

# Beautiful Disaster

Spotted Lanternfly (SLF) is an exotic pest known to attack over 70 plant species including hops, pear, plum, apple, cherry, and grape. A major pest in its native range of Southeast Asia, SLF was first seen in the US in 2014 and is now found in 18 US states.

Eggs: look like inch long mud smears. Fresh eggs (1) are laid on any hard surface (wood, planters, crates, equipment, etc) and are the life stage most likely to be moved. Hatched cases (5) are similar but with rows of elongate score markings. Immatures: hatchlings (2) are wingless, black with white spots. Late instars (3) are red with white spots. Adults (4) are about 1" long, peach colored with black spots. Red hind wings are not always visible.

SLF are known hitchhikers! Keep an eye out when moving vehicles or materials from these 18 infested states: CT, DE, GA, IL, IN, KY, MD, MA, MI, NJ, NY, NC, OH, PA, RI, TN, VA, and WV

If you believe you have seen SLF in Oregon please notify the ODA immediately. Early detection is critical. Take a picture or capture the insect and contact us at:
