive orders and Department and Service policies?	✓	
(d) Is the use consistent with public safety?	✓	
(e) Is the use consistent with goals and objectives in an approved management plan or other document?	✓	
(f) Has an earlier documented analysis not denied the use or is this the first time the use has been proposed?	✓	
(g) Is the use manageable within available budget and staff?	✓	
(h) Will this be manageable in the future within existing resources?	✓	
(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?	✓	
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?	✓	

Where we do not have jurisdiction over the use ("no" to (a)), there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ("no" to (b), (c), or (d)) may not be found appropriate. If the answer is "no" to any of the other questions above, we will **generally** not allow the use.

If indicated, the refuge manager has consulted with State fish and wildlife agencies. Yes ___ No ✓

When the refuge manager finds the use appropriate based on sound professional judgment, the refuge manager must justify the use in writing on an attached sheet and obtain the refuge supervisor's concurrence.

Based on an overall assessment of these factors, my summary conclusion is that the proposed use is:

Not Appropriate____ **Appropriate** ✓

Refuge Manager: Eric Holms Date: 4/23/13

If found to be **Not Appropriate**, the refuge supervisor does not need to sign concurrence if the use is a new use.

If an existing use is found **Not Appropriate** outside the CCP process, the refuge supervisor must sign concurrence.

If found to be **Appropriate**, the refuge supervisor must sign concurrence.

Refuge Supervisor: _____ Date: 4/23/13

A compatibility determination is required before the use may be allowed.

FWS Form 3-2319
02/06

Refuge: Tualatin River National Wildlife Refuge

Use: Mosquito and disease vector management

Summary: In the interest of human health and public safety, mosquito and disease vector management has been determined to be an appropriate use to help control the spread of mosquito-borne diseases.

Further explanation of the answers from USFWS Form 3-2319 is provided below:

(e) Mosquito and disease vector management is consistent with the management direction described in Chapter 2 of this CCP. With the spread of mosquito-borne diseases across the country, refuges have come under increasing pressure to manage mosquito populations that are bred or harbored within refuge boundaries. The refuge will refer to the interim guidance for refuges that the Director of the Service has produced until the Service policy document is finalized.

(f) This is the first time the use has been formally proposed.

(g) The use will be manageable within available budget and staff. Monitoring and control of target mosquito larvae will be conducted by the Washington County Mosquito Control District (District). The District will be responsible for staffing and expenditures for sampling and pesticide applications. Refuge staff resources will be needed to review annual proposals, prepare SUPs, and monitor District personnel to ensure compliance.

(h) Future mosquito and disease vector management will be conducted by non-refuge staff with minimal refuge staff oversight.

(i) Providing information on mosquito-borne diseases is beneficial to the public. Arboviral (arthropod-borne viral) diseases are a potential concern. These include West Nile virus, western equine encephalitis, and St. Louis encephalitis.

(j) The impacts of mosquito monitoring and treatment would be localized and temporary. The treatments and monitoring will be conducted in areas closed to public use, meaning they would likely not conflict with any wildlife-dependent public uses in the future. Any mosquito control undertaken will have minimal impact on any priority wildlife-dependent public use program. The disturbance of wildlife by District staff is minimized to the extent practicable by restricting access to sensitive areas and by controlling the type of access. The impacts anticipated from the logistical activities resulting from the proposed monitoring and treatment actions on wildlife are minimal.

Appropriate Uses Justification, Attachment 9

FINDING OF APPROPRIATENESS OF A REFUGE USE

Refuge Name: Tualatin River National Wildlife Refuge

Use: Research and monitoring

This form is not required for wildlife-dependent recreational uses, take regulated by the State, or uses already described in a refuge CCP or step-down management plan approved after October 9, 1997.

Decision Criteria:	YES	NO
(a) Do we have jurisdiction over the use?	✓	
(b) Does the use comply with applicable laws and regulations (Federal, State, tribal, and local)?	✓	
(c) Is the use consistent with applicable Executive orders and Department and Service policies?	✓	
(d) Is the use consistent with public safety?	✓	
(e) Is the use consistent with goals and objectives in an approved management plan or other document?	✓	
(f) Has an earlier documented analysis not denied the use or is this the first time the use has been proposed?	✓	
(g) Is the use manageable within available budget and staff?	✓	
(h) Will this be manageable in the future within existing resources?	✓	
(i) Does the use contribute to the public's understanding and appreciation of the refuge's natural or cultural resources, or is the use beneficial to the refuge's natural or cultural resources?	✓	
(j) Can the use be accommodated without impairing existing wildlife-dependent recreational uses or reducing the potential to provide quality (see section 1.6D, 603 FW 1, for description), compatible, wildlife-dependent recreation into the future?	✓	

Where we do not have jurisdiction over the use ("no" to (a)), there is no need to evaluate it further as we cannot control the use. Uses that are illegal, inconsistent with existing policy, or unsafe ("no" to (b), (c), or (d)) may not be found appropriate. If the answer is "no" to any of the other questions above, we will **generally** not allow the use.

If indicated, the refuge manager has consulted with State fish and wildlife agencies. Yes ___ No ✓

When the refuge manager finds the use appropriate based on sound professional judgment, the refuge manager must justify the use in writing on an attached sheet and obtain the refuge supervisor's concurrence.

Based on an overall assessment of these factors, my summary conclusion is that the proposed use is:

Not Appropriate___ **Appropriate** ✓

Refuge Manager: Eric Hahn Date: 4/23/13

If found to be **Not Appropriate**, the refuge supervisor does not need to sign concurrence if the use is a new use.

If an existing use is found **Not Appropriate** outside the CCP process, the refuge supervisor must sign concurrence.

If found to be **Appropriate**, the refuge supervisor must sign concurrence.

Refuge Supervisor: Date: 4/23/13

A compatibility determination is required before the use may be allowed.

FWS Form 3-2319
02/06

Refuge: Tualatin River National Wildlife Refuge

Use: Research and monitoring

Summary: Research and monitoring on refuge lands are fundamentally valuable as they make available scientific information for resource management decisions. The refuge receives requests from universities and other organizations to conduct scientific research and monitoring efforts within the refuge. These uses have been ongoing on the refuge for many years, and are consistent with the CCP goals. Research and monitoring are determined to be appropriate uses.

Further explanation of the answers from FWS Form 3-2319 is provided below:

(e) Research and monitoring are consistent with Goal 8 of this CCP. Conducting research and monitoring studies will provide the refuge with the best science with which to conduct refuge operations. Determining resource status and evaluating progress toward achieving objectives is essential to implementing adaptive management on the refuge. Research projects on refuge lands would address a wide range of natural and public use management issues. Examples of research projects include habitat use and life history requirements for specific species/species groups, practical methods for habitat management and restoration, extent and severity of environmental contaminants, techniques to control or eradicate pest species, effects of climate change on environmental conditions and associated habitat/wildlife response, modeling of wildlife populations, and assessing response of habitat/wildlife to disturbance from public uses.

(f) This is the first time these uses have been formally proposed.

(g) The use will be manageable within available budget and staff. Proposed research and monitoring will be conducted by outside entities, not refuge staff. Minimal refuge staff time is anticipated for project oversight.

(h) Future use will not be conducted by refuge staff, but by outside personnel, with minimal refuge staff oversight.

(i) Providing information on current status and trends of fish and wildlife populations is beneficial for public education and interpretation.

(j) Any research or monitoring project would be undertaken such that it would have minimal interference with any priority wildlife-dependent public use program.

Appendix B. Compatibility Determinations

B.1 Introduction

Compatibility determinations (CDs) developed during the comprehensive conservation plan (CCP) planning process evaluated uses that are projected to occur under the management direction. The evaluation of funds needed for management and implementation of each use also assume implementation as described under the management direction. Chapter 6 of the draft CCP/environmental assessment (EA) contains an analysis of the impacts of public uses to wildlife and habitats. That portion of the document is incorporated through reference into this set of CDs.

B.1.1 Uses Evaluated at This Time

The following section includes full CDs for all refuge uses that are required to be evaluated at this time. According to Service policy, CDs will be completed for all uses described under a CCP that have been determined to be appropriate. Existing wildlife-dependent recreational uses must also be reevaluated and new CDs prepared during development of a CCP.

According to the Service's compatibility policy, uses other than wildlife-dependent recreational uses are not explicitly required to be reevaluated in concert with preparation of a CCP, unless conditions of the use have changed or unless significant new information relative to the use and its effects have become available, or the existing CDs are more than 10 years old. However, the Service planning policy recommends preparing CDs for all individual uses, specific use programs, or groups of related uses associated with the CCP management direction.

B.1.2 Compatibility—Legal and Historical Context

Compatibility is a tool refuge managers use to ensure that recreational and other uses do not interfere with wildlife conservation, the primary focus of the refuge. Compatibility is not new to the Refuge System and dates back to 1918 as a concept. As policy, it has been used since 1962. The Refuge Recreation Act of 1962 directed the Secretary of the Interior to allow only those public uses of refuge lands that were ~~"~~compatible with the primary purposes for which the area was established."

Legally, refuges are closed to all public uses until officially opened through a compatibility determination. Regulations require that adequate funds be available for administration and protection of refuges before opening them to any public uses. However, wildlife-dependent recreational uses (hunting, fishing, wildlife observation and photography, and environmental education and interpretation) are to receive enhanced consideration and cannot be rejected simply for lack of funding resources unless the refuge has made a concerted effort to seek out funds from all potential partners. Once found compatible, wildlife-dependent recreational uses are deemed the priority public uses at the refuge. If a use is found not compatible, the refuge manager is legally precluded from approving it. However, a use found not compatible may be modified such that it can be found compatible. Economic uses that are conducted by or authorized by the refuge also require compatibility determinations.

Under compatibility policy, uses are defined as recreational, economic/commercial, or management uses of a refuge by the public or a non-Refuge System entity. Uses generally providing an economic return (even if conducted for the purposes of habitat management) are also subject to compatibility

determinations. The Service does not prepare compatibility determinations for uses when the Service does not have jurisdiction. For example, the Service may have limited jurisdiction over refuge areas where property rights are vested by others, where legally binding agreements exist, or where there are treaty rights held by tribes. In addition, aircraft overflights, emergency actions, some activities on navigable waters, and activities by other federal agencies on "overlay refuges" are exempt from the compatibility review process.

New compatibility regulations, required by the National Wildlife Refuge System Improvement Act of 1997 (Improvement Act), were adopted by the Service in October 2000 (http://refuges.fws.gov/policymakers/nwrpolicies.html). The regulations require that a use must be compatible with both the mission of the Refuge System and the purposes of the individual refuge. This standard helps to ensure consistency in application across the Refuge System. The Act also requires that compatibility determinations be in writing and that the public have an opportunity to comment on most use evaluations.

The Refuge System mission emphasizes that the needs of fish, wildlife, and plants must be of primary consideration. The Improvement Act defined a compatible use as one that "... in the sound professional judgment of the Director, will not materially interfere with or detract from the fulfillment of the mission of the System or the purposes of the Refuge." Sound professional judgment is defined under the Improvement Act as "... a finding, determination, or decision, that is consistent with principles of sound fish and wildlife management and administration, available science and resources ...." Compatibility for priority wildlife-dependent uses may depend on the level or extent of a use.

Court interpretations of the compatibility standard have found that compatibility is a biological standard and cannot be used to balance or weigh economic, political, or recreational interests against the primary purpose of the Refuge (Defenders of Wildlife v. Andrus [Ruby Lake Refuge]). The Service recognizes that compatibility determinations are complex. For this reason, refuge managers are required to consider "principles of sound fish and wildlife management" and "best available science" in making these determinations (House of Representatives 1997).

Evaluations of the existing uses on the Tualatin River National Wildlife Refuge are based on the professional judgment of refuge and planning personnel, including observations of refuge uses and reviews of appropriate scientific literature.

In July 2006, the Service published its Appropriate Refuge Uses Policy (603 FW 1). Under this policy, most proposed uses must also undergo a review prior to compatibility. Uses excepted from the policy include the "Big Six" uses and uses under reserved rights—see the policy for more detail.

B.2 Compatibility Determination for Wildlife Observation, Wildlife Photography, and Interpretation at Tualatin River National Wildlife Refuge

Use: Wildlife observation, wildlife photography, and interpretation

Station Name: Tualatin River National Wildlife Refuge (the refuge)

Date Established: 1992

Establishing and Acquisition Authority(ies):

Fish and Wildlife Act of 1956 (16 U.S. Code [U.S.C.] § 742a. et seq.)

Emergency Wetlands Resources Act of 1986 (16 U.S.C. § 3901-3932)

Refuge Purpose(s):

—… for the development, advancement, management, conservation, and protection of fish and wildlife resources … ” 16 U.S.C. § 742f(a)(4) (Fish and Wildlife Act of 1956)

—… for the benefit of the United States Fish and Wildlife Service, in performing its activities and services. Such acceptance may be subject to the terms of any restrictive or affirmative covenant, or condition of servitude …” 16 U.S.C. § 742f(b)(1) (Fish and Wildlife Act of 1956)

—… the conservation of the wetlands of the Nation in order to maintain the public benefits they provide and to help fulfill international obligations contained in various migratory bird treaties and conventions …” 16 U.S.C. § 3901(b) (Emergency Wetlands Resources Act of 1986)

National Wildlife Refuge System Mission:

—To administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans” (National Wildlife Refuge System Administration Act of 1966, as amended [16 U.S.C. 668dd et seq.]).

Description of Use:

This compatibility determination (CD) examines wildlife observation, wildlife photography, and interpretation as described under the management direction of the Tualatin River National Wildlife Refuge (refuge) comprehensive conservation plan (CCP). There is substantial overlap between activities associated with wildlife observation, wildlife photography, and interpretation where participants are engaged in self-directed learning about the natural and cultural resources on the refuge, and as such these uses are evaluated together in this CD. This use will foster an aware and involved citizenry that will take an active role in conservation.

Visitors typically engage in wildlife observation, wildlife photography, and interpretation uses at the refuge Wildlife Center, along the year-round and seasonal trails, at a number of overlooks, and at the

wildlife photography blind—all located on the Atfálat'i Unit of the refuge. Projections indicate that refuge public facilities could serve an estimated 200,000 to 300,000 visitors annually (U.S. Fish and Wildlife Service [Service; USFWS] 2003a). Currently, nearly 100,000 people visit the refuge annually. See Sections 5.3 and 5.4 of the refuge CCP for a complete description of visitor use statistics.

The highest visitor use generally occurs spring through fall, though there is some use throughout the year. The seasonal trail is open from May 1 through September 30 to minimize disturbance to migrating and wintering waterfowl. Visitor use is limited to developed facilities, and other areas of the refuge remain closed to general public use. Visitors are limited to pedestrian use only—bicycling, dog walking, and jogging are prohibited. Maps, brochures, kiosks, and directional and regulatory signs will be provided to visitors to communicate activities that are encouraged and those that are prohibited.

Group size is usually small (families, individuals, and couples constitute the majority of groups) but occasionally larger groups use the refuge. Local nonprofit groups (e.g., Audubon Society, walking clubs, parent groups) as well as for-profit organizations (tour buses) frequently visit the refuge and lead field trips on the trails and/or visit the Wildlife Center. As is currently the case, groups of 15 people or more must: make advance reservations; be limited to no more than 50 people; break up into subgroups of 15 people or less when on trails; strive to carpool or provide group transportation; follow all refuge regulations; and not charge any fee to their participants. Any organization that charges a fee to their participants will be subject to the stipulations in the commercial visitor services CD. Fundraising activities (including providing guided tours and hosting special events and meetings) conducted by Friends of the Tualatin River National Wildlife Refuge (Friends of the Refuge) are not subject to the commercial visitor services CD, but are subject to refuge approval, per the memorandum of understanding (MOU) between the Service and the Friends of the Refuge.

The CCP provides more opportunities for developing wildlife observation, photography, and interpretation programs and structured visitor experiences with enhanced facilities and improved access. Actions described in the management direction are as follows.

Up to three additional wildlife photography blinds will be constructed on the Atfálat'i Unit of the refuge. Access trails to the blind(s) will be developed with minimal footprint and be constructed out of gravel or other low-impact and low-maintenance material. Use of the blind(s) will be managed on a reservation basis for up to two people at a time. Blinds will be available up to three days a week, from dawn to dusk. For both wildlife photography and observation areas, the refuge will maintain ~~"v~~iewing lanes" by selectively trimming branches, mowing tall grass, and/or occasionally removing vegetation. In addition, areas around these facilities may be enhanced to maximize wildlife use of the area. Examples of enhancements include planting vegetation for additional habitat; providing habitat structure such as basking logs; increasing vegetation cover to serve as a natural blind; and adding trees and/or shrubs to minimize ~~"u~~rban noise" from off-refuge sources (i.e., roads, industrial activities). Though no public use facilities currently exist at the Wapato Lake Unit, one or two additional kiosks are planned and have potential to be developed off-refuge in partnership with local city and county jurisdictions.

Several regional land and water trail systems outside of the refuge being studied by local jurisdictions and organizations have the potential of connecting to the refuge. However, at this time, no specific location for connection has been proposed; therefore, additional appropriateness and CDs for new trails will be completed at a later date. The refuge supports providing additional wildlife observation,

photography, and interpretation opportunities by linking to regional trail systems and plans to continue working with local organizations to explore this further.

Wildlife observation, photography, and interpretation will continue to occur primarily informally as self-guided activities on the refuge. Refer to Section 5.4 in Chapter 5 for a complete description of existing programs. In addition, regular staff-, volunteer-, or partner-led tours, workshops, and demonstrations will be expanded to diversify the visitor experience and opportunities for these uses. Increased outreach and program offerings will likely result in increased visitation to the refuge. Refuge-approved and guided activities may include the use of the Wildlife Center or other refuge public use facilities, and may occasionally occur after dark when the refuge is normally closed to the public. The Friends of the Refuge may also conduct similar activities in support of wildlife observation, photography, and interpretation. These programs will require pre-approval by the refuge manager and will be subject to all of the same regulations as the general public (i.e., no special access to closed areas will be granted) and stipulations of this CD.

Virtual geocaching (drawing people to specific sites via electronic means) is considered a legitimate form of interpretation under this CD. Virtual geocaching may only be conducted on areas otherwise open to the public. Physical geocaching (the actual placement of objects in the landscape by the public) is not appropriate (see Appendix A) and is not included as a form of interpretation.

A number of existing and new special events, hosted by the refuge or in partnership with the Friends of the Refuge, could occur on the refuge in support of wildlife-dependent recreation and education activities. Examples include, but are not limited to, Tualatin River Bird Festival, National Wildlife Refuge Week, Spring Break Exploration Days, native plant sales, and one-time celebratory events such as dedications, groundbreakings, and grand openings. Special events typically last anywhere from 4 hours to all day, and may include multiple back-to-back days. Past events have attracted over 1,200 a day and may attract more, up to 2,000 people a day, in the future. Special event activities typically include, but are not limited to, guided nature walks; evening programs; indoor and outdoor temporary exhibits; self-guided tours/walks; hands-on educational activities; live animal shows; workshops; nature-related music (generally in the plaza area of the Wildlife Center); awards ceremonies for nature photography contests; and keynote speakers. Activities are limited to the areas of the refuge open to the public. Any special event activity occurring outside the public use areas will be subject to case-by-case refuge manager approval and, if necessary, a special use permit (SUP).

In support of enhanced wildlife observation, photography, and interpretation programs described in the CCP, the refuge will continue to pursue additional volunteers and interns. This will include providing bunkhouses or recreational vehicle (RV) pads to support long-term housing on the refuge. These facilities will be located in areas such as the maintenance and shop facility on the Tualatin River Unit and/or within proximity of existing or newly acquired quarters buildings.

Availability of Resources:

Estimated costs for operating the wildlife observation, photography, and interpretation programs as envisioned under the management direction are displayed in the following table. With assistance from Friends of the Refuge, grants, volunteers, and other partners, the refuge currently has sufficient staff and funding to support these programs at their current levels. Additional resources will be needed to fully implement the uses and strategies described in the CCP.

Costs to Administer and Manage Wildlife Observation, Wildlife Photography, and Interpretation under the CCP

Activity or Project	One-time Expenses ($)	Recurring Expenses ($/year)
Volunteer Coordinator		55,000
Law Enforcement Officer		78,500
Develop new kiosks at Wapato Lake Unit	20,000	
Maintain Wildlife Center and exhibits		5,000
Host special events		5,000
Transportation study	30,000	
Maintain parking lots, trails, overlooks, blinds, signs, outdoor exhibits		15,000
Construct up to 3 additional photo blinds and associated trails	40,000	
Construct RV pads and bunkhouse	300,000	5,000
Maintain existing and develop new signage and publications	5,000	5,000
Program oversight: Visitor Services Manager		20,000
Total	395,000	188,500

Anticipated Impacts of Use:

General Impacts Expected:

A general assessment of impacts resulting from wildlife observation, photography, and interpretation uses has been compiled from the literature and is briefly summarized below.

Disturbance intensity (frequency, distance, etc.): Human activities on recreational lands, trails, and other access points can result in direct effects on wildlife. Disturbance responses can depend upon the activity type, recreationists' behavior, and the distance, duration, frequency, predictability, timing, and visibility of the use (Knight and Cole 1995). Disturbance to migrant shorebirds on eastern coastal bays was found to increase as the total number of disturbances and recreationists increased and the duration of the disturbance and distance from the disturbance decreased (Burger 1986). Flushing, especially repetitive flushing, can strongly impact patterns of many bird species. Migratory birds have been observed to be more sensitive than resident species to disturbance (Klein 1989), and in the case of the eastern coastal migrant shorebirds, the percentage of observed shorebirds that were flushed and did not return increased by 53 percent from 1982 to 2002, suggesting that the birds were not adapting to the presence of people by habituation and were being affected in the long term (Burger et al. 2004).

Nest predation for songbirds (Miller et al. 1998), raptors (Glinski 1976), colonial nesting species (Buckley and Buckley 1976), and waterfowl (Boyle and Samson 1985) tends to increase in areas

more frequently visited by people where disturbance flushes birds away from their nests and creates vulnerabilities during nesting seasons. Frequency is a major factor, and songbirds have been found to alter behavior after repeated human disturbance, particularly red-winged blackbirds, goldfinches, and American robins, which became much more aggressive toward humans who repeatedly visited their nests (Knight and Temple 1986a, 1986b, 1986c).

Set-back distances for public use facilities have been found to be important in limiting human disturbance to wildlife. In Florida, 15 species of colonial waterbirds nesting at 17 colonies were exposed to three different human disturbance mechanisms to determine recommended set-back distances for protecting mixed-species nesting assemblages (Rodgers and Smith 1995). In general, a recommended set-back distance of about 100 meters (m) for wading bird colonies and 180 m for mixed tern/skimmer colonies was found to be adequate to effectively buffer sites from human disturbance caused by approach of pedestrians and motor boats (Rodgers and Smith 1995). In Nebraska, roosting sandhill cranes avoided sites near human disturbance features at 500 m from nearest paved road, 400 m from nearest gravel road, and 400 m from a single dwelling structure (Norling et al. 1992). Klein (1989) studied the effect of visitation on migrant and resident waterbirds at Ding Darling National Wildlife Refuge, finding that resident birds were less sensitive to human disturbance than migrants. Migrant ducks were particularly sensitive when they first arrived on-site in the fall. They usually remained at a distance of more than 80 m [from a visitor footpath on a dike], even at very low visitor levels. Herons, egrets, brown pelicans, and anhingas were most likely to habituate to humans, thus exposing them to direct disturbance as they fed on or near the dike. Shorebirds showed intermediate sensitivity. Strauss (1990) observed piping plover chicks spent less time feeding (50% versus 91%) and more time running (33% versus 2%), fighting with other chicks (4% versus 0.1%), and standing alert (9% versus 0.1%) when pedestrians or moving vehicles were closer than 100 m than when they were undisturbed. In addition, plover chicks spent less time out on the feeding flats (8% versus 97%) and more time up in the grass (66% versus 0.1%) during periods of human disturbance.

Conversely, wildlife tends to habituate best to disturbance that is predictable, as indicated by sandhill cranes in Florida and in Nebraska that nested within 400 m of highways, railroads, mines, and power lines, which provided a predictable background disturbance (Dwyer and Tanner 1992; Norling et al. 1992). Taylor and Knight (2003) found that for mule deer, the area of influence around off-trail areas was much greater than for on-trail areas, suggesting habituation to trails. However, the time it takes for wildlife to habituate, and what wildlife use is like compared to pre-disturbance uses, remains a question.

Group size: Disturbance impact to wildlife in relation to visitor group size is not a well-documented research area; however, a few studies have analyzed these impacts. Most animals flee from humans, and large groups of people may represent greater perceived risk of predation (Geist et al. 2005). Remacha et al. (2011) analyzed visitor group size influences on the number and variety of birds observed during guided educational tours in a forested area in central Spain, with group sizes ranging from 7 to 20 people. The study showed that increasing visitor group sizes had an impact on wildlife, as large groups were associated with decreased bird numbers; additionally, the study found that birds may demonstrate reduced tolerance when faced with large groups of visitors, not only reducing their frequency of occurrence but also reducing the number of individuals. The study concluded that reducing the group size of visitors helps minimize the negative impacts on wildlife and also allows visitors to watch more wildlife (Remacha et al. 2011).

Another study by Beale and Monaghan (2004) on human disturbance effects to seabird colonies at St. Abbs Head National Nature Reserve in Scotland examined the variation in nesting success for two birds, kittiwakes and guillemots, as a function of different disturbance regimes, including varying the average number of people per hour and people load, which takes into consideration the number of visitors and their distance from the nest. Human disturbance was found to have a significant negative effect on nesting success in both species of birds. Increasing visitor numbers by 8.5 percent resulted in a 22 percent increase in the failure rate of kittiwakes and a 13 percent increase in the failure rate for guillemots. Beale and Monaghan concluded that perhaps the most likely explanation is that nesting birds perceive people to be a potential predator and show appropriate anti-predator physiological responses, which interferes with energy resources available for nesting. The results showed that safe distances, or buffer zones, depend on the numbers of people visiting an area and that both numbers and distance matter in determining disturbance effects.

In addition to group size, loudness has also been found as an important variable in whether birds altered their behavior. A study was conducted at the Arthur B. Marshall Loxahatchee National Wildlife Refuge in Florida between 1992 and 1994 to observe foraging behavior of birds at the refuge and understand how people affect foraging birds (Burger and Gochfeld 1991). Variation in feeding behavior was largely explained by whether people were present, the number of people present, and the amount of noise made by the people (Burger and Gochfeld 1991). For all species, time devoted to feeding and number of strikes or pecks decreased while people were present and as the noise made by people increased; interestingly, loudness was found to be more important than the number of people present (Burger and Gochfeld 1991). Noise level is not necessarily correlated with number of people present, but larger groups might be more prone to producing noise than small groups or individuals.

Literature suggests that organizing visitors in small numbers is recommended for groups, but also spreading out visits and locations of visits is recommended to mitigate disturbance across the landscape.

Pedestrian (hiking) versus vehicular access: It is widely accepted that wildlife are frequently more sensitive to disturbance from people on foot than in vehicles (Grubb and King 1991; MacArthur et al. 1982; Pease et al. 2005; Skagen 1980). Numerous studies have confirmed that people on foot can cause a variety of disturbance reactions in wildlife, including flushing or displacement (Erwin 1989; Fraser et al. 1985; Freddy 1986; Pease et al. 2005), heart rate increases (MacArthur et al. 1982), altered foraging patterns (Burger and Gochfeld 1991), and even, in some cases, diminished reproductive success (Boyle and Samson 1985).

A study on seven species of dabbling ducks at the Back Bay National Wildlife Refuge in Virginia found a significant difference between vehicular (diesel truck and electric passenger tram) and nonvehicular (pedestrian and bicyclist) treatments in the number of ducks that were flushed. In this study, 90 percent of the birds showed an observable response to nonvehicular treatments, of which 43 percent flew; the proportion of ducks that flew was greatest when they were located less than 100 m from the disturbance (Pease et al. 2005). In a review of several studies of the reaction of waterfowl and other wetland birds to people on foot, it was found that distances greater than 100 m in general did not result in a behavioral response (DeLong 2002). Mule deer in sagebrush-grassland habitat in Utah showed a 96 percent probability of flushing at 100 m from the line of movement of off-trail recreationists, with the probability not dropping to 70 percent until the perpendicular distance increased to 390 m (Taylor and Knight 2003).

These studies and others have shown that the severity of the effects depends upon the wildlife's distance from the disturbance and its duration, frequency, predictability, and visibility to wildlife (Knight and Cole 1995). In a logistic regression analyzing mule deer, pronghorn antelope, and bison response to mountain biking and hiking on- and off-trail, Taylor and Knight (2003) found that the variables best explaining wildlife response included wildlife species, perpendicular distance of animals to trail (closest distance of animal to trail, regardless of recreationist position), trail position (on-trail or off-trail), and degree of vegetation cover.

Wildlife photography: Wildlife photography in particular can be a more disturbing activity because photographers are more likely to leave vehicles and wander off-trail, approach wildlife, and remain close for an extended period of time to capture a detailed photograph, as observed at Ding Darling National Wildlife Refuge and other places (Dobb 1998; Klein 1993; Morton 1995). This may also apply to the experience of the user, as avid wildlife viewers tend to intentionally seek out rare or spectacular species and/or are more eager to see the most viewing opportunities in the limited amount of time (e.g., bird listing), and thus potentially pose a larger negative impact to wildlife (Knight and Cole 1995). People engaged in wildlife observation and photography react to the presence of birds and thus are generally more unpredictable on foot depending on excitement level, curiosity, and desire to observe closely.

Refuge-specific Impacts:

People engaging in wildlife observation, photography, or interpretation generally access the refuge by motorized vehicles traveling on public roads and parking lots. Additional wildlife photography blinds and associated access trails of less than 0.25 mile each will be added under the CCP. Minimal effect as a whole will occur as a result of new wildlife observation and photography facilities constructed under the CCP. Interpretive signs were not included as an impact as the assumption is that signs do not displace habitat.

Pedestrian access: Pedestrian use of the refuge creates the highest potential for disturbance or damage to natural resources. Foot travel associated with wildlife observation or photography could potentially result in temporary and minor vegetation trampling. Foot travel may also potentially create disturbance in or near any habitat. During the wintering season, pedestrian access is limited to the year-round trail. This limits pedestrian human disturbance during the season of highest waterbird activity at the vast majority of key wintertime wildlife congregation areas (primarily wetlands and upland fields) and allows wildlife to habituate to the few areas where humans and wildlife may both be regularly present. Outside the winter season, people may access the seasonal trail as well.

Some interpretive programs are large, organized special events that differ in character from the more informal day-to-day observation and interpretive activities. These types of programs create more disturbance and can overfill parking facilities to the point where parking lots fill and off-site parking and shuttle service is necessary to avoid safety issues and parking off roadways.

Both refuge visitation and the number of facilities and emphasis devoted to wildlife observation, photography, and interpretation are projected to increase under the CCP. Given this, future disturbance effects are likely to be somewhat higher than present. Most studies cited above have demonstrated immediate, rather than long-term responses to disturbance. Long-term responses are inherently more difficult and expensive to determine. Given that wildlife observation, photography, and interpretation are not typically loud or intense kinds of activities, the area of habitat within a known distance of human activity centers (trails, kiosks, blinds, etc.) is considered a reasonable

indicator to evaluate the disturbance effects of public uses on refuge wildlife. As mentioned previously, in a review of several studies of the reaction of waterfowl and other wetland birds to people on foot, distances greater than 328 feet (100 m) generally did not result in a behavioral response (DeLong 2002).

Public education that informs photographers of ethical and least intrusive methods could reduce some impacts. Careful placement and camouflaging of additional photography blinds will likely reduce disturbance from wildlife photographers.

Although disturbance to wildlife from these activities will be higher than at present, the overall effect to refuge wildlife is expected to be minor. In addition, if disturbance to wildlife or damage to habitat reaches unacceptable levels, the refuge will limit access to areas where unacceptable impacts occur (see stipulations).

Impacts to Listed Species:

No direct impact to listed species is anticipated to occur as a result of the wildlife observation, photography, or interpretation programs. Any unanticipated future impacts will be reduced by ensuring that the public avoids or severely limits activity in areas hosting rare species.

Impacts to Other Priority Public Uses:

Wildlife observation, photography, and interpretation generally result in little disturbance to other visitors. However, some wildlife observers may inadvertently flush animals being observed or photographed by others. This conflict is expected to be minimal.

No significant effects to roads, trails, or other infrastructure from wildlife observation, photography, and interpretation programs are foreseen. Normal road, trail, and facility maintenance will continue to be necessary. Additional facility construction or upgrade, if needed, is addressed in the Availability of Resources section.

Public Review and Comment:

Various opportunities were provided for the public to engage with the planning process. Appendix K details public involvement undertaken during development of the CCP. Written comments on the draft CCP/EA, which included this compatibility determination, were collected during the public comment period.

Determination (check one below):

____ Use is Not Compatible

__X__ Use is Compatible with Following Stipulations

Stipulations Necessary to Ensure Compatibility:

- Motorized vehicles and bicycles will be limited to designated public roads and parking lots. Bicycles will not be allowed outside of parking areas.
- Registration will be required for organized groups of 15 people or more.

- Electric wheelchairs shall be allowed on trails for persons with disabilities.
- During special events, tours must avoid sensitive sites occupied by rare species.
- Wintertime sanctuary closures will be maintained. The refuge will be open dawn to dusk daily. Evening guided activities are approved by the refuge manager on a case-by-case basis.
- Dogs are not allowed outside of vehicles. Registered service animals are an exception.
- Signs, pamphlets, and verbal instructions and other public education from refuge staff and volunteers will promote appropriate use of facilities to minimize wildlife and habitat disturbance. Examples include promoting ethical wildlife observation/photography behavior by sharing regulations including the prohibition of audio bird calling devices or off-trail use.
- Periodic monitoring and evaluation of sites and programs will be conducted to assess if objectives are being met and ensure that the resource is not being unacceptably degraded. If disturbance to wildlife or damage to habitat reaches unacceptable levels, the refuge will avoid or limit activities in areas where unacceptable impacts occur.

Justification:

As wildlife-dependent recreational uses, wildlife observation, photography, and interpretation receive enhanced consideration in the CCP planning process. Given the location of wintertime sanctuary closed areas and the locations of wildlife viewing, photography, and interpretation facilities, these uses are expected to have a minor direct impact on refuge resources. The associated disturbance to wildlife from these activities under CCP, though larger than at present, is also expected to be minor. It is anticipated that wildlife populations will find sufficient food resources and resting places such that their abundance and use of the refuge will not be measurably lessened from allowing these activities to occur. The relatively limited number of individual animals and plants expected to be adversely affected will not cause populations to materially decline, the physiological condition and production of refuge species will not be impaired, their behavior and normal activity patterns will not be altered dramatically, and their overall welfare will not be negatively impacted. Thus, allowing wildlife photography, observation, interpretation to occur under the stipulations described above will not materially detract from or interfere with the purposes for which the refuge was established or the refuge mission. Wildlife observation, photography, and interpretation provide visitors with the joy of experiencing wildlife on their public lands, and as such, help fulfill the mission of the National Wildlife Refuge System (Refuge System).

Mandatory 10- or 15-year Re-evaluation Date (provide month and year for "allowed" uses):

__2028__ Mandatory 15-year re-evaluation date (for wildlife-dependent public uses)

_____ Mandatory 10-year re-evaluation date (for all uses other than wildlife-dependent public uses)

B.3 Compatibility Determination for Waterfowl Hunting at Tualatin River National Wildlife Refuge

Use: Waterfowl hunting

Station Name: Tualatin River National Wildlife Refuge

Date Established: 1992

Establishing and Acquisition Authority(ies):

Fish and Wildlife Act of 1956 (16 U.S.C. § 742a. *et seq*.)

Emergency Wetlands Resources Act of 1986 (16 U.S.C. § 3901-3932)

Refuge Purpose(s):

—… for the development, advancement, management, conservation, and protection of fish and wildlife resources …" 16 U.S.C. § 742f(a)(4) (Fish and Wildlife Act of 1956)

—… for the benefit of the United States Fish and Wildlife Service, in performing its activities and services. Such acceptance may be subject to the terms of any restrictive or affirmative covenant, or condition of servitude …" 16 U.S.C. § 742f(b)(1) (Fish and Wildlife Act of 1956)

—… the conservation of the wetlands of the Nation in order to maintain the public benefits they provide and to help fulfill international obligations contained in various migratory bird treaties and conventions …" 16 U.S.C. § 3901(b) (Emergency Wetlands Resources Act of 1986)

National Wildlife Refuge System Mission:

—To administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans" (National Wildlife Refuge System Administration Act of 1966, as amended [16 U.S.C. 668dd et seq.]).

Description of Use:

The Service plans to allow hunting of ducks, geese, and coots in accordance with state and Federal regulations and refuge-specific special conditions. A youth waterfowl hunt will be conducted on the Oleson parcel of the Riverboat Unit.

Hunting will take place during regular state seasons, which generally run from October to January, but dates are subject to change annually and based on evaluation of the program success. Youth hunts will be conducted on selected days in coordination with Oregon Department of Fish and Wildlife. Youth hunting will be allowed using two to five blinds on the Riverboat Unit, but this may change depending on the quality of the hunt. A maximum of two youth and two supervising (but nonhunting) adults will be accommodated in each blind. Blind assignments will be conducted via lottery prior to each hunt date. Although dogs are generally prohibited for all other uses on the refuge, they are a vital part of the waterfowl hunting tradition and can reduce the loss of waterfowl, thus reducing the

overall impact to the resource. Because of their role in retrieving waterfowl, dogs used for waterfowl retrieval purposes are allowed on the refuge for waterfowl hunting.

In accordance with the National Wildlife Refuge System Administration Act of 1966, as amended, hunting is a priority wildlife-dependent public use. Public land for waterfowl hunting is in limited supply, especially near large metropolitan areas (U.S. Department of the Interior [USDOI] et al. 2007) such as Portland. In general, there has been a static or declining trend in hunting participation relative to population growth in the United States (USFWS 2004) since 1985. The trend also indicates a declining number of young hunters. From 1991 to 2001, the number of Americans 16 years of age and older who hunted declined by 7 percent. However, in Oregon from 1991 to 2001, hunter participation increased by 2 percent (USFWS 2004). According to Raftovich et al. (2011) there were approximately 21,400 active waterfowl hunters in Oregon during 2010. Opportunities to hunt in the greater Portland area are increasingly scarce due to an ever-growing population, urbanization, and a relative lack of public lands open to these uses. Hunting (both for and against) was the subject of more letters and e-mails received during scoping for the CCP than any other topic. In particular, the community has expressed a very strong interest in sharing hunting traditions with youth. Opening the refuge to waterfowl hunting will provide the public an opportunity to hunt in proximity to the urban area, in uncrowded and relatively natural environments, and at a reasonable cost. The habitat and wildlife objectives for the Riverboat Unit are very likely to support quality waterfowl hunts as the refuge will be restoring habitat used by waterfowl. Refuge hunting opportunities will be offered consistent with state hunting regulations, and with management plans for applicable species and the Pacific Flyway Council's (PFC's) plans for cackling Canada geese (PFC 1999) and dusky Canada geese (PFC 2008).

Hunters have helped buy land for the Refuge System for nearly 70 years through the purchase of Migratory Bird Hunting and Conservation Stamps—also known as Duck Stamps—and continue to support and advocate for refuges and conservation. Hunters also participate and share in wildlife photography, education, and interpretation while hunting. These activities will tend to promote and support the mission of the Refuge System.

Tualatin River National Wildlife Refuge was established under, or to fulfill the purpose of, the Migratory Bird Conservation Act (16 U.S.C. § 715a-715r), or through approval of the Migratory Bird Conservation Committee, as an ~~"in~~violate sanctuary for migratory birds, or for any other management purpose, for migratory birds." On units of the Refuge System or portions thereof established as an ~~"in~~violate sanctuary," the Service may only allow hunting of migratory gamebirds on no more than 40 percent of that refuge, or portion, at any one time unless the Service finds that taking of any such species in more than 40 percent of such an area will be beneficial to the species (National Wildlife Refuge System Administration Act and Migratory Bird Conservation Act).

Availability of Resources:

Administering the refuge hunt program requires substantial staff time, equipment, and funding. To provide a quality hunting experience, access trails, parking lots, signs, and other facilities must be maintained annually. The refuge does not have a law enforcement officer on staff and must rely on zone officers or partnering law enforcement agencies to ensure compliance with state and Federal regulations and refuge-specific special conditions. Funding associated with facilities maintenance (roads, parking areas, signs, etc.) is included in other refuge programs requiring the same support.

