Animal Waste Management Plan

Name of Landowner/Operator: Frank Ausman
Address: 872 Enterprise Ave.
City: Nyssa
State: OR 97913
Phone: 541-372-3415
Plan Prepared by: Jim Hendrickson
Date: June 12, 2002

Oregon Dairy Farmers Association
10505 S.W. Barbur Blvd., Portland, Oregon 97219
(503) 229-5033 Fax: (503) 245-7916

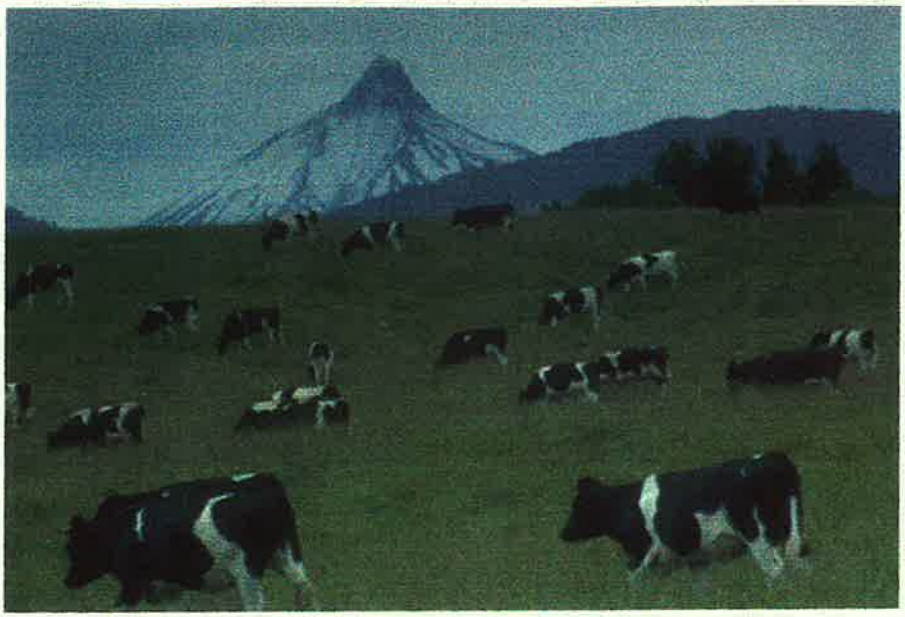
Jim Hendrickson
Water Quality Specialist (503) 887-1956

AWMP #0235
Due Date: 8-1-02

As the owner and operator of the Dairy of Ozz, I intend to install the conservation practices described in this plan and manage them in accordance with the operation and maintenance section of this plan.

Signature Frank Ausman *Date* 6-25-02

MA# 138707



Dairy of Ozz 2002

Animal Waste Management Plan
Dairy of Ozz 2002
Oregon Dairy Farmers Association

Dairy of Ozz 2002

Nyssa, Oregon

General Description

The Dairy of Ozz consists of 350 Holstein cows and is located near Nyssa, Oregon in Malheur County. The operation will consist of 135 milk cows, 35 dry cows, 110 heifers, and 70 bottle calves. The dairy has approximately 326 acres total. Of those 326 acres, 311 acres are available for manure distribution. See *"Dairy of Ozz 2002 Property Map"*. None of the land is tiled or on a flood plain. The operator confines the cattle year round in several dry lot pens. Please view *"Dairy of Ozz 2002 Site Map"* for dairy layout. As the manure accumulates in the pens, it is dehydrated and stacked in piles. The pens are cleaned once a year, in the fall to utilize the manure for crop production. There are 6 soil types found on the farm including, Nyssa silt loam types, Nyssa-Malheur silt loam types, and Xeric Torriorthents. Please view *"Dairy of Ozz 2002 Soil Map"* for location of soils. The operation is very efficient in respect to water usage in the parlor. The system is set up to collect wash water in a storage tank and reuse it to wash down the parlor. Parlor wash is gravity fed to an evaporation pond, which is just east of the milking parlor. See attached diagram titled, "Dairy of Ozz 2002 Evaporation Pond". The diagrams explain the construction done for water collection. This is done using an overflow catch basin, which empties, into the evaporation pond. This pond is placed so it can also collect and runoff from the dry lot pens that may accumulate from rainfall or melting snow. Care should be taken when applying manures within 50-foot or an appropriate buffer zone from irrigation laterals so not to contaminate either waterway or waters of the state. This plan will need to be updated if cattle numbers exceed the CAFO permits allotted amount or any structural changes that would affect liquid storage

