

***OREGON DEPARTMENT OF TRANSPORTATION***

# **ODOT STATE TRANSPORTATION REVENUE FORECAST**

---

April 2026

Economic & Financial Analysis

## Foreword

This summary report presents a selection of Other Funds State Highway Revenue forecasts for the Oregon Department of Transportation (ODOT). It is published twice a year to assist in financial planning, the formulation of transportation budgets, and to support other decision-making activities. The forecast is consistent with the Department of Administrative Services' Oregon Economic and Revenue Forecast (Vol. XLVI, No. 1, March 2026) and the associated baseline macroeconomic forecast from S&P Global.

The projections set forth in this forecast represent the Oregon Department of Transportation's forecast of future results as of the date of preparation based on information then available to ODOT as well as estimates, trends and assumptions that are inherently subject to economic, political, regulatory and other uncertainties, all of which are difficult to predict and many are beyond the control of ODOT. No assurance can be given that the future results discussed herein will be achieved, and actual results may differ materially from the forecasts described. In this respect, the words "estimate," "project," "forecast," "anticipate," "expect," "intend," "believe," and similar expressions are intended to identify forward-looking statements.

The prospective financial information was not prepared with a view toward compliance with published guidelines of the United States Securities and Exchange Commission or the guidelines established by the American Institute of Certified Public Accountants for preparation and presentation of prospective financial information.

This document is also available online at:

Forecast Tables with May 2026 Referendum – HB 3991 Provisions on Hold Approved .....	69