Increased volunteer assistance, stronger existing partnerships, and new partnerships will be sought to support these programs in an effective, safe, and compatible manner. Refuge staff will increase volunteer recruitment efforts. Volunteers, interns, and various user groups when provided appropriate training can assist the refuge with monitoring, education and interpretation programs, and maintenance projects. With additional assistance as described above, staffing and funding is expected to be sufficient to manage these uses.

Costs to Administer and Manage Hunting under the CCP

Category and Itemization for Waterfowl Hunting Program	One-time Expenses	Annual Expenses
Develop youth hunting program opening package	$10,000	
Construct youth hunting blinds	$15,000	
Develop signage and brochures	$2,000	$500
Administration and management		$5,000
Maintenance		$2,000
Law enforcement staff		$5,000
Total one-time expenses for youth waterfowl hunting program	**$27,000**	
Total annual expenses for youth waterfowl hunting program		**$12,500**

Anticipated Impacts of the Use:

Short-term Impacts:

Short-term impacts include disturbance to wetland habitat to install hunting blinds. Blinds will be installed during late summer when wetland water levels are low or dry, migratory waterfowl are not present, and locally nesting birds have hatched their young. Short-term impacts will also include disturbance of migratory waterfowl and other wildlife during hunting activities. Direct take of waterfowl will occur, and take of some non-target species might also occur. The presence of hunters and dogs, sounds of gunfire, and the sight of hunters traveling to and from hunt areas can disturb wildlife species such as pied-billed grebe, great blue heron, bald eagle, and tundra swan, which forage in refuge wetlands. This disturbance, especially when repeated over a period of time, may result in some wildlife species altering their behavior or moving to other areas. Hunting will occur outside of the breeding season. No significant effects are expected for refuge fish populations.

Long-term Impacts:

Long-term impacts include loss of some vegetation surrounding hunting blinds and impacts to migratory waterfowl and other wildlife species from repeated disturbance. The hunting blind itself will have a ~~f~~ootprint" of vegetation disturbance and trampling of vegetation by hunters using the blind. Migratory waterfowl and other wildlife species will be disturbed during times when hunting is occurring, and to some extent some will avoid the hunt area during nonhunting days as well. Annual maintenance of hunting blinds will also cause disturbance to both habitat and wildlife in the vicinity of the blinds.

Although hunting directly impacts individuals, the amount of waterfowl harvest is not expected to change or to have a measurable effect on refuge, Willamette Valley, or Pacific Flyway populations, as waterfowl hunting activity is not extremely high in the highly urbanized Willamette Valley. Hunting may be either compensatory or additive to natural mortality (Anderson 1995). Compensatory mortality occurs when hunting substitutes for other forms of mortality (disease, competition, predation, severe weather, etc.). Additive mortality occurs when hunting compounds the total mortality. In some cases, hunting can be used as a management tool to control populations. In concert with Canada, Mexico, and multi-state flyway councils, the Service and state wildlife agencies regulate hunting so that harvest does not reduce populations to unsustainable levels.

Direct effects of hunting on waterfowl are mortality, wounding, and disturbance (DeLong 2002). Hunting can alter behavior (e.g., foraging time), population structure, and distribution patterns of wildlife (Bartelt 1987; Cole and Knight 1990; Madsen 1985; Owens 1977; Raveling 1979; Thomas 1983; White-Robinson 1982). In Denmark, hunting was documented to affect the diversity and number of birds using a site (Madsen 1995). Avian diversity changed from predominantly mute swan and mallard to a more even distribution of a greater number of species when a sanctuary was established. Hence, species diversity increased with the elimination of hunting. There also appears to be an inverse relationship between the numbers of birds using an area and hunting intensity (DeLong 2002). In Connecticut, lesser scaup were observed to forage less in areas that were heavily hunted (Cronan 1957). In California, the numbers of northern pintails on Sacramento Refuge's non-hunt areas increased after the first week of hunting and remained high until the season was over in early January (Heitmeyer and Raveling 1988). Following the close of hunting season, ducks generally increased their use of the hunt area; however, use was lower than before the hunting season began.

Human disturbance to wintering birds and other wildlife using the open waters of the refuge will occur as a result of hunting activity. Migratory and wintering waterfowl generally attempt to minimize time spent in flight and maximize foraging time because flight requires considerably more energy than any other activity other than egg laying. Human disturbance associated with hunting includes loud noises and rapid movements, such as those produced by shotguns and dogs. This disturbance, especially when repeated over a period of time, compels waterfowl to change food habits, feed only at night, lose weight, or desert feeding areas (Madsen 1995; Wolder 1993). Disturbance levels from hunting activity outside Chincoteague Refuge were found to be high enough to force wintering black ducks into a pattern of nocturnal feeding within surrounding salt marsh and diurnal resting within refuge impoundments (Morton et al. 1989a, 1989b). Unhunted populations have been documented to behave differently from hunted ones (Wood 1993).

The impacts noted above can be reduced by the presence of adjacent sanctuary areas where hunting does not occur, and birds can feed and rest relatively undisturbed. Sanctuaries or non-hunt areas have been identified as the most common solution to disturbance problems caused from hunting (Havera et al. 1992). Prolonged and extensive disturbances may cause large numbers of waterfowl to leave disturbed areas and migrate elsewhere (Madsen 1995; Paulus 1984). In Denmark, hunting disturbance effects were experimentally tested by establishing two sanctuaries (Madsen 1995). Over a five-year period, these sanctuaries became two of the most important staging areas for coastal waterfowl. Numbers of dabbling ducks and geese increased fourfold to 20-fold within the sanctuary (Madsen 1995). On the refuge, all units except the Atfálat'i and Riverboat Units will be closed to public entry, and with numerous wetlands and sloughs available, these other units act as a sanctuary during the waterfowl season.

Cumulative Impacts:

The hunting of waterfowl in the United States is based upon a thorough regulatory setting process that involves numerous sources of waterfowl population and harvest monitoring data. Waterfowl populations throughout North America are managed through an administrative process known as flyways, of which there are four (Pacific, Central, Mississippi, and Atlantic). Oregon is included in the Pacific Flyway.

National Environmental Policy Act (NEPA) considerations incorporated by the Service for hunted migratory gamebird species are addressed by the programmatic document *Final Supplemental Environmental Impact Statement: Issuance of Annual Regulations Permitting the Sport Hunting of Migratory Birds*, which was filed with the U.S. Environmental Protection Agency (EPA) on June 9, 1988. The Service published the record of decision for this document on August 18, 1988 (53 Federal Register [FR] 31341). This document is in the process of being updated; in August 2009, the *Draft Supplemental Environmental Impact Statement: Issuance of Annual Regulations Permitting the Hunting of Migratory Birds* was released (USDOI 2009). Annual NEPA considerations for waterfowl hunting frameworks are covered under a separate environmental assessment and finding of no significant impact.

The Migratory Bird Treaty Act stipulates that all hunting seasons for migratory gamebirds be closed unless specifically opened by the Secretary of the Interior. The Service annually promulgates regulations establishing the Migratory Bird Hunting Frameworks. The frameworks are essentially permissive in that hunting of migratory birds will not be permitted without them. Thus, in effect, Federal annual regulations both allow and limit the hunting of migratory birds.

The Migratory Bird Hunting Frameworks provide season dates, bag limits, and other options for the states to select that should result in the level of harvest determined to be appropriate based upon Service-prepared annual biological assessments detailing the status of migratory game bird populations. In North America, the process for establishing waterfowl hunting regulations is conducted annually. In the United States, the process involves a number of scheduled meetings (Flyway Study Committees, Flyway Councils, Service Regulations Committee, etc.) in which information regarding the status of waterfowl populations and their habitats is presented to individuals within the agencies responsible for setting hunting regulations. In addition, public hearings are held, and the proposed regulations are published in the Federal Register to allow public comment.

For waterfowl, annual assessments used in establishing the frameworks include the Breeding Population and Habitat Survey, which is conducted throughout portions of the United States and Canada. This survey is used to establish a Waterfowl Population Status Report annually. In addition, the number of waterfowl hunters and resulting harvest are closely monitored through both the Harvest Information Program and the Parts Collection Survey. Since 1995, such information has been used to support the adaptive harvest management (AHM) process for setting duck-hunting regulations. Under AHM, a number of decision-making protocols determine the choice (package) of predetermined regulations (appropriate levels of harvest) that constitute the framework offered to the states that year. Each state's wildlife commission then selects season dates, bag limits, shooting hours, and other options from the Flyway package. Their selections can be more restrictive but not more liberal than AHM allows. Thus, the level of hunting opportunity afforded each state depends on the annual status of waterfowl populations.

Season dates and bag limits for national wildlife refuges open to hunting are never longer or larger than state regulations. In fact, season dates and bag limits may be more restrictive than the state allows. Each national wildlife refuge considers the cumulative impacts to hunted migratory species through the Migratory Bird Hunting Frameworks published annually in the Service's regulations on migratory bird hunting.

According to Raftovich et al. (2011) total waterfowl harvest in Oregon during 2009-2010 was estimated at 464,500 out of a total Pacific Flyway harvest of 3,458,700, or approximately 13 percent of the flyway total. It is estimated that refuge youth hunters will annually harvest approximately 144 waterfowl. The total estimated annual harvest will be less than 1/10 of one percent of the Oregon and Pacific Flyway harvests.

The cumulative effects of disturbance to nonhunted birds and other species under the CCP are expected to be minor. Hunting seasons will not coincide with the nesting season; thus, reproduction will not be reduced by hunting. Disturbance to foraging or resting migrating or resident birds might occur, but will be minor because of the small amount of area allowed for these hunts relative to the size of the refuge and the limited time parameters for hunting. Disturbance to other taxa will be unlikely or negligible. Encounters with reptiles and amphibians in the early fall will be few and should not have cumulative negative effects on reptile and amphibian populations. Refuge regulations further mitigate possible disturbance by hunters to nonhunted wildlife. Vehicles will be restricted to roads, and the harassment or taking of any wildlife other than the game species legal for the season will not be permitted.

Hunting has the potential to disturb refuge visitors engaged in other priority public uses, and mitigation measures to avoid user conflict will be undertaken. For example, the youth waterfowl hunt will be conducted on the Riverboat Unit, a location that is not open to other public uses.

Waterfowl hunting opportunity helps to better provide a priority public ~~"b~~big six" use, and this use is currently not provided at the refuge. Providing opportunities for youth is an important initiative in the Service and helps address a public desire to see more hunting opportunities for youth.

There could be some indirect beneficial impacts from implementing a hunting program on the refuge. Refuge hunting can contribute to wildlife and habitat conservation and provide educational and sociological benefits. The hunting community in general remains the largest support base for funding land acquisitions in the Refuge System through the purchase of Duck Stamps. Refuges provide an opportunity for a high-quality waterfowl hunting experience to all citizens regardless of economic standing. Many individual refuges have developed extensive public information and education programs bringing hunters into contact with refuge activities and facilitating awareness of wildlife issues beyond hunting.

Summary of Effects:

The Service concludes that hunting on the Tualatin River National Wildlife Refuge, as planned under the CCP, will not have a significant impact on local, regional, or Pacific Flyway waterfowl populations because the percentage likely to be taken on the refuge, though possibly additive to existing hunting take, will be a tiny fraction of estimated populations. In addition, overall populations will continue to be monitored and future harvests will be adjusted as needed under the existing flyway and state regulatory processes.

This hunt will not add to cumulative impacts to waterfowl stemming from hunting on national wildlife refuges. Several points support this conclusion: 1) the proportion of the national waterfowl harvest that occurs on national wildlife refuges is only 6 percent (USDOI 2009); 2) there are no waterfowl populations that exist wholly and exclusively on national wildlife refuges; 3) annual hunting regulations within the United States are established at levels consistent with the current population status; 4) refuges cannot permit more liberal seasons than provided for in Federal frameworks; and 5) refuges purchased with funds derived from Federal Duck Stamps must limit hunting to 40 percent of the available area.

Public Review and Comment:

Various opportunities were provided for the public to engage with the planning process. Appendix K details public involvement undertaken during development of the CCP. Written comments on the draft CCP/EA, which included this compatibility determination, were collected during the public comment period.

Determination (check one below):

____ Use is Not Compatible

__X__ Use is Compatible with Following Stipulations

Stipulations Necessary to Ensure Compatibility:

- Hunting will be conducted in accordance with all Federal, state, and refuge-specific regulations.
- Only ducks, geese, and coots may be taken in accordance with state regulations.
- Hunting will only be allowed from established blinds or blind sites.
- The hunting program will be conducted as outlined in Chapter 2 of the CCP and follow a step-down hunting management plan.
- Hunting program leaflets and 50 Code of Federal Regulations [CFR] 32 will be updated as necessary.
- Law enforcement patrols will be conducted on a regular basis to ensure compliance with state, Federal, and refuge regulations.
- The refuge will ensure safety and minimize conflict with other priority public uses by providing information about hunting boundaries and seasons to the general public and those engaging in other refuge programs. Information will be provided at interpretive kiosks, on the refuge website, and in refuge offices.
- Camping, overnight use, and fires will be prohibited.
- Habitat will be managed for the benefit of wildlife.

Justification:

Under the National Wildlife Refuge System Administration Act of 1966, as amended, hunting is a wildlife-dependent recreational activity, which receives enhanced consideration in the CCP planning process and is to be encouraged on national wildlife refuges if compatible with refuge purposes. This refuge hunting program is designed to provide a high-quality, safe experience, with a reasonable opportunity to harvest waterfowl. Despite the direct and indirect impacts associated with waterfowl

hunting, waterfowl populations are unlikely to be affected significantly by the hunting program. Waterfowl population objectives and allowable harvests are determined on a flyway basis using an established annual regulatory process as described above. Limited hunt seasons and days, no-hunt zones, and established winter sanctuary on the majority of the acreage of the Tualatin River National Wildlife Refuge ensure that wintering and migrating waterfowl, as well as non-target species, find adequate food and rest areas on the refuge even during the hunting season.

In addition, by respecting seasons and limits, purchasing all required licenses, and paying Federal excise taxes on hunting equipment and ammunition, individual hunters make a big contribution toward ensuring the future of many species of wildlife and habitat for the future. By paying the Federal excise tax on hunting equipment, hunters are contributing hundreds of millions of dollars for conservation programs that benefit many wildlife species, both hunted and nonhunted. Each year, nearly $200 million in hunters' Federal excise taxes are distributed to state agencies to support wildlife management programs, the purchase of lands open to hunters, and hunter education and safety classes. Since 1934, the Service has spent more than $1 billion Migratory Bird Conservation Fund dollars from sales of Federal Duck Stamps (USFWS 2011d). Proceeds from the Federal Duck Stamp, a required purchase for adult hunters of migratory waterfowl, have purchased more than five million acres of important waterfowl habitat, including land in the Tualatin River NWR. These lands support waterfowl and many other wildlife species, and are often open to hunting (USFWS 2011e). Thus, allowing waterfowl hunting under the stipulations described above will not materially detract from or interfere with the purposes for which the refuge was established or the refuge mission.

Mandatory 10- or 15-Year Re-evaluation Date (provide month and year for "allowed" uses only):

__2028__ Mandatory 15-year re-evaluation date (for wildlife-dependent public uses)

_____ Mandatory 10-year re-evaluation date (for all uses other than wildlife-dependent public uses)

B.4 Compatibility Determination for Research, Scientific Collecting, and Surveys at Tualatin River National Wildlife Refuge

Uses: Research, scientific collecting, and surveys

Research: Planned, organized, and systematic investigation of a scientific nature

Scientific collecting: Gathering of refuge natural resources or cultural artifacts for scientific purposes

Surveys: Scientific inventory or monitoring

Station Name: Tualatin River National Wildlife Refuge

Date Established: 1992

Establishing and Acquisition Authority(ies):

Fish and Wildlife Act of 1956 (16 U.S.C. § 742a. et seq.)

Emergency Wetlands Resources Act of 1986 (16 U.S.C. § 3901-3932)

Refuge Purposes:

—… for the development, advancement, management, conservation, and protection of fish and wildlife resources …" 16 U.S.C. § 742f(a)(4) (Fish and Wildlife Act of 1956)

—… for the benefit of the United States Fish and Wildlife Service, in performing its activities and services. Such acceptance may be subject to the terms of any restrictive or affirmative covenant, or condition of servitude …" 16 U.S.C. § 742f(b)(1) (Fish and Wildlife Act of 1956)

—… the conservation of the wetlands of the Nation in order to maintain the public benefits they provide and to help fulfill international obligations contained in various migratory bird treaties and conventions …" 16 U.S.C. § 3901(b) (Emergency Wetlands Resources Act of 1986)

National Wildlife Refuge System Mission:

—To administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans" (National Wildlife Refuge System Administration Act of 1966, as amended [16 U.S.C. 668dd et seq.]).

Description of Uses:

Refuge staff receives periodic requests from non-Service entities (e.g., universities, state agencies, other Federal agencies, non-governmental organizations) to conduct research, scientific collecting, and surveys on refuge lands. These project requests can involve a wide range of natural and cultural resources as well as public use management issues including basic absence/presence surveys, collection of new species for identification, habitat use and life history requirements for specific species/species groups, practical methods for habitat restoration, extent and severity of environmental

contaminants, techniques to control or eradicate pest species, effects of climate change on environmental conditions and associated habitat/wildlife response, identification and analyses of paleontological specimens, wilderness character, modeling of wildlife populations, bioprospecting, and assessing response of habitat/wildlife to disturbance from public uses. Projects may be species-specific or refuge-specific, or evaluate the relative contribution of the refuge lands to larger landscapes (e.g., ecoregion, region, flyway, national, international) and issues and trends.

The Service's Research and Management Studies and Appropriate Refuge Uses policies indicate priority for scientific investigatory studies that contribute to the enhancement, protection, use, preservation, and management of native wildlife populations and their habitats as well as their natural diversity. Projects that contribute to refuge-specific needs for resource and/or wilderness management goals and objectives, where applicable, will be given a higher priority over other requests.

Research, scientific collecting, and surveys may be conducted on any and all refuge-managed lands during any part of the year as appropriate. Research, scientific collecting, and surveys may be conducted in cooperation with other Federal, state, or local agencies; colleges and universities; nonprofit organizations; consultants; or individuals. These studies are conducted to better inform refuge management decisions and increase general knowledge about the flora, fauna, and abiotic factors affecting refuge habitats.

Availability of Resources:

Refuge staff responsibilities for projects by non-Service entities will primarily be limited to the following: review of proposals, preparation of SUPs and other compliance documents (e.g., Section 7 of the Endangered Species Act of 1973, Section 106 of the National Historic Preservation Act), and monitoring of project implementation to ensure that impacts and conflicts remain within acceptable levels (compatible) over time. Additional administrative, logistical, and operational support may also be provided depending on each specific request. Estimated costs for one-time (e.g., SUP preparation) and annually recurring tasks by refuge staff and other Service employees will be determined for each project. Sufficient funding in the general operating budget of the refuge must be available to cover expenses for these projects. The terms and conditions for funding and staff support necessary to administer each project on the refuge will be clearly stated in the SUP(s).

The refuge has the following staffing and funding to administratively support and monitor research that is currently taking place on refuge lands (see table below). Any substantial increase in the number of projects will create a need for additional resources to oversee the administration and monitoring of the investigators and their projects. Any substantial additional costs above those listed below may result in finding a project not compatible unless expenses are offset by the investigator(s), sponsoring agency, or organization.

Current Refuge Staffing and Funding to Support and Monitor Research

Category and Itemization	One-time Expenses	Annual Expenses
Administration and management		$10,000

Anticipated Impacts of the Uses:

Use of the refuge to conduct research, scientific collecting, and surveys will generally provide information that will benefit fish, wildlife, plants, and their habitats. Scientific findings gained through these projects provide important information regarding life history needs of species and species groups, and identify or refine management actions to achieve resource management objectives in refuge management plans (especially CCPs). Reducing uncertainty regarding wildlife and habitat responses to refuge management actions to achieve desired outcomes reflected in resource management objectives is essential for adaptive management in accordance with 522 DM 1.

If project methods impact or conflict with refuge-specific resources, priority wildlife-dependent public uses, other high-priority research, or refuge habitat and wildlife management programs, then for the project to be compatible it must be clearly demonstrated that the project's scientific findings will contribute to resource management and that the project cannot be conducted off refuge lands. The investigator(s) must identify methods/strategies necessary to minimize or eliminate potential impact(s) and conflict(s) in advance. If unacceptable impacts cannot be avoided, then the project will not be determined compatible. Projects that represent public or private economic use of natural resources of any national wildlife refuge (e.g., bioprospecting) must contribute to the achievement of the national wildlife refuge purposes or the Refuge System mission to be compatible.

Impacts will be project- and site-specific, where they will vary depending upon the nature and scope of fieldwork. Data collection techniques will generally have minimal animal mortality or disturbance, minimal habitat destruction, no introduction of contaminants, and no introduction of nonindigenous species. Projects involving the collection of biotic samples (plants or animals) or requiring intensive ground-based data or sample collection will have short-term impacts. To reduce impacts, the minimum number of samples (e.g., water, soils, vegetative litter, plants, macroinvertebrates, vertebrates) will be collected for identification and/or experimentation and statistical analysis. Where possible, researchers will coordinate and share collections to reduce sampling needed for multiple projects. For example, if one investigator collects fish for a diet study and another researcher examines otoliths, then it may be possible to accomplish sampling for both projects with one collection effort.

Investigator(s) obtaining required state and Federal collecting permits will also ensure minimal impacts to fish, wildlife, plants, and their habitats. If projects result in long-term or cumulative effects to federally listed species and/or critical habitat, a Section 7 consultation under the Endangered Species Act will be required. Only projects that have no effect or that have ~~"n~~not likely to adversely affect" determinations will be considered compatible.

There is potential for the spread of invasive plants and/or pathogens from ground disturbance and/or transportation of project equipment and personnel, but it will be minimized or eliminated by requiring proper cleaning of investigator equipment and clothing as well as quarantine methods, where necessary. If after all practical measures are taken, unacceptable spread of invasive species is still expected to occur, the project will be found not compatible.

There also could be localized and temporary effects from vegetation trampling, collecting of soil and plant samples, or trapping and handling of wildlife. Impacts may also occur from infrastructure necessary to support a project (e.g., permanent transect or plot markers, exclosure devices, monitoring equipment, solar panels to power unattended monitoring equipment). Some level of disturbance is expected with these projects, especially if investigators enter areas closed to the public

and collect samples or handle wildlife. However, wildlife disturbance (including altered behavior) will usually be localized and temporary in nature. Where long-term or unacceptable cumulative effects cannot be avoided, the project will not be found compatible.

At least 3 months before initiation of fieldwork (unless an exception is made by prior approval of the refuge manager), project investigator(s) must submit a detailed proposal. Project proposals will be reviewed by refuge staff and others, as needed, to assess the potential impacts (short, long-term, and cumulative) relative to the benefits of the investigation to refuge management issues and understanding of natural systems. This assessment will form the primary basis for allowing or denying a specific project. Projects that result in unacceptable refuge impacts will not be found compatible.

If a proposal is approved, the refuge manager will issue an SUP(s) with required stipulations (terms and conditions) of the project to avoid and/or minimize potential impacts to refuge resources as well as conflicts with other public use activities and refuge field management operations. After approval, projects will be monitored during implementation to ensure impacts and conflicts remain within acceptable levels based upon documented stipulations.

The combination of stipulations identified above and conditions included in any SUP(s) will ensure that proposed projects contribute to the enhancement, protection, conservation, and management of native fish and wildlife populations and their habitats on the refuge. As a result, these projects will help fulfill refuge purpose(s); contribute to the mission of the Refuge System; and maintain the biological integrity, diversity, and environmental health of the refuge.

Projects that are not covered by the CCP (objectives under Goal 8 [Collect scientific information—surveys, scientific assessments, and research]) will require additional NEPA documentation.

Public Review and Comment:

Various opportunities were provided for the public to engage with the planning process. Appendix K details public involvement undertaken during development of the CCP. Written comments on the draft CCP/EA, which included this compatibility determination, were collected during the public comment period.

Determination (check one below):

____Use is Not Compatible

__X__Use is Compatible with Following Stipulations

Stipulations Necessary to Ensure Compatibility:

Each project will require an SUP. Annual or other short-term SUPs are preferred; however, some permits will be for a longer period, if needed, to allow completion of the project. Renewals will be subject to refuge manager review and approval based on timely submission of and content in progress reports, compliance with SUP stipulations, and required permits.

- Projects will adhere to scientifically defensible protocols for data collection, where available and applicable.

- Investigators must possess appropriate permits and comply with conditions of state or Federal permits for their projects.
- If unacceptable impacts to natural resources or conflicts arise or are documented by refuge staff, then the refuge manager can suspend, modify conditions of, or terminate an ongoing project already permitted by SUP(s) on the refuge.
- Progress reports are required at least annually for multiple-year projects. The minimum required elements for a progress report will be provided to investigator(s).
- Final reports are due after completion of the project unless negotiated otherwise with the refuge manager.
- Continuation of existing projects will require approval by the refuge manager.
- Refuge staff will be given the opportunity to review draft manuscript(s) from the project before manuscripts are submitted to a scientific journal(s) for consideration of publication.
- Refuge staff will be provided with copies (reprints) of all publications resulting from a refuge project.
- Refuge staff will be provided with copies of raw data (preferably electronic database format) at the conclusion of the project.
- Upon completion of the project or annually, all equipment and markers (unless required for long-term projects) must be removed and sites must restored to the refuge manager's satisfaction. Conditions for clean-up and removal of equipment and physical markers will be stipulated in the SUP(s).
- All samples collected on refuge lands are the property of the Service even while in the possession of the investigator(s). Any future work with previously collected samples not clearly identified in the project proposal will require submission of a subsequent proposal for review and approval. In addition, a new SUP will be required for additional project work. For samples or specimens to be stored at other facilities (e.g., museums), a memorandum of understand will be necessary.
- Sampling equipment as well as investigator(s) clothing and vehicles (e.g., all-terrain vehicles [ATVs], boats) will be thoroughly cleaned (free of dirt and plant material) before being allowed on refuge lands to prevent the introduction and/or spread of pests .
- The Refuge System, specific refuge, names of refuge staff, and other Service personnel that supported or contributed to the project will be appropriately cited and acknowledged in all written and oral presentations resulting from projects on refuge lands.
- Refuge staff may accompany investigator(s) in the field at any time.
- Investigator(s) and support staff will follow all refuge-specific regulations that specify access and travel on the refuge.
- There may be other permits or paperwork required in addition to the SUP.

Justification:

Research, scientific collecting, and surveys on refuge lands are inherently valuable to the Service because they expand scientific information available for resource management decisions. In addition, only projects that directly or indirectly contribute to the enhancement, protection, use, preservation, and management of refuge fish and wildlife populations and their habitats will generally be authorized on refuge lands. By allowing the use to occur under the stipulations described above, it is anticipated that fish and wildlife species will experience minimal disturbance. Additionally, it is anticipated that monitoring, as needed, will prevent unacceptable or irreversible impacts to fish, wildlife, plants, and their habitats. Allowing the use as described above will not materially detract

from or interfere with the purposes for which the refuge was established or the mission of the Refuge System.

Mandatory 10- or 15-Year Re-evaluation Date (provide month and year for "allowed" uses only):

B.5 Compatibility Determination for Mosquito and Disease Vector Management on Tualatin River National Wildlife Refuge

Use: Mosquito and disease vector management

Station Name: Tualatin River National Wildlife Refuge

Date Established: 1992

Establishing and Acquisition Authority(ies):

Fish and Wildlife Act of 1956 (16 U.S.C. § 742a. et seq.)

Emergency Wetlands Resources Act of 1986 (16 U.S.C. § 3901-3932)

Refuge Purpose(s):

—… for the development, advancement, management, conservation, and protection of fish and wildlife resources …" 16 U.S.C. § 742f(a)(4) (Fish and Wildlife Act of 1956)

—… for the benefit of the United States Fish and Wildlife Service, in performing its activities and services. Such acceptance may be subject to the terms of any restrictive or affirmative covenant, or condition of servitude …" 16 U.S.C. § 742f(b)(1) (Fish and Wildlife Act of 1956)

—… the conservation of the wetlands of the Nation in order to maintain the public benefits they provide and to help fulfill international obligations contained in various migratory bird treaties and conventions …" 16 U.S.C. § 3901(b) (Emergency Wetlands Resources Act of 1986)

National Wildlife Refuge System Mission:

—To administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans" (National Wildlife Refuge System Administration Act of 1996, as amended [16 U.S.C. 668dd et seq.]).

Description of Use:

With the spread of mosquito-borne diseases across the country, national wildlife refuges have come under increasing pressure to manage mosquito populations that are bred or harbored within refuge boundaries. The Service has produced interim guidance for refuges (USFWS 2005b) to be used until the Service policy document is finalized. Tualatin River National Wildlife Refuge will adhere to the interim guidance, and our mosquito management program will follow the response matrix presented in the following table. The refuge currently has sufficient staff and funding to support this use.

Example of Mosquito-borne Disease Health Threat and Response Matrix

Current Conditions		Threat Level	Refuge Response
Health Threat Category[1]	**Refuge Mosquito Populations[2]**		
No documented existing or historical health threat/emergency	No action threshold	1	Remove/manage artificial mosquito breeding sites such as tires, tanks, or similar debris/containers. Allow compatible monitoring.
Documented human health threat/emergency	Below action threshold	2	Response as in threat level 1, plus: evaluate compatible nonpesticide management options such as water level management and vegetation removal to reduce mosquito production.
	Above action threshold	3	Response as in threat level 2, plus: allow compatible site-specific larviciding of infested areas as determined by monitoring.
Officially determined existing human health emergency	Below action threshold	4	Response as in threat level 2, plus: increase monitoring and disease surveillance.
	Above action threshold	5	Response as in threat levels 3 and 4, plus: allow compatible site-specific larviciding, pupaciding, or adulticiding of infested areas as determined by monitoring data. Identify ways to minimize treatment area to avoid non-target effects

[1] Health threat/emergency as determined by Federal and/or state/local public health or wildlife management authorities with jurisdiction inclusive of refuge boundaries and/or neighboring public health authorities.

[2] Action thresholds represent mosquito population levels that may require intervention measures. Thresholds will be developed in collaboration with Federal and/or state/local public health or wildlife management authorities and vector control districts. They must be species- and life stage-specific.

Annual precipitation and water management fill many wetlands on the refuge. This water and vegetation provides egg-laying sites for mosquitoes. When high water levels recede, the eggs hatch, larvae grow rapidly, and adults feed for two weeks or more until they breed, lay eggs, and then die. Under certain conditions the refuge may provide suitable habitat for multiple hatches of mosquitoes in a single summer.

Arboviral (arthropod-borne viral) diseases are a potential concern. These include West Nile virus, western equine encephalitis, and St. Louis encephalitis. Between 1964 and 2010 there has only been

one reported case of human infection by western equine encephalitis in Oregon (Centers for Disease Control [CDC] 2012a). St. Louis encephalitis in a human was documented in Oregon in 2003, the first case in more than 30 years (Oregon Department of Human Services 2012).

Although West Nile virus was first documented in the eastern United States, it has been moving west since that time. West Nile virus first appeared in Oregon in 2004. The first human, avian, and equine West Nile virus cases in Oregon were all diagnosed in August 2004. In 2010, no humans were diagnosed with West Nile virus infection (Oregon Health Authority Office of Disease Prevention and Epidemiology 2011). Moreover, less than 1 percent of humans who are exposed to and infected with West Nile virus become seriously ill. The fatality rate of those who do develop serious illness is 3 to 15 percent. Most human infections of West Nile virus are asymptomatic or characterized by mild flu-like symptoms. Persons over 50 years of age are more likely to develop severe illness (CDC 2012b).

The refuge, in cooperation with Washington County Health and Human Services (HHS) and Yamhill County Public Health (YCPH), proposes to monitor and control larval mosquito species that have been determined to have a negative effect on public health adjacent to the refuge. Monitoring generally takes place between early April and late September.

The HHS/YCPH staff proposes to monitor and control mosquito larvae with *Bacillus thuringiensis* var. *israelensis*, which is frequently referred to as *B.t.i.* (EPA Registration No. 73049-10), when established thresholds are exceeded and human health risks exist as indicated through monitoring. Monitoring and larval treatments will be restricted to shallowly flooded (<8 inches) vegetation that represents mosquito breeding habitat. From 2005 through 2008, refuge staff conducted monitoring for mosquito larvae on the Atfálat'i, Tualatin River, and Riverboat Units of the refuge (Figure D-1), and the results were given to Washington County's vector control personnel.

To protect sensitive resources such as eagle nesting and roosting areas and listed plant species, and to reduce the spread of invasive plant species, sampling periods and frequency as well as type of access (four-wheel-drive vehicle, ATV, foot traffic only) will be determined by the refuge in late winter/early spring. Because the locations of sensitive resources may change over time, the refuge will establish sampling and treatment stipulations on an annual basis through the SUP process.

The HHS/YCPH may also monitor adult mosquito populations from May to September using dry ice traps, or other approved methods, as part of the county-wide surveillance for the presence of mosquito-borne human health diseases.

The protocol for mosquito control when monitoring wetlands for mosquito larvae is to treat with the larvicide *B.t.i.* when the larvae reach established threshold levels and a human health threat has been documented. The treatment threshold used by the HHS/YCPH will be determined and specified in the annual SUP.

Mosquito larvae numbers within the refuge are affected by a number of factors such as weather conditions, precipitation, and time of year. The primary factor contributing to the production of mosquitoes, however, is the water level fluctuation along shorelines, where mosquitoes lay their eggs. Water level fluctuations are primarily due to precipitation and refuge water management activities. Due to the uncertainty of water levels resulting from the above factors, and subsequent mosquito hatches, the total amount of larvicide to be used and the times, dates, and exact locations of application (magnitude and frequency) cannot be predicted. In some cases, certain areas may need repeated treatments.

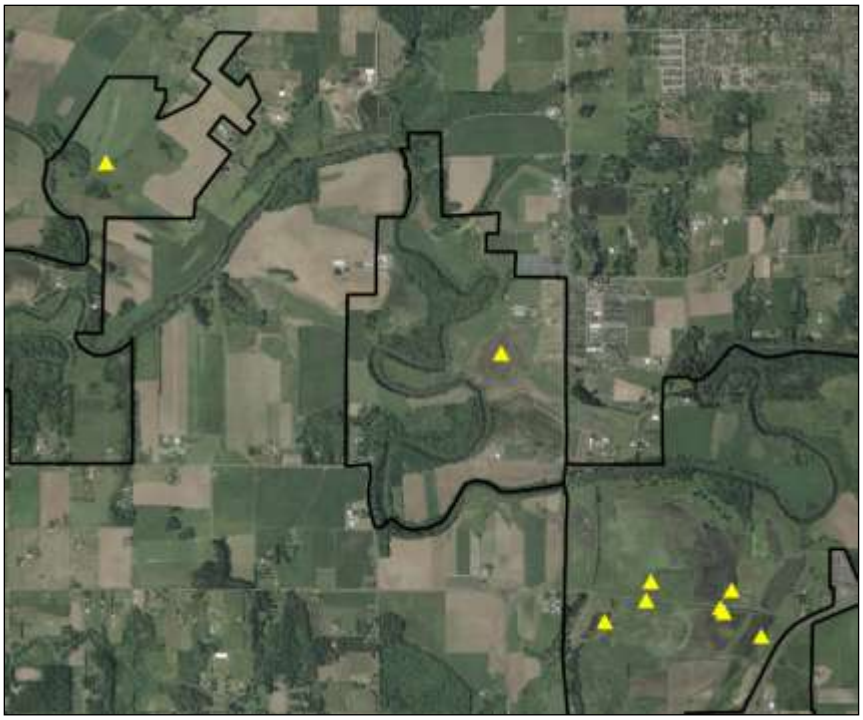

Figure D-1. Mosquito monitoring locations.

The refuge and the HHS/YCPH will establish larval abundance thresholds associated with human health threats through the SUP process to protect public health and reduce impacts to fish and wildlife populations. If mosquito larvae dip numbers reach threshold levels and a human health risk is present, HHS/YCPH staff will request approval from the refuge manager to apply *B.t.i*, at a rate consistent with label directions; this will be done as soon as possible after a threat to human health is documented.

As proposed, *B.t.i* may be applied according to label directions as often as once every two to three weeks until a human health threat is removed. The bacteria are grown on high-protein bases (fishmeal, soy flour), which are then formulated onto corncob pellets, enabling them to be broadcast over the treatment area by a handheld or ATV-mounted spreader. *B.t.i.* is a selective microbial insecticide targeting mosquito larvae; however, studies during the mid-1990s in the Midwest (Hershey et al. 1995) found that other Dipteran species (flies) can also be impacted, including chironomids, an important fish and wildlife food source. *B.t.i.* has practically no acute or chronic toxicity to mammals, fish, birds, or vegetation (EPA 1998a). It produces protein endo-toxins that, when ingested by the susceptible insect, cause paralysis of cells in the gut, interfering with normal digestion and feeding.

All applications are required to be reported to the refuge and included in an annual report submitted to the refuge by the HHS/YCPH. The extent and frequency of treatments is likely to vary annually in response to water levels, weather conditions, and larvae distribution.

In accordance with the 2005 Interim Mosquito Management Policy and the response matrix (see table titled *Example of Mosquito-borne Disease Health Threat and Response Matrix*), the Service may also permit the use of approved adulticides and/or pupacides on refuge lands in response to a declaration of a human health threat or emergency by a Federal, state, or local public health agency.

A human health emergency indicates an imminent risk of serious human disease or death and represents the highest level of mosquito-associated health threats. Human health emergencies will be determined by Federal, state, or local public health authorities and documented with local and current mosquito population and disease monitoring data. With the exception of vaccines to protect horses against West Nile virus and western equine encephalomyelitis, there are no vaccines that provide specific protection against these diseases. Mosquito control is the only practicable method currently available to protect the public from these diseases.

To date, refuge staff has not needed to permit the application of larvicides, pupacides, or adulticides due to public human health concerns.

The refuge will continue to evaluate measures to control mosquitoes that pose a threat to human health while limiting the risk associated with the use of chemical control. Water level manipulation is possible in many refuge wetland basins where mosquito larvae have been found. In the event that a human health emergency is declared and the use of pesticides is authorized, the refuge will work with the HHS/YCPH to identify which portions of the refuge are supporting species of mosquitoes that may serve as disease vectors and reduce the treatment area to the extent practicable.

Availability of Resources:

The HHS/YCPH is responsible for staffing and expenditures for sampling and pesticide applications (mainly *B.t.i.*). Refuge staff resources are needed to review annual proposals, prepare SUPs, and monitor HHS/YCPH personnel to ensure compliance (see table below).

Costs to Administer and Manage Vector Control Programs at the Refuge.

Activity or Project	One-time Expenses ($)	Recurring Expenses ($/year)
Development and issuance of SUP		$500.00
Total		$500.00

Anticipated Impacts of Use:

This use has three principal, potential impacts on refuge lands, waters, or interests.

1. The disturbance of wildlife caused by monitoring efforts and application of pesticides.
2. The impacts on wildlife from periodic elimination of mosquito larvae from the wetland community.
3. The impacts of pesticides on non-target organisms.

Impacts Associated with Disturbance of Wildlife Caused by the Monitoring Efforts:

Disturbance of wildlife by HHS/YCPH staff is minimized to the extent practicable by restricting access to sensitive areas and by controlling the type of access (four-wheel-drive vehicle, ATV, or foot traffic). Impacts anticipated from the logistical activities resulting from monitoring and treatment actions on wildlife are minimal. One or two HHS/YCPH employees will conduct these activities, and they will be restricted to refuge service roads and a minimum of off-road areas. The

speed limit for HHS/YCPH staff using vehicles on service roads is 15 miles per hour and ATVs are restricted to 5 miles per hour. Any necessary treatments will occur as soon as possible after monitoring activities. These activities cause short-term and temporary disturbance to wildlife. In the event of an identified public human health threat or emergency by the Oregon Health Authority, the data from these monitoring efforts will be used by the refuge for determining an appropriate course of action.

