Oregon Grasshopper and Mormon Cricket Survey Summary for 2024

INTRODUCTION

In 2024 the Oregon Department of Agriculture (ODA) conducted surveys for Grasshopper (GH) and Mormon cricket (MC) from April 17- September 5th. During this time a total of 4,056 sites were visited. Of that total, 4,056 sites were surveyed for MC and 4,056 sites were surveyed for GH (Fig. 1 and 2).

Survey sites were selected based on public response to requests for assistance with survey and based on the ODA's standard search for and assessment of GH and MC populations. This work was supported by general funds allocated to the ODA for grasshopper mitigation during the 2024 legislative session (Senate Bill 5701).

GRASSHOPPERS

This season, many areas experienced outbreaks similar to 2023, while other areas experienced less pressure. The outbreak areas were in areas that have previously experience high population pressure. This year 52 percent of survey sites were at an economic density¹ (Table 2), and for those stops the mean density was 55 GH/yd² (Table 2).

Of the total sites surveyed 2,940 were during the period for nymphal grasshopper survey and 1,116 during the adult period (Table 2). Nymphal survey takes place early in the season and is used to locate potential outbreak areas for response during the current year. The adult survey (conducted this year July 5- September 5th) is used by ODA to make predictions for the following season and considers economic levels as 8 or more grasshoppers per square yard. The 236 Common Data Sites (CDS) (standard locations visited each year for year-to-year comparison) were included in the survey.

Approximately 10.8 million acres across 18 counties in eastern Oregon were estimated to contain economically infested locations (Fig. 2; Table 2). Malheur County had the most infested acreage at 2,781,692. Lake, Klamath, Baker, and Harney all had more than 1.5 million infested acres. (Fig. 9; Table 3; Appendix 1).

Survey resources have been reduced since 2011 (Sites Surveyed, No. of Surveyors, Table 2) so the percent of economically infested acreage to the total surveyed acreage may be more useful for comparing the between year trend in population density.

¹ Note: 'Economic density' is a term used in this report and in historical survey data to indicate a population level of 8 grasshoppers per square yard or greater. This is considered a minimum population level for potentially damaging impacts to occur. The actual rate of damage will vary by season, species complex, climate, and the combined ecological and agronomical features of the site. Economic density should therefore not be considered a functional threshold for recommending treatment, but rather an indication that a closer look may be warranted. For help in determining if a grasshopper population meets a site specific minimum threshold for economically justifying treatment, please refer to the Decision Support Tools section of APHIS' Grasshopper Integrated Pest Management User Handbook (www.sidney.ars.usda.gov/grasshopper/Handbook/index.htm).

Table 1. A comparison of grasshopper (GH) infestation densities (/ yd²) adjusted for effort (percentage of total surveyed acres within each year).