## Introduction

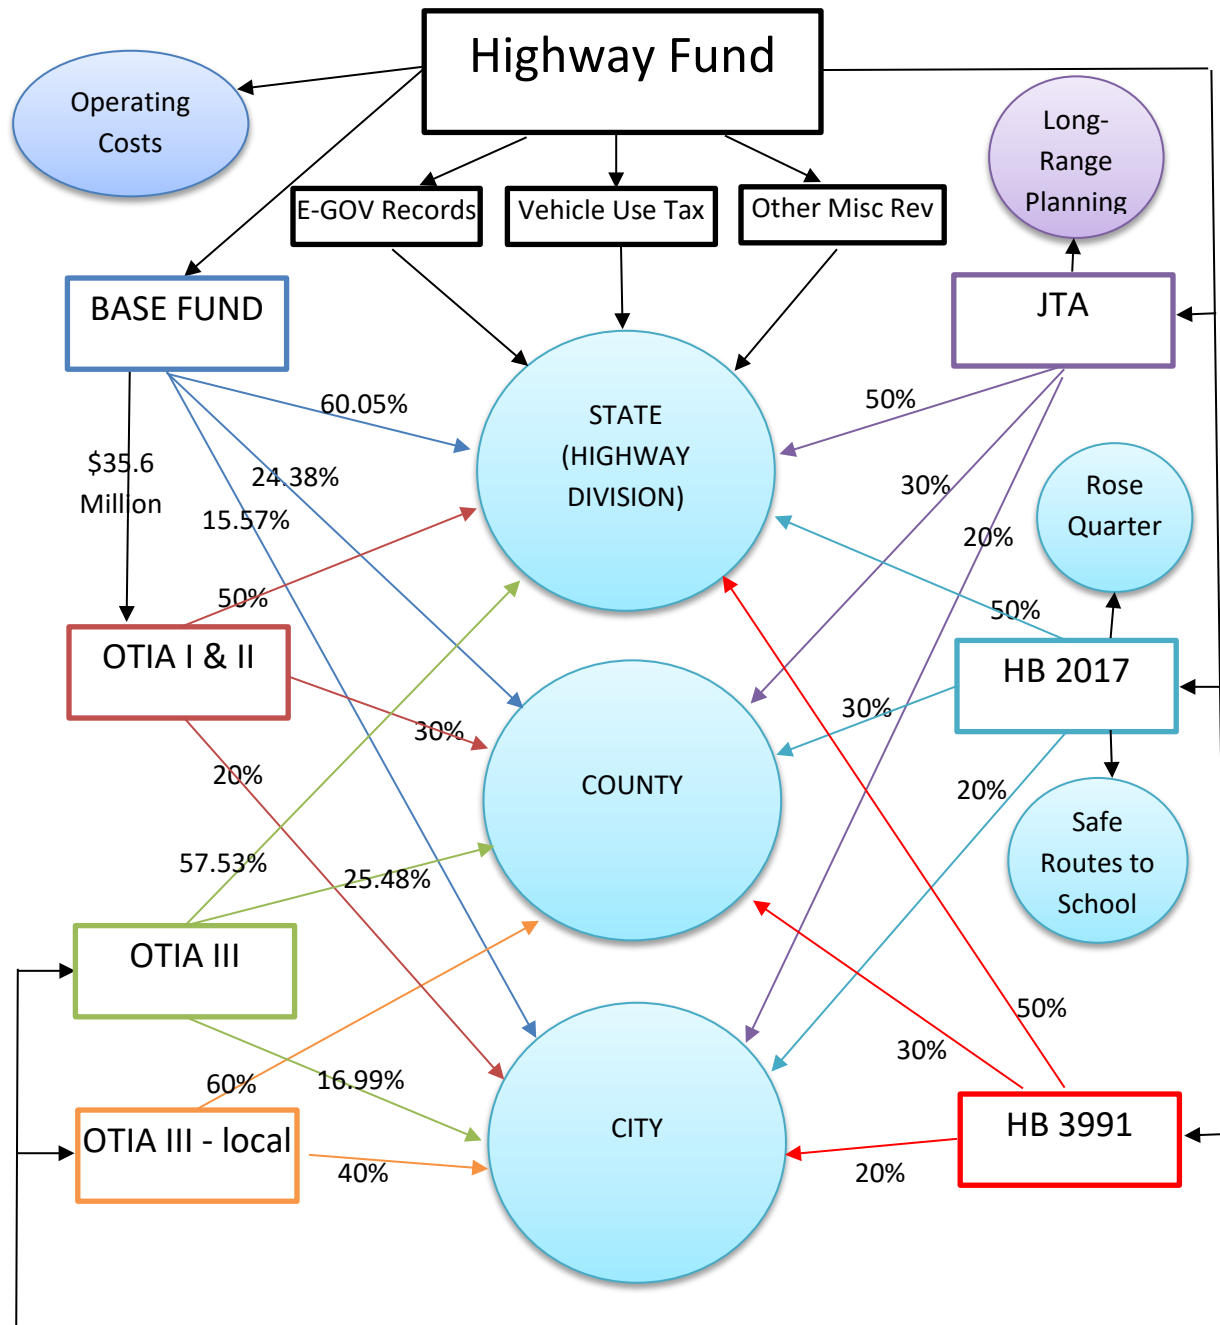

ODOT revenue collections can be broadly divided into four main groups: Driver and Motor Vehicle (DMV), Commerce and Compliance (CCD), Finance and Budget Division (FBD), and Other Revenues (OTHER). FBD collects revenues for Motor Fuels (FUELS) and Road Usage Charge (RUC). This publication will discuss the details for each one of these groups. The most recent transportation bill, House Bill (HB) 3991, added a mandatory RUC program and restructured the way heavy duty vehicles are taxed. See appendix A for a summary of HB 3991. In addition, each chapter will investigate specific aspects of HB 3991 as it relates to individual sources in more detail. Appendix D will have summary tables without HB 3991 for reference and to demonstrate what the revenues would have been without any changes. The diagram below summarizes graphically the flow of funds into specific programs (the size of the circle is not reflective of the fund size). Overall, as of fiscal year (FY) 2025, the share of Highway Fund in total collections was 89 percent. Public transit (Transit Payroll Tax) was the second largest fund with a seven percent share and Transportation and Operating Fund was the third largest fund with one percent share of total revenues.

Figure 1. ODOT Collections and Distributions Diagram

Appendix B lists all the revenue items that we forecast, including the associated current fee, future fee after HB 3991 is implemented, forecast group, and fund. The revenues in the Highway Fund are divided into Base Fund, OTIA I & II Set Aside, OTIA III Funds, JTA, HB 2017, and HB 3991. Each of these buckets further distributes revenues into specific programs: State (Highway Division), City, and County Funds. The diagram below shows how Highway Funds are distributed. Note the forecast now includes the expected cash flow from federal revenues, however, those revenues are not incorporated into these diagrams and are not discussed in this publication.

Figure 2. Highway Funds Distribution Diagram

## Revenue Forecast Overview

If there was a road sign to describe our current forecast outlook it would say “Limited Sight Distance.” There is a heightened level of uncertainty in transportation funding generally. At the national level, the current federal authorization expires in September. If the next authorization follows a similar timeline as the last couple of authorizations, there will be a delay before any certainty on the next five-year funding bill. This uncertainty is also true at the state level, as HB 3991 faces a referendum vote in May 2026. As we look ahead there is an expected transportation funding conversation coming during the 2027 Legislative Session. In addition to these larger policy considerations, there is also a heightened uncertainty about the recent escalation in fuel prices due to conflict with Iran. Traditionally, these increases of limited duration have only a temporary impact on fuel sales. But if prices remain elevated for an extended period, households may make more permanent adjustments to reduce their transportation costs. Despite these significant risks, the current State Highway Fund gross revenue forecast is overall just slightly lower than the prior forecast. The main drags are the higher fuel prices leading to lower than projected fuel sales and slower new vehicle sales which translate into a drop in new light-vehicle title and registration transactions.