Impacts Associated with Application of Pesticides:

Where necessary and in accordance with the response matrix (see table titled *Example of Mosquito-borne Disease Health Threat and Response Matrix*), pesticides (larvicides, pupacides, and adulticides) will only be used on refuge lands for mosquito control after approval of a Pesticide Use Proposal (PUP). The Service's Pest Control Policy (7 RM 14) requires preparation and approval of a PUP before pesticides can be applied on refuge lands. In general, proposed pesticide uses on refuge lands will only be approved where there will likely be minor, temporary, or localized effects to fish and wildlife as well as minimal potential to degrade environmental quality. Potential effects to listed and non-listed species will be evaluated with quantitative ecological risk assessments and other screening measures. Potential effects to environmental quality will be based upon pesticide characteristics of environmental fate (water solubility, soil mobility, soil persistence, and volatilization) and other quantitative screening tools. Ecological risk assessments as well as characteristics of environmental fate and potential to degrade environmental quality for pesticides will be documented in chemical profiles. These profiles will include threshold values for quantitative measures of ecological risk assessments and screening tools for environmental fate that represent minimal potential effects to species and environmental quality. In general, only pesticide uses with appropriate best management practices on refuge lands that will potentially have minor, temporary, or localized effects on refuge biological and environmental quality (threshold values not exceeded) will be approved. However, pesticides may be used on refuge lands where substantial effects to species and the environment are possible (exceed threshold values) in order to protect human health and safety when a documented threat exists (e.g., mosquito-borne disease). The Service does not anticipate any short-term effects of the use directly on non-target invertebrates or indirectly to fish.

The refuge has developed an integrated pest management (IPM) plan (see Appendix G of refuge CCP) to manage mosquito populations. Based on adult mosquito control conducted in Washington County, pyrethroids such as Anvil are the most likely adulticides to be used to address a human health emergency. Pyrethroids are synthetic molecules that mimic natural pyrethrins that are extracted from plants in the chrysanthemum family. Pyrethroids are generally less toxic to terrestrial wildlife than other families of adulticides such as organophosphates. However, they are toxic to fish and aquatic invertebrates. The county has not used pupacides in recent years. Methoprene, a commonly used pupacide, is an insect growth regulator that prevents pupae from metamorphosing into adults. Methoprene has been found to be practically nontoxic to people and terrestrial vertebrates and poses minimal chronic and acute risk to fish, freshwater invertebrates (other than mosquitoes and closely related chironomids), and estuarine species at the doses tested (EPA 2001). Detailed mapping of areas where disease-carrying mosquitoes are present and the use of an ultra-low volume fogger will reduce the impacts to nontarget organisms. Other practices to reduce impacts to nontarget wildlife include application in the evening hours (when many insect pollinators are less active) and conducting applications when wind speeds are steady and low, and temperatures are lower.

Impacts on Wildlife from Periodic Elimination of Mosquito Larvae from the Wetland Community:

The Service does not anticipate long-term impacts to result from this use. Hershey et al. (1995) conducted a 6-year study on 27 wetlands in Wright County, Minnesota, consisting of 3 years of pretreatment sampling of aquatic invertebrates and other parameters, followed by 3 years of treatment with *B.t.i.* Insect densities and diversity were reduced by 57 to 83 percent in the second and third years of treatment, respectively. During this study, 179 genera of aquatic insects were examined, with chironomids (primarily midges) representing about half of the insect genera present at the beginning of the study. By the end of the study, however, only one to six genera dominated the treatment sites. Adverse impacts were primarily observed in the invertebrate tribes Chironomini and Tanytarsini. These tribes are ubiquitous and are represented in almost every wetland with chironomids. Although Hershey et al. (1995) found negative effects of *B.t.i.* on nontarget invertebrates; this study is not applicable in the case of Tualatin River National Wildlife Refuge for the following reasons.

1. Entire wetlands were treated with *B.t.i.* multiple times within and over several consecutive years in the Minnesota study. In contrast, the treatment area at Tualatin River National Wildlife Refuge will likely only include wetland margins where vegetation interfaces with open water.
2. Because of fluctuating water levels changing the location of the shallow flooded shoreline, it is unlikely *B.t.i.* applications will occur in the same area more than three times in a single year, and most areas will receive a single application. Stipulations in the SUP will limit the number of applications in a specific location during one season.

Recently completed invertebrate and salmonid research along the south Franz Lake shoreline (Franz Lake National Wildlife Refuge, Washington) has provided valuable information regarding the cumulative impacts of mosquito treatment and control measures that are applicable to the program at this refuge. The invertebrate study was conducted during the latter part of the application period (July to September). During this study, stable water levels from July to September resulted in three applications of *B.t.i*. to the same locations. No impacts to non-target invertebrates were reported as a result of these applications. Consequently, it is unlikely there will be negative cumulative direct impact on the invertebrate community or indirectly on fish and wildlife. Because there were no impacts to non-target invertebrates from *B.t.i.* treatment at Franz Lake, it is unlikely that native fish will be impacted from applications at Tualatin River National Wildlife Refuge.

Although mosquito larvae were reduced as a result of *B.t.i.* treatments at Franz Lake, there were no significant differences in the numbers of over 40 taxa of invertebrates, with 50 percent of the taxa being other insects that had been represented at shallow water sites. Based on results of the invertebrate survey, it is expected that alternative prey will be available for native fishes (including salmonids), as well as other wildlife that depend on larval or adult mosquitoes as forage.

Consequently, the Service concludes that monitoring and subsequent applications of *B.t.i.* will not have substantial short-term, long-term, or cumulative impacts on refuge fish and wildlife resources.

Impacts to Biological Integrity, Diversity, and Environmental Health:

Biological integrity, diversity, and environmental health can be simply defined as native fish, wildlife, plants, and their habitats as well as natural processes that support them. As described above, the impacts from larvicide application to most fish, wildlife, and plants will be temporary and

localized. Mosquito populations that are part of the biological integrity, diversity, and environmental health of the refuge will be impacted from control actions. Although numbers of mosquitoes will be temporarily and locally reduced, there will likely be no long-term or cumulative effects to mosquitoes and the species that feed upon them at the refuge. As part of the refuge's mosquito management plan, the refuge will assess the impacts of adulticide applications on biological integrity, diversity, and environmental health.

Public Review and Comment:

Various opportunities were provided for the public to engage with the planning process. Appendix K details public involvement undertaken during development of the CCP. Written comments on the draft CCP/EA, which included this compatibility determination, were collected during the public comment period.

Determination (check one below):

____ Use is Not Compatible

__X__ Use is Compatible with Following Stipulations

Stipulations Necessary to Ensure Compatibility:

- The HHS/YCPH must apply for and receive an SUP annually from the refuge manager. The permit will specify conditions including, but not limited to, access restrictions, timing of applications, and measures required to limit the spread of invasive plants.
- Mosquito management will follow an IPM approach, and any compatible cultural and/or mechanical control methods will be identified and implemented before chemical control is permitted.
- Larvae control is to be conducted only when the HHS/YCPH determines that mosquitos breeding in specific units is widespread and poses a documented threat to human health.
- Only Service-approved pesticides may be applied on refuge wetlands and only after PUPs have been approved.
- The HHS/YCPH will contact the refuge manager at least one day in advance of each application. The refuge manager has final approval over all pesticide treatments.
- The HHS/YCPH will notify the refuge manager in the event that virus activity is detected within or near the refuge and will work with the refuge to determine whether additional surveillance or control actions are necessary.
- The HHS/YCPH must provide the refuge manager with monthly and annual reports of all control activities on the refuge.
- The refuge may rescind this CD at any time based on future Service policy determinations or scientific studies of the effects of pesticides on the environment or nontarget organisms.
- This CD will be reviewed when the Service finalizes its pending policy on mosquito management, and a new CD will be issued if this CD is not in full compliance with the new policy.

Justification:

Several suburban communities exist near the refuge within the flight range of adult mosquitoes (5 to 10 miles). Mosquito species capable of transmitting diseases to people may be present on the refuge, though the risk of transmission is generally low. The refuge's mosquito control program is consistent with the Service's 2005 Interim Mosquito Management Policy and will help manage mosquito populations that pose a threat to human health.

The refuge will ensure that its mosquito management program is consistent with national policies for disease control and will work with the HHS/YCPH to continue to identify new ways to use compatible mechanical and cultural control methods, reduce larvicide applications, and avoid impacts to sensitive resources.

In the event that compatible mechanical and cultural control methods are not effective or practicable, the use of the larvicide *B.t.i.* will help avoid ecologically significant impacts to nontarget organisms and help the HHS/YCPH avoid the need to apply adulticides, which are generally more toxic to nontarget organisms. For the following reasons, mosquito monitoring and *B.t.i.* treatments for control of mosquitoes on the refuge will not materially interfere with or detract from fulfilling the Refuge System mission or achieving refuge purposes.

- Under the worst-case scenario, a maximum of 18 acres or less than 1 percent of the total refuge acreage will be impacted by mosquito monitoring and treatment activities annually from April 1 through September 30.
- The invertebrate *B.t.i.* study indicated that no impacts to nontarget invertebrates were associated with three *B.t.i.* treatments for control of mosquito larvae on the shallowly flooded south shoreline of Franz Lake National Wildlife Refuge.
- Although mosquito larvae will be reduced from *B.t.i.* treatments, over 40 taxa of invertebrates, with 50 percent of the taxa represented by other insects, were found at shallow water sites (where treatments will occur) after treatment. Therefore, alternative prey is likely available for fish and other wildlife species.
- Monitoring and treatment activities will likely result in only temporary and localized disturbance to fish and wildlife.

Mandatory 10- or 15-year Re-evaluation Date (provide month and year for "allowed" uses):

_____ Mandatory 15-year re-evaluation date (for wildlife-dependent public uses)

__2023__Mandatory 10-year re-evaluation date (for all uses other than wildlife-dependent public uses)

B.6 Compatibility Determination for Fishing at Tualatin River National Wildlife Refuge

Use: Fishing

Station Name: Tualatin River National Wildlife Refuge

Date Established: 1992

Establishing and Acquisition Authority(ies):

Fish and Wildlife Act of 1956 (16 U.S.C. § 742a. et seq.)

Emergency Wetlands Resources Act of 1986 (16 U.S.C. § 3901-3932)

Refuge Purpose(s):

—…for the development, advancement, management, conservation, and protection of fish and wildlife resources …" 16 U.S.C. § 742f(a)(4) (Fish and Wildlife Act of 1956)

—… for the benefit of the United States Fish and Wildlife Service, in performing its activities and services. Such acceptance may be subject to the terms of any restrictive or affirmative covenant, or condition of servitude …" 16 U.S.C. § 742f(b)(1) (Fish and Wildlife Act of 1956)

—…the conservation of the wetlands of the Nation in order to maintain the public benefits they provide and to help fulfill international obligations contained in various migratory bird treaties and conventions …" 16 U.S.C. § 3901(b) (Emergency Wetlands Resources Act of 1986)

National Wildlife Refuge System Mission:

—To administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans" (National Wildlife Refuge System Administration Act of 1966, as amended [16 U.S.C. 668dd et seq.]).

Description of Use:

Fishing is one of the priority public uses that promote traditional outdoor recreation opportunity for the surrounding community. Very few opportunities exist on the Tualatin River for public fishing, in particular for disabled anglers. Fishing in the Tualatin River will be implemented at the existing River Overlook on the Atfálat'i Unit of the refuge—a cantilevered platform will provide access to fishing on the river below.

A wide variety of fish inhabit the Tualatin River mainstem, including warm-water, cold-water, and anadromous species, and the river will support a fishery for these species. Fisheries in the Tualatin River could include cold-water species such as rainbow trout and cutthroat trout; anadromous species such as upper Willamette River steelhead, Chinook salmon, and coho salmon; and warm-water species such as white crappie, bluegill, bullhead, and large-mouthed bass (Leader 2001). Generally, from May to August, under current Oregon Department of Fish and Wildlife (ODFW) regulations,

fishing could occur in the Tualatin River for trout species and coho salmon as identified in the special regulations for Tualatin River; a wide variety of warm-water species; crayfish; and bullfrogs. For purposes of regulations, ODFW considers rainbow trout over 20 inches to be steelhead (ODFW 2011d).

Recreational fishing will be allowed in accordance with all applicable laws and regulations of the State of Oregon; however, access will be limited to daylight hours only and cleaning of fish on-site will be prohibited. Access to the River Overlook from the public parking lot will be via the existing year-round trail. No other areas of the refuge will be open to fishing. The overlook and associated facilities will be provided during daylight hours and will be fully accessible to users under the guidelines of the Architectural Barriers Act. Limited removal or trimming of vegetation near the overlook will be necessary to minimize tangling of fishing lines. The overlook will comfortably accommodate three to four anglers at a time, plus up to 15 other visitors when fishing is not occurring. The maximum number of anglers anticipated annually will be 1,000, some of whom may be participants in special fishing events and clinics hosted by the refuge. Events will focus on fishing ethics and techniques, natural resource conservation, and environmental education.

Availability of Resources:

Direct annual recurring costs to administer and maintain a recreational fishing program are primarily in the form of staff time, publication of leaflets, and maintenance of overlook and trail facilities. The management direction of the CCP proposes that the desirability of a user fee be explored to help operate the fishing program and maintain and repair associated facilities. The refuge currently has sufficient staff and funding to offer the use.

Costs to Administer and Manage Fishing under the CCP

Activity or Project	One-time Expenses ($)	Recurring Expenses ($/year)
Development of fishing plan	$5,000	
Administration and maintenance of program		$15,000
Total	$5,000	$15,000

Anticipated Impacts of Use:

General Impacts:

A general assessment of impacts resulting from fishing has been compiled from the literature and is briefly summarized below.

Disturbance to Wildlife: Fishing as a solitary and stationary activity tends to be less disturbing to wildlife than hunting or motorized boating (Tuite et al. 1983). Fishing has the potential to cause disturbance to birds and other wildlife using open waters and tributaries where fishing occurs. Fishing activities may influence the composition of bird communities as well as distribution, abundance, and productivity of waterbirds (Bell and Austin 1985; Bordignon 1985; Bouffard 1982; Bouffard and Hanson 1997; Cooke 1987; Edwards and Bell 1985; Tydeman 1977). Anglers often fish in shallow, sheltered bays and creeks that birds prefer, which can negatively impact distribution

and abundance of waterfowl, grebes, and coots (Cooke 1987). Increases in anglers and associated shoreline activity have been found to discourage waterfowl from using otherwise suitable habitat (Jahn and Hunt 1964). When compared to non-fishing days and/or non-fishing rivers, anglers influenced the numbers, behavior, and diurnal distribution of avian scavengers present at sites along the Skagit and Toutle Rivers in Washington, disrupted feeding, and increased energy expenditure through avoidance flights (Knight and Knight 1984; Knight et al. 1991).

Stream Fishing Impacts: Shoreline activities related to stream fishing, such as human noise, will cause some birds to flush and go elsewhere. Waterbirds and waterfowl in particular use shorelines seasonally for resting, feeding, and nesting. Furthermore, anglers frequently show long periods of inactivity interspersed with short periods of rapid movements, which has the potential to disturb nearby wildlife (Bell and Austin 1985).

Refuge-specific Impacts:

Anglers accessing and using the River Overlook may occasionally disturb resident mammals, but the impact will likely not exceed that which already occurs from other pedestrians using the trail. Neotropical migratory songbirds and resident birds may be disturbed, but will likely remain in the general area. Waterfowl and shorebirds will likely experience minimal disturbance due to the dense tree and shrub buffer planting that separates the trail and overlook area from seasonal wetlands.

Impacts to Listed Species:

Upper Willamette River steelhead and Chinook salmon were both listed as threatened species in August and March 1999, respectively (Federal Register 1999a, Federal Register 1999b), and critical habitat was designated in 2005 (Federal Register 2005) in the upper Tualatin River Basin (roughly defined as the Tualatin River and its tributaries upstream of Highway 219 near Hillsboro, excluding Rock Creek). The use will not occur in designated critical habitat. No other listed species are known to exist in the area that will be designated for fishing. The recreational fishing program and associated facility are anticipated to have no effect on threatened species if anglers are held in compliance with ODFW and refuge regulations. The designated fishing season for trout and coho salmon according to ODFW regulations is generally May 31 to October 31. During the winter, listed species are migrating upstream to spawn, and then in late winter and early spring, the smolts would be outmigrating. The spring-summer-early fall period planned for fishing, especially at the refuge's location on the river, is generally considered to be too warm for these species to survive. By the end of April the temperature in the river near the planned fishing location is reaching a lethal range for salmonids. Local rainbow and cutthroat trout move up into tributaries that have cooler and more oxygenated water for them to survive.

Impacts to Nonlisted Species:

The majority of fish species expected to be caught are nonlisted fish such as small-mouth bass and bluegill. For fish that are released it is anticipated that there will be some mortality of these non-native species as a result from handling. However, with proper care and quick releases, these impacts are expected to be minimal. Some fish will be killed and kept in accordance with regulations. These direct impacts will likely be minimal and will not have a significant impact on overall populations of these species.

Impacts to Other Priority Public Uses:

Fishing is expected to result in occasional disturbance to other visitors. In addition, anglers may inadvertently flush wildlife that are being observed by other visitors. Occasional crowding may occur on the overlook due to multiple public uses occurring simultaneously. No significant effects to roads, trails, and other infrastructure from the fishing program are foreseen. Normal facility maintenance will continue to be necessary.

Public Review and Comment:

Various opportunities were provided for the public to engage with the planning process. Appendix K details public involvement undertaken during development of the CCP. Written comments on the draft CCP/EA, which included this compatibility determination, were collected during the public comment period.

Determination (check one below):

____Use is Not Compatible

__X__Use is Compatible with Following Stipulations

Stipulations Necessary to Ensure Compatibility:

- Fishing will be opened only after a fishing package is completed in coordination with ODFW and draft and final regulations are published in the Federal Register.
- Fishing will be allowed only during daylight hours.
- Fires, off-trail use, and littering are prohibited.
- Information signs and/or publications will be provided to ensure anglers have access to all regulations that apply to the refuge and to fishing activities.
- All persons fishing shall be required to have a valid Oregon State fishing license and follow all applicable state regulations.
- Law enforcement patrols will be conducted on a periodic basis to ensure compliance with state and refuge regulations.
- Access to fishing will be limited to foot traffic along the existing trail. Persons with disabilities who are unable to access the River Overlook to fish will be accommodated on a case-by-case basis. This will require prior notification to the refuge.
- If disturbance to wildlife or damage to habitat results in unacceptable levels, the refuge will limit fishing access to reduce impacts.
- If conflict with other priority public uses, or overcrowding by anglers occurs, the refuge may institute techniques to reduce negative impacts to visitor experience. These may include limiting fishing to specific days and/or times; developing signage to inform visitors of fishing program opportunities; developing a permit system for anglers; and/or other methods as appropriate to the situation.

Justification:

As a wildlife-dependent recreational use, fishing receives enhanced consideration in the CCP planning process. Despite direct and indirect impacts associated with fishing, refuge riparian and

riverine species and their habitats are unlikely to be affected significantly by the fishing program on the refuge at the levels of use anticipated in the CCP. Other riparian and stream areas not subject to fishing disturbance will be maintained on other portions of the refuge. State regulations, including bag limits, ensure that harvesting of fish does not harm long-term populations. It is anticipated that wildlife populations will find sufficient food resources and resting places, and their abundance and use of the refuge will not be measurably lessened from disturbance by fishing. The relatively limited number of individual animals and plants expected to be adversely affected will not cause wildlife populations to materially decline, the physiological condition and production of refuge species will not be impaired, their behavior and normal activity patterns will not be altered dramatically, and their overall welfare will not be negatively impacted. Thus, allowing fishing to occur under the stipulations described above will not materially detract from or interfere with the purposes for which the refuge was established or the Refuge System mission.

Mandatory 10- or 15-year Re-evaluation Date (provide month and year for "allowed" uses):

__2028__ Mandatory 15-year re-evaluation date (for wildlife-dependent public uses)

_____ Mandatory 10-year re-evaluation date (for all uses other than wildlife-dependent public uses)

B.7 Compatibility Determination for Environmental Education at Tualatin River National Wildlife Refuge

Use: Environmental education

Station Name: Tualatin River National Wildlife Refuge

Date Established: 1992

Establishing and Acquisition Authority(ies):

Fish and Wildlife Act of 1956 (16 U.S.C. § 742a et seq.)

Emergency Wetlands Resources Act of 1986 (16 U.S.C. § 3901-3932)

Refuge Purpose(s):

—… for the development, advancement, management, conservation, and protection of fish and wildlife resources …" 16 U.S.C. § 742f(a)(4) (Fish and Wildlife Act of 1956)

—… for the benefit of the United States Fish and Wildlife Service, in performing its activities and services. Such acceptance may be subject to the terms of any restrictive or affirmative covenant, or condition of servitude …" 16 U.S.C. § 742f(b)(1) (Fish and Wildlife Act of 1956)

—… the conservation of the wetlands of the Nation in order to maintain the public benefits they provide and to help fulfill international obligations contained in various migratory bird treaties and conventions …" 16 U.S.C. § 3901(b) (Emergency Wetlands Resources Act of 1986)

National Wildlife Refuge System Mission:

—To administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans" (National Wildlife Refuge System Administration Act of 1966, as amended [16 U.S.C. 668dd et seq.]).

Description of Use:

Environmental education refers to formal, curriculum-based education opportunities primarily for students and organizations. Environmental education fosters an aware and involved citizenry that takes an active role in conservation. The environmental education program at the refuge will be administered as described in Goal 13 of the CCP. Environmental education could occur in any season at the refuge. In practice, most environmental education will occur between September and June, during the school year. The total number of people served by the environmental education program is expected to grow to 10,000 over the 15-year life of the CCP. The program will continue to rely on volunteers for full implementation.

Environmental education activities will take place primarily within designated facilities designed to support the program. These include the year-round and seasonal trails, including overlooks; five trailside environmental education study sites; the environmental education shelter; an environmental

education classroom, and the Wildlife Center. Refer to Section 5.2 of the CCP for a complete description of current facilities. An off-trail study area described in the CCP management direction will only be used by students who are participating in refuge lesson plans that include off-trail activities. This area will be clearly marked for student use only, and the use will be overseen by trained refuge staff and/or volunteers. Additional off-trail use may include occasional refuge-led field trips to areas generally closed to the public that will provide educational value not available in the designated public use areas. Examples include activities such as, but not limited to, access for secondary or collegiate-level students studying hydric soils along wetland edges, students accompanying refuge staff on biological monitoring activities such as bird banding, and habitat surveys such as conducting vegetation transects. A nature explore area for young children described in the CCP management direction will be limited to less than 1 acre, be located adjacent to the year-round trail in an area where limited additional wildlife disturbance will occur, be bound by a barrier to contain the use, be primarily constructed with natural and/or sustainable materials, and be signed appropriately to guide the use.

Students and educators of all ages and grade levels will participate in curriculum-based education on the refuge. In addition to formal classroom participants, the environmental education program will serve home-school groups/families, pre-school groups, youth groups such as scouts, after-school clubs, and other informal organized groups such as summer youth programs. Generally, no more than 100 students (plus teachers and chaperones) will be visiting any given unit of the refuge at any given time, and advance reservations will be required. Educators wishing to bring K-8 students will be required to attend a teacher workshop prior to the field trip or have trained volunteers and/or refuge staff accompanying the group. Educators bringing high school and college students will be required to consult with refuge staff prior to their visit to both register and to obtain approval for planned activities. In all cases, educators will be instructed in how to teach and are expected to enforce "field trip etiquette" that is designed to minimize wildlife and habitat disturbance. To the greatest extent possible, the refuge will provide staff and/or volunteers to welcome and accompany field trips to the refuge.

The refuge will provide approved curricula and guidance to all teachers conducting education on the refuge. Activities generally fall into the same guidelines that are expected of all other visitors (refer to CD for wildlife observation, photography, and interpretation). However, additional activities may occur as part of refuge-approved lesson plans and when conducted by a trained volunteer or refuge staff. These may include, but are not limited to, capture, study, and release of small animals such as macroinvertebrates, frogs, snakes, insects, worms, etc; handling and return of features such as leaves, scat, and feathers; and collection of water, seeds, and soil taken either to the classroom or off-site for further study and analysis.

Availability of Resources:

Estimated costs for operating the environmental education program as envisioned under the CCP are displayed in the following table. With assistance from Friends of the Refuge, grants, volunteers, and other partners, the refuge currently has sufficient staff and funding to support these programs at their current levels. Additional resources will be needed to fully implement the uses and strategies described in the CCP.

Costs to Administer and Manage Environmental Education under the CCP

Activity or Project	One-time Expenses ($)	Recurring Expenses ($/year)
Environmental Education Specialist		67,500
Environmental Education Intern		25,000
Develop curricula resources for educators	10,000	2,000
Conduct annual teacher workshops		5,000
Provide and maintain educational equipment and materials	10,000	5,000
Conduct annual volunteer training		2,000
Maintain environmental education facilities		20,000
Develop additional signage and publications	5,000	1,000
Design and construct nature explore area	50,000	2,000
Program oversight: Visitor Services Manager		20,000
Total	$75,000	149,500

Anticipated Impacts of Use:

General Impacts:

A general assessment of impacts resulting from environmental education uses has been compiled from the literature and is briefly summarized below.

Disturbance Impacts: In general, impacts that could occur from environmental education programs will be similar to those expected from wildlife observation, photography, or interpretation activities. Such impacts will be expected to include temporary damage to vegetation resulting from trampling, disturbance to nesting birds, and disturbance to feeding or resting birds or other wildlife in the vicinity. Environmental education programs generally accommodate groups of participants, and studies have shown that increasing group size has an impact on wildlife (Beale and Monaghan 2004; Remacha et al. 2011). In addition to group size, loudness has also been found as an important variable to disturbance of wildlife, and loudness of people present can be more important than the number of people present (Burger and Gochfeld 1998). Studies showed that reducing group size, allowing safe distances, and reducing noise levels helps minimize negative impacts on wildlife (Beale and Monaghan 2004; Burger and Gochfeld 1991; Remacha et al. 2011). An unpublished study examined the effect of environmental education site activities at Blackhorse Lake on the Turnbull National Wildlife Refuge (Jose 1997). The study was designed to compare waterfowl presence and behavior patterns between the times when environmental education activities were occurring and when environmental education classes were not on-site. The study results indicated that fewer waterfowl were present in the study area when environmental education classes were on-site as compared to control times. The study also found more short flights undertaken by birds when classes were on-site. Redheads displayed the highest number of flight responses, followed by mallards. Ruddy ducks almost never flew but had the highest increase in directional swimming away from

classes. The study recommended that sites heavily used by smaller bodied birds, such as ruddy ducks, buffleheads, and teal, not be used as environmental education sites.

Conservation Benefits: Environmental education provides indirect beneficial impacts for visitors engaged in environmental education programs and activities. One study found that animal-oriented activities have an impact on the knowledge and attitudes of students involved in environmental education. Direct instruction methods in which children examined the anatomical and behavioral characteristics of live spiders and snakes promoted a positive attitude toward these animals (Kellert and Westervelt 1983; Kress 1975). Eighth graders engaged in wildlife-oriented activities were found to be more likely to recognize the importance of lower forms of animal life and preserving endangered species and to have greater tolerance for predators (LaHart 1974). Another study concluded, ~~"~~if one were to try to change attitudes, education without an experiential component might not be very effective" (Baird and Tolman 1982:12).

Refuge-specific Impacts:

Environmental education activities will be more localized and will occur less frequently than general wildlife observation. Larger group sizes will likely result in greater magnitude of disturbance to feeding, resting, or nesting birds or other wildlife in the vicinity; however, having groups accompanied by staff or trained naturalists will help mitigate this disturbance. Most of the sites to be used by environmental education groups are already regularly used by other wildlife viewers, so the additional impact by the environmental education program will likely be small. However, to the extent that students are encouraged to conduct hands-on studies of vegetation, insects, water, or less mobile wildlife, more off-trail use will be expected for this activity than for any other non-consumptive use, with attendant impacts that could be higher than for more typical wildlife observation activity.

Participation in environmental education programs is growing throughout Oregon and Washington. With the growth of participation in environmental education programs and the emphasis on these programs under the CCP, future effects can be expected to be higher than present. Nonetheless, environmental education activities will occur outside of wintertime sanctuary areas and outside of fragile habitats.

Impacts to Listed Species:

No direct impact to listed species is anticipated to occur as a result of the environmental education program. Any unanticipated future impacts will be reduced by ensuring that environmental education groups avoid or severely limit activity in areas hosting rare species.

Impacts to Other Priority Public Uses:

Environmental education may result in disturbance to other visitors. School groups, especially those dominated by younger primary school children, may be loud and may flush wildlife being enjoyed by other visitors. This effect is expected to be fairly minimal, since the majority of other visitors use the refuge on weekends and school groups will generally be present on weekdays.

Public Review and Comment:

Various opportunities were provided for the public to engage with the planning process. Appendix K details public involvement undertaken during development of the CCP. Written comments on the draft CCP/EA, which included this compatibility determination, were collected during the public comment period.

Determination (check one below):

____Use is Not Compatible

__X__Use is Compatible with Following Stipulations

Stipulations Necessary to Ensure Compatibility:

- Environmental education facilities and activity areas shall be designated and/or constructed in locations that consider the site's potential for contributing to a diverse and rich curriculum and minimizing impacts to sensitive resources, including listed species and wintering waterfowl.
- Advance reservations will be required for all groups participating in environmental education activities.
- Educators will be required to use refuge-approved curricula and/or lesson plans.
- Adult supervision will be required for students up to twelfth grade.
- All groups will be instructed in trail and off-trail etiquette and ways to reduce wildlife and habitat disturbance during a ~~"~~welcome" session. During ~~"~~teach the teachers" workshops, instructors will review trail etiquette and how to minimize wildlife disturbances.
- Generally, no more than 100 students (plus teachers and chaperones) will be allowed on any given unit of the refuge at any given time. Classes will be asked to break up into smaller groups averaging 15 students.
- Signs, pamphlets, and verbal instructions from refuge staff and volunteers will promote appropriate use of facilities to minimize wildlife and habitat disturbance.
- Periodic monitoring and evaluation of sites and programs will be conducted to assess if objectives are being met and ensure the resource is not being unacceptably degraded. If disturbance to wildlife or damage to habitat reaches unacceptable levels, the refuge will avoid or limit environmental education activities in areas where unacceptable impacts occur.

Justification:

As a wildlife-dependent recreational use, environmental education receives enhanced consideration in the CCP planning process. Environmental education can provide students with the joy of experiencing wildlife on their public lands, and as such, helps fulfill the mission of the Refuge System. Based on the analysis presented above, this use will be expected to have a minor direct negative impact on refuge resources. By limiting the size of groups and locating environmental education activities in areas that are already regularly used, the additional disturbance to wildlife, though larger than at present, is also expected to be minor. It is anticipated that wildlife populations will find sufficient food resources and resting places such that their abundance and use of the refuge will not be measurably lessened from education activities. The relatively limited number of individual animals and plants expected to be adversely affected will not cause wildlife populations to

materially decline, the physiological condition and production of refuge species will not be impaired, their behavior and normal activity patterns will not be altered dramatically, and their overall welfare will not be negatively impacted. Thus, allowing environmental education activities to occur on selected areas of the refuge under the stipulations described above will not materially detract from or interfere with the purposes for which the refuge was established or the Refuge System's mission.

Mandatory 10- or 15-year Re-evaluation Date (provide month and year for "allowed" uses):

__2028__ Mandatory 15-year re-evaluation date (for wildlife-dependent public uses)

_____ Mandatory 10-year re-evaluation date (for all uses other than wildlife-dependent public uses)

B.8 Compatibility Determination for Cooperative Farming at Tualatin River National Wildlife Refuge

Use: Cooperative farming

Station Name: Tualatin River National Wildlife Refuge

Date Established: 1992

Establishing and Acquisition Authority(ies):

Fish and Wildlife Act of 1956 (16 U.S.C. § 742a. et seq.)

Emergency Wetlands Resources Act of 1986 (16 U.S.C. § 3901-3932)

Refuge Purpose(s):

—… for the development, advancement, management, conservation, and protection of fish and wildlife resources …" 16 U.S.C. § 742f(a)(4) (Fish and Wildlife Act of 1956)

—… for the benefit of the United States Fish and Wildlife Service, in performing its activities and services. Such acceptance may be subject to the terms of any restrictive or affirmative covenant, or condition of servitude …" 16 U.S.C. § 742f(b)(1) (Fish and Wildlife Act of 1956)

—… the conservation of the wetlands of the Nation in order to maintain the public benefits they provide and to help fulfill international obligations contained in various migratory bird treaties and conventions …" 16 U.S.C. § 3901(b) (Emergency Wetlands Resources Act of 1986)

National Wildlife Refuge System Mission:

—To administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans" (National Wildlife Refuge System Administration Act of 1966, as amended [16 U.S.C. 668dd et seq.]).

Description of Use:

Cooperative farming is an interim tool, and an effective one, that allows the refuge to manage invasive species while at the same time providing forage for wildlife. Prior to and during restoration of native habitats, invasive species can outcompete native plants, therefore reducing the success of native plants to become established. Cooperative farming will allow the refuge to control invasive plants, which will give native plants a greater chance of success when restoration occurs.

The refuge manages small grain croplands and pastures to:

- Provide wildlife habitat for migratory birds and other resident wildlife, and
- Prevent invasive plants from dominating the landscape prior to restoration of the land to native habitats.

Invasive plants have the potential to reduce habitat quality and forage opportunity and have been identified as one of the most serious threats to refuge habitats. Preventing infestation is the most effective strategy because if left without refuge intervention, agricultural lands acquired by the refuge will most likely convert to invasive weed parcels. Species such as reed canarygrass and Himalayan blackberry pose serious threats. The refuge continually monitors for new invasive plants as well. A variety of methods, including mechanical, herbicidal, and cultural treatments, are used to manage these invasive plant species. The refuge uses an IPM approach to control weeds (Appendix G), whereby management options are selected based on on-site conditions and not implemented until established thresholds are exceeded.

Various methods will continue to be evaluated for efficiency and appropriateness to treat invasive species. If one particular method is not expected to be effective or may have undesirable consequences (such as impacting grassland nesting birds), then the refuge will evaluate other methods until one is deemed appropriate for a particular situation.

Approximately 800 acres of the Wapato Lake and Onion Flats Units will be maintained in cooperative farming until restoration begins. The farming will occur through a cooperative farming program in which croplands will typically be planted and maintained by local area farmers who operate according to farming agreements. Farming typically occurs with planting in the late spring and early summer with harvesting in late summer and early fall. Cooperative farming agreements are a negotiated agreement between the refuge and the private farmer to manage the lands for both parties. To benefit wildlife, the refuge's share of 30 percent will be left in the field where it will be available to wildlife, primarily waterfowl. The types of small grain crops and pasture grasses proposed under the cooperative farming program include, but are not limited to, plantings of corn, spring and winter wheat, and clover. Implementation of cooperative farming is dependent on weather and other environmental conditions. Determination of location, small grain crop species or pasture grasses, and timing of farming are made annually dependent on refuge needs.

Availability of Resources:

Estimated costs for operating the cooperative farming program as envisioned under the CCP are costs associated with administrative functions and are displayed in the following table. These administrative functions include the personnel required to review farming proposals, execute cooperative agreements, and monitor the program. The refuge currently has sufficient staff and funding to support this use.

Costs Associated with Operation of Cooperative Farming Program

Category and Itemization	One-time Expenses ($)	Recurring Expenses ($/year)
Administrative support	0	$5,000
Total expenses	0	$5,000

Anticipated Impacts of Use:

Approximately 800 acres of land will be cooperatively farmed under the CCP management direction at the Wapato Lake and Onion Flats Units. These units will be farmed to manage for invasive species until such time that restoration begins.

General Impacts:

Direct impacts of cropland management include exposure of soils to wind erosion and impacts from farm machinery. During tillage, the soil is left bare prior to planting. The bare soil is exposed for much of the year to environmental factors that may alter its quality. Wind, heat, and precipitation are the most damaging factors that may affect the soil. Wind and precipitation can both lead to displacement of soil, increasing the rate of erosion, and heat can effectively bake the soil, causing it to become inhospitable to seed banks; it may even cause the soil to become dry and compacted, making it impossible for any vegetation to grow if tillage is not performed.

Compaction of the soil can also result from the use of farming equipment for seeding, causing undesirable increases in bulk density, while tilling may prevent the accumulation or accelerate the decomposition of organic matter and diminish earthworm populations.

Farming may also result in the use and introduction into the environment of chemical agents from pesticide use. Weed issues may greatly increase from ground disturbance and from movement of cultivating and harvesting equipment from field to field, therefore spreading invasive species' seeds. In addition, small mammals, reptiles, and amphibians may be subject to mortality from farm equipment, and nesting birds may be disrupted and have nests destroyed.

Refuge-specific Impacts:

There will be no loss of native habitats due to farming since areas proposed for farming were already in production prior to refuge acquisition. There will be some continued impact to soil quality, but the CCP management direction will reduce the acreage under cultivation; thus, there will be a minor beneficial impact on soil and water quality, compared to the present. There will be a minor negative impact on farming as the amount of land under cultivation will decrease.

The introduction and spread of weeds is expected to be minimal through proper decontamination practices such as equipment cleaning, mowing to prevent seed set and dispersal, and treatments to any source populations that have the potential to infect a field. Early detection and rapid response methods will be employed to ensure any new populations are treated and eradicated immediately. Cooperators will be required to clean their equipment prior to moving it both on to the refuge and across units of the refuge. This will help minimize the spread of undesirable plants. The refuge will continue to monitor farming sites for invasive weeds and will maintain an aggressive approach to invasive species control. In addition, the refuge will work with the County Weed Board to prevent, identify, and eradicate new infestations.

For weed species that are or become established, mechanical, cultural, and biological controls will be evaluated as methods of treatment. If these methods are not expected to be effective, then herbicidal applications may be necessary. Chemical applications will be subject to the provisions of the IPM plan. This plan directs the refuge to select the most effective herbicide that will have the least environmental degradation to soils, surface water, and groundwater, and the least impact to native wildlife and vegetation. Each approved herbicide used will undergo a chemical profile analysis; active ingredients will be analyzed for their risk quotient and this value compared to a Level of Concern for surrogate species, as established by the EPA. All applications of herbicides will conform to the specific pesticide label requirements.

Employment of this approach will provide for a moderate to minor risk from chemical exposure. However, some risks may still occur from factors not assessed under current protocols, such as intermingling of unlike chemicals in the field; species-specific sensitivity that differs from surrogate species; exposure through inhalation; exposure through ingestion of pesticide-contaminated soil; and other factors as described in the IPM plan.

Positive short-term effects are also anticipated. In addition to providing high-carbohydrate forage for wintering waterfowl, crop fields can benefit other bird species by providing some foraging habitat for a variety of seed-eating migratory bird species.

Impacts to Listed Species:

Currently there are no known listed species inhabiting farm fields. Should conflicts occur in the future, measures such as erecting protective barriers and/or transplanting listed populations out of harm's way will be enacted. Additionally, if deemed necessary, the cooperative farming program will be halted until all protective measures can be evaluated and implemented as necessary.

Impacts to Other Priority Public Uses:

Farming on the refuge does not occur in areas that are open to the public; therefore, there are no impacts to public uses.

Public Review and Comment:

Various opportunities were provided for the public to engage with the planning process. Appendix K details public involvement undertaken during development of the CCP. Written comments on the draft CCP/EA, which included this compatibility determination, were collected during the public comment period.

Determination (check one below):

____ Use is Not Compatible

__X__ Use is Compatible with Following Stipulations

Stipulations Necessary to Ensure Compatibility:

- Cooperative farming agreements will be established with the cooperator per agency policy.
- Genetically modified seeds and other organisms will not be permitted for use in the farming program.
- Weeds will be controlled in accordance with the refuge's IPM program using methods such as crop rotation, mechanical treatment, biological controls, and approved pesticides.
- Herbicide applications may only be applied with prior refuge approval, and applicators must meet all state, Federal, and agency requirements.
- Equipment of cooperating farmers will be cleaned prior to being moved onto the refuge and between fields when working in areas with weed infestations.
- Cooperators will provide a record of herbicides used, including chemical name, amount used, date, location, and method of application.
- Diligence shall be exercised in the control of county-listed invasive weeds.

- Best management practices will be used to avoid fertilizer runoff into wetlands or leaching into groundwater and to minimize sedimentation of streams and water bodies. For example, nitrogen fertilizer applications will be avoided in the fall to help avoid waste and prevent fertilizer from leaching into groundwater, and buffer strips of dense vegetation will be left between farmland and wetlands to filter runoff and prevent sedimentation.
- Monitoring of the cropland farming program will be performed by qualified refuge staff.

Justification:

Cropland farming has been shown to be an effective habitat management practice performed to prevent invasive species from infesting a highly disturbed area until restoration of native vegetation can occur. Additionally, cropland farming provides high-quality food for wildlife species at the refuge. Wintering and migratory birds readily use agricultural crop fields to help meet their energy needs.

Although these large monocultures of planted grasses are not native, and do not support the diversity of species that native habitats do, it is critical to maintain these areas in production to keep them from becoming infested with noxious weeds. By conducting the farming program under the practices and stipulations above, it is anticipated that the program will contribute to the enhancement, protection, conservation, and management of native wildlife populations and their habitats on the refuge. As a result, cooperative farming contributes to achieving refuge purpose(s), contributes to the mission of the Refuge System, and helps maintain the biological integrity, diversity, and environmental health of the refuge. Allowing the use as described above will not materially detract from or interfere with the purposes for which the refuge was established or the mission of the Refuge System.