Storage & Application

Solid manure is collected and stacked in individual dry lots from March through October of each year. Beginning in October after the crops are harvested, the manure will be spread on acreage that will be planted in barley or corn the following spring or fields that will be seeded with a new planting of alfalfa. The dry manure will primarily be applied to soils that are of poorer quality to improve soil tilth and percentage of organic matter. Solids are applied to the acreage via the use of a GEHL model (325) solid spreader that has a capacity of 243-cu.ft. Annual soil testing will be the most beneficial for application and nutrient monitoring.

The liquid waste water is collected from the milk house, parlor, and rain water from unsurfaced lots will be stored in an evaporation pond measuring 300'x 86'x 3.5' which equals 1.3 acre feet (AF). Due to the size of the pond and the average evaporation rate in this climatic region, it is anticipated that the liquid will evaporate into the atmosphere. During a May visit I noticed no appreciable accumulation of liquids in the pond. ORAWM v.1.5 anticipates for 90 days of storage the evaporation pond should equal 1.0 AF of storage. In the case of a heavy rainfall event causing the pond to fill to capacity, a "honey wagon" will be used to apply the wastewater to the cropland. Currently the operation does not apply any liquids from the facility to the cropping system. There is not enough produced to make any financial difference.

The operator will contain all wastewater within the facilities, while diverting clean water out of the system. Manure will be applied to the acreage to meet the expected nutrient

uptake of the cropping system. Application of manure will be done at appropriate times of the year as to utilize nutrients for maximal forage production.

Nutrient Utilization-Data Estimated by ORAWM v. 1.5

Nutrient Uptake by Cropping System

Crop	*Acres*	*N (lbs)*	*Total N*	*P2O5 (lbs)*	*Total P*	*K2O(lbs)*	*Total K*
Corn Silage	106	270	28,620	140	14,840	322	34,132
Spring Barley	60	154	9,240	61	3,660	120	7,200
Alfalfa	145	270	39,150	60	8,700	270	39,150
Totals	**311**		**77,010**		**27,200**		**80,482**

- *Totals Represent Total Nutrients Needed for Cropping System.*

Total Nutrient Balance After Denitrification

Nutrient (lbs)	*Nitrogen*	*Phosphorus*	*Potassium*
Needed	77,010	27,200	80,482
Produced by Dairy	23,616	17,035	36,798
Difference	**-53,394**	**-10,165**	**-43,684**

Breakdown in Pounds per Acre are Shown

Nitrogen	*Phosphorus*	*Potassium*
-171 lbs/acre	**-33 lbs/acre**	**-140 lbs/acre**

- Data Provided by USDA-NRCS ORAWM v.1.5

These figures are only *estimates* and proper manure application equipment calibration should be done coupled with annual fall soil testing to verify the nutrient levels in the soil prior to spring application. Also recommended is manure application record keeping ensuring proper application rates are monitored.

Soils Descriptions

21A – Nyssa Silt Loam, 0-2% slopes.
The Nyssa series consists of moderately deep, *well-drained* soils that formed in mixed lacustrine materials. Nyssa soils are on terraces and have slopes of 0 to 20 percent. The mean annual precipitation is about 10 inches and the mean annual air temperature is about 52 degrees F. 0 to 13 inches; light brownish gray (10YR 6/2) silt loam, dark grayish brown (10YR 4/2) moist; weak medium granular structure; slightly hard, friable,