Year	Percent of Total Surveyed Acres		
	Economic	Non-Econ	No GH

9-East Steens area Harney County

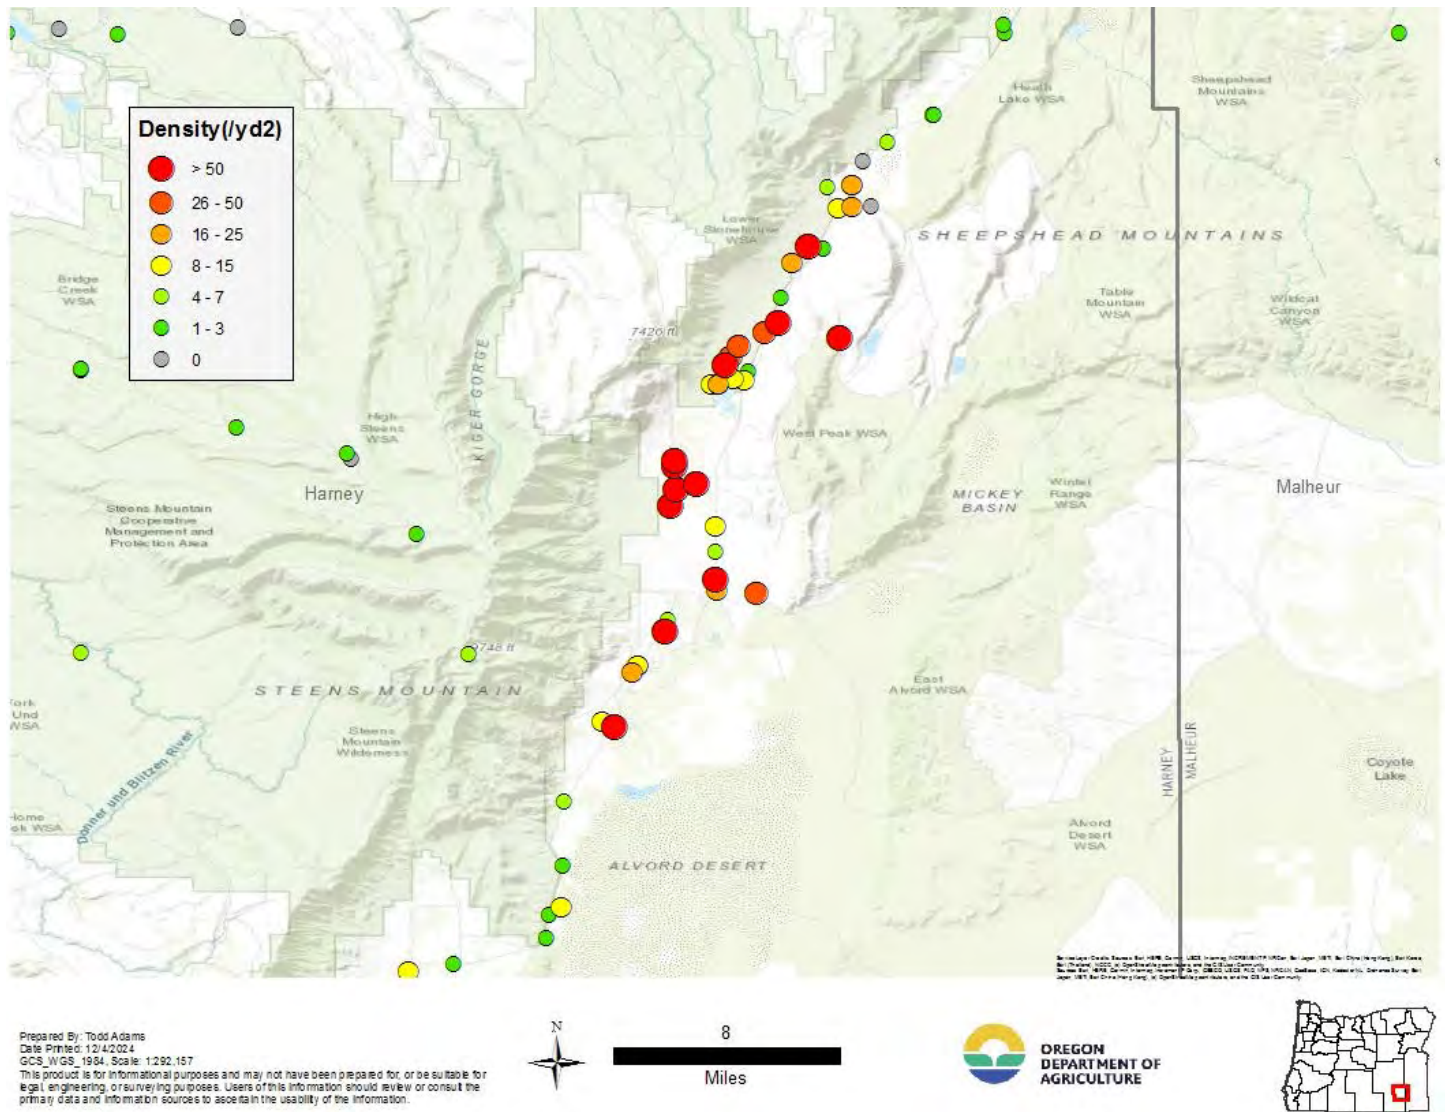

Figure 16. Grasshopper classified densities (GH/yd²) in East Steens area, Harney County.

TRIBAL LANDS

The grasshopper survey intersected tribal holdings at several locations across eastern Oregon (~119,273 ac; 48,268 ha), including the Umatilla and Warm Springs Reservations (Fig. 17). Area estimates on the Umatilla and Warm Springs Reservations contained both Economic and Non-economic densities (Table 6).