Mandatory 10- or 15-year Re-evaluation Date (provide month and year for "allowed" uses):

B.9 Compatibility Determination for Commercial Visitor Services at Tualatin River National Wildlife Refuge

Use: Commercial visitor services

Station Name: Tualatin River National Wildlife Refuge

Date Established: 1992

Establishing and Acquisition Authority(ies):

Fish and Wildlife Act of 1956 (16 U.S.C. § 742a. et seq.)

Emergency Wetlands Resources Act of 1986 (16 U.S.C. § 3901-3932)

Refuge Purpose(s):

—… for the development, advancement, management, conservation, and protection of fish and wildlife resources …" 16 U.S.C. § 742f(a)(4) (Fish and Wildlife Act of 1956)

—… for the benefit of the United States Fish and Wildlife Service, in performing its activities and services. Such acceptance may be subject to the terms of any restrictive or affirmative covenant, or condition of servitude …" 16 U.S.C. § 742f(b)(1) (Fish and Wildlife Act of 1956)

—… the conservation of the wetlands of the Nation in order to maintain the public benefits they provide and to help fulfill international obligations contained in various migratory bird treaties and conventions …" 16 U.S.C. § 3901(b) (Emergency Wetlands Resources Act of 1986)

National Wildlife Refuge System Mission:

—To administer a national network of lands and waters for the conservation, management, and where appropriate, restoration of the fish, wildlife, and plant resources and their habitats within the United States for the benefit of present and future generations of Americans." (National Wildlife Administration Act of 1966, as amended [16 U.S.C 668dd et seq.]

Description of Use:

This CD addresses nonconsumptive commercial uses related to wildlife observation, wildlife photography, interpretation, and environmental education. This CD does not address consumptive uses such as commercial guiding for hunting and fishing, nor activities that are not related to natural, historical, or cultural subjects. Additionally, a variety of nonprofit and for-profit organizations, educational institutions, and individuals engage in leading natural resource- and environmental education-based activities on the refuge. Some of these organizations may request to charge fees for services they intend to provide. This CD covers the fee collection and program quality aspects of commercial visitor services. Refer to the CDs for wildlife observation, wildlife photography, and interpretation and for environmental education for a complete compatibility examination of the wildlife-dependent activities that apply to commercial visitor services.

By regulation, the Service may only authorize public or private economic use of natural resources on any national wildlife refuge, where it is determined that the use contributes to the achievement of the refuge's purpose or the Refuge System mission. Refuge System policy on management of specialized uses states that when monetary gain (profit) is the objective of a refuge recreational use, the use is to be managed as an economic and commercial use.

Commercial visitor services on the refuge cover a broad range of wildlife-dependent recreation and education activities that are led by any organization or individual that charges a fee to participate in the activity. Activities could include, but are not limited to, birding tours, plant identification, wildlife photography, art, interpretive programs, guided trail walks, training workshops, summer youth camp, nature classes, and other similar nonconsumptive uses. These uses will occur in areas and facilities that are open to the public and will support the identified wildlife-dependent public uses of the refuge. Organizations conducting commercial visitor services will require an SUP, except for the Friends of the Refuge commercial activities, which are governed by statute under an existing MOU.

Commercial visitor services most often will be expected to occur in groups. These uses may occur year-round on the refuge. They may be conducted on existing public use trails and overlooks and at times inside the Wildlife Center. It is not expected that uses will occur on closed areas of the refuge, unless specifically authorized and approved by the refuge manager.

An SUP will be required for all uses by organizations and/or individuals wishing to collect fees for services, regardless of for-profit or nonprofit status, with the exception of Friends of the Refuge. Friends of the Refuge fundraising and/or fee collection for providing programs will be governed by existing the MOU and/or partnership agreements between the Service and the Friends of the Refuge, except when the refuge manager determines that a proposed use falls outside the scope of any agreement. In such a case, an SUP will be required. In all cases, the refuge manager will require that any organization (including Friends of the Refuge) and/or individual requesting to charge a fee for visitor services complete a written request that includes the activity type, date(s) and time(s) requested, group size, purpose of visit, proposed fee structure, where the activity will occur, and other details determined necessary by the refuge manager.

The refuge will have the option to accompany any group on their activity to assess program quality, adherence to refuge regulations and SUP stipulations, and safety guidelines. The refuge may also provide training and/or materials to requestors to ensure that program participants and visitors are receiving high-quality information and services.

Refer to the Stipulations Necessary to Ensure Compatibility section in this document for more information.

Availability of Resources:

Estimated costs for operating the commercial visitor services program as envisioned under the CCP are displayed in the following table. These costs are to perform, review, and administer proposals and SUPs, and monitor those SUPs during the proposed action. With assistance from Friends of the Refuge, volunteers, and other partners, the refuge currently has sufficient staff and funding to support this use.

Costs to Administer and Manage Commercial Visitor Services

Activity or Project	One-time Expenses ($)	Recurring Expenses ($/year)
Visitor Services Manager and management of SUPs		$5,000

Anticipated Impacts of Use:

The anticipated impacts of use are fully discussed in the CDs for wildlife observation, wildlife photography, and interpretation, and for environmental education.

Refuge-specific Impacts:

Disturbances to wildlife and their habitats will be the same as those discussed in the CDs for wildlife observation, wildlife photography, and interpretation and for environmental education. If disturbance to wildlife or damage to habitat reaches unacceptable levels, the refuge will limit access to areas where unacceptable impacts occur (see stipulations).

It is expected that many organizations could offer high-quality wildlife-dependent recreation and education activities on the refuge. These services may enhance visitor experience, learning, and appreciation of the refuge and its natural and cultural resources. These types of services, if provided in a high-quality manner, will likely reach more people than the refuge can.

Impacts to Listed Species:

No direct impact to listed species is anticipated to occur as a result of commercial visitor services. Any unanticipated future impacts will be reduced by ensuring that the public avoids or severely limits activity in areas hosting listed species.

Impacts to Other Priority Public Uses:

Both refuge visitation and the number of facilities and emphasis devoted to wildlife observation, wildlife photography, interpretation, and education are projected to increase under the CCP. Conflict between commercial visitor services groups will be expected to increase. If conflict between user groups reaches unacceptable levels, the refuge will limit access to areas where unacceptable impacts occur (see stipulations).

No significant effects to roads, trails, or other infrastructure from commercial visitor services are expected. Normal road, trail, and facility maintenance will continue to be necessary. Additional facility construction or upgrade, if needed, is addressed in the Availability of Resources section.

Public Review and Comment:

Various opportunities were provided for the public to engage with the planning process. Appendix K details public involvement undertaken during development of the CCP. Written comments on the draft CCP/EA, which included this compatibility determination, were collected during the public comment period.

Determination (check one below):

____Use is Not Compatible

__X__Use is Compatible with Following Stipulations

Stipulations Necessary to Ensure Compatibility:

General Stipulations

- Stipulations in the CDs for wildlife observation, wildlife photography, and interpretation and for environmental education apply to commercial visitor services.
- Visitors are restricted to designated trails, sites, or facilities as determined by refuge staff. Use is open daily from dawn to dusk.
- All refuge rules and regulations apply, including group size and management, and safety guidelines.
- Commercial photographers/videographers should ensure proper credit is given to the refuge and the Service.
- Collection of natural objects such as plants, animals, minerals, antlers, and cultural resources is prohibited.
- If disturbance to wildlife or damage to habitat reaches unacceptable levels, the refuge will limit uses in areas where unacceptable impacts occur. Monitoring will be conducted to ensure that high-quality habitat for wildlife feeding, resting, and breeding is maintained.
- The refuge may provide training and/or materials to requestors to ensure that program participants and visitors are receiving high-quality information and services.

Special Use Permit

- An SUP will be required for all commercial visitor services. Guiding for hunting and fishing is not allowed on the refuge.
- Fee-based activities conducted by Friends of the Refuge will require approval by the refuge manager as governed by MOUs and/or partnership agreements.
- A standard permit form stipulating dates, times, and locations of use will be made available prior to the visit.
- SUPs for areas open to the public may be granted on a case-by-case basis or for up to 1 year, at the refuge manager's discretion.
- Special permission requests to closed habitat/wildlife sanctuary areas or other special considerations (e.g., access to the refuge after normal public visitation hours, setting up temporary equipment, requiring additional resources or staff) will require an SUP and permit fee, and may be granted on a case-by-case basis with no renewal.
- The SUP will be required to be readily available while conducting the permitted use on the refuge.
- Requests must demonstrate a means to enhance education, appreciation, and/or understanding of the refuge and the Refuge System. Failure to abide by any part of the SUP or regulations will be considered grounds for immediate revocation of the permit and could result in denial of future permit requests.

- Refuge can deny use for any reason such as to minimize crowding, avert conflict with other activities/visitors, and, if disturbance is excessive, the refuge reserves the right to scale the use appropriately.
- The refuge will have the option of accompany any group on their activity to assess program quality, adherence to refuge regulations and SUP stipulations, and safety guidelines.

Justification:

By allowing commercial visitor services as an economic use to occur under the stipulations described above, it is anticipated that wildlife species, which could be disturbed during the use, will find sufficient resources and resting places such that their abundance and use of the refuge will not be measurably lessened. Additionally, it is anticipated that use of SUPs will provide the refuge a tool for managing uses; protecting natural and cultural resources; reducing user conflicts; and mitigating disturbance impacts. The SUPs will also create an opportunity for communication and outreach between the refuge staff and users to increase knowledge and awareness of refuge regulations and ethical behavior. Commercial visitor services will provide visitors an organized and educational opportunity to view wildlife safely under the use stipulations. Additionally, providers of commercial visitor services may create end products that will provide an educational opportunity to a much broader distribution of people. Thus, the use will not materially interfere with or detract from the Refuge System mission, or the purposes for which the refuge was established.

Mandatory 10- or 15-year Re-evaluation Date (provide month and year for "allowed" uses):

_____Mandatory 15-year re-evaluation date (for wildlife-dependent public uses)

__2023_Mandatory 10-year re-evaluation date (for all uses other than wildlife-dependent public uses)

Appendix C. Implementation

C.1 Overview and Historical Funding Picture

A comprehensive conservation plan (CCP) provides long-term guidance for management decisions, sets forth goals, objectives, and strategies needed to accomplish refuge purposes, and identifies the U.S. Fish and Wildlife Service's (Service's; USFWS's) best estimate of future needs. Often, a CCP provides detailed program planning levels that are substantially above current budget allocations and, as such, are primarily for Service strategic planning and program prioritization purposes. A CCP does not constitute a commitment for staffing increases, operational and maintenance increases, or funding for future land acquisition.

Implementation of the management direction of the CCP requires increased funding, which will be sought through an increase in base funding (Congressional allocations), partnerships (both private and public), and grants. Activities and projects identified will be implemented as funds become available.

C.1.1 Operating Funds History

Operational management of refuge lands is accomplished by permanent and temporary staffing, volunteers, and partnerships. Operational management includes managing public use, law enforcement, cultural resources, biology, fire, maintenance, administration, and habitat/wildlife restoration/maintenance management programs.

In fiscal year 2011, the majority of the station's operating funds came from Congressional allocated base funding. This funds salaries and benefits for six permanent full-time employees, annual maintenance, and overhead expenses associated with maintaining public use and administrative facilities.

Other funding sources include the Bonneville Power Administration's (BPA's) Fish and Wildlife Program, Migratory Birds Program, and Refuge Roads Program, and American Recovery and Reinvestment Act (ARRA) youth programs. Without these additional funds, the majority of work in the habitat restoration and environmental education program that is accomplished each year will not happen.

C.1.2 Revenue Sharing

In lieu of property taxes, the Tualatin River National Wildlife Refuge (the refuge) annually provides revenue-sharing payments to Yamhill and Washington Counties. The U.S. Congress each year determines what percent of funds will be appropriated for all appraised Federal lands. Counties are not restricted in the use of these funds. If the refuge expands through the purchase of inholdings (privately owned lands within the current approved boundary) or through an expanded refuge boundary, additional payments in lieu of tax will be made to the counties.

C.2 Step-Down Plans

The Comprehensive Conservation Plan is one of several plans necessary for refuge management. The CCP provides guidance in the form of goals, objectives, and strategies for several refuge program areas but may lack some of the specifics needed for implementation. Step-down management plans will be developed for individual program areas within approximately 5 years after CCP completion. All step-down plans require appropriate NEPA compliance; implementation may require additional permits. Step-down plans for the refuge are listed in Table C-1. Project-specific plans, with appropriate NEPA compliance, may be prepared outside of these step-down plans.

Table C-1. Refuge Step-Down Plans

Step-Down Management Plans	Status (Date Completed and/or Date to be Prepared/Updated)
Wapato Lake Unit Habitat Management Plan – Land Protection Plan	Contingent on acquisition and results of planning study
Cultural Resources Museum Management Plan	2015
TDML Plan	2014
Visitor Services Plan update	2017
Hunt Plan – youth waterfowl	2015
Hunt Plan – adult waterfowl	Contingent on Wapato Lake Unit restoration
Fishing Plan	2016
Integrated Pest Management Plan	2012 (prepared concurrently with CCP, Appendix G)
Wildland Fire Management Plan	2012 (prepared concurrently with CCP, Appendix O)
Elk Management Plan	Will be prepared concurrently with Willamette Valley NWR Complex
Habitat Management Plans and Restoration Plans for each parcel	Varies; restoration plans will be developed prior to any restoration action being implemented
Disease Contingency Plan	2015
Facilities Management Plan	2017
Inventorying and Monitoring Plan	2015

C.3 Future Needs

C.3.1 Future Sources of Funds

Projects listed below were drawn from the goals, objectives, and strategies and could be implemented during the next 15 years. Many of these projects will be included in either the Refuge Operational Needs System (RONS) or the Refuge Management Information System (RMIS). Both are used to request funding from Congress.

Currently, a large backlog of maintenance needs exists on the refuge. In 2010, the deferred maintenance backlog for the Tualatin River National Wildlife Refuge was $1,450,347. Reduction of the backlog is an ongoing goal and is included here in the analysis of funding needs. The RONS documents proposed new projects to implement the CCP to meet refuge goals and objectives and legal mandates.

Several infrastructure and facility projects will be eligible for funding through construction, deferred maintenance, or Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU) funds (i.e., Refuge Roads program).

Funds for other ~~"o~~ne-time costs" (see below) will be sought through increases in refuge base funding, special project funds, grants, Refuge Roads, or Federal Highway Administration funding.

C.3.2 Spending Priorities

Priorities are designated in Table C-2 for one-time and ongoing (recurring) projects (strategies) identified in the CCP. Priorities are designated as High (H), Medium (M), or Low (L). The rankings were determined according to the following criteria:

- A ~~"h~~igh"-ranked project/strategy is ongoing, needed immediately, or should be considered in the near future to successfully manage habitat and public use on refuges. It should directly support the ~~"r~~efuge purpose" or a ~~"b~~ig six" public use activity, and/or restore a ~~"th~~reatened or endangered" species or rare/unique habitat (oak savanna, wet prairie, etc.).
- A ~~"m~~edium"-ranked project/strategy is of a lesser degree of urgency, but also directly supports the ~~"r~~efuge purpose" or a ~~"b~~ig six" public use activity, and/or maintains and restores a ~~"th~~reatened or endangered" species or rare/unique habitat (oak savanna, wet prairie, etc.).
- A ~~"l~~ow"-ranked project/strategy maintains restored habitat or species and/or addresses a ~~"b~~ig six" public use activity that is not as widely sought out by the public as other ~~"b~~ig six" public use activities.

C.3.3 Operational Costs to Implement CCP

The following sections detail both one-time and recurring costs for various projects. Recurring costs reflect the future operational and maintenance costs associated with the project.

One-time Costs: One-time costs are project costs that have a startup cost associated with them, such as purchasing a new vehicle for wildlife and habitat monitoring or designing and installing an interpretive sign. Some are full project costs for those projects that can be completed in 3 years or less. These projects do not include permanent operational costs (staff salary and support). They can, however, include the cost of temporary or term salary associated with a short-term project. Salary for new positions and operational costs are reflected in operational or ~~"r~~ecurring" costs. Table C-2 compares both one-time and recurring costs across current and future management.

Operational and Maintenance (Recurring) Costs: Operational and maintenance costs reflect refuge spending of base funds allocated each year. These are also known as recurring costs and are usually associated with day-to-day operations and projects that last longer than 3 years. Operational costs use base funding in Service codes 1261, 1262, 1263, and 1264.

Maintenance includes preventive maintenance; cyclic maintenance; repairs; replacement of parts, components, or items of equipment; adjustments, lubrication, and cleaning (nonjanitorial) of equipment; painting; resurfacing; rehabilitation; special safety inspections; and other actions to ensure continuing service and to prevent breakdown. Maintenance also includes maintaining public use, administrative, historical, and shop buildings and facilities. Due to normal use and weather conditions, buildings and facilities need annual maintenance and repairs. Maintenance of habitat throughout the refuge as a result of the threat of invasive plants and animals and succession, and protection of threatened and endangered species is an annual occurrence.

Operational costs includes all costs associated with the operation of all programs including supplies and materials needed to support these programs, such as field supplies, brochures, media, and other interpretative materials, volunteer supplies, herbicide, fuel, overhead costs (electricity, phone, natural gas, office supplies, alarm systems for security and fire monitoring), training for staff and volunteers, and safety materials. These costs do reflect salaries for temporary positions, but do not include permanent staff salary.

Table C-2 displays estimated operating and maintenance costs for the major project items identified in the CCP. One column is based on an estimate of costs for implementing current management. The other reflects increased funding needs for increases in public uses and facilities, increased habitat restoration and conservation activities, and other strategies planned under the management direction described in Chapter 2.

Table C-2. Estimated Operating and Maintenance Costs for the Major Project Items Identified in the CCP

Goal/ Objective	Strategy	One-time Cost	Recurring Cost (annual)	Priority	Cost/Unit	Units/Total Cost	Current Management	Future Management
1/1.1	Maintenance of riparian forest (integrated pest management [IPM], monitoring)		X	M	$100	Acres	349	322
						Cost	$34,900	$32,200
1/1.2	Restore riparian forest (pretreatment, planting, seeding, mechanical methods)	X		H	*$6,400	Acres	39	111
						Cost	$249,600	$710,400
2/2.1	Maintenance of mixed forest (IPM, prescribed fire, monitoring, snag creation)		X	L	$250	Acres	49	52
						Cost	$12,250	$13,000
2/2.2	Restore mixed forest (pretreatment, planting, seeding, mechanical methods)	X		L	*$3,000	Acres	0	51
						Cost	$0	$153,000
3/3.1	Maintain oak savanna (prescribed fire, IPM, mowing, tree thinning, monitoring)		X	H	$250	Acres	149	109
						Cost	$37,250	$27,250
3/3.2	Restore oak savanna (pretreatment, plantings, seeding, prescribed fire)	X		H	*$910	Acres	0	38
						Cost	$0	$34,580
3/3.3	Maintain oak/pine woodland (IPM, prescribed fire, monitoring, snag creation)		X	H	$250	Acres	0	23
						Cost	$0	$5,750
3/3.4	Restore oak/pine woodland (pretreatment, planting, seeding, mechanical methods)	X		M	*$3,000	Acres	0	20
						Cost	$0	$60,000

Table C-2. Estimated Operating and Maintenance Costs for the Major Project Items Identified in the CCP

Goal/ Objective	Strategy	One-time Cost	Recurring Cost (annual)	Priority	Cost/Unit	Units/Total Cost	Current Management	Future Management
4/4.1	Maintain wet prairie (planting, IPM, prescribed fire, mowing/haying, monitoring)		X	M	$200	Acres	27	27
						Cost	$5,400	$5,400
4/4.2	Restore wet prairie (pretreatment, planting, seeding, monitoring)	X		H	$1,000	Acres	0	114
						Cost	$0	$114,000
5/5.1	Maintain herbaceous wetlands (irrigation, water manipulation, mowing/discing, IPM, contouring of wetlands, pest management, prescribed fire)		X	M	$250	Acres	294	187
						Cost	$73,500	$46,750
5/5.2	Enhance scrub-shrub wetlands (IPM, mowing/discing, pest management, planting, seeding)	X		H	$2,000	Acres	0	Approx. 700 acres max.
						Cost	$0	$1.4 million
5/5.3	Maintain scrub-shrub wetlands (IPM, prescribed fire, logs/trees for basking and resting structures, monitoring)		X	M	$150	Acres	20	20
						Cost	$3,000	$3,000
5/5.3	Restore scrub-shrub wetlands (pretreatment, creating swales, plantings, fish passageways)	X		H	**$2,350	Acres	0	180
						Cost	$0	$80,252 average

Table C-2. Estimated Operating and Maintenance Costs for the Major Project Items Identified in the CCP

Goal/ Objective	Strategy	One-time Cost	Recurring Cost (annual)	Priority	Cost/Unit	Units/Total Cost	Current Management	Future Management
6/6.1	Maintain streams and sloughs (install fish passageways, remove fish barriers, plantings, erosion control, IPM, best management practices [BMPs])		X	L	$1,000	Miles	7.2	7.2
						Cost	$7,200	$7,200
6/6.2 and 6.3	Restore streams and sloughs (topographical surveys, heavy equipment work, removal of barriers, plantings, erosion control)	X		H	$10,000	Miles	0	4.3
						Cost	$0	$43,000
7/7.1	Cooperative farming (administration)		X	L		Acres	909	0
						Cost	$2,000	$0
8/8.1	Inventorying and monitoring surveys (develop and continue surveys for refuge)		X	H		Cost	$100,000	$200,000
8/8.2	Conduct research (studies and investigations toward water quality, soils, IPM techniques, fishery resources, climate change)	X		L		Cost	$300,00	$200,000
9/9.1	Inventory, evaluate, monitor, and protect cultural resources		X	L		Cost	$2,500	$35,000
9/9.2	Cultural resources interpretation (tribal partnerships,	X		M		Cost	$0	$10,000

Table C-2. Estimated Operating and Maintenance Costs for the Major Project Items Identified in the CCP

Goal/ Objective	Strategy	One-time Cost	Recurring Cost (annual)	Priority	Cost/Unit	Units/Total Cost	Current Management	Future Management
	interpretative media and exhibits)							
10/10.1	Provide interpretive information to visitors (media, brochures, signs)	X		H		Cost	$0	$120,000
10/10.2	Outreach and special events		X	M		#Events	4	4
						Cost	$6,500	$6,500
10/10.3	Evaluation of visitor services	X		M		Cost	$0	$25,000
10/10.4	Public access (partnership on trails, safe highway access)		X	L		Cost	$0	$2,500
10/10.5	Volunteer program (develop/provide manuals, bunkhouse, and recreational vehicle [RV pads)	X		M		Cost	$0	$50,000
11—all	Environmental education (develop curricula, materials, and install nature explore area)	X		H		Cost	$0	$75,000
	Environmental education (programs/workshops and materials)		X	H		Cost	$40,000	$158,000
12/12.1 and 12.2	Wildlife observation, photography, and interpretation (kiosks, signs, photo blinds, bunkhouse for volunteers)	X		M		Cost	$0	$327,000

Table C-2. Estimated Operating and Maintenance Costs for the Major Project Items Identified in the CCP

Goal/ Objective	Strategy	One-time Cost	Recurring Cost (annual)	Priority	Cost/Unit	Units/Total Cost	Current Management	Future Management
	Wildlife observation, photography, and interpretation (new positions, facilities maintenance)		X	H		Cost	$30,000	$258,000
12/12.3 and 12.5	Waterfowl hunting—complete hunting package	X		M		Cost	$0	$90,000
	Waterfowl hunting—manage program		X	M		Cost	$0	$50,000
12/12.4	Fishing—complete fishing package	X		L		Cost	$0	$5,000
	Fishing—manage fishing program		X	L		Cost	$0	$15,000
All	Develop step-down plans	X		M	$15,000	# Plans	0	5
						Cost	$0	$75,000

*Cost was estimated from previous restoration contracts that included labor, plants (trees and grass), protective tree coverings, and other supplies.

**Since the acreage is undetermined for restoration at the Wapato Lake Unit due to a pending hydrological study, cost was estimated based on mean acreage.

C.3.4 Staffing Needs To Implement CCP

Personnel are needed to manage and enhance the quality and diversity of indigenous wildlife habitats on the Tualatin River National Wildlife Refuge. With the proper staffing to implement this plan, habitat management practices can be implemented and monitoring of flora and fauna responses to management can be applied, which will allow us to apply adaptive management strategies crucial for long-term success in meeting the mission, goals, and objectives of the refuge. Staff will interact with the public for education purposes and to provide for public safety. Maintenance staff will maintain facilities and equipment. Training of staff and coordination among staff, volunteers, and refuge partners will ensure that the mission and guiding principles of the National Wildlife Refuge System endure.

Table C-3 shows costs for permanent and seasonal staff needed each year. It does not include staff costs associated with special projects; these are summarized in Table C-2. Table C-3 is related to the Refuge Annual Performance Plan. The section of the table titled ―Present Core Staff' shows permanent full-time staff and temporary staff funded with base budgets and other Federal funding. It is important to note that partnerships with other organizations are crucial to achieving baseline objectives as described under current management. Future management staffing positions demonstrate additional staff needed to succeed with the goals of the CCP.

The proposed full development-level staffing plan will achieve optimum refuge outputs within this planning period (15 years). The rate at which this station achieves its full potential to fulfill the objectives and strategies contained in the CCP is dependent upon receiving adequate funding and staffing.

Table C-3. Staffing Needs for Major Project Items in CCP

Staff-Refuge Operations	Status*	Position*	Justifying Objective	Current Management	Future Management
Present core staff					
Project Leader	PFT	GS-0485-13	Current	X	X
Deputy Project Leader	PFT	GS-0485-12	Current	X	X
Wildlife Biologist	PFT	GS-0486-11	Current	X	X
Visitor Services Manager	PFT	GS-0025-11	Current	X	X

Environmental Education Specialist	PFT	GS-0025-7/9	11.1		X
Engineering Equipment Operator	PFT	WG-5716-8	1.2		X

*Status and Position definitions:

PFT: Permanent full time
TEMP: Temporary position
GS: General schedule Federal employees
WG: Wage grade scale

Volunteer Program: The Tualatin River National Wildlife Refuge has a very active volunteer program that supports all programs of the refuge. During fiscal year 2011, more than 225 volunteers donated over 14,640 hours of their time to accomplishing the goals of refuge programs, including maintenance, public use, biological support, environmental education, habitat restoration and management, and administrative duties (Table C-4). The refuge provides transportation, training, supplies, equipment, and housing as needed in support of the volunteer program. The number of hours donated in 2010 was equivalent to $21.79 per hour as estimated by the Independent Sector (2011). The value of time donated equated to $328,000, or seven full-time employees.

Table C-4. Volunteer Contributions over a 5-year Time Frame (2007-2011)

Year	2007	2008	2009	2010	2011
Volunteers	340	558	477	205	226

Appendix D. Wilderness Review

D.1 Background

The Wilderness Act (Act) became Federal law in 1964 (16 U.S. Code [U.S.C.] 1131-1136). In Section 2(a) of the Act, the U.S. Congress expressed concern that " … an increasing human population, accompanied by expanding settlement and growing mechanization … [should not be allowed to] … occupy and modify all areas within the United States and its possessions, leaving no lands designated for preservation and protection in their natural condition …." The Act also established the National Wilderness Preservation System (Wilderness System) and stated that areas in the Wilderness System " … shall be administered for the use and enjoyment of the American people in such manner as will leave them unimpaired for future use as wilderness, and so as to provide for the protection of these areas, the preservation of their wilderness character, and for the gathering and dissemination of information regarding their use and enjoyment as wilderness…."

Section 2(c) of the Act defined a wilderness area as one that " … in contrast with those areas where man and his own works dominate the landscape, is hereby recognized as an area where the earth and its community of life are untrammeled by man, where man himself is a visitor who does not remain. An area of wilderness is further defined to mean in this chapter an area of undeveloped Federal land retaining its primeval character and influence, without permanent improvements or human habitation, which is protected and managed so as to preserve its natural conditions and which (1) generally appears to have been affected primarily by the forces of nature, with the imprint of man's work substantially unnoticeable; (2) has outstanding opportunities for solitude or a primitive and unconfined type of recreation; (3) has at least five thousand acres of land or is of sufficient size as to make practicable its preservation and use in an unimpaired condition; and (4) may also contain ecological, geological, or other features of scientific, educational, scenic, or historical value."

Section 3 of the Act required a review of Federal lands to determine their suitability for designation as a unit(s) of the Wilderness System. The U.S. Congress reserved to itself the authority to officially designate wilderness areas.

A wilderness review is the process used by the Service to determine whether to recommend lands or waters in the National Wildlife Refuge System to Congress for designation as wilderness. A wilderness review is required for refuges as part of the comprehensive conservation plan (CCP) planning process. Lands or waters that meet the minimum criteria for wilderness (610 FW 4) are identified in the CCP and further evaluated to determine whether they merit recommendation for inclusion in the Wilderness System.

For a refuge to be considered for wilderness designation, all or part of the refuge must:

- Be affected primarily by the forces of nature, with the human imprint substantially unnoticeable;
- Have outstanding opportunities for solitude or primitive and unconfined type of recreation;
- Have at least 5,000 contiguous acres or be sufficient in size to make practical its preservation and use in an unimpaired condition, or be capable of restoration to wilderness character through appropriate management, at the time of review; or
- Be a roadless island.

D.2 Conclusion

Tualatin River National Wildlife Refuge (the refuge) is not recommended for further study for inclusion in the Wilderness System because it does not meet the above criteria. The refuge is only 2,137 acres in size and the largest roadless block is approximately 800 acres. The size of this block is insufficient to make practicable its preservation and use as wilderness. The refuge also has considerable evidence of past human use, does not have outstanding opportunities for solitude or primitive and unconfined type of recreation, and is not a roadless island.

Appendix E. Biological Resources of Concern

E.1 Introduction and Background

Management direction of individual refuges is driven by refuge purposes and statutory mandates, coupled with species and habitat priorities. Management on a refuge should first and foremost address the individual refuge purposes. Additionally, management should address maintenance, follow policy and, where appropriate, restore biological integrity, diversity, and environmental health (BIDEH) (Table E-1) and manage for National Wildlife Refuge System (Refuge System) Resources of Concern (ROCs). With this approach, the refuge contributes to the goals of the Refuge System and achievement of its mission.

In concert with this approach, and as an initial step in planning, the comprehensive conservation plan (CCP) planning team for the Tualatin River National Wildlife Refuge (the refuge) identified ROCs for the refuge. As defined in the policy on Habitat Management Plans (620 FW 1G) ROCs are:

> *All plant and/or animal species, species groups, or communities specifically identified in refuge purpose(s), System mission, or international, national, regional, State, or ecosystem conservation plans or acts. For example, waterfowl and shorebirds are a resource of concern on a refuge whose purpose is to protect 'migrating waterfowl and shorebirds.' Federal or State threatened and endangered species on that same refuge are also a resource of concern under terms of the respective endangered species acts.*

To provide a framework for development of goals and objectives in the CCP, the planning team identified ROCs following the process outlined in the handbook *Identifying Refuge Resources of Concern and Management Priorities: A Handbook* (U.S. Fish and Wildlife Service 2009c).

E.2 Comprehensive Resources of Concern

A comprehensive list of potential ROCs was created early in the planning process. The planning team identified species, species groups, and communities of concern, based upon a review of the refuge's establishing history and purposes, a description of the key habitat types existing at the refuge, and a review of numerous conservation plans (see Sections 1.6, 1.7, and 1.8 of the CCP), many of which highlight priority species or habitats for conservation. The comprehensive ROCs list is contained in Table E-2.

Table E-1. Summary of BIDEH for Tualatin River National Wildlife Refuge

Habitats (plant communities) that Represent Existing BIDEH	Population/Habitat Attributes (age class, structure, seral stage, species composition)	Natural Processes Responsible for These Conditions	Limiting Factors
Bottomland Riparian Forest	Native overstory trees include Oregon ash, grand fir, big-leaf maple, Douglas-fir, and black cottonwood. Native subcanopy trees include black hawthorn, vine maple, cascara, Pacific ninebark, hazel, red alder, and Pacific yew. Native shrub layer includes snowberry, rose, red-osier dogwood, Douglas spirea, blue and red elderberry, red-flowering currant, Carex, and sword fern. Generally within the 100-year floodplain. *Potential Conservation Species: beaver, mink, downy woodpecker, northern red-legged frog, pileated woodpecker, Swainson's thrush, western wood peewee, wood duck, and yellow warbler.*	Functioning floodplain: infrequent major flood events (flood heavily once every 3-5 years), scouring of trees/herbaceous layers, deposition of silts. Frequent short-term flooding (may flood for a few days two to three times per year). Deposition of large woody debris in both the forest floor and river/stream channel. Flooding is the primary natural disturbance regime in Tualatin River Basin bottomland riparian forest.	Non-functioning floodplain and altered hydrology in refuge watershed. Floodplain alterations including ditching and tile drains associated with agricultural practices, urban and rural development leading to increased runoff, and summer water withdrawals for agriculture, industrial, and urban uses. Climate change may cause further changes in weather and/or flooding patterns. Invasive species such as reed canary grass, Himalayan blackberry, English hawthorn, English ivy, and holly.
Mixed Coniferous/deciduous Upland Forest	Native overstory trees include Douglas-fir, western red-cedar, big-leaf maple, western hemlock, Garry oak, Pacific Madrone, and some grand fir. Native subcanopy trees include black hawthorn, vine maple, cascara, hazel,	Relatively undisturbed forest with openings caused by wind storms. Infrequent fires. Cool, wet winters and mild summers.	Habitat fragmentation from agricultural and urban development. Invasive species such as Himalayan blackberry, English hawthorn, English ivy, and holly. Species composition

Table E-1. Summary of BIDEH for Tualatin River National Wildlife Refuge

Habitats (plant communities) that Represent Existing BIDEH	Population/Habitat Attributes (age class, structure, seral stage, species composition)	Natural Processes Responsible for These Conditions	Limiting Factors
	serviceberry, Pacific dogwood, and red alder. Native shrub layer includes snowberry, Oregon grape, Indian plum, Mock orange, red-flowering currant, and sword fern. Generally occurs above the 100-year floodplain. *Potential Conservation Species: brown creeper, chestnut-backed chickadee, Pacific slope flycatcher, black-tailed deer, olive-sided flycatcher, Swainson's thrush, and pileated woodpecker.*		may change with changes in precipitation or temperature due to climate change. Forest diseases such as Swiss needle cast may also increase due to climate change.
Wet Prairie	Few to no woody shrubs and trees. Native herbaceous species include sedges, rushes, tufted hairgrass, popcorn flower, Nelson's checker-mallow, and other forbs. *Potential Conservation Species: American kestrel, northern harrier, common yellowthroat, Nelson's checker-mallow, western meadowlark, Wilson's snipe, and sora.*	Periodic fire, poorly drained soils, and seasonal flooding. Typically a transition area between upland and wetland. Periodic grazing by large ungulates.	Invasive species especially reed canary grass and Himalayan blackberry. Fire suppression facilitates encroachment of woody species especially Oregon ash. With elk being removed from Willamette Valley habitats, no grazing by large ungulates. Draining and conversion to agriculture and urban development.
Oak Habitats	Widely scattered Garry oaks and/or Willamette	Frequent (approximately every	Agricultural and urban developments.

Table E-1. Summary of BIDEH for Tualatin River National Wildlife Refuge

Habitats (plant communities) that Represent Existing BIDEH	Population/Habitat Attributes (age class, structure, seral stage, species composition)	Natural Processes Responsible for These Conditions	Limiting Factors
	Valley ponderosa pine. Very few shrubs. Dominated by native grasses and forbs including Roemer's fescue, California oatgrass, California brome, blue wildrye, and meadow barley. *Potential Conservation Species: downy woodpecker, white-breasted nuthatch, western bluebird, western gray squirrel, and coyote.*	5 years) low-intensity fire; absence of ground disturbance; presence of acorn-dispersing animals (squirrels, jays, acorn woodpeckers); light grazing/browsing by native ungulates. Oak habitats were formerly maintained by Native Americans with fires of various frequencies.	Fire suppression causing conifer encroachment and competition by native trees and shrubs. Invasive species such as Himalayan blackberry and non-native grasses.
Herbaceous Wetland	Seasonal, semipermanent, and permanent wetlands characterized by annual vegetation and perennial emergent and submerged aquatic wetland plants. Few trees and shrubs. *Potential Conservation Species: waterfowl, canvasback, dusky and cackling Canada geese, tundra swans, shorebirds, sora, northern pintail, northwestern pond turtle, American bittern, and pied-billed grebe.*	Hydric soils flooded at least part of the year from rainfall accumulation or overflow from rivers and streams in the floodplain. Fluctuating water levels and deposition of sediments from flood waters. Infrequent fire. Consumption of vegetation by large concentrations of waterfowl. Functioning floodplain: infrequent major flood events (flood heavily once every 3-5 years), scouring of woody species, deposition of silts, and reduction of emergents.	Non-functioning floodplain and altered hydrology in the refuge watershed. Floodplain alterations including ditching and tile drains associated with agricultural practices, urban and rural development leading to increased runoff, and summer water withdrawals for agriculture, industrial, and urban uses. Encroachment of woody species. Invasive species including reed canary grass, velvetleaf, knotgrass (Bermuda grass), common

Table E-1. Summary of BIDEH for Tualatin River National Wildlife Refuge

Habitats (plant communities) that Represent Existing BIDEH	Population/Habitat Attributes (age class, structure, seral stage, species composition)	Natural Processes Responsible for These Conditions	Limiting Factors
			cocklebur, and nutria. Urban development with draining and filling of wetlands.
Scrub-shrub Wetland	Dominated by willow species, red-osier dogwood, rose, and spirea generally less than 20 ft. tall. Herbaceous plants include common cattail, sedges, and rushes. Typically characterized by deep organic peat soils. *Potential Conservation Species: willow flycatcher, common yellowthroat, American bittern, northern red-legged frog, and sora.*	Hydric soils flooded for a large part of the year from rainfall accumulation or functional floodplain causing overflow from rivers and streams.	Urban development with draining and filling of wetlands. Many of these habitat types were drained and converted to agriculture through draining, ditching, and tiling. Invasive species such as reed canary grass outcompete native plants.
Rivers, Streams, and Backwater Sloughs	Lower Tualatin River mainstem is characterized as low-gradient (about 1 foot/mile drop) and slow-flowing with riparian vegetation along the banks. Tributary streams may be low- to high-gradient. Sloughs may be inundated year-round or seasonally. Vegetation may include native riparian plant species such as Oregon ash, red-osier dogwood, willows, snowberry, twinberry, and Pacific ninebark.	Periodic flooding, scouring and movement of river/stream channel, inputs of coarse woody debris and leafy detritus, and occasional catastrophic flooding.	Dams; water removal for agricultural, industrial, urban, and rural uses; and ditching, tiling, and draining of adjacent lands. Changes in frequency, duration, and intensity of flood events. Poor water quality, such as water with low dissolved oxygen, high phosphorus, and high temperature. Climate change may exacerbate flooding frequency and/or water quality issues.

Table E-1. Summary of BIDEH for Tualatin River National Wildlife Refuge

Habitats (plant communities) that Represent Existing BIDEH	Population/Habitat Attributes (age class, structure, seral stage, species composition)	Natural Processes Responsible for These Conditions	Limiting Factors
	Potential Conservation Species: anadromous fish, beaver, mink, northwestern pond turtle, and wood duck.		Tualatin River channel is deeply incised and some tributary streams are highly modified into channelized sections with steep banks. Artificial fish passage barriers such as culverts and water diversion structures. Invasive species such as reed canary grass outcompete native plants.

Possible Focal Species

Key:

Federal Threatened and Endangered Species

FE = Federal Endangered
FT = Federal Threatened

State Threatened and Endangered Species

SE = State Endangered
ST = State Threatened

FC = Federal Candidate
FS = Federal Species of Concern
SC = State Candidate
SS = State Sensitive

BMC Region 1 Designation Codes:

BCC/N = Birds of Conservation Concern/National
BCC/R = Birds of Conservation Concern/Regional
BCC/BCR = Birds of Conservation Concern/Bird Conservation Region
GBBDC = Gamebirds Below Desired Condition
GBADC = Game Birds Above Desired Condition
T/E = Threatened or Endangered under the Endangered Species Act

E.3 Priority Resources of Concern

The Comprehensive Resources of Concern list was further culled in developing a more targeted assemblage of Priority Resources of Concern (Table E-3). The Priority Resources of Concern table is comprised of 14 focal species, including birds and fish that were selected as representatives or indicators for the overall condition of important refuge habitats. Most of the biological emphasis of the CCP is focused on maintaining and restoring these priority resources.

