

Checklist of required information to include in evaluation of land action impacts to state-listed plants:

	Scientific name and authority of species being impacted
	Common name
	Historical and present distribution
	Estimated known range of species likely to be affected by current or proposed land action
	Description of listed species habitat at proposed site (include relative abundances of other plant species, soil characteristics, elevation, history of land actions, summary of current land uses, and ownership patterns of adjoining properties)
	Qualitative and quantitative assessment of listed species populations at the site (number of individuals, age/state structure, signs of disease or predation, pollinators, seed production, suspected present or past impacts of land actions)
	Evaluation of predicted effects of proposed land action and reasonable measures to minimize any potential adverse impacts