Table 6. 2024 grasshopper survey area estimates intersecting with eastern Oregon tribal lands.

	Economic		Non-Economic		No Grasshoppers	
	Acres	Hectares	Acres	Hectares	Acres	Hectares
Burns Paiute Reservation	30	12	0	0	0	0
Fort McDermitt Reservation	0	0	0	0	3,809	1,542

MORMON CRICKETS

Mormon Crickets continue to move farther west from Idaho making to the Arock area and beyond along HWY 95. Populations continue to build and move north from McDermitt, Nevada. Mormon crickets spread further into Harney County this year.

There were no significant numbers of Mormon crickets found in the area around Arlington (Gilliam County). This may signal the beginning of the end of this recent Mormon cricket outbreak. Continued surveys for

Mormon crickets in the region will be needed to determine if the outbreak is waning. It is too early to tell if this is a result of coordinated efforts to suppress the population or if there were some other biotic factors at play here. Again, this year bands did not enter the town of Arlington. No Mormon Crickets were found in Morrow County this year.

Support was provided for Robert Srygley (USDA, ARS, Sidney, MT), as he continues his research on Mormon cricket egg development and delayed hatch ('hedge betting') in the Arlington and Blalock Canyon area. All hope that Bob's work will help anticipate population outbreaks and assist in planning the long-term local response which is needed now and will be in the future.

Table 7. The number of Mormon cricket stops by Density Category (/yd²) and Dominant Life Stage encountered across the entire season.