Several different conservation focal species may be listed for specific habitats to cover the variety of habitat structures and plant associations. In addition, species with specific "niche" ecological requirements may be listed as a focal species. Other species utilizing the habitat will generally be expected to benefit as a result of management for the focal species.

Definitions for the column headings in Table E-3 are as follows:

- **Focal Species**: Species selected as representatives or indicators for the overall condition of the conservation target. In situations where the conservation target may include a broad variety of habitat structures and plant associations, several different conservation focal species may be listed. In addition, species with specific "niche" ecological requirements may be listed as a focal species. Management will be focused on attaining conditions required by the focal species. Other species utilizing the conservation target will generally be expected to benefit as a result of management for the focal species.
- **Habitat Type:** The general habitat description utilized by the focal species.
- **Habitat Structure:** The specific and measurable habitat attributes considered necessary to support the focal species.
- **Life History Requirement:** The general season of use for the focal species.
- **Other Benefiting Species:** Other species that are expected to benefit from management for the selected focal species. The list is not comprehensive; see the *Table of Potential Resources of Concern for the Refuges* for a more complete list.

Table E-3. Priority Resources of Concern for Tualatin River National Wildlife Refuge

Focal Species	Habitat Type	Habitat Structure	Life History Requirement	Other Benefitting Species
Pacific slope flycatcher	Bottomland riparian forest	Early to mid-successional forest with shrub understory (Sakai and Noon 1991) associated with deciduous trees (Pearson and Manuwal 2001). Canopy trees >12 ft. tall with <20% tree canopy cover, where canopy is Oregon ash-dominated, with willow, red-osier dogwood, bigleaf maple, and hazel (Altman 2000). Shrub cover 30-80%.	Breeding	Yellow warbler, song sparrow, willow flycatcher, and rufous hummingbird
Swainson's thrush		Mid- to late-successional forest with shrub understory. Oregon ash, Douglas-fir, bigleaf maple, cascara as overstory species with >50% canopy closure. Swamp rose, snowberry, elderberry, and salmonberry; >50% shrub cover with >60% native species (Altman 2000).	Breeding, year-round for benefitting species	Beaver, northern red-legged frog, anadromous fish (coho and steelhead), yellow-breasted chat, and black-capped chickadee
Brown creeper		Old-growth and mature forest types (Anthony et al. 1996). Oregon ash, bigleaf maple, Douglas-fir with canopy height >33 ft. and canopy closure >50%. Subcanopy cover >10% by snowberry, Pacific yew, cascara, some grand fir. Habitat patches >50 meter wide (PIF 2000).	Breeding and year-round	Chestnut-backed chickadee, anadromous fish, western wood pewee, downy woodpecker, and pileated woodpecker
Orange-crowned warbler	Mixed coniferous/ deciduous forest	Douglas-fir-dominated canopy with mixtures of grand fir, western red-cedar, western hemlock, bigleaf maple, Garry oak, Pacific dogwood, Pacific yew, and red alder. Understory consists of snowberry, hazel, sword fern, and other shrubs. Understory trees <15 ft. and >30% cover (Altman 1999).	Breeding and year-round for benefitting species	Bewick's wren, spotted towhee, downy woodpecker, olive-sided flycatcher, and pileated woodpecker
Wilson's snipe	Wet prairie	Dominated by sedges and native grasses with very few shrubs or trees (NatureServe 2010). Grasses may be >3 ft. tall (e.g., *Deschampsia* sp.). A wide variety	Breeding, wintering for waterfowl species	American bittern, savanna sparrow, western meadowlark, northern harrier,

Table E-3. Priority Resources of Concern for Tualatin River National Wildlife Refuge

Focal Species	Habitat Type	Habitat Structure	Life History Requirement	Other Benefitting Species
		of sedges and rushes should be represented. May retain water at the soil surface more than 6 months during the year.		dusky Canada goose, migrating and wintering waterfowl, and Nelson's checker-mallow
Western bluebird	Oak Habitats	Early successional stages (restoration areas) dominated by native grasses and forbs with scattered sapling Garry oak trees. Trees may range from <3 ft. tall to >15 ft.	Breeding, year-round	Chipping sparrow, coyote, grasshopper sparrow, mourning dove, and rufous hummingbird
White-breasted nuthatch		Trees dominated by widely spaced (Vesely and Tucker 2004) mature Garry oak >25 inches diameter at breast height (DBH) with cavities. Some areas with scattered ponderosa pine large enough (>25 inches) to provide nest cavities, and <1 snags/acre >1 ft. DBH. Native grass and forb understory <30 inches with few to no shrubs. Tree and shrub cover <10% with variable grass heights. Patch size >200 acres (PIF 2000).	Breeding, year-round	Western gray squirrel, acorn woodpecker, western bluebird, black-tailed deer, and lesser goldfinch
Northern pintail	Herbaceous wetland	Shallow water depths averaging 4-18 inches over 75% of wetland basins. Dominated by seed-producing annual plants (e.g., smartweeds, plantain), and native emergent plant species (e.g., sedges, rushes), with few encroaching trees.	Wintering, migrating	Tundra swan, cackling Canada goose, wintering waterfowl, river otter, mink, northwestern pond turtle; bald eagle and peregrine falcon (foraging)
Greater yellowlegs		Declining water depths producing saturated mud flats to mostly drained during summer.	Migrating and year-round or breeding for benefitting species	Least sandpiper, dunlin, killdeer, lesser yellowlegs, long-billed dowitcher, spotted sandpiper, tree swallow, and great blue heron
Virginia rail		Water depths averaging 12-30 inches over 25-75%. Dominated	Breeding and year-round for	Wintering waterfowl,

Table E-3. Priority Resources of Concern for Tualatin River National Wildlife Refuge

Focal Species	Habitat Type	Habitat Structure	Life History Requirement	Other Benefitting Species
		by emergent plant species such as spike rush, wapato, softstem bulrush, and common cattail.	benefitting species	American bittern, sora, common yellowthroat, common garter snake, and chorus frog
Pied-billed grebe		Water depths averaging 24-48 inches over 50-75%. Open water >50%. Plant species dominated by submergent plants such as *Potamogeton* sp., *Callitriche* sp., and emergent plants such as *Scirpus* sp., softstem bulrush, and common cattail.	Breeding and year-round for benefitting species	Diving ducks, red-winged blackbird, wood duck, Vaux's swift, mink, purple martin, northwestern pond turtle, and northwestern salamander
Willow flycatcher	Scrub-shrub wetland	Water depths typically 3-10 ft. with some water remaining during most of the year. Vegetation dominated by willow, rose, and Douglas spirea with some Oregon ash, redosier dogwood, and black cottonwood.	Breeding and year-round	American bittern, sora, Virginia rail, red-winged blackbird, common yellowthroat, northern red-legged frog, and northwestern salamander
Coastal cutthroat trout, winter steelhead	Rivers, streams, and backwater sloughs	Barrier-free river, stream channels, and sloughs. Shaded along the banks, and with coarse woody debris for in-stream structure.	Migration corridor for migrating fish, off-channel winter refuge for juvenile fish	Northwestern pond turtle, mink, beaver, belted kingfisher, spring Chinook, coho, and Pacific lamprey
Cackling Canada goose	Cropland	Cultivated cereal grains including corn, barley, wheat, oats, etc. Green browse pastures with annual/perennial ryegrass, fescue, legumes, etc. Mowed to <4 inches before October 1.	Migrating and wintering waterfowl, year-round for benefitting species	Tundra swan, dusky Canada goose, northern pintail, American wigeon, northern harrier, and western meadowlark

Appendix F. Statement of Compliance

Statement of Compliance for Implementation of the Tualatin River National Wildlife Refuge Comprehensive Conservation Plan, Washington and Yamhill Counties, Oregon

The following executive orders and legislative acts have been reviewed as they apply to implementation of the Tualatin River National Wildlife Refuge comprehensive conservation plan (CCP).

National Environmental Policy Act (1969), as Amended (42 U.S.C. § 4321 et seq.)

The planning process has been conducted in accordance with National Environmental Policy Act (NEPA) implementing procedures, with U.S. Department of the Interior and U.S. Fish and Wildlife Service (Service) procedures, and in coordination with the affected public. The requirements of NEPA (42 U.S. Code [U.S.C.] § 4321 et seq.) and its implementing regulations in 40 Code of Federal Regulations (CFR) 1500-1508 have been satisfied in the procedures used to reach decisions. These procedures included the development of a range of alternatives for the CCP; analysis of the likely effects of each alternative; and public involvement throughout the planning process. The start of the scoping period was announced through a Federal Register notice, news releases to local newspapers, the Service's refuge planning website, and a planning update. The draft CCP/environmental assessment (EA) was released for a 30-day public comment period. The affected public was notified of the availability of the document through a Federal Register notice, news releases to local newspapers, the Service's refuge planning website, and a planning update. Copies of the draft CCP/EA and/or planning updates were distributed to an extensive mailing list. In addition, the Service participated in a variety of public outreach efforts throughout the planning process (see Appendix K).

The CCP is programmatic in many respects and specific details of certain projects and actions cannot be determined until a later date depending on funding and implementation schedules. Certain projects or actions may require additional NEPA compliance.

National Historic Preservation Act (1966), as Amended (16 U.S.C. § 470 et seq.)

The management of the archaeological and cultural resources of the refuge will comply with the regulations of Section 106 of the National Historic Preservation Act. Under the CCP, historic properties will be maintained and repaired as funding becomes available. Maintenance and improvement of historic resources will result in positive impacts to cultural resources; however, determining whether a particular action has the potential to affect cultural resources is an ongoing process that occurs as step-down and site-specific project plans are developed. Should additional historic properties be identified or acquired in the future, the Service will comply with the National Historic Preservation Act if any management actions have the potential to affect these properties.

Executive Order 12372. Intergovernmental Review

Coordination and consultation with affected Tribal, local, and state governments, other Federal agencies, and the landowners has been completed through personal contact by refuge staff or supervisors, and/or by inclusion of the appropriate entities on the CCP mailing list.

Executive Order 13175. Consultation and Coordination with Indian Tribal Governments

As required under the Secretary of the Interior Order 3206—American Indian Tribal Rights, Federal Tribal Trust Responsibilities, and the Endangered Species Act—the project leader notified and consulted interested Tribes.

Executive Order 12898. Federal Actions to Address Environmental Justice in Minority and Low-income Populations

All Federal actions must address and identify, as appropriate, disproportionally high and adverse human health or environmental effects of their programs, policies, and activities on minority populations, low-income populations, and Indian Tribes in the United States. Actions in the management direction were evaluated and no adverse human health or environmental effects were identified for minority or low-income populations, Indian Tribes, or anyone else.

Wilderness Preservation Act of 1964 (16 U.S.C. § 1131 et seq.)

The Service has evaluated the suitability of the refuge for wilderness designation through the "inventory" phase according to the guidelines of the Wilderness Review process as described in 610 FW 4. In this inventory, no areas on the refuge were found to meet the minimum wilderness criteria for size, naturalness, or outstanding opportunities for solitude and primitive/unconfined recreation (see Appendix D for additional details).

Architectural Barriers Act of 1968, as Amended (42 U.S.C. § 4151 et seq.)

The Architectural Barriers Act requires access to Federal facilities for people with disabilities. Access for persons with disabilities has been considered during the planning process, and actions related to access are found in Chapter 2 of the CCP.

National Wildlife Refuge SystemAdministration Act of 1966, as Amended (16 U.S.C. § 668dd-668ee)

This Act requires the Service to develop and implement a CCP for each refuge. The CCP identifies and describes refuge purposes; the vision and goals for the refuge; fish, wildlife, and plant populations and related habitats on the refuge; archaeological and cultural values of the refuge; issues that may affect populations and habitats of fish, wildlife, and plants; actions necessary to restore and improve biological diversity on the refuge; and opportunities for wildlife-dependent recreation, as required by the Act.

During the CCP development process, the refuge manager evaluated all existing and proposed uses at the Tualatin River National Wildlife Refuge. Priority wildlife-dependent uses (hunting, fishing, wildlife observation and photography, environmental education, and interpretation) are considered automatically appropriate under Service policy and are thus exempt from appropriate uses review.

Compatibility determinations have been prepared for all uses found appropriate (see Appendices A and B of the CCP).

Executive Order 13186. Responsibilities of Federal Agencies to Protect Migratory Birds

This Order directs agencies to take certain actions to further implement the Migratory Bird Treaty Act. A provision of the Order directs Federal agencies to consider the impacts of their activities, especially in reference to birds on the Service's list of Birds of Conservation Concern. It also directs agencies to incorporate conservation recommendations and objectives in the North American Waterbird Conservation Plan and bird conservation plans developed by Partners in Flight into agency planning as described in Chapter 1. The effects to refuge habitats used by migratory birds from habitat, public use, and cultural resources actions were assessed within the CCP.

Endangered Species Act (1973), as Amended (16 U.S.C. § 1531 et seq.)

This Act provides for the conservation of threatened and endangered species of fish, wildlife, and plants by Federal action and by encouraging the establishment of state programs. Documentation is required under Section 7 of the Act. Refuge policy requires the refuge manager to document issues that affect or may affect endangered species before initiating projects. Consultation on specific projects will be conducted prior to implementation to avoid any adverse impacts to these species and their habitats. See section 4-5 for discussion of federally listed species.

Executive Order 11990. Protection of Wetlands

The CCP is consistent with Executive Order 11990 because CCP implementation will protect any existing wetlands.

Executive Order 11988. Floodplain Management

Under this Order, Federal agencies "shall take action to reduce the risk of flood loss, to minimize the impact of floods on human safety, health and welfare, and to restore and preserve the natural and beneficial values served by floodplains." The CCP is consistent with Executive Order 11988 because CCP implementation will maintain and enhance riverine, riparian, wetland, and wet prairie habitats located within floodplains on the refuge, which will minimize flood impacts and continue to contribute to the natural and beneficial fish and wildlife resource values unique to the area.

Integrated Pest Management, 517 DM 1 and 7 RM 14

In accordance with 517 DM 1 and 7 RM 14, an integrated pest management (IPM) approach has been adopted to eradicate, control, or contain pest and invasive species on the refuge. In accordance with 517 DM 1, only pesticides registered with the U.S. Environmental Protection Agency (EPA) in full compliance with the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and as provided in regulations, orders, or permits issued by the EPA may be applied on lands and waters under refuge jurisdiction.

Appendix G. Integrated Pest Management Program

G.1 Background

Integrated pest management (IPM) is an interdisciplinary approach using methods to prevent, eliminate, contain, and/or control pest and invasive species (herein collectively referred to as pests) in concert with other management activities on refuge lands and waters to achieve wildlife and habitat management goals and objectives. IPM is a scientific adaptive management process where available scientific information and best professional judgment of the refuge staff and other resource experts will be used to identify and implement appropriate management strategies that can be modified and/or changed over time to ensure effective, site-specific management of pest species to achieve desired outcomes. In accordance with 43 Code of Federal Regulations (CFR) 46.145, adaptive management would be particularly relevant where long-term impacts may be uncertain, and future monitoring would be needed to make adjustments in subsequent implementation decisions. After a tolerable pest population (threshold) is determined considering achievement of refuge resource objectives and the ecology of pest species, one or more methods, or combinations thereof, will be selected that are feasible, efficacious, and most protective of nontarget resources, including native species (fish, wildlife, and plants) and U.S. Fish and Wildlife Service (Service) personnel, Service-authorized agents, volunteers, and the public. Staff time and available funding will be considered when determining feasibility/practicality of various treatments.

IPM techniques to address pests are presented as comprehensive conservation plan (CCP) strategies (see Chapter 2 of this CCP) in an adaptive management context to achieve resource objectives of the Tualatin River National Wildlife Refuge (the refuge). To satisfy requirements for IPM planning as identified in the Service director's memo (dated September 9, 2004) titled *Integrated Pest Management Plans and Pesticide Use Proposals: Updates, Guidance, and an Online Database*, the following elements of an IPM program have been incorporated into this CCP:

- Habitat and/or wildlife objectives that identify pest species and appropriate thresholds to indicate the need for and successful implementation of IPM techniques; and
- Monitoring before and/or after treatment to assess progress toward achieving objectives including pest thresholds.

Where pesticides would be necessary to address pests, this appendix provides a structured procedure to evaluate potential effects of proposed uses involving ground-based applications to refuge biological resources and environmental quality in accordance with effects analyses presented in Chapter 6 (Environmental Consequences) of the draft CCP/EA. Only pesticide uses that likely would cause minor, temporary, or localized effects to refuge biological resources and environmental quality with appropriate best management practices (BMPs), where necessary, will be allowed for use on the refuge.

This appendix does not describe the more detailed process of evaluating potential effects associated with aerial applications of pesticides. However, the basic framework to assess potential effects to refuge biological resources and environmental quality from aerial application of pesticides would be similar to the process described in this appendix for ground-based treatments of other pesticides.

G.2 Pest Management Laws and Policies

In accordance with Service policy 569 FW 1 (Integrated Pest Management), plant, invertebrate, and vertebrate pests on units of the National Wildlife Refuge System (Refuge System) can be controlled to ensure balanced wildlife and fish populations in support of refuge-specific wildlife and habitat management objectives. Pest control on Federal (refuge) lands and waters also is authorized under the following legal mandates:

- National Wildlife Refuge System Administration Act of 1966, as amended (16 U.S. Code [U.S.C.] 668dd-668ee);
- Plant Protection Act of 2000 (7 U.S.C. 7701 et seq.);
- Noxious Weed Control and Eradication Act of 2004 (7 U.S.C. 7781-7786, Subtitle E);
- Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) of 1996 (7 U.S.C. 136-136y);
- National Invasive Species Act of 1996 (16 U.S.C. 4701);
- Nonindigenous Aquatic Nuisance Prevention and Control Act of 1990 (16 U.S.C. 4701);
- Food Quality Protection Act of 1996 (7 U.S.C. 136);
- Executive Order 13148, Section 601(a);
- Executive Order 13112; and
- Animal Damage Control Act of 1931 (7 U.S.C. 426-426c, 46 Stat. 1468).

Pests are defined as "… living organisms that may interfere with the site-specific purposes, operations, or management objectives or that jeopardize human health or safety" according to Department Policy 517 DM 1 (Integrated Pest Management Policy), published by the U.S. Department of the Interior. Similarly, 569 FW 1 defines pests as "… invasive plants and introduced or native organisms, that may interfere with achieving our management goals and objectives on or off our lands, or that jeopardize human health or safety." 517 DM 1 also defines an invasive species as "a species that is non-native to the ecosystem under consideration and whose introduction causes or is likely to cause economic or environmental harm or harm to human health." Throughout the remainder of this CCP, the terms pest and invasive species are used interchangeably because both can prevent/impede achievement of refuge wildlife and habitat objectives and/or degrade environmental quality.

In general, control of pests on the refuge would conserve and protect the nation's fish, wildlife, and plant resources as well as maintain environmental quality. From 569 FW 1, animal or plant species that are considered pests may be managed if the following criteria are met:

- There is threat to human health and well being or private property, the acceptable level of damage by the pest has been exceeded, or state or local government has designated the pest as noxious;
- It is detrimental to resource objectives as specified in a refuge resource management plan (e.g., CCP, habitat management plan), if available; and
- Control would not conflict with attainment of resource objectives or the purposes for which the refuge was established.

The specific justifications for pest management activities on the refuge are the following:

- Protect human health and well being;
- Prevent substantial damage to important refuge resources;

- Protect newly introduced or reestablished native species;
- Control nonnative (exotic) species to support existence of populations of native species;
- Prevent damage to private property; and
- Provide the public with quality, compatible wildlife-dependent recreational opportunities.

In accordance with Service policy 620 FW 1 (Habitat Management Plans), there are additional management directives regarding invasive species found on the refuge:

- ~~–~~We are prohibited by Executive Order, law, and policy from authorizing, funding, or carrying out actions that are likely to cause or promote the introduction or spread of invasive species in the United States or elsewhere."
- ~~–~~Manage invasive species to improve or stabilize biotic communities to minimize unacceptable change to ecosystem structure and function and prevent new and expanded infestations of invasive species. Conduct refuge habitat management activities to prevent, control, or eradicate invasive species …."

Animal species damaging/destroying Federal property and/or detrimental to the management program of a refuge may be controlled as described in 50 CFR 31.14 (Official Animal Control Operations). For example, the incidental removal of beaver damaging refuge infrastructure (e.g., clogging with subsequent damaging of water control structures) and/or negatively affecting habitats (e.g., removing woody species from existing or restored riparian areas) managed on refuge lands may be conducted without a pest control proposal. We recognize beavers are a native species and most of their activities on refuge lands represent a natural process beneficial for maintaining wetland habitats. Exotic nutria, whose denning and burrowing activities in wetland dikes causes cave-ins and breaches, can also be controlled using the most effective techniques considering site-specific factors without a pest control proposal. Along with the loss of quality wetland habitats associated with breaching of impoundments, the safety of refuge staff, volunteers, contractors, and public driving on structurally compromised levees and dikes can be threatened by sudden and unexpected cave-ins. Disposed wildlife specimens may be donated or loaned to public institutions. Donation or loans of resident wildlife species would only be made after securing state approval (50 CFR 31.11 [Donation and Loan of Wildlife Specimens]). Surplus wildlife specimens may be sold alive or butchered, dressed, and processed subject to Federal and state laws and regulations (50 CFR 31.12 [Sale of Wildlife Specimens]).

Trespass and feral animals also may be controlled on refuge lands. Based upon 50 CFR 28.43 (Destruction of Dogs and Cats), dogs and cats running at large on a national wildlife refuge and observed in the act of killing, injuring, harassing, or molesting humans or wildlife may be disposed of in the interest of public safety and protection of wildlife. Feral animals should be disposed of by the most humane method available and in accordance with relevant Service directives.

G.3 Strategies

To fully embrace IPM as identified in 569 FW 1, the following strategies, where applicable, would be carefully considered on the refuge for each pest species:

- **Prevention.** This would be the most effective and least expensive long-term management option for pests. It encompasses methods to prevent new introductions or the spread of the established pests to uninfested areas. It requires identifying potential routes of invasion to

reduce the likelihood of infestation. Hazard Analysis and Critical Control Points (HACCP) planning can be used to determine if current management activities on a refuge may introduce and/or spread invasive species in order to identify appropriate BMPs for prevention. See http://www.haccp-nrm.org/ for more information about HACCP planning.

Prevention may include source reduction, using pathogen-free or weed-free seeds or fill, exclusion methods (e.g., barriers), and/or sanitation methods (e.g., wash stations) to prevent reintroductions by various mechanisms including vehicles and personnel. Because invasive species are frequently the first to establish newly disturbed sites, prevention would require a reporting mechanism for early detection of new pest occurrences with quick response to eliminate any new pest populations. Prevention would require consideration of the scale and scope of land management activities that may promote pest establishment within uninfested areas or promote reproduction and spread of existing populations. Along with preventing initial introduction, prevention would involve halting the spread of existing infestations to new sites (Mullin et al. 2000). The primary reason for prevention would be to keep pest-free lands or waters from becoming infested. Executive Order 11312 emphasizes the priority for prevention with respect to managing pests.

The following would be methods to prevent the introduction and/or spread of pests on refuge lands:

- Before beginning ground-disturbing activities (e.g., discing, scraping), inventory and prioritize pest infestations in project operating areas and along access routes. Refuge staff would identify pest species on-site or within reasonably expected potential invasion vicinity. Where possible, the refuge staff would begin project activities in uninfested areas before working in pest-infested areas.
- Refuge staff would locate and use pest-free project staging areas. They would avoid or minimize travel through pest-infested areas, or restrict travel to those periods when the spread of seed or propagules of invasive plants would be least likely.
- Refuge staff would determine the need for, and when appropriate identify, sanitation sites where equipment can be cleaned of pests. Where possible, refuge staff would clean equipment before entering lands at on-refuge approved cleaning site(s). This practice does not pertain to vehicles traveling frequently in and out of the project area that would remain on roadways. Refuge staff would remove mud, dirt, and plant parts from project equipment before moving it into a project area.
- Refuge staff would clean all equipment before leaving the project site, if operating in areas infested with pests. Refuge staff would determine the need for, and when appropriate identify, sanitation sites where equipment can be cleaned.
- Refuge staff, their authorized agents, and refuge volunteers would, where possible, inspect, remove, and properly dispose of seed and parts of invasive plants found on their clothing and equipment. Proper disposal means bagging the seeds and plant parts and then properly disposing of them.
- Refuge staff would evaluate options, including closure, to restrict traffic on sites with ongoing restoration of desired vegetation. Refuge staff would revegetate disturbed soil (except travelways on surfaced projects) to optimize native plant establishment for each specific site. Revegetation may include topsoil replacement, planting, seeding, fertilization, and weed-free mulching as necessary. The refuge staff would use native material where appropriate and feasible. They would also use certified

weed-free or weed-seed-free hay or straw where certified materials are reasonably available.
- Refuge staff would provide information, training, and appropriate pest identification materials to permit holders and recreational visitors. They would educate them about pest identification, biology, impacts, and effective prevention measures.
- Refuge staff would require grazing permittees to use preventative measures for their livestock while on refuge lands.
- Refuge staff would inspect borrow material for invasive plants prior to use and transport onto and/or within refuge lands.
- Refuge staff would consider invasive plants in planning for road maintenance activities.

The following methods would be used to prevent the introduction and/or spread of pests into refuge waters:

- Refuge staff would inspect boats, trailers, other boating equipment, and waders or boots. Where possible, refuge staff would remove any visible plants, animals, or mud before leaving any waters or boat launching facilities. Where possible, refuge staff would drain water from motor, live well, bilge, and transom wells while on land before leaving the site. If possible, the refuge staff would wash and dry boats, anchors, nets, floors of boats, propellers, axles, trailers, and other boating equipment to kill pests not visible at the boat launch. Waders and boots would be cleaned and disinfected as necessary.
- Where feasible, refuge staff would maintain a l00-foot buffer of aquatic pest-free clearance around boat launches and docks or quarantine areas when cleaning around culverts, canals, or irrigation sites. Where possible, refuge staff would inspect and clean equipment before moving to new sites or from one project area to another.

- **Mechanical/Physical Methods.** These methods would remove and destroy, disrupt the growth of, or interfere with the reproduction of pest species. For plants species, these treatments can be accomplished by hand, hand tools (manual), or power tools (mechanical) and include pulling, grubbing, digging, tilling/discing, cutting, swathing, grinding, shearing, girdling, mowing, and mulching of the pest plants.

  For animal species, Service employees or their authorized agents could use mechanical/physical methods (including trapping) to control pests as a refuge management activity. Based upon 50 CFR 31.2, trapping can be used on a refuge to reduce surplus wildlife populations for a ~~"b~~balanced conservation program" in accordance with Federal or state laws and regulations. In some cases, non-lethally trapped animals would be relocated to off-refuge sites with prior approval from the state.

  Each of these tools would be efficacious to some degree and applicable to specific situations. In general, mechanical controls can effectively control annual and biennial pest plants. However, to control perennial plants, the root system has to be destroyed or it would resprout and continue to grow and develop. Mechanical controls are typically not capable of destroying a perennial plant's root system. Although some mechanical tools (e.g., discing, plowing) may damage root systems, they may also stimulate regrowth producing a denser plant population that may aid in the spread depending upon the target species (e.g., Canada

thistle). In addition, steep terrain and soil conditions would be major factors that can limit the use of many mechanical control methods.

Some mechanical control methods (e.g., mowing), which would be used in combination with herbicides, can be very effective at controlling perennial species. For example, mowing perennial plants followed sequentially by treating the plant regrowth with a systemic herbicide often would improve the efficacy of the herbicide compared to herbicide treatment alone.

- **Cultural Methods.** These methods would involve manipulating habitat to increase pest mortality by reducing its suitability to the pest. Cultural methods would include water-level manipulation, mulching, planting winter cover crops, changing planting dates to minimize pest impact, prescribed burning (which facilitates revegetation, increases herbicide efficacy, and removes litter to assist in emergence of desirable species), flaming with propane torches, trap crops, crop rotations that include nonsusceptible crops, moisture management, addition of beneficial insect habitat, reducing clutter, proper trash disposal, planting or seeding desirable species to shade or outcompete invasive plants, applying fertilizer to enhance desirable vegetation, prescriptive grazing, and other habitat alterations.

- **Biological Control Agents.** Classical biological control would involve the deliberate introduction and management of natural enemies (parasites, predators, or pathogens) to reduce pest populations. Many of the most ecologically or economically damaging pest species in the United States originated in foreign countries. These newly introduced pests, which are free from natural enemies found in their country or region of origin, may have a competitive advantage over cultivated and native species. This competitive advantage often allows introduced species to flourish, and they may cause widespread economic damage to crops or outcompete and displace native vegetation. Once the introduced pest species population reaches a certain level, traditional methods of pest management may be cost-prohibitive or impractical. Biological controls typically are used when these pest populations have become so widespread that eradication or effective control would be difficult or no longer practical.

  Biological control has advantages as well as disadvantages. Benefits include reducing pesticide use, host specificity for target pests, long-term self-perpetuating control, low cost per acre, capacity for searching and locating hosts, synchronizing biological control agents to hosts' life cycles, and the unlikelihood that hosts would develop resistance to agents. Disadvantages include limited availability of agents from their native lands, the dependence of control on target species' density, the slow rate at which control occurs, biotype matching, the difficulty and expense of conflicts over control of the target pest, and host specificity when host populations are low.

  A reduction in target species populations from biological controls is typically a slow process, and efficacy can be highly variable. It may not work well in a particular area although it does work well in other areas. Biological control agents would require specific environmental conditions to survive over time. Some of these conditions are understood, whereas others are only partially understood or not understood at all.

  Biological control agents would not eradicate a target pest. When using biological control agents, residual levels of the target pest typically are expected; the agent's population level or

survival would be dependent upon the density of its host. After the pest population decreases, the population of the biological control agent would decrease correspondingly. This is a natural cycle. Some pest populations (e.g., invasive plants) tend to persist for several years after a biological control agent becomes established due to seed reserves in the soil, inefficiencies in the agent's search behavior, and the natural lag in population buildup of the agent.

The full range of pest groups potentially found on refuge lands and waters includes diseases, invertebrates (insects, mollusks), vertebrates, and invasive plants (the most common group). Often it is assumed that biological control would address many if not most of these pest problems. There are several well-documented success stories of biological control of invasive weed species in the Pacific Northwest including Mediterranean sage, St. John's wort (Klamath weed), and tansy ragwort. Emerging success stories include Dalmatian toadflax, diffuse knapweed, leafy spurge, purple loosestrife, and yellow star thistle. However, historically, each new introduction of a biological control agent in the United States has only about a 30 percent success rate (Coombs et al. 2004).

Introduced species without desirable close relatives in the United States would generally be selected as biological controls. Natural enemies that are restricted to one or a few closely related plants in their country of origin are targeted as biological controls (Center et al. 1997; Hasan and Ayres 1990).

Refuge staff would ensure introduced agents are approved by applicable authorities. Except for a small number of formulated biological control products registered by the U.S. Environmental Protection Agency (EPA) under FIFRA, most biological control agents are regulated by the U.S. Department of Agriculture (USDA)-Animal Plant Health Inspection Service, Plant Protection and Quarantine (APHIS-PPQ). State departments of agriculture and, in some cases, county agricultural commissioners or weed districts have additional approval authority.

Federal permits (USDA-APHIS-PPQ Form 526) are required to import biocontrol agents from another state. Form 526 may be obtained through the Internet at: http://www.aphis.usda.gov/ppq/permits/bioligical/weedbio.html.

The Service strongly supports the development and legal and responsible use of appropriate, safe, and effective biological control agents for nuisance and nonindigenous or pest species.

State and county agriculture departments may also be sources for biological control agents or they may have information about where biological control agents may be obtained. Commercial sources should have an Application and Permit to Move Live Plant Pests and Noxious Weeds to release specific biological control agents in a state and/or county. Furthermore, certification regarding the biological control agent's identity (genus, specific epithet, subspecies, and variety) and purity (e.g., parasite-free, pathogen-free, and biotic and abiotic contaminants) should be specified in purchase orders.

Biological control agents are subject to 7 Refuge Manual (RM) 8 (Exotic Species Introduction and Management). In addition, refuge staff would follow the International Code of Best Practice for Classical Biological Control of Weeds (http://invasives.wsu.edu/Code.htm) as ratified by delegates to the Tenth International

Symposium on Biological Control of Weeds in Bozeman, Montana, on July 9, 1999. This code states the following:

- Release only approved biological control agents,
- Use the most effective agents,
- Document releases, and
- Monitor for impact to the target pest, non-target species, and the environment.

Biological control agents formulated as pesticide products and registered by the EPA (e.g., *Bacillus thuringiensis* var. *israelensis [B.t.i.]*) are also subject to pesticide use proposal (PUP) review and approval (see below).

A record of all releases would be maintained with date(s), location(s), and environmental conditions of the release site(s); the identity, quantity, and condition of the biological control agents released; and other relevant data and comments such as weather conditions. Systematic monitoring to determine the establishment and effectiveness of the release is also recommended.

National Environmental Policy Act (NEPA) documents regarding biological and other environmental effects of biological control agents prepared by another Federal agency, where the scope is relevant to evaluation of releases on refuge lands, would be reviewed. Possible source agencies for such NEPA documents include the Bureau of Land Management, U.S. Forest Service (USFS), the National Park Service, the USDA-APHIS, and the military services. It might be appropriate to incorporate by reference parts or all of existing document(s) from the review. Incorporating by reference (43 CFR 46.135) is a technique used to avoid redundancies in analysis. It also can reduce the bulk of a Service NEPA document, which only must identify the documents that are incorporated by reference. In addition, relevant portions must be summarized in the Service NEPA document to the extent necessary to provide the decision maker and public with an understanding of the relevance of the referenced material to the current analysis.

- **Pesticides.** The selective use of pesticides would be based upon pest ecology (including mode of reproduction), the size and distribution of pest populations, site-specific conditions (e.g., soils, topography), known efficacy under similar site conditions, and the capability to use BMPs to reduce/eliminate potential effects to nontarget species and sensitive habitats, and prevent contamination of surface and groundwater. All pesticide use (pesticide, target species, application rate, and method of application) would comply with the applicable Federal (FIFRA) and state regulations pertaining to pesticide use, safety, storage, disposal, and reporting. Before pesticides can be used to eradicate, control, or contain pests on refuge lands and waters, PUPs would be prepared and approved in accordance with 569 FW 1. PUP records would provide a detailed, time-, site-, and target-specific description of the proposed use of pesticides on the refuge. All PUPs would be created, approved or disapproved, and stored in the Pesticide Use Proposal System (PUPS), which is a centralized database only accessible on the Service's intranet (https://systems.fws.gov/pups). Only Service employees would be authorized to access PUP records for a refuge in this database.

  Application equipment would be selected to provide site-specific delivery to target pests while minimizing/eliminating direct or indirect (e.g., drift) exposure to non-target areas and degradation of surface and groundwater quality. Where possible, target-specific equipment

(e.g., backpack sprayer, roller, wiper) would be used to treat target pests. Other target-specific equipment used to apply pesticides include soaked wicks or paint brushes for wiping vegetation and lances, hatchets, or syringes for direct injection into stems. Granular pesticides may be applied using seeders or other specialized dispensers. In contrast, aerial spraying (e.g., fixed-wing or helicopter) would only be used where access is difficult (due to remoteness) and/or the size and distribution of infestations precludes practical use of ground-based methods.

Because repeated use of one pesticide may allow resistant organisms to survive and reproduce, multiple pesticides with variable modes of action would be considered for treatments on refuge lands and waters. This is especially important if multiple applications within years and/or over a growing season likely would be necessary for habitat maintenance and restoration activities to achieve resource objectives. Integrated chemical and non-chemical controls also are highly effective, where practical, because pesticide-resistant organisms can be removed from the site.

Cost may not be the primary factor in selecting a pesticide for use on a refuge. If the least expensive pesticide would potentially harm natural resources or people, then a different product would be selected, if available. The most efficacious pesticide available with the least potential to degrade environmental quality (soils, surface water, and groundwater) as well as the least potential effect to native species and communities of fish, wildlife, plants, and their habitats would be acceptable for use on refuge lands in the context of an IPM approach.

- **Habitat Restoration/Maintenance.** Restoration and/or proper maintenance of refuge habitats associated with achieving wildlife and habitat objectives would be essential for long-term prevention, eradication, or control (at or below threshold levels) of pests. Promoting desirable plant communities through the manipulation of species composition, plant density, and growth rate is an essential component of invasive plant management (Brooks et al. 2004; Masters et al. 1996; Masters and Sheley 2001). The following three components of succession could be manipulated through habitat maintenance and restoration: site availability, species availability, and species performance (Cox and Anderson 2004). Although a single method (e.g., herbicide treatment) may eliminate or suppress pest species in the short term, the resulting gaps and bare soil create niches that are conducive to further invasion by the species and/or other invasive plants. On degraded sites where desirable species are absent or in low abundance, revegetation with native/desirable grasses, forbs, and legumes may be necessary to direct and accelerate plant community recovery, and achieve site-specific objectives in a reasonable time frame. The selection of appropriate species for revegetation would be dependent on a number of factors including resource objectives and site-specific, abiotic factors (e.g., soil texture, precipitation/temperature regimes, and shade conditions). Seed availability and cost, ease of establishment, seed production, and competitive ability also would be important considerations.

G.4 Priorities for Treatments

For many refuges, the magnitude (number, distribution, and sizes of infestations) of pest problems is too extensive and beyond the available capital resources to effectively address during any single field season. To manage pests on a refuge, it is essential to prioritize treatment of infestations. Highest

priority treatments are focused on early detection and rapid response to eliminate infestations of new pests, if possible. This is especially important for aggressive pests potentially impacting species, species groups, communities, and/or habitats associated with the refuge purpose(s), Refuge System resources of concern (federally listed species, migratory birds, and interjurisdictional fish), and native species important for maintaining/restoring biological integrity, diversity, and environmental health.

The next priority would be treating established pests that appear in one or more previously uninfested areas. Moody and Mack (1988) demonstrated through modeling that small, new outbreaks of invasive plants eventually would infest an area larger than the established source population. They also found that control efforts focusing on the large, main infestation rather than the new, small satellites reduced the chances of overall success.

The lowest priority would be treating large infestations (sometimes monotypic stands) of well-established pests. In this case, initial efforts would focus upon containment of the perimeter followed by work to control/eradicate the established infested area. If containment and/or control of a large infestation is not effective, then efforts would focus upon halting pest reproduction or managing source populations. Maxwell et al. (2009) found that treating fewer populations that are sources represents an effective long-term strategy to reduce total number of invasive populations and decreasing population growth rates.

Although state-listed noxious weeds would always be of high priority for management, other pest species known to cause substantial ecological impact would also be considered. For example, reed canarygrass may not be listed by a state as noxious, but it can greatly alter wetland plant composition by forming monotypic stands. Pest control would likely require a multiyear commitment from refuge staff. Essential to the long-term success of pest management would be pretreatment and posttreatment monitoring, assessment of the successes and failures of treatments, and development of new approaches when proposed methods do not achieve desired outcomes.

G.5 Best Management Practices

BMPs can minimize or eliminate possible effects associated with pesticide usage to non-target species and/or sensitive habitats as well as degradation of water quality from drift, surface runoff, or leaching. Based upon the Department of Interior Pesticide Use Policy (517 DM 1) and the Service Pest Management Policy and Responsibilities (30 AM 12), the use of applicable BMPs also would likely ensure that pesticide uses do not adversely affect federally listed species and/or their critical habitats through determinations made using the process described in 50 CFR 402.

The following are BMPs pertaining to mixing/handling and applying pesticides for all ground-based treatments of pesticides, which would be considered and used, where feasible, based upon target- and site-specific factors and time-specific environmental conditions.

G.5.1 Pesticide Handling and Mixing

- As a precaution against spilling, spray tanks would not be left unattended during filling.
- All pesticide containers would be triple-rinsed and the rinsate would be used as water in the sprayer tank and applied to treatment areas.
- All pesticide spray equipment would be properly cleaned. Where possible, rinsate would be used as part of the make-up water in the sprayer tank and applied to treatment areas.

- The refuge staff would triple-rinse and recycle (where feasible) pesticide containers.
- All unused pesticides would be properly discarded at a local "safe send" collection.
- Pesticides and pesticide containers would be lawfully stored, handled, and disposed of in accordance with the label and in a manner safeguarding human health and fish and wildlife, and preventing soil and water contamination.
- Refuge staff would consider the water quality parameters (e.g., pH, hardness) that are important to ensure greatest efficacy where specified on the pesticide label.
- All pesticide spills would be addressed immediately using procedures identified in the refuge spill response plan.