As initially discussed in our prior forecast, a very significant bill (HB 3991) was passed during the 2025 Special Session by Legislature. Portions of this bill containing the fuels tax, transit tax and base light vehicle title and registration fee increase are currently being referred to the voters in the May election. Since our forecasts are current law forecasts, we do not assume these potential increases will take effect. As an alternative, we do include forecast tables in our Appendix providing estimates of expected revenue if the voters do approve these increases. However, not all elements of the bill were referred to the voters and some major tax changes remain in effect. On the light-vehicle side, a Road Usage Charge (RUC) will be introduced in phases for electric and hybrid vehicles starting in July 2027. Vehicles subject to RUC will not be paying enhanced registration fees and will receive credit for fuel taxes that they pay at the pump. Instead, they will be charged 2.0 cents per mile driven. On the heavy-vehicle side, a hybrid system will be implemented where carriers will be paying both the weight-mile tax, and the diesel tax. While the weight-mile rate will be reduced to partially offset the diesel tax increase, the heavy truck taxation system will be significantly changed. Figure 3 below shows the anticipated revenue impact of HB 3991 along with historical impacts of prior bills (OTIA III, JTA, and HB 2017).

Table 1 shows the biennial change in highway revenues compared to our previous October 2025 forecast. As stated above our current April 2026 forecast is slightly weaker than our previous forecast. We are expecting \$19.6 million less in gross revenues for current biennium (2025-27) compared to the October 2025 forecast that assumes partial implementation of HB 3991 and that voters will reject fee increases that were passed by legislature and referred to referendum. The net apportionable revenue changes reflect the change in pre-apportionment collection and administration costs from DMV, CCD, and FBD. The administrative costs were revisited and significantly reduced, that is why the net apportionable revenue figures are better than in our previous forecast even though the gross revenues are less.