Density	Totals	Dominant Developmental Stage

Percentages:		0.0	5.2	3.0	13.4	15.7	3.0	0.0	0.0	59.7

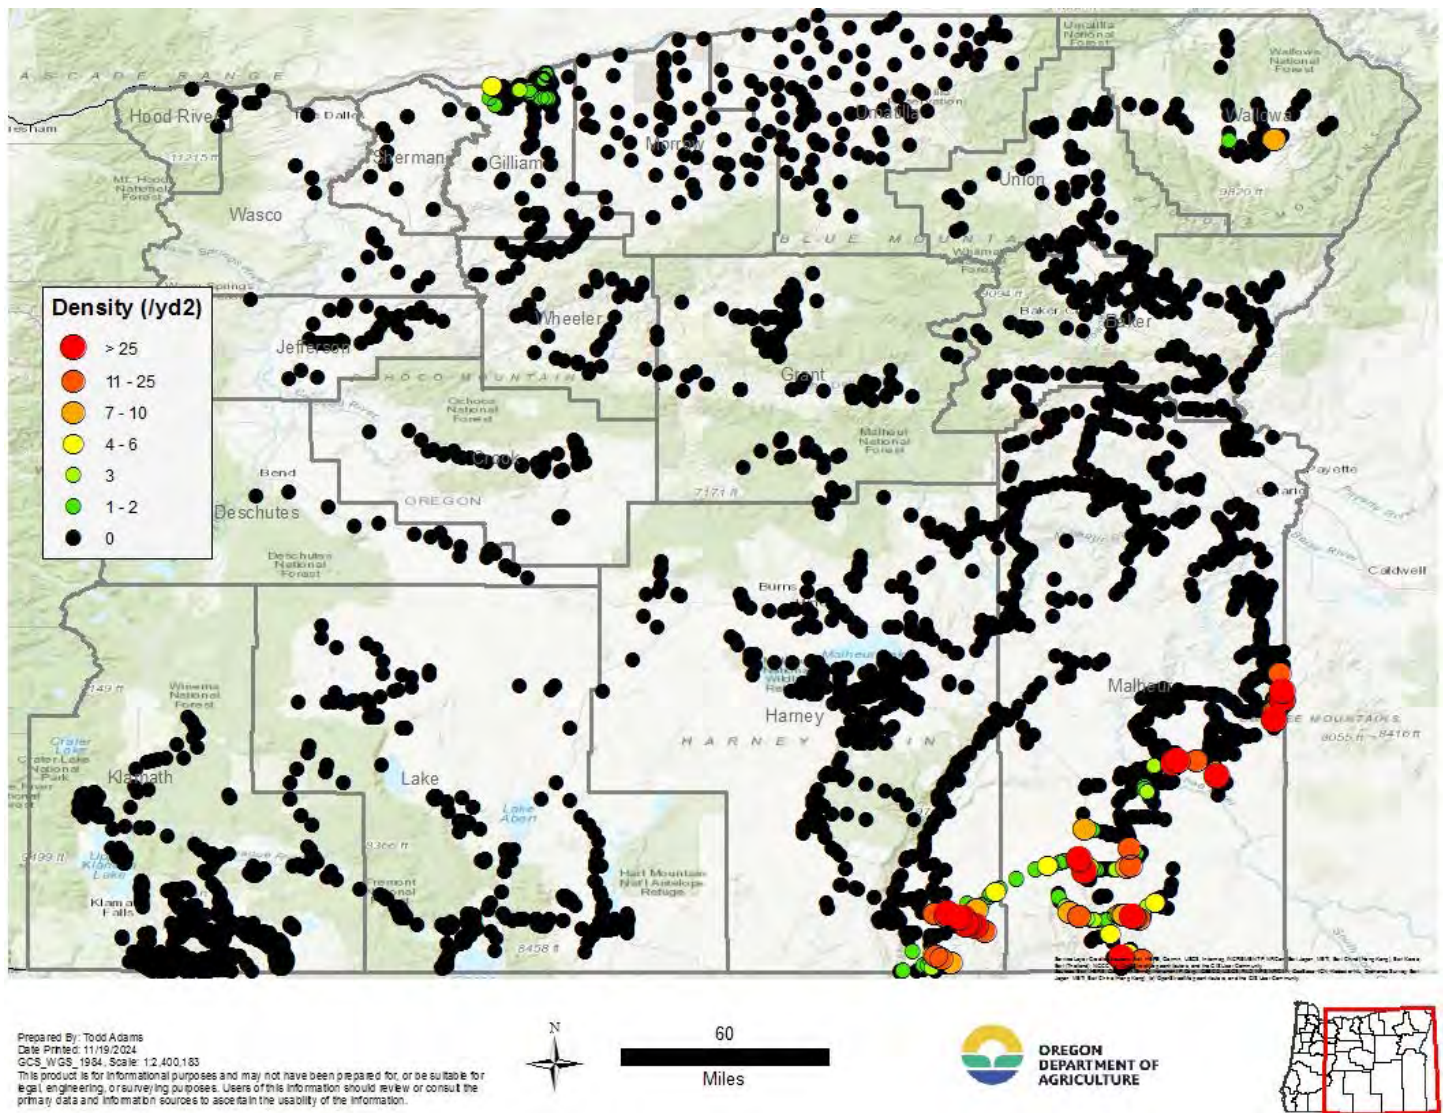

Figure 19. Locations surveyed for Mormon crickets (*Anabrus* sp.) in eastern Oregon classified by density (/yd²). (1:2400k).

A CLOSER LOOK

1-Arlington Area, Gilliam County

The Mormon cricket outbreak in the Arlington area maybe over.