G.5.2 Applying Pesticides

- Pesticide treatments would only be conducted by or under the supervision of Service personnel and non-Service applicators with the appropriate state certification to safely and effectively conduct these activities on refuge lands and waters.
- Refuge staff would comply with all Federal, state, and local pesticide use laws and regulations as well as Departmental, Service, and Refuge System pesticide-related policies.
- Before each treatment season and prior to mixing or applying any product for the first time each season, all applicators would review the labels, material safety data sheets (MSDS), and PUPs for each pesticide, determining the target pest, appropriate mix rate(s), required personal protective equipment (PPE), and other requirements listed on the pesticide label.
- Low-impact herbicide application techniques (e.g., spot treatment, cut stump, oil basal, Thinvert system applications) would be used rather than broadcast foliar applications (e.g., boom sprayer, other larger tank, wand applications), where practical.
- Low-volume rather than high-volume foliar applications would be used where low-impact methods described above are not feasible or practical, to maximize herbicide effectiveness and ensure correct and uniform application rates.
- Applicators would use and adjust spray equipment to apply the coarsest droplet size spectrum with optimal coverage of the target species while reducing drift.
- Applicators would use the largest droplet size that results in uniform coverage.
- Applicators would use drift reduction technologies such as low-drift nozzles, where possible.
- Where possible, spraying would occur during low (average <7 miles per hour [mph] and preferably 3 to 5 mph) and consistent direction wind conditions with moderate temperatures (typically <80°F).
- Where possible, applicators would avoid spraying during inversion conditions (often associated with calm and very low wind conditions), which can cause large-scale herbicide drift to nontarget areas.
- Equipment would be calibrated regularly to ensure that the proper rate of pesticide is applied to the target area or species.
- Spray applications would be made at the lowest height for uniform coverage of target pests to minimize/eliminate potential drift.
- If windy conditions frequently occur during afternoons, spraying (especially boom treatments) would typically be conducted during early morning hours.
- Spray applications would not be conducted on days with >30 percent forecast for rain within 6 hours, except for pesticides that are rapidly rain fast (e.g., glyphosate in 1 hour) to minimize/eliminate potential runoff.

- Where possible, applicators would use drift retardant adjuvants during spray applications, especially adjacent to sensitive areas.
- Where possible, applicators would use a non-toxic dye to aid in identifying target area treated as well as potential overspray or drift. A dye can also aid in detecting equipment leaks. If a leak is discovered, the application would be stopped until repairs can be made to the sprayer.
- For pesticide uses associated with cropland and facilities management, buffers, as appropriate, would be used to protect sensitive habitats, especially wetlands and other aquatic habitats.
- When drift cannot be sufficiently reduced through altering equipment setup and application techniques, buffer zones may be identified to protect sensitive areas downwind of applications. Refuge staff would only apply pesticide adjacent to sensitive areas when the wind is blowing in the opposite direction.
- Refuge staff would consider timing of application so native plants are protected (e.g., senescence) while effectively treating invasive plants.
- Rinsate from cleaning spray equipment after application would be recaptured and reused or applied to an appropriate pest plant infestation.
- Application equipment (e.g., sprayer, all-terrain vehicle [ATV], tractor) would be thoroughly cleaned and PPE would be removed/disposed of on-site by applicators after treatments to eliminate the potential spread of pests to uninfested areas.

G.6. Safety

G.6.1 Personal Protective Equipment

All applicators would wear the specific PPE identified on the pesticide label. The appropriate PPE would be worn at all times during handling, mixing, and application. PPE can include the following: disposable (e.g., Tyvek) or laundered coveralls; gloves (latex, rubber, or nitrile); rubber boots; and/or a National Institute for Occupational Safety and Health (NIOSH)-approved respirator. Because exposure to concentrated product is usually greatest during mixing, extra care should be taken while preparing pesticide solutions. Persons mixing these solutions can be best protected if they wear long gloves, an apron, footwear, and a face shield.

Coveralls and other protective clothing used during an application would be laundered separately from other laundry items. Transporting, storing, handling, mixing, and disposing of pesticide containers would be consistent with label requirements, EPA and Occupational Safety and Health Administration (OSHA) requirements, and Service policy.

If a respirator is necessary for a pesticide use, then the following requirements would be met in accordance with Service safety policy: a written Respirator Program, fit testing, physical examination (including pulmonary function and blood work for contaminants), and proper storage of the respirator.

G.6.2 Notification

The restricted entry interval (REI) is the time period required after application after which someone may safely enter a treated area without PPE. Refuge staff, authorized management agents of the Service, volunteers, and members of the public who could be in or near a pesticide-treated area within the stated re-entry time period on the label would be notified about treatment areas. Posting

would occur at any site where individuals might inadvertently become exposed to a pesticide during other activities on the refuge. Where required by the label and/or state-specific regulations, signs would also be posted on the perimeter of treatment areas and at other likely locations of entry. Refuge staff would also notify appropriate private property owners of an intended application, including any private individuals who have requested notification. Special efforts would be made to contact nearby individuals who are beekeepers or who have expressed chemical sensitivities.

G.6.3 Medical Surveillance

Medical surveillance may be required for Service personnel and approved volunteers who mix, apply, and/or monitor use of pesticides (see 242 FW 7 [Pesticide Users] and 242 FW 4 [Medical Surveillance]). In accordance with 242 FW 7.12A, Service personnel would be medically monitored if one or more of the following criteria is met: exposed or may be exposed to concentrations at or above the published permissible exposure limits or threshold limit values (see 242 FW 4); pesticide use is considered ~~f~~frequent pesticide use"; or pesticide use requires a respirator (see 242 FW 14 for respirator use requirements). According to 242 FW 7.7A, ~~f~~frequent pesticide use means when a person applying pesticide handles, mixes, or applies pesticides, with a Health Hazard rating of 3 or higher, for 8 or more hours in any week or 16 or more hours in any 30-day period." Under some circumstances, individuals who use pesticides infrequently, experience an acute exposure (sudden, short term), or use pesticides with a health hazard ranking of 1 or 2 may also be medically monitored. This decision would consider the individual's health and fitness level, the pesticide's specific health risks, and the potential risks from other pesticide-related activities. Refuge cooperators (e.g., cooperative farmers) and other authorized agents (e.g., state and county employees) would be responsible for their own medical monitoring needs and costs.

Standard examinations (at refuge expense) of appropriate refuge staff would be provided by the nearest certified occupational health and safety physician as determined by Federal Occupational Health.

G.6.4 Certification and Supervision of Pesticide Applicators

Appropriate refuge staff or approved volunteers handling, mixing, and/or applying, or directly supervising others engaged in pesticide use activities, would be trained and state or federally licensed to apply pesticides to refuge lands or waters. In accordance with 242 FW 7.18A and 569 FW 1.10B, certification is required to apply restricted use pesticides based upon EPA regulations. For safety reasons, all individuals participating in pest management activities with general use pesticides also are encouraged to attend appropriate training or acquire pesticide applicator certification. New staff unfamiliar with proper procedures for storing, mixing, handling, applying, and disposing of pesticides and containers would receive orientation and training before handling or using any products. Documentation of training would be kept in the files at the refuge office.

G.6.5 Record Keeping

G.6.5.1 Labels and Material Safety Data Sheets

Pesticide labels and MSDSs would be maintained at the refuge shop. A written reference (e.g., note pad, chalk board, dry erase board) for each tank to be mixed would be kept in the mixing area for quick reference while mixing is in progress. In addition, approved PUPs stored in the PUPS database typically contain website links to pesticide labels and MSDSs.

G.6.5.2 Pesticide Use Proposals

A PUP would be prepared for each proposed pesticide use associated with annual pest management on refuge lands and waters. A PUP would include specific information about the proposed pesticide use including the common and chemical names of the pesticide(s), target pest species, size and location of treatment site(s), application rate(s) and method(s), and federally listed species determinations, where applicable.

In accordance with Service guidelines (Service Director's memo [December 12, 2007]), refuge staff may receive up to 5-year approvals for Service Washington Office and field-reviewed proposed pesticide uses based upon meeting identified criteria including an approved IPM plan, where necessary (see http://www.fws.gov/contaminants/Issues/IPM.cfm). For a refuge, an IPM plan (requirements described herein) can be completed independently or in association with a CCP or a habitat management plant (HMP) if IPM strategies and potential environmental effects are adequately addressed within appropriate NEPA documentation.

G.6.5.3 Pesticide Use

In accordance with 569 FW 1, the refuge project leader would be required to maintain records of all pesticides annually applied on lands or waters under refuge jurisdiction. This would encompass pesticides applied by other Federal agencies, state and county governments, and nongovernment applicators including cooperators and their pest management service providers with Service permission. For clarification, pesticide means all insecticides, insect and plant growth regulators, desiccants, herbicides, fungicides, rodenticides, acaricides, nematicides, fumigants, avicides, and piscicides.

The following usage information can be reported for approved PUPs in the PUPS database:

- Pesticide trade name(s)
- Active ingredient(s)
- Total acres treated
- Total amount of pesticides used (lbs or gallons)
- Total amount of active ingredient(s) used (lbs)
- Target pest(s)
- Efficacy (% control)

To determine whether treatments are efficacious (eradicating, controlling, or containing the target pest) and achieving resource objectives, habitat and/or wildlife response would be monitored both pretreatment and posttreatment, where possible. Considering available annual funding and staffing, appropriate monitoring data regarding characteristics (attributes) of pest infestations (e.g., area, perimeter, degree of infestation density, percent cover, density) as well as habitat and/or wildlife response to treatments may be collected and stored in a relational database (e.g., Refuge Habitat Management Database), preferably a georeferenced data management system (e.g., Refuge Lands Geographic Information System [GIS]) to facilitate data analyses and subsequent reporting. In accordance with adaptive management, data analysis and interpretation would allow treatments to be modified or changed over time, as necessary, to achieve resource objectives considering site-specific conditions in conjunction with habitat and/or wildlife responses. Monitoring could also identify short- and long-term impacts to natural resources and environmental quality associated with IPM treatments in accordance with adaptive management principles identified in 43 CFR 46.145.

G.7 Evaluating Pesticide Use Proposals

Pesticides would only be used on refuge lands for habitat management and croplands/facilities maintenance after approval of a PUP. In general, proposed pesticide uses on refuge lands would only be approved where there would likely be minor, temporary, or localized effects to fish and wildlife species as well as minimal potential to degrade environmental quality. Potential effects to listed and nonlisted species would be evaluated with quantitative ecological risk assessments and other screening measures. Potential effects to environmental quality would be based upon pesticide characteristics of environmental fate (water solubility, soil mobility, soil persistence, and volatilization) and other quantitative screening tools. Ecological risk assessments and characteristics of environmental fate and potential of pesticides to degrade environmental quality would be documented in chemical profiles (see Section G.7.6). These profiles would include threshold values for quantitative measures of ecological risk assessments and screening tools for environmental fate that represent minimal potential effects to species and environmental quality. In general, only pesticide uses with appropriate BMPs (see Section G.5) for habitat management and cropland/facilities maintenance on refuge lands that would potentially have minor, temporary, or localized effects on refuge biological and environmental quality (threshold values not exceeded) would be approved.

G.7.1 Overview of Ecological Risk Assessment

An ecological risk assessment process would be used to evaluate potential adverse effects to biological resources as a result of a pesticide proposed for use on refuge lands. It is an established quantitative and qualitative methodology for comparing and prioritizing risks of pesticides and conveying an estimate of the potential risk for an adverse effect. This quantitative methodology provides an efficient mechanism to integrate best available scientific information regarding hazards, patterns of use (exposure), and dose-response relationships in a manner that is useful for ecological risk decision making. It would provide an effective way to evaluate potential effects where there is missing or unavailable scientific information (data gaps) to address reasonable, foreseeable adverse effects in the field as required under 40 CFR 1502.22. Protocols for ecological risk assessment of pesticide uses on the refuge were developed through research and established by the EPA (2004).

The toxicological data used in ecological risk assessments are typically results of standardized laboratory studies provided by pesticide registrants to the EPA to meet regulatory requirements under FIFRA. These studies assess the acute (lethality) and chronic (reproductive) effects associated with short- and long-term exposure to pesticides on representative species of birds, mammals, freshwater fish, aquatic invertebrates, and terrestrial and aquatic plants. Other effects data publicly available would also be used for risk assessment protocols described herein. Toxicity endpoint and environmental fate data are available from a variety of resources. Some of the more useful resources can be found in Section G.7.6.

G.7.2 Determining Ecological Risk to Fish and Wildlife

The potential for pesticides used on the refuge to cause direct adverse effects to fish and wildlife would be evaluated using the EPA's ecological risk assessment process (EPA 2004). This deterministic approach, which is based upon a two-phase process involving estimation of environmental concentrations and then characterization of risk, would be used for ecological risk assessments. This method integrates exposure estimates (estimated environmental concentration

[EEC] and toxicological endpoints [e.g., LC_{50} and oral LD_{50}]) to evaluate the potential for adverse effects to species groups (birds, mammals, and fish) representative of legal mandates relevant for managing units of the Refuge System. This integration is achieved through risk quotients (RQs) calculated by dividing the EEC by acute and chronic toxicity values selected from standardized toxicological endpoints or published effects (Table G-1).

$$RQ = EEC/Toxicological\ Endpoint$$

Table G-1. Ecotoxicity Tests Used to Evaluate Potential Effects to Birds, Fish, and Mammals to Establish Toxicity Endpoints for Risk Quotient Calculations

Species Group	Exposure	Measurement Endpoint
Bird	Acute	Median Lethal Concentration (LC_{50})
	Chronic	No Observed Effect Concentration (NOEC) or No Observed Adverse Effect Concentration (NOAEC)[1]
Fish	Acute	LC_{50}
	Chronic	NOEC or NOAEC[2]
Mammal	Acute	Oral Lethal Dose (LD_{50})
	Chronic	NOEC or NOAEC[3]

[1]Measurement endpoints typically include a variety of reproductive parameters (e.g., number of eggs, number of offspring, eggshell thickness, and number of cracked eggs).

[2]Measurement endpoints for early life stage/life cycle typically include embryo hatch rates, time to hatch, growth, and time to swim-up.

[3]Measurement endpoints include maternal toxicity, teratogenic effects or developmental anomalies, evidence of mutagenicity or genotoxicity, and interference with cellular mechanisms such as DNA synthesis and DNA repair.

The level of risk associated with direct effects of pesticide use would be characterized by comparing calculated RQs to the appropriate Level of Concern (LOC) established by the EPA (1998b) (Table G-2). The LOC represents a quantitative threshold value for screening potential adverse effects to fish and wildlife resources associated with pesticide use. The following are four exposure-species group scenarios that would be used to characterize ecological risk to fish and wildlife on the refuge: acute-listed species, acute-nonlisted species, chronic-listed species, and chronic-nonlisted species.

Table G-2. Presumption of Unacceptable Risk for Birds, Fish, and Mammals (EPA 1998b)

Risk Presumption		Level of Concern	
		Listed Species	Nonlisted Species
Acute	Birds	0.1	0.5
	Fish	0.5	0.5
	Mammals	0.1	0.5
Chronic	Birds	1.0	1.0

Table G-2. Presumption of Unacceptable Risk for Birds, Fish, and Mammals (EPA 1998b)

Risk Presumption		Level of Concern	
		Listed Species	Nonlisted Species
	Fish	1.0	1.0
	Mammals	1.0	1.0

Acute risk would indicate the potential for mortality associated with short-term dietary exposure to pesticides immediately after an application. For characterization of acute risks, median values from LC_{50} and LD_{50} tests would be used as toxicological endpoints for RQ calculations. In contrast, chronic risks would indicate the potential for adverse effects associated with long-term dietary exposure to pesticides from a single application or multiple applications over time (within a season and over years). For characterization of chronic risks, the no observed adverse effect concentration (NOAEC) or no observed effect concentration (NOEC) for reproduction would be used as toxicological endpoints for RQ calculations. Where available, the NOAEC would be preferred over a NOEC value.

Listed species are those federally designated as threatened, endangered, or proposed in accordance with the Endangered Species Act of 1973. For listed species, potential adverse effects would be assessed at the individual level because loss of individuals from a population could detrimentally impact a species. In contrast, risks to nonlisted species would consider effects at the population level. A RQ<LOC would indicate the proposed pesticide use "may affect, not likely to adversely affect" individuals (listed species) and it would not pose an unacceptable risk for adverse effects to populations (nonlisted species) for each taxonomic group (Table G-2). In contrast, an RQ>LOC would indicate a "may affect, likely to adversely affect" for listed species, and it would also pose unacceptable ecological risk for adverse effects to nonlisted species.

G.7.2.1 Environmental Exposure

Following release into the environment through application, pesticides would experience several different routes of environmental fate. Pesticides that would be sprayed can move through the air (e.g., particle or vapor drift) and may eventually end up in other parts of the environment such as nontarget vegetation, soil, or water. Pesticides applied directly to the soil may be washed off the soil into nearby bodies of surface water (e.g., surface runoff) or may percolate through the soil to lower soil layers and groundwater (Baker and Miller 1999; Butler et al. 1998; Extension Toxicology Network [EXTOXNET] 1993; Pope et al. 1999; Ramsay et al. 1995). Pesticides that would be injected into the soil may also be subject to the latter two fates. The aforementioned possibilities are by no means complete, but do indicate that movement of pesticides in the environment is very complex, with transfers occurring continually among different environmental compartments. In some cases, these exchanges occur not only between areas that are close together, but may also involve transportation of pesticides over long distances (Barry 2004; Woods 2004).

G.7.2.1.1 Terrestrial Exposure

The ECC for exposure to terrestrial wildlife would be quantified using an EPA screening-level approach (EPA 2004). This screening-level approach is not affected by product formulation because

it evaluates pesticide active ingredient (a.i.). This approach would vary depending upon the proposed pesticide application method: spray or granular.

G.7.2.1.1.1 Terrestrial—spray application

For spray applications, exposure would be determined using the Kanaga nomogram method (EPA 2004, 2005a; Pfleeger et al. 1996) through the EPA's Terrestrial Residue Exposure model (T-REX) version 1.2.3 (EPA 2005b). To estimate the maximum (initial) pesticide residue on short grass (<20 centimeter [cm] tall) as a general food item category for terrestrial vertebrate species, T-REX input variables would include the following from the pesticide label: maximum pesticide application rate (pounds a.i. [acid equivalent]/acre) and pesticide half-life (days) in soil. Although there are other food item categories (tall grasses; broadleaf plants and small insects; and fruits, pods, seeds and large insects), short grass was selected because it would yield maximum EECs (240 parts per million [ppm] per lb a.i./acre) for worst-case risk assessments. Short grass is not representative of forage for carnivorous species (e.g., raptors), but it would characterize the maximum potential exposure through the diet of avian and mammalian prey items. Consequently, this approach would provide a conservative screening tool for pesticides that do not biomagnify.

For RQ calculations in T-REX, the model would require the weight of surrogate species and Mineau scaling factors (Mineau et al. 1996). Body weights of bobwhite quail and mallard are included in T-REX by default, but body weights of other organisms (Table G-3) would be entered manually. The Mineau scaling factor accounts for small-bodied bird species that may be more sensitive to pesticide exposure than would be predicted only by body weight. Mineau scaling factors would be entered manually with values ranging from 1 to 1.55 that are unique to a particular pesticide or group of pesticides. If specific information to select a scaling factor is not available, then a value of 1.15 would be used as a default. Alternatively, zero would be entered if it is known that body weight does not influence toxicity of pesticide(s) being assessed. The upper bound estimate output from the T-REX Kanaga nomogram would be used as an EEC for calculation of RQs. This approach would yield a conservative estimate of ecological risk.

Table G-3. Average Body Weight of Selected Terrestrial Wildlife Species Frequently used in Research to Establish Toxicological Endpoints (Dunning 1984)

Species	Body Weight (kilogram [kg])
Mammal (15 g)	0.015
House sparrow	0.0277
Mammal (35 g)	0.035
Starling	0.0823
Red-winged blackbird	0.0526
Rock dove (aka pigeon)	0.542
Mammal (1,000 g)	1.000
Mallard	1.082
Ring-necked pheasant	1.135

G.7.2.1.1.2 Terrestrial—granular application

Granular pesticide formulations and pesticide-treated seed would pose a unique route of exposure for avian and mammalian species. The pesticide is applied in discrete units, which birds or mammals might ingest accidentally with food items or intentionally as in the case of some bird species that actively seek and pick up gravel or grit to aid digestion or seed as a food source. Granules may also be consumed by wildlife foraging on earthworms, slugs, or other soft-bodied soil organisms to which the granules may adhere.

Terrestrial wildlife RQs for granular formulations or seed treatments would be calculated by dividing the maximum milligrams of a.i. exposed (e.g., EEC) on the surface of an area equal to 1 square foot by the appropriate LD_{50} value multiplied by the surrogate's body weight (Table G-3). An adjustment to surface area calculations would be made for broadcast, banded, and in-furrow applications. An adjustment also would be made for applications with and without incorporation of the granules. Without incorporation, it would be assumed that 100 percent of the granules remain on the soil surface available to foraging birds and mammals. Press wheels push granules flat with the soil surface, but the granules are not incorporated into the soil. If granules are incorporated in the soil during band or T-band applications or after broadcast applications, it would be assumed only 15 percent of the applied granules remain available to wildlife. It would be assumed that only 1 percent of the granules are available on the soil surface following in-furrow applications.

EECs for pesticides applied in granular form and as seed treatments would be determined considering potential ingestion rates of avian or mammalian species (e.g., 10-30% body weight/day). This would provide an estimate of maximum exposure that may occur as a result of granule or seed treatment spills such as those that commonly occur at end rows during application and planting. The availability of granules and seed treatments to terrestrial vertebrates would also be considered by calculating the loading per unit area (LD_{50}/feet^2) for comparison to the EPA LOC (EPA 1998b). The T-REX version 1.2.3 (EPA 2005b) contains a submodel that automates Kanaga exposure calculations for granular pesticides and treated seed.

The following formulas would be used to calculate EECs depending upon the type of granular pesticide application:

- In-furrow applications assume a typical value of 1 percent granules, bait, or seed remain unincorporated.

$$mg\ a.i./feet^2 = [(lbs.\ product/acre)(\%\ a.i.)(453{,}580\ mg/lbs)(1\%\ exposed))] / \{[(43{,}560\ feet^2/acre)/(row\ spacing\ (feet))] / (row\ spacing\ (feet)\}$$

or

$$mg\ a.i./feet^2 = [(lbs\ product/1{,}000\ foot\ row)(\%\ a.i.)(1{,}000\ foot\ row)(453{,}580\ mg/lb.)(1\%\ exposed)$$

$$EEC = [(mg\ a.i./feet^2)(\%\ of\ pesticide\ biologically\ available)]$$

- Incorporated banded treatments assume that 15 percent of granules, bait, and seeds are unincorporated.

$$mg\ a.i./feet^2 = [(lbs.\ product/1{,}000\ row\ feet)(\%\ a.i.)(453{,}580\ mg/lb.)(1 - \%\ incorporated)]/(1{,}000\ feet)(band\ width\ (feet))$$

$$EEC = [(mg\ a.i./feet^2)(\%\ of\ pesticide\ biologically\ available)]$$

- Broadcast treatment without incorporation assumes 100 percent of granules, bait, and seeds are unincorporated.

$$mg\ a.i./feet^2 = [(lbs.\ product/acre)(\%\ a.i.)(453{,}590\ mg/lb.)]/(43{,}560\ feet^2/acre)$$

$$EEC = [(mg\ a.i./feet^2)(\%\ of\ pesticide\ biologically\ available)]$$

Where:

- % of pesticide biologically available = 100 percent without species-specific ingestion rates
- Conversion for calculating mg a.i./feet^2 using ounces: 453,580 mg/lb./16 = 28,349 mg/oz.

The following equation would be used to calculate an RQ based on the EEC calculated by one of the above equations. The EEC would be divided by the surrogate LD_{50} toxicological endpoint multiplied by the body weight (Table G-3) of the surrogate.

$$RQ = EEC / [LD50\ (mg/kg) * body\ weight\ (kg)]$$

As with other risk assessments, an RQ>LOC would be a presumption of unacceptable ecological risk. An RQ<LOC would be a presumption of acceptable risk with only minor, temporary, or localized effects to species.

G.7.2.1.2 Aquatic Exposure

Exposures to aquatic habitats (e.g., wetlands, meadows, ephemeral pools, water delivery ditches) would be evaluated separately for ground-based pesticide treatments of habitats managed for fish and wildlife compared with cropland/facilities maintenance. The primary exposure pathway for aquatic organisms from any ground-based treatments likely would be particle drift during the pesticide application. However, different exposure scenarios would be necessary as a result of contrasting application equipment and techniques as well as pesticides used to control pests on agricultural lands (especially those cultivated by cooperative farmers for economic return from crop yields) and facilities maintenance (e.g., roadsides, parking lots, trails) compared with other managed habitats on the refuge. In addition, pesticide applications may be done <25 feet of the high water mark of aquatic habitats for habitat management treatments, whereas no-spray buffers (≥25 feet) would be used for croplands/facilities maintenance treatments.

G.7.2.1.2.1 Habitat treatments

For the worst-case exposure scenario to non-target aquatic habitats, EECs (Table G-4) would be derived from Urban and Cook (1986), which assumes an intentional overspray to an entire, non-target water body (1 foot depth) from a treatment <25 feet from the high water mark using the maximum application rate (acid basis). However, use of BMPs for applying pesticides (see Section

G.5.2) would likely minimize/eliminate potential drift to non-target aquatic habitats during actual treatments. If there would be unacceptable (acute or chronic) risk to fish and wildlife with the simulated 100 percent overspray (RQ>LOC), then the proposed pesticide use may be disapproved or the PUP may be approved at a lower application rate to minimize/eliminate unacceptable risk to aquatic organisms (RQ = LOC).

Table G-4. Estimated Environmental Concentrations of Pesticides in Aquatic Habitats (1 foot depth) Immediately after Direct Application (Urban and Cook 1986)

Lbs/acre	EEC (parts per billion (ppb)
0.10	36.7
0.20	73.5
0.25	91.9
0.30	110.2
0.40	147.0
0.50	183.7
0.75	275.6
1.00	367.5
1.25	459.7
1.50	551.6
1.75	643.5
2.00	735.7
2.25	827.6
2.50	919.4
3.00	1,103.5
4.00	1,471.4
5.00	1,839
6.00	2,207
7.00	2,575
8.00	2,943
9.00	3,311
10.00	3,678

G.7.2.1.2.2 Cropland/facilities maintenance treatments

Field drift studies conducted by the Spray Drift Task Force (SDTF), which is a joint project of several agricultural chemical businesses, were used to develop a generic spray drift database. From this database, the AgDRIFT computer model was created to satisfy EPA pesticide registration spray drift data requirements and as a scientific basis to evaluate off-target movement of pesticides from particle drift and assess potential effects of exposure to wildlife. The SDTF AgDRIFT model version 2.01 (AgDRIFT 2001; SDTF 2003) would be used to derive EECs resulting from drift of pesticides to refuge aquatic resources from ground-based pesticide applications >25 feet from the high water mark. The SDTF AgDRIFT model is publicly available at http://www.agdrift.com. At this website, click "AgDRIFT 2.0," followed by "Download Now," and follow the instructions to obtain the computer model.

The AgDRIFT model is composed of submodels called tiers. Tier I Ground submodel would be used to assess ground-based applications of pesticides. Tier outputs (EECs) would be calculated with AgDRIFT using the following input variables: maximum application rate (acid basis), low boom (20 inches), fine to medium droplet size, EPA-defined wetland, and a ≥25-foot distance (buffer) from treated area to water.

G.7.2.2 Use of Information on Effects of Biological Control Agents, Pesticides, Degradates, and Adjuvants

NEPA documents regarding biological and other environmental effects of biological control agents, pesticides, degradates, and adjuvants prepared by another Federal agency, where the scope would be relevant to evaluation of effects from pesticide uses on refuge lands, would be reviewed. Possible source agencies for such NEPA documents include the Bureau of Land Management, USFS, National Park Service, USDA-APHIS, and the military services. It might be appropriate to incorporate by reference parts or all of existing document(s). Incorporating by reference (40 CFR 1502.21) is a technique used to avoid redundancies in analysis. It also would reduce the bulk of a Service NEPA document, which only would identify the documents that are incorporated by reference. In addition, relevant portions would be summarized in the Service NEPA document to the extent necessary to provide the decision maker and public with an understanding of relevance of the referenced material to the current analysis.

In accordance with the requirements set forth in 43 CFR 46.135, the Service would specifically incorporate through reference ecological risk assessments prepared by the USFS (http://www.fs.fed.us/r6/invasiveplant-eis/Risk-Assessments/Herbicides-Analyzed-InvPlant-EIS.htm) and Bureau of Land Management (http://www.blm.gov/wo/st/en/prog/more/veg_eis.html). These risk assessments and associated documentation also are available in total with the administrative record for the final environmental impact statement titled *Pacific Northwest Region Invasive Plant Program – Preventing and Managing Invasive Plants* (USFS 2005) and *Vegetation Treatments Using Herbicides on Bureau of Land Management Lands in 17 Western States Programmatic EIS (PEIS)* (Bureau of Land Management 2007). In accordance with 43 CFR 46.120(d), use of existing NEPA documents by supplementing, tiering to, incorporating by reference, or adopting previous NEPA environmental analyses would avoid redundancy and unnecessary paperwork.

As a basis for completing chemical profiles for approving or disapproving refuge PUPs, ecological risk assessments for the following herbicide and adjuvant uses prepared by the USFS would be incorporated by reference:

- 2,4-D
- Chlorosulfuron
- Clopyralid
- Dicamba
- Glyphosate
- Imazapic
- Imazapyr
- Metsulfuron methyl
- Picloram
- Sethoxydim
- Sulfometuron methyl
- Triclopyr
- Nonylphenol polyethoxylate (NPE)-based surfactants

As a basis for completing chemical profiles for approving or disapproving refuge PUPs, ecological risk assessments for the following herbicide uses as well as evaluation of risks associated with pesticide degradates and adjuvants prepared by the Bureau of Land Management would be incorporated by reference:

- Bromacil
- Chlorosulfuron
- Diflufenzopyr
- Diquat
- Diuron
- Fluridone
- Imazapic
- Overdrive (diflufenzopyr and dicamba)
- Sulfometuron methyl
- Tebuthiuron
- Pesticide degradates and adjuvants

G.7.2.3 Assumptions for Ecological Risk Assessments

There are a number of assumptions involved with the ecological risk assessment process for terrestrial and aquatic organisms associated with use of the EPA's (2004) process. These assumptions may be risk neutral or may lead to an over- or under-estimation of risk from pesticide exposure depending upon site-specific conditions. The following describes these assumptions, their application to the conditions typically encountered, and whether they may lead to recommendations that are risk neutral, or that underestimate or overestimate ecological risk from potential pesticide exposure.

- Indirect effects would not be evaluated by ecological risk assessments. These effects include the mechanisms of indirect exposure to pesticides: consuming prey items (fish, birds, or

small mammals), reductions in the availability of prey items, and disturbance associated with pesticide application activities.

- Exposure to a pesticide product can be assessed based upon the active ingredient. However, exposure to a chemical mixture (pesticide formulation) may result in effects that are similar or substantially different compared to only the active ingredient. Nontarget organisms may be exposed directly to the pesticide formulation or only various constituents of the formulation as they dissipate and partition in the environment. If toxicological information for both the active ingredient and formulated product are available, then data representing the greatest potential toxicity would be selected for use in the risk assessment process (EPA 2004). As a result, this conservative approach may lead to an overestimation of risk characterization from pesticide exposure.
- Because toxicity tests with listed or candidate species or closely related species are not available, data for surrogate species would be most often used for risk assessments. Specifically, bobwhite quail and mallard duck are the most frequently used surrogates for evaluating potential toxicity to federally listed avian species. Bluegill sunfish, rainbow trout, and fathead minnow are the most common surrogates for evaluating toxicity for freshwater fishes. Sheep's head minnow can be an appropriate surrogate marine species for coastal environments. Rats and mice are the most common surrogates for evaluating toxicity to mammals. Interspecies sensitivity is a major source of uncertainty in pesticide assessments. As a result of this uncertainty, data are selected for the most sensitive species tested within a taxonomic group (birds, fish, and mammals) given the quality of the data is acceptable. If additional toxicity data for more species of organisms in a particular group are available, the selected data would not be limited to the species previously listed as common surrogates.
- The Kanaga nomogram outputs maximum EEC values that may be used to calculate an average daily concentration over a specified interval of time, which is referred to as a time-weighted-average (TWA). The maximum EEC would be selected as the exposure input for both acute and chronic risk assessments in the screening-level evaluations. The initial or maximum EEC derived from the Kanaga nomogram represents the maximum expected instantaneous or acute exposure to a pesticide. Acute toxicity endpoints are determined using a single exposure to a known pesticide concentration typically for 48 to 96 hours. This value is assumed to represent ecological risk from acute exposure to a pesticide. On the other hand, chronic risk to pesticide exposure is a function of pesticide concentration and duration of exposure to the pesticide. An organism's response to chronic pesticide exposure may result from either the concentration of the pesticide or the length of exposure, or some combination of both factors. Standardized tests for chronic toxicity typically involve exposing an organism to several different pesticide concentrations for a specified length of time (days, weeks, months, years, or generations). For example, avian reproduction tests include a 10-week exposure phase. Because a single length of time is used in the test, time response data are usually not available for inclusion in risk assessments. Without time response data it is difficult to determine the concentration that elicits a toxicological response.
- Using maximum EECs for chronic risk estimates may result in an overestimation of risk, particularly for compounds that dissipate rapidly. Conversely, using TWAs for chronic risk estimates may underestimate risk if it is the concentration rather than the duration of exposure that is primarily responsible for the observed adverse effect. The maximum EEC would be used for chronic risk assessments although it may result in an overestimation of risk. TWAs may be used for chronic risk assessments, but they would be applied judiciously considering the potential for underestimation or overestimation of risk. For example, the number of days exposure exceeds an LOC may influence the suitability of a pesticide use.

The greater the number of days the EEC exceeds the LOC, the greater the ecological risk. This is a qualitative assessment, and is subject to reviewers' expertise in ecological risk assessment and tolerance for risk.

- The length of time used to calculate the TWA can have a substantial effect on the exposure estimates, and there is no standard method for determining the appropriate duration for this estimate. The T-REX model assumes a 21-week exposure period, which is equivalent to avian reproductive studies designed to establish a steady-state concentration for bioaccumulative compounds. However, this does not necessarily define the true exposure duration needed to elicit a toxicological response. Pesticides that do not bioaccumulate may achieve a steady-state concentration earlier than 21 weeks. The duration of time for calculating TWAs would require justification and would not exceed the duration of exposure in the chronic toxicity test (approximately 70 days for the standard avian reproduction study). An alternative to using the duration of the chronic toxicity study is to base the TWA on the application interval. In this case, increasing the application interval would suppress both the estimated peak pesticide concentration and the TWA. Another alternative to using TWAs would be to consider the number of days that a chemical is predicted to exceed the LOC.
- Pesticide dissipation is assumed to be first-order in the absence of data suggesting alternative dissipation patterns such as biphasic. Field dissipation data would generally be the most pertinent for assessing exposure in terrestrial species that forage on vegetation. However, these data are often not available and can be misleading, particularly if the compound is prone to ~~"w~~wash-off." Soil half-life is the most common degradation data available. Dissipation or degradation data that would reflect the environmental conditions typical of refuge lands would be used, if available.
- For species found in the water column, it would be assumed that the greatest bioavailable fraction of the pesticide active ingredient in surface waters is freely dissolved in the water column.
- Actual habitat requirements of any particular terrestrial species are not considered, and it is assumed that species exclusively and permanently occupy the treated area, or adjacent areas receiving pesticide at rates commensurate with the treatment rate. This assumption would produce a maximum estimate of exposure for risk characterization. This assumption would likely lead to an overestimation of exposure for species that do not permanently and exclusively occupy the treated area (EPA 2004).
- Exposure through incidental ingestion of pesticide-contaminated soil is not considered in the EPA risk assessment protocols. Research suggests <15 percent of the diet can consist of incidentally ingested soil depending upon species and feeding strategy (Beyer et al. 1994). An assessment of pesticide concentrations in soil compared to food item categories in the Kanaga nomogram indicates incidental soil ingestion would not likely increase dietary exposure to pesticides. Inclusion of soil into the diet would effectively reduce the overall dietary concentration compared to the present assumption that the entire diet consists of a contaminated food source (Fletcher et al. 1994). An exception to this may be soil-applied pesticides in which exposure from incidental ingestion of soil may increase. Potential for pesticide exposure under this assumption may be underestimated for soil-applied pesticides and overestimated for foliar-applied pesticides. The concentration of a pesticide in soil would likely be less than predicted on food items.
- Exposure through inhalation of pesticides is not considered in the EPA risk assessment protocols. Such exposure may occur through three potential sources: spray material in droplet form at time of application, vapor phase with the pesticide volatilizing from treated surfaces, and airborne particulates (soil, vegetative matter, and pesticide dusts). The EPA (1990)

reported exposure from inhaling spray droplets at the time of application is not an appreciable route of exposure for birds. According to research on mallards and bobwhite quail, respirable particle size (particles reaching the lung) in birds is limited to maximum diameter of 2 to 5 microns. The spray droplet spectra covering the majority of pesticide application scenarios indicate that less than 1 percent of the applied material is within the respirable particle size. This route of exposure is further limited because the permissible spray drop size distribution for ground pesticide applications is restricted to American Society of Agricultural Engineers (ASAE) medium or coarser drop size distribution.

- Inhalation of a pesticide in the vapor phase may be another source of exposure for some pesticides under certain conditions. This mechanism of exposure to pesticides occurs post-application, and it would pertain to those pesticides with a high vapor pressure. The EPA is currently evaluating protocols for modeling inhalation exposure from pesticides including near-field and near-ground air concentrations based upon equilibrium and kinetics-based models. Risk characterization for exposure with this mechanism is unavailable.
- The effect from exposure to dust contaminated with the pesticide cannot be assessed generically as partitioning issues related to application site soils and chemical properties of the applied pesticides render the exposure potential from this route highly situation-specific.
- Dermal exposure may occur through three potential sources: direct application of spray to terrestrial wildlife in the treated area or within the drift footprint, incidental contact with contaminated vegetation, or contact with contaminated water or soil. Interception of spray and incidental contact with treated substrates may pose risk to avian wildlife (Driver et al. 1991). However, available research related to wildlife dermal contact with pesticides is extremely limited, with the exception of dermal toxicity values for some mammals used as human surrogates (rats and mice), which are common. The EPA is currently evaluating protocols for modeling dermal exposure. Risk characterization may be underestimated for this route of exposure, particularly with high-risk pesticides such as some organophosphates or carbamate insecticides. If protocols are established by the EPA for assessing dermal exposure to pesticides, they would be considered for incorporation into pesticide assessment protocols.
- Exposure to a pesticide may occur from consuming surface water, dew, or other water on treated surfaces. Water-soluble pesticides have the potential to dissolve in surface runoff, and puddles in a treated area may contain pesticide residues. Similarly, pesticides with lower organic carbon partitioning characteristics and higher solubility in water have a greater potential to dissolve in dew and other water associated with plant surfaces. Estimating the extent to which such pesticide loadings to drinking water occurs is complex and would depend upon the partitioning characteristics of the active ingredient, soil types in the treatment area, and the meteorology of the treatment area. In addition, the use of various water sources by wildlife is highly species-specific. Currently, risk characterization for this exposure mechanism is not available. The EPA is actively developing protocols to quantify drinking water exposure from puddles and dew. If and when protocols are formally established by the EPA for assessing exposure to pesticides through drinking water, these protocols would be incorporated into pesticide risk assessment protocols.
- Risk assessments are based upon the assumption that the entire treatment area would be subject to pesticide application at the rates specified on the label. In most cases, there is potential for uneven application of pesticides through such plausible incidents such as changes in calibration of application equipment, spillage, and localized releases at specific areas in or near the treated field that are associated with mixing and handling and application equipment as well as applicator skill. Inappropriate use of pesticides and the occurrence of

spills represent a potential underestimation of risk. It is likely not an important factor for risk characterization. All pesticide applicators are required to be certified by the state in which they apply pesticides. Certification training includes the safe storage, transport, handling, and mixing of pesticides; equipment calibration; and proper application with annual continuing education.