slightly sticky and slightly plastic; few roots; many very fine tubular pores; mildly alkaline (ph 7.5); clear smooth boundary. (5 to 13 inches thick)
The mean annual soil temperature ranges from 52 to 56 degrees F. The soils are usually dry but are moist for more than 60 days during the winter season. Depth to the duripan ranges from 20 to 40 inches. The A and B-horizons above the duripan are slightly to moderately alkaline and commonly no calcareous but some pedons are weakly calcareous in the B-horizon. The A and B horizons above the duripan are silt loam or very fine sandy loam and have less than 18 percent clay and less than 15 percent fine sand and coarser. Nyssa soils are on nearly level to gently sloping terraces with gradients up to 20 percent but commonly less than 8 percent at elevations of 2,100 to 2,600 feet. The soils formed in lacustrine materials with the surface reworked by wind. The climate is semiarid and has hot dry summers and cold winters. Mean annual precipitation is 9 to 11 inches. The mean annual temperature is 50 to 54 degrees F., the mean summer temperature is 70 to 74 degrees F., and the mean winter temperature is 31 to 33 degrees F. The frost-free period ranges from 150 to 170 days.
Principal use is irrigated crops: sugar beets, potatoes, onions, small grain, specialty seed crops, mint, and alfalfa. Native vegetation is mainly big sagebrush, bud sagebrush, needle grass, Sandberg bluegrass, annual fescue, and associated forbs.

21B & C – Nyssa Silt Loam, 2-5% slopes.
The Nyssa series consists of moderately deep, *well-drained* soils that formed in mixed lacustrine materials. Nyssa soils are on terraces and have slopes of 0 to 20 percent. The mean annual precipitation is about 10 inches and the mean annual air temperature is about 52 degrees F. 13 to 20 inches; pale brown (10YR 6/3) silt loam, dark brown (10YR 3/3) moist; weak coarse sub angular blocky structure; slightly hard, friable, slightly sticky and slightly plastic; few roots; many very fine tubular pores; neutral (pH 7.0); clear wavy boundary. (7 to 10 inches thick)
The mean annual soil temperature ranges from 52 to 56 degrees F. The soils are usually dry but are moist for more than 60 days during the winter season. Depth to the duripan ranges from 20 to 40 inches. The A and B-horizons above the duripan are slightly to moderately alkaline and commonly no calcareous but some pedons are weakly calcareous in the B-horizon. The A and B horizons above the duripan are silt loam or very fine sandy loam and have less than 18 percent clay and less than 15 percent fine sand and coarser. Nyssa soils are on nearly level to gently sloping terraces with gradients up to 20 percent but commonly less than 8 percent at elevations of 2,100 to 2,600 feet. The soils formed in lacustrine materials with the surface reworked by wind. The climate is semiarid and has hot dry summers and cold winters. Mean annual precipitation is 9 to 11 inches. The mean annual temperature is 50 to 54 degrees F., the mean summer temperature is 70 to 74 degrees F., and the mean winter temperature is 31 to 33 degrees F. The frost-free period ranges from 150 to 170 days.
Principal use is irrigated crops: sugar beets, potatoes, onions, small grain, specialty seed crops, mint, and alfalfa. Native vegetation is mainly big sagebrush, bud sagebrush, needle grass, Sandberg bluegrass, annual fescue, and associated forbs.

23A & 23B – Nyssa-Malheur silt loams, 0-2% slopes
This complex consists of about 50 to 60% Nyssa silt loam; about 20 to 40% Malheur silt loam; about 5% Virtue soils; about 5% Nyssa silt loam, gravel substratum; and about 5% Owyhee soils. It is in irregularly shaped areas on terraces. Runoff is slow, and the hazard of erosion is slight.

36F Xeric Torriorthents
These soils consist of gravelly and silty alluvium that is variable in characteristics. Slopes are normally 20-60 percent. Areas are along sidewalls on terrace scarps. Most of this mapping unit is nearly barren of vegetation. The sparse vegetation consists of hop sage, desert shrubs, and annual weeds and grasses.

Operation & Maintenance Plan

Pipeline
Pipeline route and water line will be inspected periodically for leaks. Any leaks and or broken pipes will be repaired and or replaced. Line will be flushed periodically to assure no sediment buildup in lines. Water will be drained during cold weather to prevent frozen lines and possible breakage. Shut off valves will be inspected annually. Broken valves will be replaced.

Concrete Gutters
Floor gutters and grates will be inspected periodically. All foreign material restricting manure flow will be removed. Broken floor gutters will be repaired and or replaced.