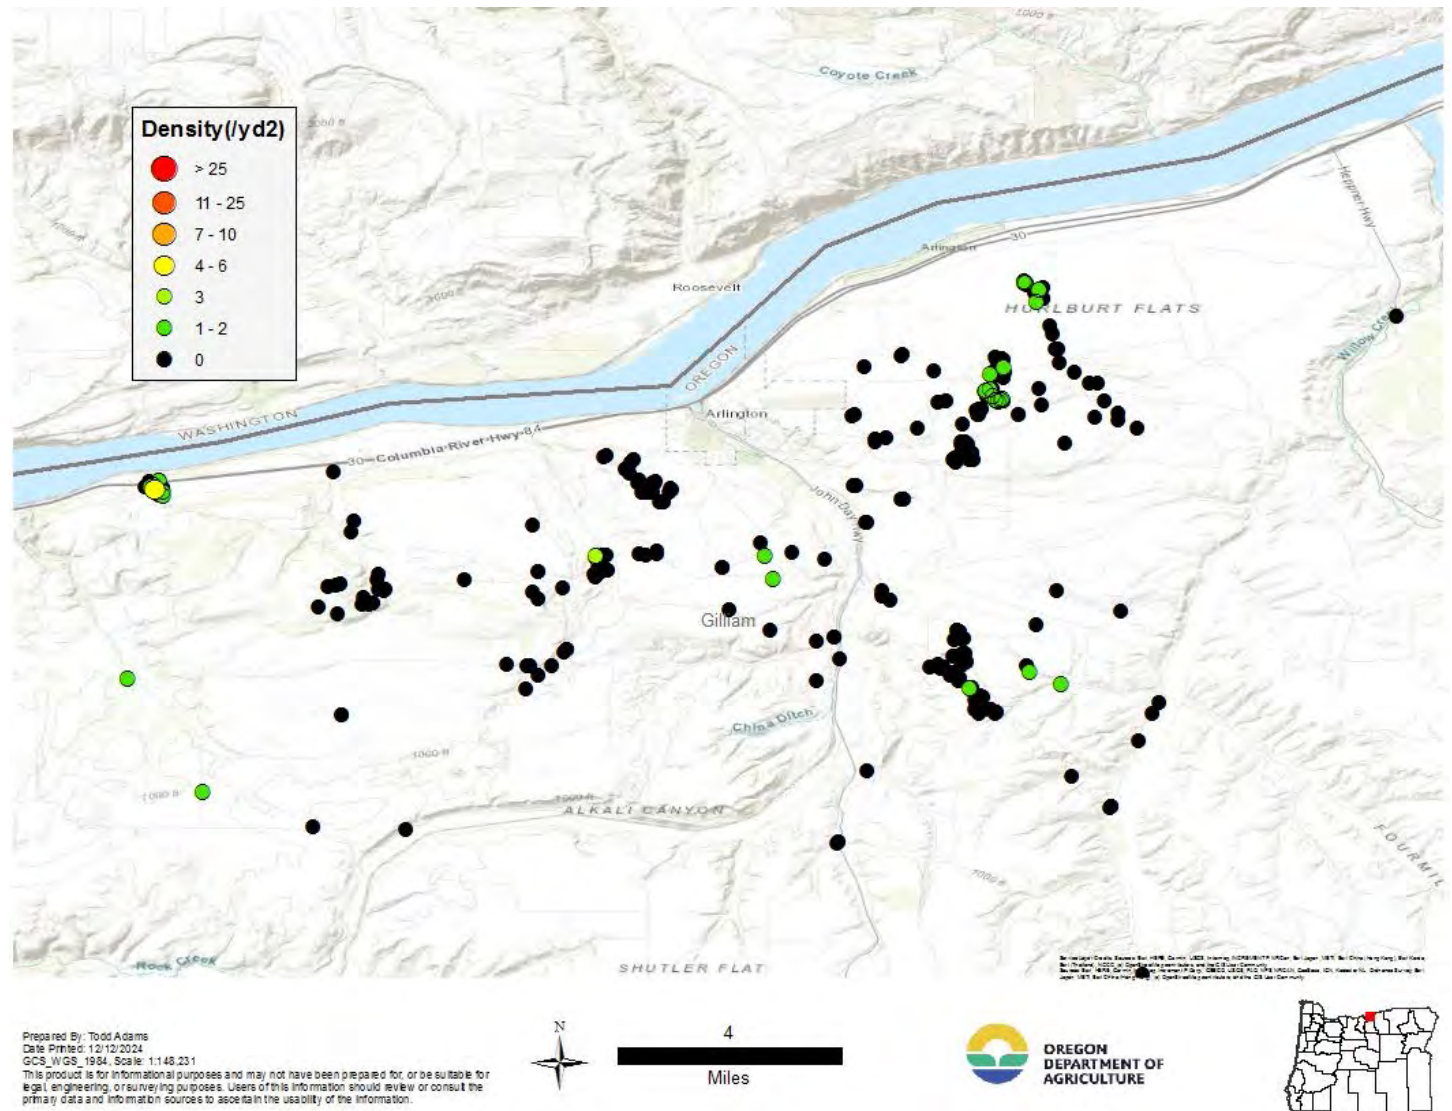

Figure 20. 2024 Mormon cricket survey results in the Arlington area.

2- Malheur County

Mormon Crickets moved farther west from Jordan Valley and Idaho. Populations continue to move north from Nevada.