- The EPA relies on Fletcher et al. (1994) for setting the assumed pesticide residues in wildlife dietary items. The EPA (2004) ~~"b~~believes that these residue assumptions reflect a realistic upper-bound residue estimate, although the degree to which this assumption reflects a specific percentile estimate is difficult to quantify." Fletcher et al.'s (1994) research suggests that the pesticide active ingredient residue assumptions used by the EPA represent a ninety-fifth percentile estimate. However, research conducted by Pfleeger et al. (1996) indicates EPA residue assumptions for short grass were not exceeded. Baehr and Habig (2000) compared the EPA residue assumptions with distributions of measured pesticide residues for the EPA's Uptake, Translocation, Accumulation, and Biotransformation (UTAB) database. Overall residue selection levels would tend to overestimate risk characterization. This is particularly evident when wildlife individuals are likely to have selected a variety of food items acquired from multiple locations. Some food items may be contaminated with pesticide residues whereas others are not contaminated. However, it is important to recognize differences in species feeding behavior. Some species may consume whole aboveground plant material, but others preferentially select different plant structures. Also, species may preferentially select a food item although multiple food items may be present. Without species-specific knowledge regarding foraging behavior, characterizing ecological risk other than in general terms is not possible.
- Acute and chronic risk assessments rely on comparisons of wildlife dietary residues with LC_{50} or NOEC values expressed as concentrations of pesticides in laboratory feed. These comparisons assume that ingestion of food items in the field occurs at rates commensurate with those in the laboratory. Although the screening assessment process adjusts dry-weight estimates of food intake to reflect the increased mass in fresh-weight wildlife food intake estimates, it does not allow for gross energy and assimilative efficiency differences between wildlife food items and laboratory feed. Differences in assimilative efficiency between laboratory and wild diets suggest that current screening assessment methods are not accounting for a potentially important aspect of food requirements.
- There are several other assumptions that can affect non-target species not considered in the risk assessment process. These include possible additive or synergistic effects from applying two or more pesticides or additives in a single application, co-location of pesticides in the environment, cumulative effects from pesticides with the same mode of action, effects of multiple stressors (e.g., combination of pesticide exposure and adverse abiotic and biotic factors), and behavioral changes induced by exposure to a pesticide. These factors may exist at some level contributing to adverse effects to non-target species, but they are usually characterized in the published literature in only a general manner, limiting their value in the risk assessment process.
- It is assumed that aquatic species exclusively and permanently occupy the water body being assessed. Actual habitat requirements of aquatic species are not considered. With the possible exception of scenarios where pesticides are directly applied to water, it is assumed that no habitat use considerations specific for any species would place the organisms in closer proximity to pesticide use sites. This assumption produces a maximum estimate of exposure or risk characterization. It would likely be realistic for many aquatic species that may be found in aquatic habitats within or in close proximity to treated terrestrial habitats. However,

the spatial distribution of wildlife is usually not random because wildlife distributions are often related to habitat requirements of species. Clumped distributions of wildlife may result in an underestimation or overestimation of risk depending upon where the initial pesticide concentration occurs relative to the species or species habitat.

- For species found in the water column, it would be assumed that the greatest bioavailable fraction of the pesticide active ingredient in surface waters is freely dissolved in the water column. Additional chemical exposure from materials associated with suspended solids or food items is not considered because partitioning onto sediments likely is minimal. Adsorption and bioconcentration occur at lower levels for many newer pesticides compared with older, more persistent bioaccumulative compounds. For pesticides with RQs close to the listed species LOC, the potential for additional exposure from these routes may be a limitation of risk assessments, where potential pesticide exposure or risk may be underestimated.
- Mass transport losses of pesticide from a water body (except for losses by volatilization, degradation, and sediment partitioning) would not be considered for ecological risk assessment. The water body would be assumed to capture all pesticide active ingredients entering as runoff, drift, and adsorbed to eroded soil particles. It would also be assumed that pesticide active ingredient is not lost from the water body by overtopping or flow-through, nor is concentration reduced by dilution. In total, these assumptions would lead to a near maximum possible water-borne concentration. However, this assumption would not account for the potential to concentrate pesticide through evaporative loss. This limitation may have the greatest impact on water bodies with high surface-to-volume ratios such as ephemeral wetlands, where evaporative losses are accentuated and applied pesticides have low rates of degradation and volatilization.
- For acute risk assessments, there would be no averaging time for exposure. An instantaneous peak concentration would be assumed, where instantaneous exposure is sufficient in duration to elicit acute effects comparable to those observed over more protracted exposure periods (typically 48 to 96 hours) tested in the laboratory. In the absence of data regarding time-to-toxic event and analyses and latent responses to instantaneous exposure, risk would likely be overestimated.
- For chronic exposure risk assessments, the averaging times considered for exposure are commensurate with the duration of the invertebrate life cycle or fish early life stage tests (e.g., 21-28 days and 56-60 days, respectively). Response profiles (time to effect and latency of effect) to pesticides likely vary widely with mode of action and species and should be evaluated on a case-by-case basis as available data allow. Nevertheless, because the EPA relies on chronic exposure, and toxicity endpoints based on a finding of no observed effect, the potential for any latent toxicity effects or averaging time assumptions to alter the results of an acceptable chronic risk assessment prediction is limited. The extent to which duration of exposure from water-borne concentrations overestimate or underestimate actual exposure depends on several factors. These include the following: localized meteorological conditions, runoff characteristics of the watershed (e.g., soils, topography), the hydrological characteristics of receiving waters, environmental fate of the pesticide active ingredient, and the method of pesticide application. It should also be understood that chronic effects studies are performed using a method that holds water concentration in a steady state. This method is not likely to reflect conditions associated with pesticide runoff. Pesticide concentrations in the field increase and decrease in surface water on a cycle influenced by rainfall, pesticide use patterns, and degradation rates. As a result of the dependency of this assumption on

several undefined variables, risk associated with chronic exposure may in some situations be overestimated or underestimated.

- The EPA is required by the Food Quality Protection Act to assess the cumulative risks of pesticides that share common mechanisms of toxicity, or act the same way within an organism. Currently, the EPA has identified four groups of pesticides that have a common mechanism of toxicity requiring cumulative risk assessments. These four groups are: the organophosphate insecticides, N-methyl carbamate insecticides, triazine herbicides, and chloroacetanilide herbicides.

G.7.3 Pesticide Mixtures and Degradates

Pesticide products are usually a formulation of several components generally categorized as active ingredients and inert or other ingredients. The term active ingredient is defined by the FIFRA as preventing, destroying, repelling, or mitigating the effects of a pest, or a plant regulator, defoliant, desiccant, or nitrogen stabilizer. In accordance with FIFRA, the active ingredient(s) must be identified by name(s) on the pesticide label along with its relative composition expressed in percentage(s) by weight. In contrast, inert ingredient(s) are not intended to affect a target pest. Their role in the pesticide formulation is to act as a solvent (keep the active ingredient is a liquid phase), an emulsifying or suspending agent (keep the active ingredient from separating out of solution), or a carrier (such as clay in which the active ingredient is impregnated on the clay particle in dry formulations). For example, if isopropyl alcohol is used as a solvent in a pesticide formulation, then it would be considered an inert ingredient. FIFRA only requires that inert ingredients identified as hazardous and associated percent composition, and the total percentage of all inert ingredients, must be declared on a product label. Inert ingredients that are not classified as hazardous are not required to be identified.

The EPA (September 1997) issued Pesticide Regulation Notice 97-6, which encouraged manufacturers, formulators, producers, and registrants of pesticide products to voluntarily substitute the term ~~"o~~other ingredients" for ~~"in~~ert ingredients" in the ingredient statement. This change recognized that all components in a pesticide formulation potentially could elicit or contribute to an adverse effect on non-target organisms and, therefore, are not necessarily inert. Whether referred to as ~~"in~~erts" or ~~"o~~ther ingredients," these constituents within a pesticide product have the potential to affect species or environmental quality. The USEPA categorizes regulated inert ingredients into the following four lists (EPA 2012):

- List 1 – Inert Ingredients of Toxicological Concern
- List 2 – Potentially Toxic Inert Ingredients
- List 3 – Inerts of Unknown Toxicity
- List 4 – Inerts of Minimal Toxicity

Several of the List 4 compounds are naturally occurring earthen materials (e.g., clay materials, simple salts) that would not elicit toxicological response at applied concentrations. However, some of the inerts (particularly the List 3 compounds and unlisted compounds) may have moderate to high potential toxicity to aquatic species based on MSDS or published data.

Comprehensively assessing potential effects to non-target fish, wildlife, plants, and/or their habitats from pesticide use is a complex task. It would be preferable to assess the cumulative effects from exposure to the active ingredient, its degradates, and inert ingredients as well as other active ingredients in the spray mixture. However, it would only be feasible to conduct deterministic risk

assessments for each component in the spray mixture singly. Limited scientific information is available regarding ecological effects (additive or synergistic) from chemical mixtures that typically rely upon broadly encompassing assumptions. For example, the USFS (2005) found that mixtures of pesticides used in forest management likely would not cause additive or synergistic effects to nontarget species based upon a review of scientific literature regarding toxicological effects and interactions of agricultural chemicals (Agency for Toxic Substances and Disease Registry [ATSDR] 2004). Moreover, information on inert ingredients, adjuvants, and degradates is often limited by the availability of and access to reliable toxicological data for these constituents.

Toxicological information regarding ~~"o~~ther ingredients" may be available from sources such as the following:

- Toxicology, Occupational Medicine, and Environmental Series (TOMES) (a proprietary toxicological database including EPA's Integrated Risk Information System (IRIS), the Hazardous Substance Data Bank, the Registry of Toxic Effects of Chemical Substances [RTECS])
- EPA's Ecotoxicology (ECOTOX) database, which includes Aquatic Information Retrieval (AQUIRE) (a database containing scientific papers published on the toxic effects of chemicals to aquatic organisms)
- TOXLINE (a literature searching tool)
- MSDSs from pesticide suppliers
- Other sources such as the *Farm Chemicals Handbook*

Because there is a lack of specific inert toxicological data, inert(s) in a pesticide may cause adverse ecological effects. However, inert ingredients typically represent only a small percentage of the pesticide spray mixture, and it would be assumed that negligible effects would be expected to result from inert ingredients.

Although the potential effects of degradates should be considered when selecting a pesticide, it is beyond the scope of this assessment process to consider all possible breakdown chemicals of the various product formulations containing an active ingredient. Degradates may be more or less mobile and more or less hazardous in the environment than their parent pesticides (Battaglin et al. 2003). Differences in environmental behavior (e.g., mobility) and toxicity between parent pesticides and degradates would make assessing potential degradate effects extremely difficult. For example, a less toxic and more mobile, bioaccumulative, or persistent degradate may have potentially greater effects on species and/or degrade environmental quality. The lack of data on the toxicity of degradates for many pesticides represents a source of uncertainty for assessing risk.

An EPA-approved label specifies whether a product can be mixed with one or more pesticides. Without product-specific toxicological data, it would not possible to quantify the potential effects of these mixtures. In addition, a quantitative analysis could only be conducted if reliable scientific information allowed a determination of whether the joint action of a mixture would be additive, synergistic, or antagonistic. Such information would not likely exist unless the mode of action is common among the chemicals and receptors. Moreover, the composition of and exposure to mixtures would be highly site- and/or time-specific and, therefore, it would be nearly impossible to assess potential effects to species and environmental quality.

To minimize or eliminate potential negative effects associated with applying two or more pesticides as a mixture, the use would be conducted in accordance with the labeling requirements. Labels for

two or more pesticides applied as a mixture should be completely reviewed, and products with the least potential for negative effects would be selected for use on the refuge. This is especially relevant when a mixture would be applied in a manner that may already have the potential for an effect(s) associated with an individual pesticide. Use of a tank mix under these conditions would increase the level of uncertainty in terms of risk to species or potential to degrade environmental quality.

Adjuvants generally function to enhance or prolong the activity of pesticide. For terrestrial herbicides, adjuvants aid in the absorption into plant tissue. Adjuvant is a broad term that generally applies to surfactants, selected oils, anti-foaming agents, buffering compounds, drift control agents, compatibility agents, stickers, and spreaders. Adjuvants are not under the same registration requirements as pesticides, and the EPA does not register or approve the labeling of spray adjuvants. Individual pesticide labels identify types of adjuvants approved for use with it. In general, adjuvants compose a relatively small portion of the volume of pesticides applied. Selection of adjuvants with limited toxicity and low volumes would be recommended to reduce the potential for the adjuvant to influence the toxicity of the pesticide.

G.7.4 Determining Effects to Soil and Water Quality

The approval process for pesticide uses would consider potential to degrade water quality on and off refuge lands. A pesticide can only affect water quality through movement away from the treatment site. After application, pesticide mobilization can be characterized by one or more of the following (Kerle et al. 1996):

- Attach (sorb) to soil, vegetation, or other surfaces and remain at or near the treated area;
- Attach to soil and move off-site through erosion from runoff or wind;
- Dissolve in water that can be subjected to runoff or leaching.

As an initial screening tool, selected chemical characteristics and rating criteria for a pesticide can be evaluated to assess potential to enter ground and/or surface waters. These would include the following: persistence, sorption coefficient (K_{oc}), groundwater ubiquity score (GUS), and solubility.

Persistence, which is expressed as half-life ($t_{½}$), represents the length of time required for 50 percent of the deposited pesticide to degrade (completely or partially). Persistence in the soil can be categorized as the following: nonpersistent <30 days, moderately persistent = 30 to 100 days, and persistent >100 days (Kerle et al. 1996). Half-life data are usually available for aquatic and terrestrial environments.

Another measure of pesticide persistence is dissipation time (DT_{50}). It represents the time required for 50 percent of the deposited pesticide to degrade and move from a treated site, whereas half-life describes the rate for degradation only. As with half-life, units of dissipation time are usually expressed in days. Field or foliar dissipation times are the preferred data for use to estimate pesticide concentrations in the environment. However, soil half-lives are the most common persistence data cited in published literature. If field or foliar dissipation data are not available, soil half-life data may be used. The average or representative half-life value of most important degradation mechanism would be selected for quantitative analysis for both terrestrial and aquatic environments.

Mobility of a pesticide is a function of how strongly it is adsorbed to soil particles and organic matter, its solubility in water, and its persistence in the environment. Pesticides strongly adsorbed to soil particles, relatively insoluble in water, and not environmentally persistent would be less likely to

move across the soil surface into surface waters or to leach through the soil profile and contaminate groundwater. Conversely, pesticides that are not strongly adsorbed to soil particles, are highly water soluble, and are persistent in the environment would have greater potential to move from the application site (off-site movement).

The degree of pesticide adsorption to soil particles and organic matter (Kerle et al. 1996) is expressed as the soil adsorption coefficient. The K_{oc} is measured as micrograms of pesticide per gram of soil (µg/g), which can range from near zero to the thousands. Pesticides with higher K_{oc} values are strongly sorbed to soil and, therefore, would be less subject to movement.

Water solubility describes the amount of pesticide that will dissolve in a known quantity of water. The water solubility of a pesticide is expressed as milligrams of pesticide dissolved in a liter of water (mg/L) or ppm. As pesticide solubility increases, there would be greater potential for off-site movement.

The GUS is a quantitative screening tool to estimate a pesticide's potential to move in the environment. It uses soil persistence and adsorption coefficients in the following formula.

$$GUS = \log_{10}(t½) \times [4 - \log10\ (K_{oc})]$$

The potential pesticide movement rating would be based upon its GUS value. Pesticides with a GUS <0.1 would be considered to have an extremely low potential to move toward groundwater. Values of 1.0 to 2.0 would have low potential, 2.0 to 3.0 would have moderate potential, 3.0 to 4.0 would have high potential, and >4.0 would have a very high potential to move toward groundwater.

GUS, water solubility, half-life, and K_{oc} values are available for selected pesticides from the Oregon State University (OSU) Extension Pesticide Properties Database at http://npic.orst.edu/ppdmove.htm. Many of the values in this database were derived from the Soil Conservation Service/Agricultural Research Service/Cooperative Extension Service (SCS/ARS/CES) Pesticide Properties Database for Environmental Decision Making (Wauchope et al. 1992).

Soil properties influence the fate of pesticides in the environment. The following six properties are mostly likely to affect pesticide degradation and the potential for pesticides to move off-site by leaching (vertical movement through the soil) or runoff (lateral movement across the soil surface).

- Permeability is the rate of water movement vertically through the soil. It is affected by soil texture and structure. Coarse-textured soils (e.g., high sand content) have a larger pore size and are generally more permeable than fine-textured soils (i.e., high clay content). The more permeable soils would have a greater potential for pesticides to move vertically down through the soil profile. Soil permeability rates (inches/hour) are usually available in county soil survey reports.
- Soil texture describes the relative percentage of sand, silt, and clay. In general, greater clay content with smaller pore size would lower the likelihood and rate that water would move through the soil profile. Clay also serves to adsorb (bind) pesticides to soil particles. Soils with high clay content would adsorb more pesticide than soils with relatively low clay content. In contrast, sandy soils with coarser texture and lower water-holding capacity would have a greater potential for water to leach through them.
- Soil structure describes soil aggregation. Soils with a well-developed soil structure have looser, more aggregated structures that would be less likely to be compacted. Both

characteristics would allow for less restricted flow of water through the soil profile, resulting in greater infiltration.

- Organic matter would be the single most important factor affecting pesticide adsorption in soils. Many pesticides are adsorbed to organic matter, which would reduce their rate of downward movement through the soil profile. Also, soils high in organic matter would tend to hold more water, which may make less water available for leaching.
- Soil moisture affects how fast water would move through the soil. If soils are already wet or saturated before rainfall or irrigation, excess moisture would result in runoff rather than infiltrate into the soil profile. Soil moisture also would influence microbial and chemical activity in soil, which effects pesticide degradation.
- Soil pH influences chemical reactions that occur in the soil, which in turn determines whether a pesticide would degrade, the rate of degradation, and, in some instances, which degradation products are produced.

Based upon the aforementioned properties, soils most vulnerable to groundwater contamination would be sandy soils with low organic matter. In contrast, the least vulnerable soils would be well-drained clayey soils with high organic matter. Consequently, pesticides with the lowest potential for movement in conjunction with appropriate BMPs (see below) would be used in an IPM framework to treat pests while minimizing effects to non-target biota and protecting environmental quality.

Along with soil properties, the potential for a pesticide to affect water quality through runoff and leaching would consider site-specific environmental and abiotic conditions including rainfall, water table conditions, and topography (Huddleston 1996).

- Water is necessary to separate pesticides from soil. This can occur in two basic ways. Pesticides that are soluble move easily with runoff water. Pesticide-laden soil particles can be dislodged and transported from the application site in runoff. The concentration of pesticides in the surface runoff would be greatest for the first runoff event following treatment. The rainfall intensity and route of water infiltration into soil, to a large extent, determine pesticide concentrations and losses in surface runoff. The timing of the rainfall after application also would have an effect. Rainfall interacts with pesticides at a shallow soil depth (¼ to ½ inch), which is called the mixing zone (Baker and Miller 1999). The pesticide/water mixture in the mixing zone would tend to leach down into the soil or runoff depending upon how quickly the soil surface becomes saturated and how rapidly water can infiltrate into the soil. Leaching would decrease the amount of pesticide available near the soil surface (mixing zone) to runoff during the initial rainfall event following application and subsequent rainfall events.
- Terrain slope would affect the potential for surface runoff and the intensity of runoff. Steeper slopes would have greater potential for runoff following a rainfall event. In contrast, soils that are relatively flat would have little potential for runoff, except during intense rainfall events. In addition, soils in lower areas would be more susceptible to leaching as a result of receiving excessive water from surrounding higher elevations.
- Depth to groundwater would be an important factor affecting the potential for pesticides to leach into groundwater. If the distance from the soil surface to the top of the water table is shallow, pesticides would have less distance to travel to reach groundwater. Shallower water tables that persist for longer periods would be more likely to experience groundwater contamination. Soil survey reports are available for individual counties. These reports provide data in tabular format regarding the water table depths and the months during which

they persist. In some situations, a hard pan exists above the water table that would prevent pesticide contamination from leaching.

G.7.5 Determining Effects to Air Quality

Pesticides may volatilize from soil and plant surfaces and move from the treated area into the atmosphere. The potential for a pesticide to volatilize is determined by the pesticide's vapor pressure, which would be affected by temperature, sorption, soil moisture, and the pesticide's water solubility. Vapor pressure is often expressed in mm Hg. To make these numbers easier to compare, vapor pressure may be expressed in exponent form ($I \times 10^{-7}$), where I represents a vapor pressure index. In general, pesticides with I<10 would have a low potential to volatilize, whereas pesticides with I>1,000 would have a high potential to volatilize (OSU 1996). Vapor pressure values for pesticides are usually available in the pesticide product MSDS or the USDA Agricultural Research Service (ARS) pesticide database.

G.7.6 Preparing a Chemical Profile

The following instructions would be used by Service personnel to complete chemical profiles for pesticides. Specifically, profiles would be prepared for pesticide active ingredients (e.g., glyphosate, imazapic) that would be contained in one or more trade name products that are registered and labeled with the EPA. All information fields under each category (e.g., toxicological endpoints, environmental fate) would be completed for a chemical profile. If no information is available for a specific field, then "No data is available in references" would be recorded in the profile. Available scientific information would be used to complete chemical profiles. Each entry of scientific information would be shown with applicable references.

Completed chemical profiles would provide a structured decision-making process using quantitative assessment/screening tools with threshold values (where appropriate) that would be used to evaluate potential biological and other environmental effects to refuge resources. For ecological risk assessments presented in these profiles, the "worst-case scenario" would be evaluated to determine whether a pesticide could be approved for use considering the maximum single application rate specified on pesticide labels for habitat management and croplands/facilities maintenance treatments pertaining to refuges. Where the worst-case scenario likely would only result in minor, temporary, and localized effects to listed and non-listed species with appropriate BMPs (see Section G.5), the proposed pesticide's use in a PUP would have a scientific basis for approval under any application rate specified on the label that is at or below rates evaluated in a chemical profile. In some cases, the chemical profile would include a lower application rate than the maximum labeled rate in order to protect refuge resources. As necessary, chemical profiles would be periodically updated with new scientific information or as pesticides with the same active ingredient are proposed for use on the refuge in PUPs.

Throughout this section, threshold values (to prevent or minimize potential biological and environmental effects) would be clearly identified for specific information presented in a completed chemical profile. Comparison with these threshold values provides an explicit scientific basis to approve or disapprove PUPs for habitat management and cropland/facilities maintenance on refuge lands. In general, PUPs would be approved for pesticides with chemical profiles where there would be no exceedances of threshold values. However, BMPs are identified for some screening tools that would minimize/eliminate potential effects (exceedance of the threshold value) as a basis for approving PUPs.

Date: Service personnel would record the date when the chemical profile is completed or updated. Chemical profiles (e.g., currently approved pesticide use patterns) would be periodically reviewed and updated as necessary. The most recent review date would be recorded on a profile to document when it was last updated.

Trade Name(s): Service personnel would accurately and completely record the trade name(s) from the pesticide label, which includes a suffix that describes the formulation (e.g., WP, DG, EC, L, SP, I, II or 64). The suffix often distinguishes a specific product from among several pesticides with the same active ingredient. Service personnel would record a trade name for each pesticide product with the same active ingredient.

Common chemical name(s): Service personnel would record the common name(s) listed on the pesticide label or MSDS for an active ingredient. The common name of a pesticide is listed as the active ingredient on the title page of the product label immediately following the trade name, and the MSDS Section 2: Composition/Information on Ingredients. A chemical profile is completed for each active ingredient.

Pesticide Type: Service personnel would record the type of pesticide for an active ingredient as one of the following: herbicide, desiccant, fungicide, fumigant, growth regulator, insecticide, piscicide, or rodenticide.

EPA Registration Number(s): The EPA Reg. No. appears on the title page of the label and MSDS Section 1: Chemical Product and Company Description. It is not the EPA Establishment Number, which is usually located near it. Service personnel would record the EPA Reg. No. for each trade name product with an active ingredient based upon PUPs.

Pesticide Class: Service personnel would list the general chemical class for the pesticide (active ingredient). For example, malathion is an organophosphate and carbaryl is a carbamate.

CAS (Chemical Abstract Service) Number: This number is often located in the second section (Composition/Information on Ingredients) of the MSDS. The MSDS table listing components usually contains this number immediately prior to or following the percent composition.

Other Ingredients: From the most recent MSDS for the proposed pesticide product(s), Service personnel would include any chemicals in the pesticide formulation that are not listed as active ingredients but are described as toxic or hazardous, or are regulated under the Superfund Amendments and Reauthorization Act (SARA), Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), Toxic Substances Control Act (TSCA), OSHA, State Right-to-Know, or other listed authorities. These are usually found in MSDS sections titled ~~"H~~Hazardous Identifications," ~~"E~~Exposure Control/Personal Protection," and ~~"R~~Regulatory Information." If concentrations of other ingredients are available for any compounds identified as toxic or hazardous, then Service personnel would record this information in the chemical profile by trade name. MSDSs may be obtained from the manufacturer, manufacturer's website or from an online database maintained by Crop Data Management Systems, Inc. (see list below).

G.7.6.1 Toxicological Endpoints

Toxicological endpoint data would be collected for acute and chronic tests with mammals, birds, and fish. Data would be recorded for species available in the scientific literature. If no data are found for

a particular taxonomic group, then –No data available is references" would be recorded as the data entry. Throughout the chemical profile, references (including toxicological endpoint data) would be cited using parentheses (#) following the recorded data.

Mammalian LD_{50}: For test species in the scientific literature, Service personnel would record available data for oral lethal dose (LD_{50}) in mg/kg-bw (body weight) or ppm-bw. The most common test species in scientific literature are the rat and mouse. The lowest LD_{50} value found for a rat would be used as a toxicological endpoint for dose-based RQ calculations to assess acute risk to mammals (see Table G-1 in Section G.7.2).

Mammalian LC_{50}: For test species in the scientific literature, Service personnel would record available data for dietary lethal concentration (LC_{50}) as reported (e.g., mg/kg-diet or ppm-diet). The most common test species in scientific literature are the rat and mouse. The lowest LC_{50} value found for a rat would be used as a toxicological endpoint for diet-based RQ calculations to assess acute risk (see Table G-1 in Section G.7.2).

Mammalian Reproduction: For test species listed in the scientific literature, Service personnel would record the test results (e.g., Lowest Observed Effect Concentration [LOEC], Lowest Observed Effect Level [LOEL], No Observed Adverse Effect Level [NOAEL], NOAEC) in mg/kg-bw or mg/kg-diet for reproductive test procedure(s) (e.g., generational studies [preferred], fertility, newborn weight). The most common test species available in scientific literature are rats and mice. The lowest NOEC, NOAEC, LOEL, or NOAEL test results found for a rat would be used as a toxicological endpoint for RQ calculations to assess chronic risk (see Table G-1 in Section G.7.2).

Avian LD_{50}: For test species available in the scientific literature, Service personnel would record values for oral lethal dose (LD_{50}) in mg/kg-bw or ppm-bw. The most common test species available in scientific literature are the bobwhite quail and mallard. The lowest LD_{50} value found for an avian species would be used as a toxicological endpoint for dose-based RQ calculations to assess acute risk (see Table G-1 in Section G.7.2).

Avian LC_{50}: For test species available in the scientific literature, Service personnel would record values for dietary lethal concentration (LC_{50}) as reported (e.g., mg/kg-diet or ppm-diet). The most common test species available in scientific literature are the bobwhite quail and mallard. The lowest LC_{50} value found for an avian species would be used as a toxicological endpoint for dietary-based RQ calculations to assess acute risk (see Table G-1 in Section G.7.2).

Avian Reproduction: For test species available in the scientific literature, Service personnel would record test results (e.g., LOEC, LOEL, NOAEC, NOAEL) in mg/kg-bw or mg/kg-diet consumed for reproductive test procedure(s) (e.g., early life cycle, reproductive). The most common test species available in scientific literature are the bobwhite quail and mallard. The lowest NOEC, NOAEC, LOEL, or NOAEL test results found for an avian species would be used as a toxicological endpoint for RQ calculations to assess chronic risk (see Table G-1 in Section G.7.2).

Fish LC_{50}: For test freshwater or marine species listed in the scientific literature, Service personnel would record a LC_{50} in ppm or mg/L. The most common test species available in the scientific literature are the bluegill, rainbow trout, and fathead minnow (marine). Test results for many game species may also be available. The lowest LC_{50} value found for a freshwater fish species would be used as a toxicological endpoint for RQ calculations to assess acute risk (see Table G-1 in Section G.7.2).

Fish Early Life Stage/Life Cycle: For test freshwater or marine species available in the scientific literature, Service personnel would record test results (e.g., LOEC, NOAEL, NOAEC, lowest observed adverse effect concentration [LOAEC]) in ppm for test procedure(s) (e.g., early life cycle, life cycle). The most common test species available in the scientific literature are bluegill, rainbow trout, and fathead minnow. Test results for other game species may also be available. The lowest test value found for a fish species (preferably freshwater) would be used as a toxicological endpoint for RQ calculations to assess chronic risk (see Table G-1 in Section G.7.2).

Other: For test invertebrate and nonvascular and vascular plant species available in the scientific literature, Service personnel would record $LC_{50,}$ $LD_{50,}$ LOEC, LOEL, NOAEC, NOAEL, or EC_{50} (environmental concentration) values in ppm or mg/L. The most common test invertebrate species available in scientific literature is the honey bee. Green algae and pondweed are frequently available test species for aquatic non-vascular and vascular plants, respectively.

Ecological Incident Reports: After a site has been treated with pesticide(s), wildlife may be exposed to these chemical(s). When exposure is high relative to the toxicity of the pesticides, wildlife may be killed or visibly harmed (incapacitated). Such events are called ecological incidents. The EPA maintains a database (Ecological Incident Information System) of ecological incidents. This database stores information extracted from incident reports submitted by various Federal and state agencies and non-government organizations. Information included in an incident report is date and location of the incident, type and magnitude of effects observed in various species, use(s) of pesticides known or suspected of contributing to the incident, and results of any chemical residue and cholinesterase activity analyses conducted during the investigation.

Incident reports can play an important role in evaluating the effects of pesticides by supplementing quantitative risk assessments. All incident reports for pesticide(s) with the active ingredient and associated information would be recorded.

G.7.6.2 Environmental Fate

Water Solubility: Service personnel would record values for water solubility (S_w), which describes the amount of pesticide that dissolves in a known quantity of water. S_w is expressed as mg/L (ppm). Pesticide S_w values would be categorized as one of the following: insoluble <0.1 ppm, moderately soluble = 100 to 1,000 ppm, highly soluble >10,000 ppm (U.S. Geological Survey 2000). As pesticide S_w increases, there would be greater potential to degrade water quality through runoff and leaching.

Sw would be used to evaluate potential for bioaccumulation in aquatic species (see Octanol-Water Partition Coefficient (K_{ow}) below).

Soil Mobility: Service personnel would record available values for soil adsorption coefficient (K_{oc} [µg/g]). It provides a measure of a chemical's mobility and leaching potential in soil. K_{oc} values are directly proportional to organic content, clay content, and surface area of the soil. K_{oc} data for a pesticide may be available for a variety of soil types (e.g., clay, loam, sand).

K_{oc} values would be used in evaluating the potential to degrade groundwater by leaching (see Potential to Move to Groundwater below).

Soil Persistence: Service personnel would record values for soil half-life, which represents the length of time (days) required for 50 percent of the deposited pesticide to degrade (completely or partially) in the soil. Based upon the half-life value, soil persistence would be categorized as one of the following: non-persistent <30 days, moderately persistent = 30 to 100 days, and persistent >100 days (Kerle et al. 1996).

Threshold for approving PUPs:

If soil half-life ≤100 days, then a PUP would be approved without additional BMPs to protect water quality.

If soil half-life >100 days, then a PUP would only be approved with additional BMPs specifically to protect water quality. One or more BMPs such as the following would be included in the ~~–S~~pecific Best Management Practices (BMPs)" section to minimize potential surface runoff and leaching that can degrade water quality:

- *Do not exceed one application per site per year.*
- *Do not use on coarse-textured soils where the groundwater table is <10 feet and average annual precipitation >12 inches.*
- *Do not use on steep slopes if substantial rainfall is expected within 24 hours or ground is saturated.*

Along with K_{oc}, soil half-life values would be used in evaluating the potential to degrade groundwater by leaching (see Potential to Move to Groundwater below).

Soil Dissipation: Field dissipation time would be the preferred data for use to estimate pesticide concentrations in the environment because it is based upon field studies, unlike soil half-life, which is derived in a laboratory. However, soil half-life is the most common persistence data available in the published literature. If field dissipation data are not available, soil half-life data would be used in a chemical profile. The average or representative half-life value of most important degradation mechanism would be selected for quantitative analysis for both terrestrial and aquatic environments.

Based upon the DT_{50} value, environmental persistence in the soil also would be categorized as one of the following: non-persistent <30 days, moderately persistent = 30 to 100 days, and persistent >100 days.

Threshold for approving PUPs:

If soil DT_{50} ≤100 days, then a PUP would be approved without additional BMPs to protect water quality.

If soil DT_{50} >100 days, then a PUP would only be approved with additional BMPs specifically to protect water quality. One or more BMPs such as the following would be included in the ~~–S~~pecific Best Management Practices (BMPs)" section to minimize potential surface runoff and leaching that can degrade water quality:

- *Do not exceed one application per site per year.*
- *Do not use on coarse-textured soils where the groundwater table is <10 feet and average annual precipitation >12 inches.*

- *Do not use on steep slopes if substantial rainfall is expected within 24 hours or ground is saturated.*

Along with K_{oc}, soil DT_{50} values (preferred over soil half-life) would be used in evaluating the potential to degrade groundwater by leaching (see Potential to Move to Groundwater below), if available.

Aquatic Persistence: Service personnel would record values for aquatic half-life, which represents the length of time required for 50 percent of the deposited pesticide to degrade (completely or partially) in water. Based upon the aquatic half-life value, aquatic persistence would be categorized as one of the following: nonpersistent <30 days, moderately persistent = 30 to 100 days, and persistent >100 days (Kerle et al. 1996).

Threshold for approving PUPs:

If aquatic half-life ≤100 days, then a PUP would be approved without additional BMPs to protect water quality.

If aquatic half-life >100 days, then a PUP would only be approved with additional BMPs specifically to protect water quality. One or more BMPs such as the following would be included in the ~~–S~~pecific Best Management Practices (BMPs)" section to minimize potential surface runoff and leaching that can degrade water quality:

- *Do not exceed one application per site per year.*
- *Do not use on coarse-textured soils where the groundwater table is <10 feet and average annual precipitation >12 inches.*
- *Do not use on steep slopes if substantial rainfall is expected within 24 hours or ground is saturated.*

Aquatic Dissipation: Dissipation time (DT_{50}) represents the time required for 50 percent of the deposited pesticide to degrade or move (dissipate), whereas, aquatic half-life describes the rate for degradation only. As with aquatic half-life, units of dissipation time are usually expressed in days. Based upon the DT_{50} value, environmental persistence in aquatic habitats also would be categorized as one of the following: non-persistent <30 days, moderately persistent = 30 to 100 days, and persistent >100 days.

Threshold for approving PUPs:

If aquatic DT_{50} ≤100 days, then a PUP would be approved without additional BMPs to protect water quality.

If aquatic DT_{50} >100 days, then a PUP would only be approved with additional BMPs specifically to protect water quality. One or more BMPs such as the following would be included in the ~~–S~~pecific Best Management Practices (BMPs)" section to minimize potential surface runoff and leaching that can degrade water quality:

- *Do not exceed one application per site per year.*
- *Do not use on coarse-textured soils where the groundwater table is <10 feet and average annual precipitation >12 inches.*

- *Do not use on steep slopes if substantial rainfall is expected within 24 hours or ground is saturated.*

Potential to Move to Groundwater: GUS = $\log_{10}$(soil $t_{½}$) × [4 − $\log_{10}$(K_{oc})]. If a DT_{50} value is available, it would be used rather than a $t_{½}$ value to calculate a GUS score. Based upon the GUS value, the potential to move toward groundwater would be recorded as one of the following categories: extremely low potential <1.0, low potential 1.0 to 2.0, moderate potential 2.0 to 3.0, high potential 3.0 to 4.0, and very high potential >4.0.

Threshold for approving PUPs:

If GUS ≤4.0, then a PUP would be approved without additional BMPs to protect water quality.

If GUS >4.0, then a PUP would only be approved with additional BMPs specifically to protect water quality. One or more BMPs such as the following would be included in the ~~–S~~pecific Best Management Practices (BMPs)" section to minimize potential surface runoff and leaching that can degrade water quality:

- *Do not exceed one application per site per year.*
- *Do not use on coarse-textured soils where the groundwater table is <10 feet and average annual precipitation >12 inches.*
- *Do not use on steep slopes if substantial rainfall is expected within 24 hours or ground is saturated.*

Threshold for approving PUPs:

If I ≤1,000, then a PUP would be approved without additional BMPs to minimize drift and protect air quality.

If I >1,000, then a PUP would only be approved with additional BMPs specifically to minimize drift and protect air quality. One or more BMPs such as the following would be included in the ~~–S~~pecific Best Management Practices (BMPs)" section to reduce volatilization and potential to drift and degrade air quality:

- *Do not treat when wind velocities are <2 or >10 mph with existing or potential inversion conditions.*
- *Apply large-diameter droplets possible for spray treatments.*
- *Avoid spraying when air temperatures >85°F.*
- *Use the lowest spray height possible above target canopy.*
- *Where identified on the pesticide label, soil should incorporate pesticide as soon as possible during or after application.*

Octanol-Water Partition Coefficient (K_{ow}): The octanol-water partition coefficient (K_{ow}) is the concentration of a pesticide in octanol and water at equilibrium at a specific temperature. Because octanol is an organic solvent, it is considered a surrogate for natural organic matter. Therefore, K_{ow} would be used to assess potential for a pesticide to bioaccumulate in tissues of aquatic species (e.g., fish). If K_{ow} >1,000 or S_w<1 mg/L and soil $t_{½}$>30 days, then there would be high potential for a pesticide to bioaccumulate in aquatic species such as fish (U.S. Geological Survey 2000).

Threshold for approving PUPs:

If the potential for a pesticide to bioaccumulate is not high in aquatic species, then the PUP would be approved.

If there is a high potential to bioaccumulate in aquatic species (K_{ow}>1,000 or S_w<1 mg/L and soil $t_{½}$>30 days), then the PUP would not be approved, except under unusual circumstances where approval would only be granted by the Washington Office.

Bioaccumulation/Bioconcentration: Bioaccumulation is the physiological process where pesticide concentrations in tissue increase in biota because they are taken and stored at a faster rate than they are metabolized or excreted. The potential for bioaccumulation would be evaluated through bioaccumulation factors (BAFs) or bioconcentration factors (BCFs). Based upon BAF or BCF values, the potential to bioaccumulate would be recorded as one of the following: low = 0 to 300, moderate = 300 to 1,000, or high >1,000 (Calabrese and Baldwin 1993).

Threshold for approving PUPs:

If BAF or BCF ≤1,000, then a PUP would be approved without additional BMPs.

If BAF or BCF >1,000, then a PUP would not be approved, except under unusual circumstances where approval would only be granted by the Washington Office.

Worst-Case Ecological Risk Assessment

Maximum Application Rates (acid equivalent [ae]): Service personnel would record the highest application rate of an active ingredient (ae basis) for habitat management and cropland/facilities maintenance treatments in this data field of a chemical profile. These rates can be found in Table CP.1 under the column heading ~~"~~Max Product Rate – Single Application (lbs/acre – AI on acid equiv basis)." This table would be prepared for a chemical profile from information specified in labels for trade name products identified in PUPs. If these data are not available in pesticide labels, then write ~~"~~NS" for ~~"n~~ot specified on label" in this table.

EECs: An estimated EEC represents potential exposure to fish and wildlife (birds and mammals) from using a pesticide. EECs would be derived by Service personnel using an EPA screening-level approach (EPA 2004). For each maximum application rate (see previous paragraph), Service personnel would record two EEC values in a chemical profile; these would represent the worst-case terrestrial and aquatic exposures for habitat management and croplands/facilities maintenance treatments. For terrestrial and aquatic EEC calculations, see the description for data entry under Presumption of Unacceptable Risk/Risk Quotients, the next field in a chemical profile.

Presumption of Unacceptable Risk/Risk Quotients: Service personnel would calculate and record acute and chronic RQs for birds, mammals, and fish using the provided tabular formats for habitat management and/or cropland/facilities maintenance treatments. RQs recorded in a chemical profile would represent the worst-case assessment for ecological risk. See Section G.7.2 for a discussion regarding the calculations of RQs.

For aquatic assessments associated with habitat management treatments, RQ calculations would be based upon selected acute and chronic toxicological endpoints for fish, and the EEC would be

derived from Urban and Cook (1986) assuming 100 percent overspray to an entire 1-foot-deep water body using the maximum application rate (ae basis [see above]).