Concrete Curb
Concrete curbs will be inspected periodically. Broken curbs will be repaired. Manure will be prevented from flowing over the curb.

Pump
Pump(s) will be operated and maintained according to manufacturer's manual. Liquids will be drained from pump during freezing weather. Pump will be inspected periodically to prevent debris from wrapping around the impeller. Broken lines will be replaced or repaired. Loose connections will be tightened.

Waste Transfer Pipeline
Pipeline will be flushed regularly to prevent clogging. Any leaks or broken section will be repaired and or replaced.

Gutters & Downspouts
Gutters will be inspected annually to insure all gutters are free of foreign materials. Broken gutters or downspouts will be replaced and or repaired. All gutters will be connected to downspouts. Leaky gutters and downspouts will be repaired. Weeds and sediment will be removed from outlets. All downspouts will be connected to outlets, which are kept free flowing. Broken rodent guards will be repaired or replaced.

Roof
Roof will be inspected annually. All rusted sections will be repaired and or replaced if needed. Loose sections will be secured. All broken trusses, rafters, beams, poles, gutters and downspouts will be repaired and or replaced.

Trough or Tank
Watering facility will be inspected periodically. Damaged facility will be repaired. Float valves will be maintained in working order. Area immediately around the facility will be maintained in a stable condition.

Access Road
Promptly repair or replace damaged components as needed. Remove debris and litter from roadway surfaces, road ditches and drainage facilities. Maintain drainage facility capacities. Maintain good vegetative cover on all slopes and watercourses.

Structure for Water Control

Culvert
Inspect annually. All foreign material restricting water flow will be removed. Damaged sections will be repaired and or replaced. Erosion around inlet or outlet will be corrected.

Surface Drainage (Main or Lateral)
Ditches will be inspected annually. They will be cleaned periodically to remove sediment and vegetation. .

Pest Management (if applicable)

Maintain mechanical equipment in good working condition and calibrate application equipment to ensure recommended rates are applied. Replace worn components of pesticide application equipment as well as other pest management implements.

Operators of equipment must be alert at all times to avoid bodily injury and unnecessary exposure to chemicals. Pesticide users must read and follow label directions, maintain appropriate Material Safety Data Sheets (MSDS), and become certified to apply restricted use pesticides. Apply chemicals during periods of minimum potential for drift. Minimize exposure to chemicals, wear protective clothing, and use safety equipment when appropriately needed. Ensure that the pesticide applicator knows the exact field location to be treated. Post signs according to label directions or state and federal laws around fields that have been treated. Follow the established re-entry time as stated on the MSDS.
Properly locate chemical mixing and equipment rinsing stations relative to potential for contamination of ground or surface water. Extreme care must be taken to follow loading and mixing procedures. Provide for managing accidental spills. Properly rinse equipment and re-use rinse solution for subsequent batches of the same pesticides, where possible. Store pesticides in original containers in a locked, well-ventilated weather resistant building. Post warning signs on or around the building in plain view. Locate

the building so that accidental spills will create minimal environmental effects. Dispose of pesticide containers according to label directions and adhere to local or state regulations.

Provide emergency wash stations for personnel who might be accidentally exposed to chemicals, and formulate a safety plan complete with information about locations or emergency treatment centers for personnel exposed to chemicals.

Ensure that back flow prevention devices are installed and operating properly on irrigation systems used for applying pesticides. Recognize the dangers from excessive exposure to take the appropriate precautionary measures. This is especially important for farm workers who spend long hours in the field.

Nutrient Management

- Calibrate manure and fertilizer application equipment to ensure recommended rates are applied.
- Minimize exposure to animal and organic wastes, manure gasses, and chemical fertilizers. Wear protective clothing when appropriate.
- Protect commercial fertilizer and agricultural waste storage facilities from weather and accidental leakage or spillage that will result in undesirable effects on soil, water, and plants.
- When cleaning equipment after nutrient application, remove and save fertilizers or wastes in an appropriate manner. If system is flushed, use rinse water in the following batch of nutrient mixture, where possible, or dispose of it according to state and local regulations, always avoiding high runoff areas, pond, lakes, streams, and other water bodies. Extreme care must be exercised to avoid contaminating wells.