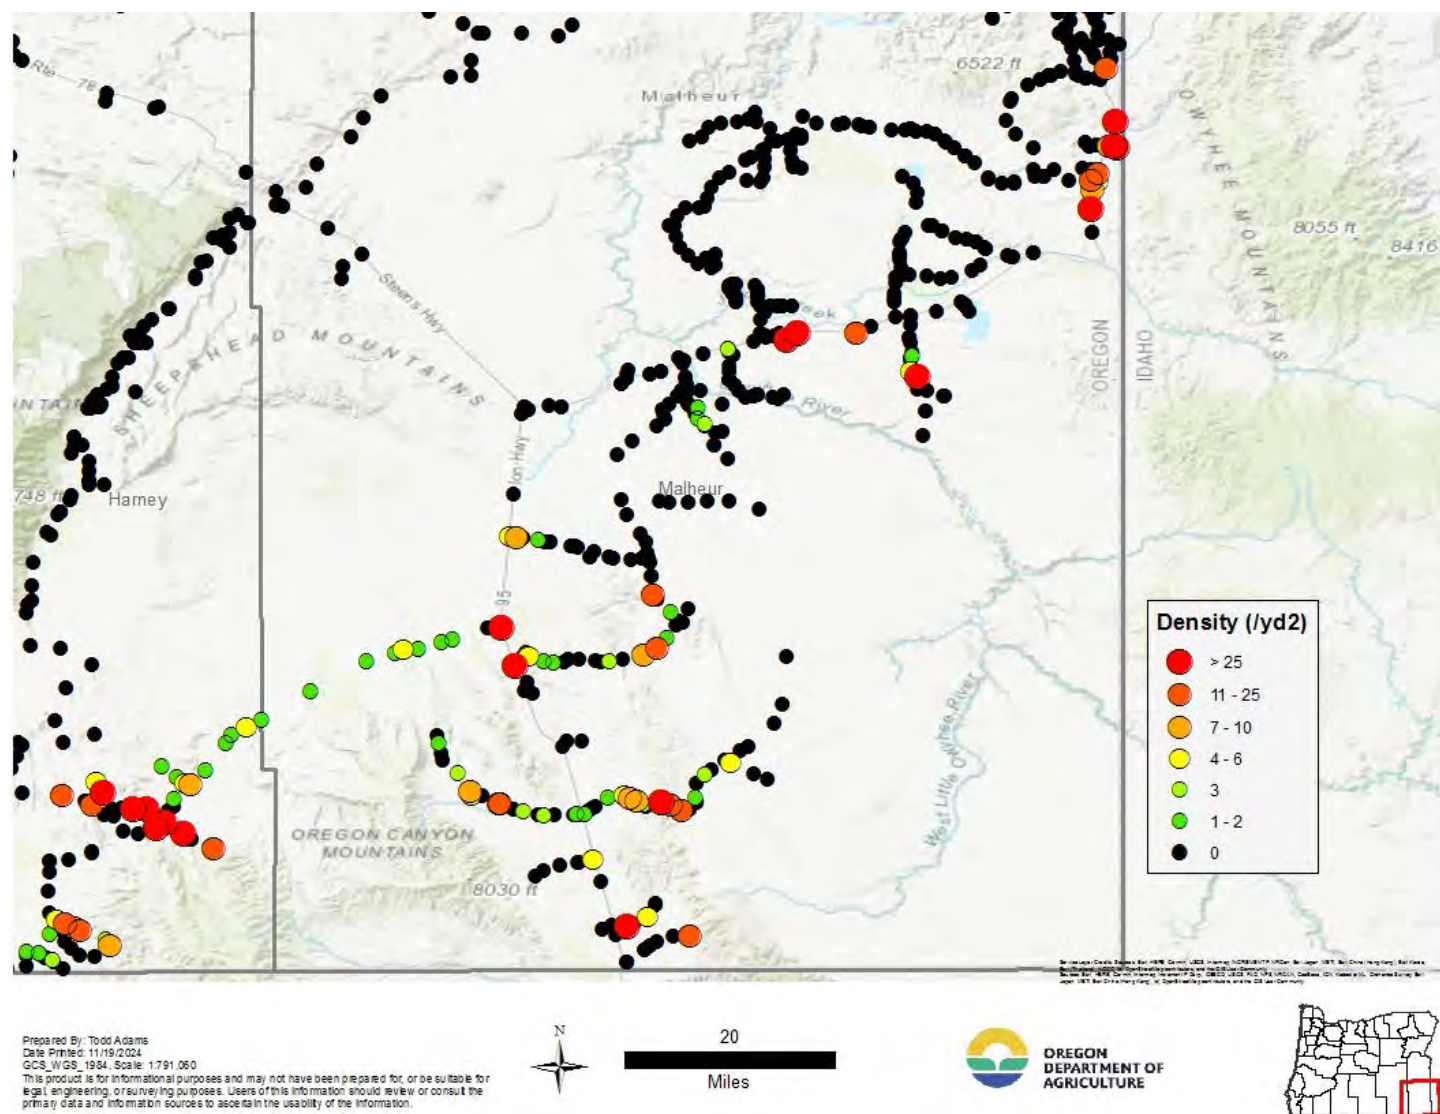

Figure 21. 2024 Mormon cricket survey results in Malheur County.

Mormon Crickets continue to spread into Harney County this year.

SUMMARY

Grasshopper populations over most of eastern Oregon appear to have increased in acreage, but those areas economically impacted; densities remain high with an average of 55 /yd² across all economically infested areas.

During 2024 a total of 4056 sampling locations were visited, 2,940 during the nymphal grasshopper survey period and 1,116 during the adult period (starting on 5 July). Nymphal survey takes place early in the season and is used to locate potential outbreak areas for response during the current year. Adult survey is used by ODA to make predictions for the following season, considering economic levels as 8 or more grasshoppers per square yard. This season there were 1,135 locations (52% of all sampled acres) that were estimated to have densities of ≥ 8 grasshoppers / yd². Land managers located within or near regions of high density should focus on early detection (hatch) in 2025. If early 2025 populations appear to be of significant density it is both fiscally and environmentally advantageous to intervene early in the grasshopper life cycle.

There are three areas in eastern Oregon known for Mormon cricket populations: the Arlington-Blalock Canyon area of Gilliam County, the region around Jordon Valley (primarily an Idaho population) in Malheur County and NW Wallowa County. This season we learned that the “Mormon cricket” population in Wallowa County was a closely related species *Peranabrus scabricollis* – “Coulee cricket”. This may explain why this population never reached the outbreak levels that are associated with Mormon crickets. More survey and identification of specimens will be needed to confirm there are no Mormon crickets in Wallowa County. In the last few years significant populations have plagued the Arlington and Jordon Valley area. The Jordan Valley population has spread further west to Arock and beyond, a distance of about 30 miles or more from Jordan Valley. There were very few Mormon crickets