For aquatic assessments associated with cropland/facilities maintenance treatments, RQ calculations would be done by Service personnel based upon selected acute and chronic toxicological endpoints for fish, and an EEC would be derived from the aquatic assessment in AgDRIFT model version 2.01 under Tier I ground-based application with the following input variables: max application rate (ae basis [see above]), low boom (20 inches), fine to medium/coarse droplet size, 20 swaths, EPA-defined wetland, and 25-foot distance (buffer) from treated area to water.

See Section G.7.2.1.2 for more details regarding the calculation of EECs for aquatic habitats for habitat management and cropland/facilities maintenance treatments.

For terrestrial avian and mammalian assessments, RQ calculations would be done by Service personnel based upon dietary exposure, where the "short grass" food item category would represent the worst-case scenario. For terrestrial spray applications associated with habitat management and cropland/facilities maintenance treatments, exposure (EECs and RQs) would be determined using the Kanaga nomogram method through the EPA's T-REX version 1.2.3. T-REX input variables would include the following: max application rate (ae basis [see above]) and pesticide half-life (days) in soil to estimate the initial, maximum pesticide residue concentration on general food items for terrestrial vertebrate species in short (<20 cm tall) grass.

For granular pesticide formulations and pesticide-treated seed with a unique route of exposure for terrestrial avian and mammalian wildlife, see Section G.7.2.1.1.2 for the procedure that would be used to calculate RQs.

All calculated RQs in both tables would be compared with LOCs established by the EPA (see Table G-2 in Section G.7.2). If a calculated RQ exceeds an established LOC value (in brackets inside the table), then there would be a potential for an acute or chronic effect (unacceptable risk) to federally listed (threatened or endangered) species and non-listed species. See Section G.7.2 for detailed descriptions of acute and chronic RQ calculations and comparison to LOCs to assess risk.

Threshold for approving PUPs:

If RQs≤LOCs, then a PUP would be approved without additional BMPs.

If RQs>LOCs, then a PUP would only be approved with additional BMPs specifically to minimize exposure (ecological risk) to bird, mammal, and/or fish species. One or more BMPs such as the following would be included in the "Specific Best Management Practices (BMPs)" section to reduce potential risk to nonlisted or listed species:

- *Lower application rate and/or fewer number of applications so RQs≤LOCs.*
- *For aquatic assessments (fish) associated with cropland/facilities maintenance, increase the buffer distance beyond 25 feet so RQs≤LOCs.*

Justification for Use: Service personnel would describe the reason for using the pesticide based on control of specific pests or groups of pests. In most cases, the pesticide label would provide the appropriate information regarding control of pests to describe in the section.

Specific Best Management Practices (BMPs): Service personnel would record specific BMPs necessary to minimize or eliminate potential effects to non-target species and/or degradation of environmental quality from drift, surface runoff, or leaching. These BMPs would be based upon scientific information documented in previous data fields of a chemical profile. Where necessary and feasible, these specific practices would be included in PUPs as a basis for approval.

If there are no specific BMPs that are appropriate, then Service personnel would describe why the potential effects to refuge resources and/or degradation of environmental quality are outweighed by the overall resource benefit(s) from the proposed pesticide use in the BMP section of the PUP. See Section G.5 of this document for a complete list of BMPs associated with mixing and applying pesticides appropriate for all PUPs with ground-based treatments that would be additive to any necessary, chemical-specific BMPs.

References: Service personnel would record scientific resources used to provide data/information for a chemical profile. They would use the number sequence to uniquely reference data in a chemical profile.

The following online data resources are readily available for toxicological endpoint and environmental fate data for pesticides:

YCPA	Yamhill County Public Health
YMCA	Young Men‟s Christian Association

H.2 Glossary

Accessible. Without fences or vegetative barriers (tall, dense vegetation) at its margins.

Adaptive management. "The rigorous application of management, research, and monitoring to gain information and experience necessary to assess and modify management activities. A process that uses feedback from refuge research and monitoring and evaluation of management actions to support or modify objectives and strategies at all planning levels" (620 FW 1).

A " … decision process that promotes flexible decision making that can be adjusted in the face of uncertainties as outcomes from management actions and other events become better understood. Careful monitoring of these outcomes both advances scientific understanding and helps adjust policies or operations as part of an iterative learning process. Adaptive management also recognizes the importance of natural variability in contributing to ecological resilience and productivity. It is not a „trial and error" process, but rather emphasizes learning while doing. Adaptive management does not represent an end in itself, but rather a means to more effective decisions and enhanced benefits. Its true measure is in how well it helps meet environmental, social, and economic goals; increases scientific knowledge; and reduces tensions among stakeholders" (522 DM 1).

Alternative. Different sets of objectives and strategies or means of achieving refuge purposes and goals, helping fulfill the National Wildlife Refuge System (Refuge System) mission, and resolving issues (602 FW 1.6). The "no action" alternative is current refuge management, while the "action" alternatives are all other alternatives.

Anadromous fish. Fish that are born in fresh water, migrate to the ocean to grow into adults, and return to fresh water to spawn.

Appropriate use. "A proposed or existing use on a refuge that meets at least one of the following four conditions.

(1) The use is a wildlife-dependent recreational use as identified in the Improvement Act.

(2) The use contributes to fulfilling the refuge purpose(s), the Refuge System mission, or goals or objectives described in a refuge management plan approved after October 9, 1997, the date the Improvement Act was signed into law.

(3) The use involves the take of fish and wildlife under State regulations.

(4) The use has been found to be appropriate as specified in section 1.11" (603 FW 1).

Approved Acquisition Boundary. National wildlife refuge boundary approved by the U.S. Fish and Wildlife Service director for potential acquisition of lands by the Service.

Approved Refuge Boundary. A national wildlife refuge boundary approved by the national or regional U.S. Fish and Wildlife Service (USFWS) director. Within this boundary, the Service may negotiate with landowners to acquire lands not already owned by the Service.

Archaeology. The scientific study of material evidence remaining from past human life and culture.

Benefiting resources. Those species, species groups, or resources expected to benefit from actions taken for a Resource of Concern.

Big Six. Wildlife-dependent recreational uses under Refuge System Improvement Act. The big sixes uses are hunting, fishing, wildlife observation, photography, and environmental education and interpretation.

Birds of Conservation Concern. A category assembled by the USFWS Division of Migratory Birds identifying the migratory and nonmigratory species (beyond those already designated as federally threatened or endangered) that represent the division"s highest conservation priorities.

Biological Diversity (also Biodiversity). The variety of life and its processes, including the variety of living organisms, the genetic differences among them, and communities and ecosystems in which they occur (601 FW 3). The Refuge System"s focus is on indigenous species, biotic communities, and ecological processes.

Biological integrity. Biotic composition, structure, and functioning at genetic, organism, and community levels comparable with historical conditions, including the natural biological processes that shape genomes, organisms, and communities (601 FW 3).

Candidate species. Plant or animal species for which USFWS or NOAA Fisheries has on file sufficient information on biological vulnerability and threats to support a proposal to list as endangered or threatened (USFWS Endangered Species Glossary).

Categorical exclusion. A category of actions that do not individually or cumulatively have a significant effect on the human environment and have been found to have no such effect in procedures adopted by a Federal agency pursuant to the National Environmental Policy Act (NEPA) (40 CFR 1508.4).

Climate change. A "… change in the state of the climate that can be identified (e.g., by using statistical tests) by changes in the mean and/or the variability of its properties, and that persists for an extended period, typically decades or longer. Climate change may be due to natural internal processes or external forcings, or to persistent anthropogenic changes in the composition of the atmosphere or in land use" (IPCC 2008).

Compatible use. A " … wildlife-dependent recreational use or any other use of a refuge that, in the sound professional judgment of the Director, will not materially interfere with or detract from the fulfillment of the mission of the System or the purposes of the refuge" (602 FW 3).

Compatibility Determination. A written determination signed and dated by the refuge manager and regional chief signifying that a proposed or existing use of a national wildlife refuge is a compatible use or is not a compatible use. The director makes this delegation through the Regional Direction (603 FW 2).

Comprehensive Conservation Plan (CCP). A document that describes the desired future conditions of a refuge or planning unit and provides long-range guidance and management direction to achieve the purpose(s) of the refuge; helps fulfill the mission of the Refuge System; maintains and, where appropriate, restores the biological integrity, diversity, and environmental health of each refuge and the Refuge System; helps achieve the goals of the National Wilderness Preservation System, if appropriate; and meets other mandates (USFWS Habitat Management Planning Policy, 602 FW 1.4).

Concern. See Issue.

Connectivity. The arrangement of habitats that allows organisms and ecological processes to move across the landscape; patches of similar habitats are either close together or linked by corridors of appropriate vegetation. The opposite of **fragmentation.**

Conservation Targets (also see **Resources of Concern; Priority Species, Species Groups,** and **Communities).** Term used by land management agencies and conservation organizations to describe the resources (ecological systems, ecological communities, species, species groups, or other natural resources) selected as the focus of conservation actions.

Consumptive use. Recreational activities, such as hunting and fishing, that involve harvest or removal of wildlife or fish, generally to be used as food by humans.

Contaminants or **environmental contaminants.** Chemicals present at levels greater than those naturally occurring in the environment resulting from anthropogenic or natural processes that potentially result in changes to biota at any ecological level (USGS 1999). They are pollutants that degrade other resources upon contact or mixing.

Cooperative agreement. An official agreement between two parties.

Cover. The estimated percent of an area, projected onto a horizontal surface, that is occupied by a particular plant species.

Cultural resources. The physical remains, objects, historic records, and traditional lifeways that connect us to our nation"s past (USFWS no date).

Cultural resource inventory. A professionally conducted study designed to locate and evaluate evidence of cultural resources present within a defined geographic area. Inventories may involve various levels, including background literature search, comprehensive field examination to identify all exposed physical manifestations of cultural resources, or sample inventory to project site distribution and density over a larger area. Evaluation of identified cultural resources to determine eligibility for the National Register of Historic Places follows the criteria found in 36 CFR 60.4 (614 FW 1.7).

DM. U.S. Department of the Interior Manual.

Decadence. Marked by decay or decline, used for plants showing little or no new growth.

Deciduous. Trees and shrubs that shed all of their leaves each year.

Depredation. Causing serious damage to agricultural, horticultural, and fish cultural interests (Adapted from 50 CFR 21.42).

Direct Loss. Loss of food or loss of habitat as nonnative species outcompete natives.

Disturbance. Significant alteration of habitat structure or composition, or of the behavior of wildlife. May be a natural (e.g., fire) or human-caused event (e.g., aircraft overflight).

Ecosystem. A dynamic and interrelating complex of plant and animal communities and their associated nonliving environment.

Ecosystem management. Management of natural resources using systemwide concepts to ensure that all plants and animals in ecosystems are maintained at viable levels in native habitats and basic ecosystem processes are perpetuated indefinitely.

Effect (impact). A direct result of an action that occurs at the same time and place; or an indirect result of an action that occurs later in time or in a different place and is reasonably foreseeable; or the cumulative results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency or person undertakes such other actions (40 CFR 1508.8).

El Niño/La Niña - Southern Oscillation. A quasiperiodic climate pattern that occurs across the tropical Pacific Ocean. The *Southern Oscillation* refers to variations in the temperature of the surface of the tropical eastern Pacific Ocean (warming and cooling known as *El Niño* and *La Niña* respectively) and in air surface pressure in the tropical western Pacific. The two variations are coupled: the warm oceanic phase, El Niño, accompanies high air surface pressure in the western Pacific, while the cold phase, La Niña, accompanies low air surface pressure in the eastern Pacific.

Endemic. In the conservation context, exclusively native to a place. For example, kangaroos are endemic to Australia.

Environmental assessment. A concise public document, prepared in compliance with NEPA, that briefly discusses the purpose and need for an action and alternatives to such action, and provides sufficient evidence and analysis of impacts to determine whether to prepare an environmental impact statement or finding of no significant impact (40 CFR 1508.9).

Environmental harm. Environmental harm by pest species refers to a biologically substantial decrease in environmental quality as indicated by a variety of potential factors, including declines in native species populations or communities, degraded habitat quality or long-term habitat loss, and/or altered ecological processes.

Endangered Species (Federal). An animal or plant species in danger of extinction throughout all or a significant portion of its range.

Endangered Species (State). A plant or animal species in danger of becoming extinct or extirpated in a state within the near future if factors contributing to its decline continue. Populations of these species are at critically low levels or their habitats have been degraded or depleted to a significant degree.

Environmental education study sites. Outdoor locations where groups of students engage in hands-on activities within an environmental education curriculum.

Environmental health. Composition, structure, and functioning of soil, water, air, and other abiotic features comparable with historical conditions, including the natural abiotic processes that shape the environment (601 FW 3).

Enhance. To improve the condition of an area or habitat, usually for the benefit of certain native species.

Ethnographical. The study and systematic recording of human cultures; also: a descriptive work produced from such research.

Executive Order. A president‟s or governor‟s declaration, which has the force of law, usually based on existing statutory powers, and requiring no action by the Congress or state legislature.

Exotic. See **Nonnative species.**

Experimental population. A population (including its offspring) of a listed species designated by rule published in the Federal Register that is wholly separate geographically from other populations of the same species. An experimental population may be subject to less stringent prohibitions than are applied to the remainder of the species to which it belongs.

Focal Species (also Priority Resources of Concern or Focal Conservation Target). A suite of conservation targets that for purposes of planning are sorted and condensed to represent threats to biological integrity, diversity, and environmental health at the refuge level.

Friends of the Refuge. Friends of the Tualatin River National Wildlife Refuge, the official, nonprofit, volunteer organization supporting the refuge.

Geocaching. Known as letter boxing, an outdoor activity in which participants use a global positioning system (GPS) to recover techniques to hide and seek containers.

Goal. Descriptive, open-ended, and often broad statement of desired future conditions that conveys a purpose but does not define measurable units (620 FW 1.6).

Habitat. Suite of existing environmental conditions required by an organism for survival and reproduction. It is the place where an organism typically lives.

Habitat Management Plan. A plan that provides refuge managers a decision-making process; guidance for the management of refuge habitat; and long-term vision, continuity, and consistency for habitat management on refuge lands (USFWS Habitat Management Planning Policy 620 FW 1.4).

Habitat restoration. Management emphasis designed to move ecosystems to desired conditions and processes, and/or to healthy ecosystems.

Historical conditions. Composition, structure, and functioning of ecosystems resulting from natural processes that we believe, based on sound professional judgment, were present prior to substantial human related changes to the landscape (601 FW 3).

Hydrology. A graph of waterflows in a river or stream. A hydrograph provides a way of seeing seasonal and yearly changes in the flow or discharge of a waterway.

Important Bird Areas. A site designated by the National Audubon Society that provides essential habitat for one or more species of bird and that is recognized as being important on a global, continental, or state level.

Indicator. A measurable characteristic of a key ecological attribute that strongly correlates with the status of the key ecological attribute; something that serves as a sign or symptom.

Indigenous knowledge. The " … knowledge that an indigenous (local) community accumulates over generations of living in a particular environment. This definition encompasses all forms of knowledge—technologies, know-how skills, practices and beliefs—that enable the community to achieve stable livelihoods in their environment" (United Nations Environment Programme 2012).

Inholding. Refers to lands within an approved refuge boundary that are not owned by the Service. These can be private lands or lands owned by a city, county, state, or other Federal agencies.

Integrated Pest Management. A " … sustainable approach to managing pests by combining biological, cultural, physical, and chemical tools in a way that minimizes economic, health, and environmental risks" (FIFRA, 7 U.S.C. 136 et seq.).

"Examples of tools listed in the IPM definition include, but are not limited to, the following:

(1) Biological tools - predators, parasites, and pathogens;
(2) Cultural tools - crop rotation, alterations in planting dates, and sanitation;
(3) Physical tools - barriers, traps, hand-pulling, hoeing, mowing, and tilling;
(4) Chemical tools - pesticides, such as herbicides, insecticides, or fungicides" (517 DM 1).

Interpretation. A teaching technique that combines factual information with stimulating explanation. Frequently used to help people understand natural and cultural resources.

Invasive species. An " … alien species whose introduction does or is likely to cause economic or environmental harm or harm to human health" (EO 13112).

Inventory. A survey of the plants or animals inhabiting an area.

Inviolate Sanctuary. The original intent of the term "inviolate sanctuary" is found in the Migratory Bird Conservation Act (first passed in 1918 as the Migratory Bird Treaty Act and amended in 1934 and 1938). This Act originally required that all refuges be inviolate sanctuaries and deemed that refuges‟ primary purposes were as breeding grounds and habitat for migratory birds. Migratory bird hunting was prohibited on migratory waterfowl areas by the Act, but most other human uses were not addressed. The 1938 amendment to the Act gave refuge managers authority to decide if, when, and how bird hunting would be allowed. The 1949 Duck Stamp Act allowed waterfowl hunting on refuges, but restricted the percentage of each refuge open to hunting. Current policy states that portions of a refuge are considered "inviolate sanctuaries" if they were (a) acquired with the approval of the Migratory Bird Conservation Commission for the purpose of an inviolate sanctuary; (b) acquired with MBCC approval or Land and Water Conservation Fund funds to protect a threatened or endangered species; or (c) established by an instrument or document that states the intent to manage the area as an "inviolate sanctuary for migratory birds" or to fulfill the purpose of the Migratory Bird Conservation Act. Policy further allows migratory game bird hunting on no more than 40 percent of the area considered inviolate sanctuary if compatible with a refuge‟s purposes and mission. Inviolate sanctuary classification imposes no limits on hunting nonmigratory birds, fur bearers, or other game species.

Issue. Any unsettled matter that requires a management decision, for example, an initiative, opportunity, resource management problem, threat to the resources of the unit, conflict in uses, public concern, or the presence of an undesirable resource condition (620 FW 1.6).

Key ecological attributes. Those aspects of the environment, such as ecological processes or patterns of biological structure and composition that are critical to sustain the long-term viability of the target. These key ecological attributes are further divided into measurable indicators.

Keystone species. Species that enrich ecosystem function in a unique and significant manner through their activities, and have an effect that is disproportionate to their numerical abundance. Their removal initiates changes in ecosystem structure and often loss of diversity. These keystone species may be habitat modifiers (e.g., Cottonwoods, beavers), predators (e.g., bobcat, coyote), or herbivores (e.g., elk).

Kalapuya. *It-galapu ywi-yu-ks,* A Chinookan term for the Willamette Valley people, consisting of eight Tribes speaking three different languages, formerly inhabiting the valley of the Willamette River in Oregon.

Land Protection. The acquisition of fee title, easement, or lease of a given land parcel to protect important natural resource values on the land from incompatible land uses.

Listed Species (Federal). Species that have been formally listed under the Endangered Species Act as threatened or endangered. Also includes candidate and proposed species. An endangered species is one that is in danger of extinction throughout all or a significant portion of its range. A threatened species is one that is likely to become endangered in the foreseeable future. Proposed species include taxa for which the Service or National Marine Fisheries Service has published a proposal to list as endangered or threatened in the Federal Register. Candidate species include those taxa for which the Service has sufficient biological information to support a proposal to list as endangered or threatened.

Maintenance. The upkeep of constructed facilities, structures, and capitalized equipment necessary to realize the originally anticipated useful life of a fixed asset. Maintenance includes preventative

maintenance; cyclic maintenance; repairs; replacement of parts, components, or items of equipment; periodic condition assessment; periodic inspections, adjustment, lubrication and cleaning (nonjanitorial) of equipment; painting, resurfacing, rehabilitation; special safety inspections; and other actions to ensure continuing service and to prevent breakdown.

Metro. Regional government for the Portland metropolitan area, including Clackamas, Multnomah, and Washington Counties and associated municipalities. Metro coordinates regionwide land-use planning; provides garbage, recycling, and transportation services; acquires, restores, and manages natural areas; and operates cemeteries, event facilities, and the zoo.

Migration. Seasonal movement of wildlife from one area to another and back.

Migratory birds. Those species of birds listed under 50 CFR 10.13 (as defined by various treaties) (720 FW 1, Policies and Responsibilities of the Migratory Bird Program).

Mixed deciduous/coniferous forest. Forest that usually has a mixture of Douglas-fir, oak, and maple, with a shrub understory.

Moist soil plants. Plants that are adapted to periodic flooding and drying conditions.

Monitoring. The process of collecting information to track changes of selected parameters over time.

National Environmental Policy Act of 1969 as amended (42 U.S.C. 4321-4375). A Federal law that requires all Federal agencies, including the Service, to examine the environmental impacts of their actions, incorporate environmental information, and use public participation in the planning and implementation of all actions. Federal agencies must integrate NEPA with other planning requirements and prepare appropriate NEPA documents to facilitate better environmental decision making (40 CFR 1500).

National Register of Historic Places. The nation‟s master inventory of known historic properties administered by the National Park Service. Includes buildings, structures, sites, objects, and districts that possess historic, architectural, engineering, archeological, or cultural significance at the national, state, and local levels (USFWS no date).

National Wildlife Refuge System. Various categories of areas administered by the Secretary of the Interior for the conservation of fish and wildlife, including species threatened with extinction; all lands, waters, and interests therein administered by the Secretary as wildlife refuges; areas for the protection and conservation of fish and wildlife that are threatened with extinction; wildlife ranges; game ranges; wildlife management areas; or waterfowl production areas.

National Wildlife Refuge System Administration Act of 1966, as amended (16 U.S.C. 668dd-668ee). A Federal law that provides guidance on the administration and management of the national wildlife refuge system.

National Wildlife Refuge System Improvement Act of 1997 (Public Law 105-57). A Federal law that amended and updated the National Wildlife Refuge System Administration Act of 1966 (16 U.S.C. 668).

Native. “With respect to a particular ecosystem, a species that, other than as a result of an introduction, historically occurred or currently occurs in that ecosystem” (601 FW 3).

Nonconsumptive recreation. Recreational activities that do not involve harvest, removal, or consumption of fish, wildlife, or other natural resources.

Nonnative species. A species that is present in the planning area but was not known to exist prior to Euro-American settlement of the Americas.

Noxious weed. A plant species designated by Federal or state law as generally possessing one or more of the following characteristics: aggressive or difficult to manage; a carrier or host of serious insect or disease; or nonnative, new, or not common to the region. According to the Federal Noxious Weed Act (PL 93-639), a noxious weed is one that causes disease or has adverse effects on man or his environment and therefore is detrimental to the agriculture and commerce of the United States and to the public health.

Objective. A concise statement of what we want to achieve, how much we want to achieve, when and where we want to achieve it, and who is responsible for the work. Objectives derive from goals and provide the basis for determining strategies, monitoring refuge accomplishments, and evaluating the success of strategies. Objectives should be attainable, time-specific, and measurable (620 FW 1.6).

Operations. Activities related to the normal performance of the functions for which a facility or item of equipment is intended to be used. Costs such as utilities (electricity, water, sewage) fuel, janitorial services, window cleaning, rodent and pest control, upkeep of grounds, vehicle rentals, waste management, and personnel costs for operating staff are generally included within the scope of operations.

Outreach. The process of providing information to the public on a specific issue through the use of the media, printed materials, and presentations.

Pacific Flyway. One of four major north-south travel corridors for migratory birds. The Pacific Flyway is west of the Rocky Mountains.

Permanent wetland. Wetlands or portions of refuge that retain water throughout the year. Permanently flooded waters are generally occupied by submergent wetland plants such as pondweeds.

Pest. "(1) any insect, rodent, nematode, fungus, weed, or (2) any other form of terrestrial or aquatic plant or animal life or virus, bacteria, or other micro-organism (except viruses, bacteria, or other micro-organisms on or in living man or other living animals) which the [U.S. Environmental Protection Agency] Administrator declares to be a pest under section 25(c)(1)" (FIFRA, 7 U.S.C. 136 et seq.).

"…living organisms, including invasive plants and introduced or native organisms, that may interfere with achieving our management goals and objectives on or off our lands, or that jeopardize human health or safety" (569 FW 1).

Planning team. The primary Service staff and others who played a key role in developing and writing the CCP/EA for a refuge. Planning teams are interdisciplinary in membership and function. Teams generally consist of a planning team leader, the refuge manager and staff biologists, a state natural resource agency representative, and other appropriate program specialists (e.g., social

scientists, ecologists, recreation specialists). We also ask other Federal and Tribal natural resource agencies to provide team members, as appropriate. The planning team prepares the CCP and appropriate NEPA documentation (620 FW 1.6).

Plant community. An assemblage of plant species that is unique in its composition; occurs in particular locations under particular influences; a reflection or integration of the environmental influences on the site such as soils, temperature, elevation, solar radiation, slope, aspect, and rainfall; and denotes a general kind of climax plant community (e.g., Oregon white oak woodland).

Preferred Alternative. This is the alternative determined [by the decision maker] to best achieve the refuge purpose, vision, and goals; to best contribute to the Refuge System mission; to best address the significant issues; and to be consistent with principles of sound fish and wildlife management.

Preplanning. The first phase of the CCP planning process. It includes identifying the planning area and data needs; establishing the planning team and planning schedule; reviewing available information; preparing a public involvement plans and conducting internal scoping.

Priority Public Uses. Defined in Improvement Act as hunting, fishing, wildlife observation and photography, and environmental education and interpretation.

Priority Resources of Concern. See **Resources of Concern** and **Focal Species** definitions.

Public. Individuals, organizations, and groups; officials of Federal, state, and local government agencies; Indian Tribes; and foreign nations. It may include anyone outside the planning team. It includes those who may or may not have indicated an interest in Service issues and those who may be affected by Service decisions.

Public Land Order. Public lands consist of that class of land remaining from the original public domain that was acquired by the United States by treaty, purchase, or cession from a foreign power.

Quality. A national wildlife refuge public use program is considered high quality if it:

A. "Promotes safety of participants, other visitors, and facilities;
B. Promotes compliance with applicable laws and regulations and responsible behavior;
C. Minimizes or eliminates conflict with fish and wildlife population or habitat goals or objectives in an approved plan;
D. Minimizes or eliminates conflicts with other compatible wildlife-dependent recreation;
E. Minimizes conflicts with neighboring landowners;
F. Promotes accessibility and availability to a broad spectrum of the American people;
G. Promotes resource stewardship and conservation;
H. Promotes public understanding and increases public appreciation of America"s natural resources and our role in managing and conserving these resources;
I. Provides reliable/reasonable opportunities to experience wildlife;
J. Uses facilities that are accessible to people and blend into the natural setting; and
K. Uses visitor satisfaction to help define and evaluate programs." (General Guidelines for Wildlife-Dependent Recreation, 605 FW 1).

Refuge. Tualatin River National Wildlife Refuge.

Refuge Operating Needs System (RONS). A national database of unfunded refuge operating needs required to meet and/or implement station goals, objectives, management plans, and legal mandates. It is used as a planning, budgeting, and communication tool describing funding and staffing needs of the Refuge System.

Refuge purpose(s). The purposes specified in or derived from the law, proclamation, executive order, agreement, public land order, donation document, or administrative memorandum establishing, authorizing, or expanding a refuge, refuge unit, or refuge subunit. For refuges that encompass congressionally designated wilderness, the purposes of the Wilderness Act are additional purposes of the refuge (620 FW 1.6).

Refuge System. National Wildlife Refuge System.

Resource of Concern (ROC). All plant and/or animal species, species groups, or communities specifically identified in refuge purpose(s), Refuge System mission, or international, national, regional, State, or ecosystem conservation plans or acts. For example, waterfowl and shorebirds are ROCs on a refuge whose purpose is to protect "migrating waterfowl and shorebirds." Federal or state threatened and endangered species on that same refuge are also a resource of concern under terms of the respective endangered species acts (Habitat Management Planning Policy, 620 FW1.4).

Restore. To bring back to a former or original condition.

Riparian habitat. Refers to an area of habitat that is transitional from terrestrial to aquatic ecosystems; including streams, lakes, wet areas, and adjacent plant communities and their associated soils that have free water at or near the surface; an area whose components are directly or indirectly attributed to the influence of water; of or relating to a river; specifically applied to ecology, "riparian" describes the land immediately adjoining and directly influenced by streams. For example riparian vegetation includes any and all plant life growing on the land adjoining a stream and directly influenced by the stream.

Riverine. Flowing perennial to intermittent waters bounded by a channel. This habitat encompasses a river or stream, its channel, and the associated aquatic vegetation.

Ruderal. Growing where the natural vegetational cover has been disturbed by humans. Generally referring to a weedy area.

Sanctuary. At the Tualatin River NWR, the term sanctuary is used colloquially to mean areas that are closed to all public uses during a portion or all of the year. Also see **Inviolate Sanctuary.**

Semipermanent Villages. Lasting or intended to last for a long time but not permanent

Seasonal Wetlands. Areas that are periodically inundated or have soils saturated to the surface at some time during the growing season (but not year-round).

Service. U.S. Fish and Wildlife Service.

Scoping. The phase of notifying the public of the opportunity to participate in the planning process to help identify issues, concerns, and opportunities related to the project early in the planning process.

Significant Effect. Use of the term in NEPA requires consideration of both context and intensity (40 CFR 1508.27). Context means the significance of an action must be analyzed in its current and proposed short- and long-term effects on the whole of a given resource (e.g., affected region). Intensity refers to the severity of the effect.

Species of Concern (Federal). Taxa whose conservation status is of concern to the Service (many were previously known as Category 2 candidates), but for which further information is still needed. Such species receive no legal protection and use of the term does not necessarily imply that a species will eventually be proposed for listing.

Step-down Management Plan. A plan that provides specific guidance on management subjects (e.g., habitat, public use, fire, safety) or groups of related subjects. It describes strategies and implementation schedules for meeting CCP goals and objectives (620 FW 1.6).

Strategy. A specific action, tool, technique, or combination of actions, tools, and techniques used to meet unit objectives (620 FW 1.6).

Thatch. The dense covering of cut grass that remains after mowing or accumulating after several growing seasons. Thatch inhibits growth of new grass.

Threatened Species (Federal). An animal or plant species, listed by the Service, as likely to become endangered within the foreseeable future throughout all or a significant portion of its range.

Threatened Species (State). A plant or animal species identified by a state wildlife agency as likely to become endangered in a state within the near future if factors contributing to population decline or habitat degradation or loss continue.

TriMet. Local agency that provides public transportation in the Portland area via bus, commuter rail, light rail, and street car.

Upland prairie/oak savanna. Characterized by widely spaced Garry oak trees with grassland habitats (upland prairie) occurring between them.

Vegetation type (**habitat type**, **forest cover type).** A land classification system based upon the concept of distinct plant associations.

Vision Statement. A concise statement of what the planning unit should be, or what we hope to do, based primarily upon the Refuge System mission and specific refuge purposes, and other mandates. The vision statement for the refuge is tied to the mission of the Refuge System; the purpose(s) of the refuge; the maintenance or restoration of the ecological integrity of each refuge and the Refuge System; and other mandates (620 FW 1.6).

Volatile Organic Compounds (VOCs). Any compound of carbon, excluding carbon monoxide, carbon dioxide, carbonic acid, metallic carbides or carbonates, and ammonium carbonate, that participates in atmospheric photochemical reactions. (http://www.epa.gov/ttn/naaqs/ozone/ozonetech/def_voc.htm)

Waterfowl. Resident and migratory ducks, geese, and swans.

Water Quality. A term used to describe the chemical, physical, and biological characteristics of water, usually in respect to its suitability for a particular purpose.

Watershed. The land area that drains water to a particular stream, river, or lake. It is a land feature that can be identified by tracing a line along the highest elevations between two areas on a map, often a ridge. Large watersheds, like the Mississippi River Basin contain thousands of smaller watersheds.

Wetlands. Wetlands are lands transitional between terrestrial and aquatic systems where the water table is usually at or near the surface or the land is covered by shallow water at some time during the growing season of each year (660 FW 2).

Wildlife-dependent recreational use. A use of a refuge involving hunting, fishing, wildlife observation and photography, or environmental education and interpretation. These are the six priority public uses of the Refuge System as established in the Administration Act, as amended. Wildlife-dependent recreational uses, other than the six priority public uses, are those that depend on the presence of wildlife. The Service will consider these other uses in the preparation of refuge CCPs; however, the six priority public uses always will take precedence (620 FW 1.6).

Appendix I. Contributors to the Comprehensive Conservation Plan

I.1 Core Planning Team

Name	Title	Organization
Erin Holmes	Project Leader, Tualatin River National Wildlife Refuge (TRNWR)	U.S. Fish and Wildlife Service (USFWS)
John Gahr	Deputy Refuge Manager, TRNWR	USFWS
Pete Schmidt	Wildlife Biologist, TRNWR	USFWS
Kim Strassburg	Visitor Services Manager, TRNWR	USFWS
Valerie Morgan	Biological Technician, TRNWR	USFWS
Tom Miewald	Geographer, Division of Refuge Information, Region 1	USFWS
Scott McCarthy	Planner, Division of Planning and Visitor Services, Region 1	USFWS
Chris Lapp	Former Deputy Refuge Manager, TRNWR (transferred)	USFWS

I.2 Extended Planning Team, Reviewers, and Subject Matter Experts

Name	Area of Assistance	Organization
Anderson, Eric	Visitor services	USFWS
Austin, Heather	City planning	City of Sherwood, Oregon
Bales, Brad	Migratory game birds	Oregon Department of Fish and Wildlife (ODFW)
Ball, Gary	Hydrology	USFWS
Barnes, Susan	Nongame wildlife	ODFW
Beall, Jock	Wildlife biology, habitat restoration	USFWS
Buerger, Ted	Wildlife biology, contaminants	USFWS
Carver, Erin	Economic analysis	USFWS
Carver, Kenny	Mosquito control	Washington County, Oregon
Christy, John	Wetlands ecology	Oregon Biodiversity Information Center
Engler, Joe	Biological goals and objectives	USFWS

Name	Area of Assistance	Organization
Flores, Bob	General review	USFWS
Gonzales-Rogers, Patrick	Tribal coordination	USFWS
Grafe, Dawn	Visitor services	USFWS
Green, Mike	Migratory birds	USFWS
Hagedorn, Greg	Fire management plan	USFWS
Harrison, Ben	General review	USFWS
Hasti, Matt	Visitor services	USFWS
Heimowitz, Paul	Climate change	USFWS
Houghten, Chuck	CCP quality and consistency	USFWS
Humphreys, Brandy	Tribal interests	Confederated Tribes of Grand Ronde
Irvine, Kolleen	Law enforcement	USFWS
Kier-Haggenjos, Kay	Writing, editing	USFWS
Kilbride, Kevin	Biological goals and objectives, integrated pest management	USFWS
Lohr, Sam	Fisheries biology	USFWS
MacCorkle, Staci	Consultant	SWCA Environmental Consultants
Mares, Carmella	Realty	USFWS
Marxen, Mike	Visitor services	USFWS
Mayer, Tim	Climate change	USFWS
McCarthy, Nicole	Writing, editing	USFWS
Moore, Steve	Consultant	Bigfoot Consulting
Moss, Berk	Environmental education	Friends of Tualatin River National Wildlife Refuge
Murphy, Maren	Visitor services	USFWS
Murtagh, Tom	Fisheries biology	ODFW
Nebeker, Mark	Wildlife biology	ODFW
Newell, Avis	Water quality	Oregon Department of Environmental Quality
O'Hara, Kevin	National Environmental Policy Act	USFWS
Parks, Virginia	Cultural resources	USFWS

Appendix J. Acquisition History

Date	Legal Document	Direction
December 20, 1991	U.S. Fish and Wildlife Service (USFWS; Service) Urban Refuge Policy	**Policy:** Acquire lands and waters in or adjacent to metropolitan statistical areas to protect fish and wildlife resources and habitats that will provide the public wildlife-oriented recreation, education, and interpretive opportunities. **Purpose:** Primary purpose for establishment of new urban refuges will be to foster environmental awareness and outreach programs to develop an informed and involved citizenry that will support fish and wildlife conservation. General policy and purpose applies to all tracts within the 3,060-acre approved acquisition boundary of the refuge.
February 13, 1992	Tualatin River National Wildlife Refuge (Refuge) Land Protection Plan	**Authority:** Migratory Bird Conservation Act of 1929 (16 U.S. Code [U.S.C.] 715 et. seq.). Established a Migratory Bird Conservation Commission to approve areas recommended by the Secretary of the Interior for acquisition with the Migratory Bird Conservation Fund. **Purpose:** "for use as an inviolate sanctuary, or for any other management purpose, for migratory birds …" **Authority:** Fish and Wildlife Act of 1956, as amended (16 U.S.C. 742a-742j). The Secretary of the Interior is authorized to take such steps as may be required. **Purpose:** "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" **Authority:** Emergency Wetlands Resources Act of 1986 (Public Law 99-645; 100 Stat 3582). Authorized the purchase of wetlands from Land and Water Conservation Fund monies. **Purpose:** "for the conservation of the wetlands of the Nation in order to maintain the public benefits they provide and to help fulfill international obligations contained in various migratory bird treaties and conventions …" **Authority:** Land and Water Conservation Fund Act of 1965, as amended (16 U.S.C. 460L 4-11). Provides funding through receipts from the sale of surplus Federal land, appropriations from oil and gas receipts from the outer shelf, and other sources for land acquisition under several authorities, including the Fish and Wildlife Act of 1956 and the Emergency Wetlands Resources Act of 1986. General authorities and purposes apply to all tracts within the 3,060-acre approved acquisition boundary of the refuge.
February 13, 1992	Refuge Land Protection Plan and Environmental Assessment (EA)	**Purpose:** Established the Tualatin River National Wildlife Refuge to protect, enhance, and manage upland, wetland, and riparian habitats for a variety of migratory birds and resident fish and wildlife, as well as for the enjoyment of people. Oregon's Natural Heritage Program has referenced Oregon ash and Oregon white oak habitats as well as scrub-shrub wetland as among the rarest that remain in the Tualatin River Valley, and suggests they be considered highest in priority for protection because of their historical status and range of importance for promoting biological diversity.

Date	Legal Document	Direction
		General purpose applies to all tracts within the 3,060-acre approved acquisition boundary of the refuge.
December 31, 1992	Warranty Deed	Tract 31a (12.0 acres) donated by Brenner et al. under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA.
March 21, 1994	Warranty Deed	Tract 59 (9.7 acres) purchased from Cerenghino et al. under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA.
March 21, 1994	Warranty Deed	Tract 70 (45.8 acres) purchased from Gerda Cerenghino Estate under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA.
July 22, 1994	Warranty Deed	Tract 84 (99.03 acres) purchased from Naujock Family Trust under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA.
July 29, 1994	Warranty Deed	Tract 53 (3.8 acres) purchased from Charles Desmond under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA.
October 26, 1994	Warranty Deed	Tracts 78, 78a, and 78b (totaling 48.77 acres) purchased from the Claus family (Robert J., Susan., Douglas C., Christine E., and R. James) under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA.

Date	Legal Document	Direction
July 6, 1995	Warranty Deed	Tract 40 (47.22 acres) purchased from Edna and David Parr under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. Life use of the property was retained under easement. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA.
May 6, 1999	Easement	Tract 40 (47.22 acres) purchased from Edna and David Parr under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. Life use of the property was purchased under easement. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA.
August 7, 1996	Warranty Deed	Tract 16 (140.98 acres) purchased from Daniel Dennis under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA. More specific purposes for management are found within the Refuge Mitigation Plan and Compatibility Determination for Granting of Easement to Washington County Department of Land Use and Transportation. Addressed are compensatory mitigation and compatibility requirements for a right-of-way roadway improvement project granted to Washington County, Department of Land Use and Transportation. Mitigation was performed to offset direct impacts to wetland and upland habitats causing a reduction in floodplain capacity and decline in water quality from stormwater runoff, and indirect impacts causing wildlife disturbance and displacement. Specifically, development conditions were satisfied by the County upon 1) restoring and creating 33 acres of emergent and forested wetland in a managed basin, 2) creating and restoring 12 acres of riparian woodland and emergent wetland swale, 3) restoring 1.5 acres of riparian forest swale to enhance backwater habitat for anadromous fish, and 4) expanding the floodplain adjacent to the managed wetland resulting in no net loss of water-storage capacity. At least 5.1 acres are to be managed in perpetuity as the following habitats: 2.99 acres forested wetland, 0.8 acre emergent wetland, 1.5 acres riparian forest, 1.75 acres floodplain habitat.
September 5, 1996	Warranty Deed	Tract 41 (369.0 acres) purchased from Erhardt Steinborn et ux. under authority of the Fish and Wildlife Act of 1956 "for the development, advancement, management, conservation, and protection of fish and wildlife resources …" using the Land and Water Conservation Fund. General purpose derived from the Urban Refuge Policy and the Refuge Land Protection Plan and EA.
September	Easement	Tract 41c (30.5 acres) purchased from Erhardt Steinborn et ux. under