detected in the Arlington area this year. It is too early to tell if the population has crashed, or it was just a low population year. The new population of Mormon Crickets that made its way into Oregon in 2021 from Nevada through McDermitt continues to spread into Oregon in all directions and spread farther into Harney County this year.

If you have encountered grasshopper or Mormon cricket issues and could benefit from information or assistance (non-treatment) please contact us. We are happy to help with providing information and even giving workshops.

Grand Total of Surveyed Acres		7,731,178					

Appendix 2. Methodology for Area Estimation.

1. Grasshopper and Mormon cricket density (count/yd²) is estimated at survey locations.
2. The density at each point is placed into two classification systems: a density classification (7 levels) and an economic classification with 3 groupings (Economic [≥ 8 /yd²], Non-economic [1-7/yd²], or No Grasshoppers/Mormon crickets).
3. To generate area each point location is buffered with a 2.5 mile radius.
For the economic classes:
 4. Resulting areas are merged by Economic Class.
 5. Intersecting areas of water (e.g. rivers, lakes, etc.) and city limits are removed.
 6. Overlapping Economic Classes are 'clipped' so that:
 - Non-economic area is preserved over a classification of No Grasshoppers.
 - Economic area is preserved over either a Non-Economic or a No Grasshopper classification.
 7. Calculation of area in each Economic Class is then enabled by Union with any desired geographic boundaries (e.g. counties, various federal lands, etc.).

Appendix 3. General Information about Maps in this Report.

These maps were prepared by Todd Adams of the Oregon Department of Agriculture (ODA) in the WGS84 Datum using data sources from ESRI, OR Geospatial Data Clearinghouse and ODA field survey. The maps are for informational purposes and may not have been prepared for, or be suitable for legal, engineering, or surveying purposes. Users of this information should review or consult the primary data and information sources to ascertain the usability of the information.