Figure 3. Total Gross State Highway Revenues by Fiscal Year

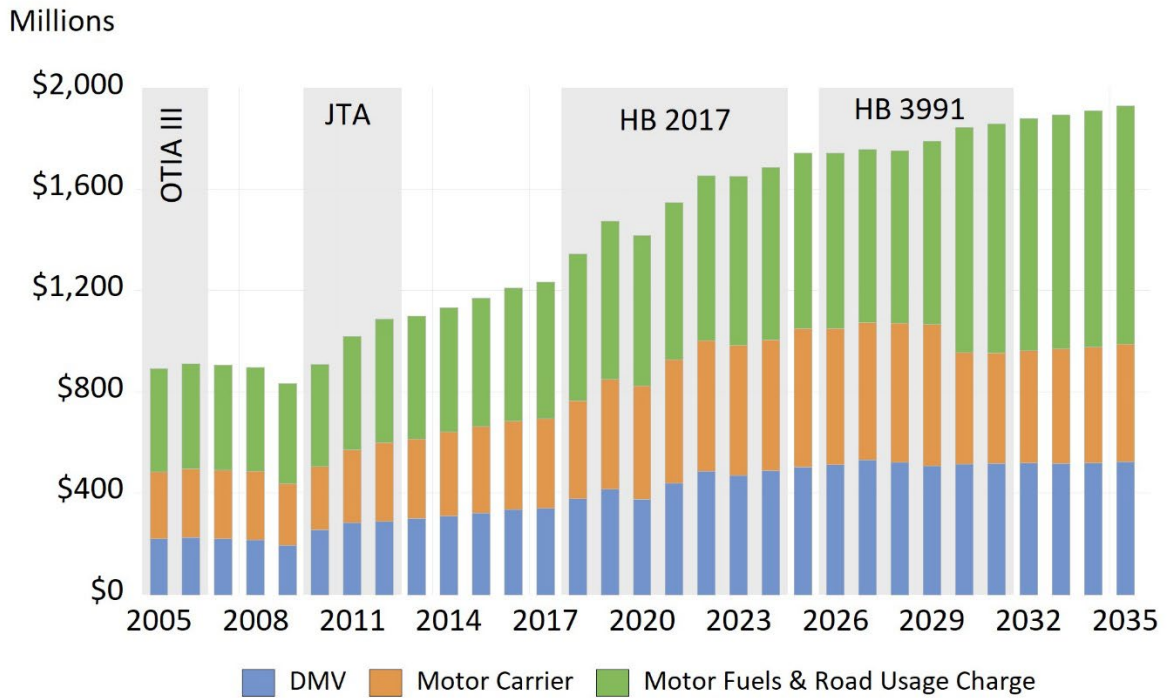

Table 1. Change in Highway Revenues from the October 2026 Forecast

(\$ Millions)	2025-27	2027-29	2029-31	2031-33	2033-35
<b>FBD</b>

Net Apportionable	\$ (2.0)	\$ 3.1	\$ 3.4	\$ 1.4	\$ 1.0
<b>Total</b>					
Gross	\$ (19.6)	\$ (16.1)	\$ (35.7)	\$ (40.0)	\$ (47.1)
Net Apportionable	\$ 13.6	\$ 25.4	\$ 16.8	\$ 15.4	\$ 16.7

Table 2 highlights change for some of the most important revenue generating transactions in the ODOT State Highway Revenue forecast. Motor fuels will continue to decline with the expected increases in number of electric vehicle registrations as well as improvements to the internal combustion engine fuel efficiency. As the transition to hybrid system begins, we will see an increase in taxable fuel gallons once heavier vehicles start paying diesel tax. Original Class C Licenses are expected to slowly decline as well, reflecting changes in population and driving habits. Passenger vehicle registrations are projected to be nearly flat. Title transfers were strong in 2025 – mostly due to some mailings that were sent out in Portland metro area to the owners of vehicles with expired registrations. In the next two years we are expecting modest growth in title transfers followed by flattening or declining demand through 2035. Trucking activity is showing relatively low growth rates as well, with a slight bump expected in calendar (CY) 2029 with the transition to hybrid system.

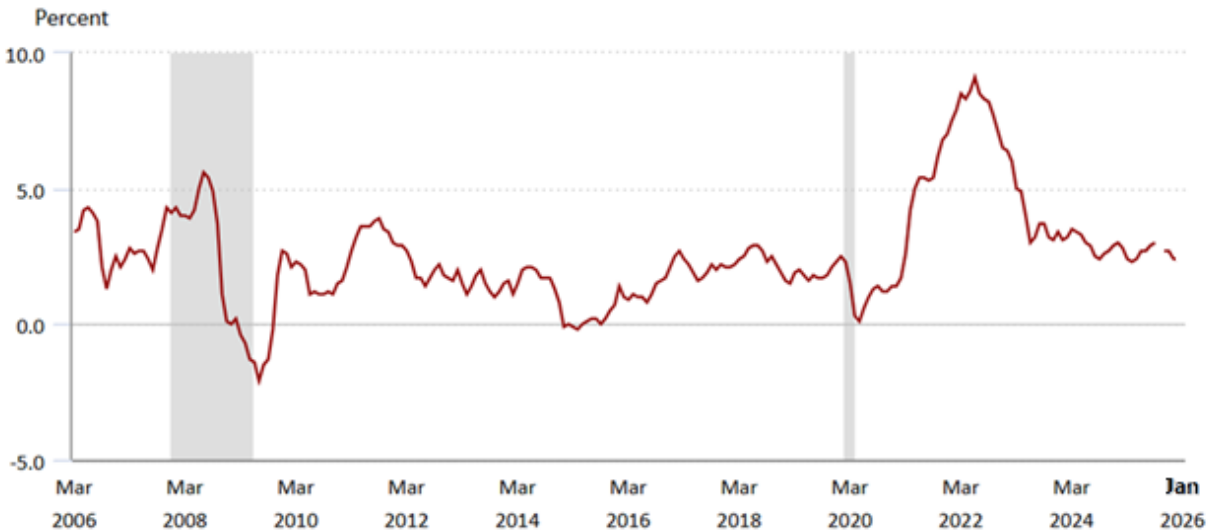

Table 2. Percentage Change in Selected Key Oregon Transportation Indicators

## Transportation Backdrop

2025 saw three interest rate cuts totaling 75 basis points to generate economic activity. Cutting interest rates usually increases economic growth and spending, which directly impacts ODOT revenues. However, the Federal Reserve has been maintaining interest rates in 2026, keeping them at 3.5-3.75 percent. They are also expected to maintain these rates for the entirety of 2026 and only attempt rate changes in 2027 if economic conditions necessitate them. Part of the reason that interest rates are staying the same is the current state of consumer side inflation, specifically energy and its direct and indirect impacts. In January 2024, the consumer price index remained above target at 2.4 percent increase year-over-year for all items (Figure 4). More recent increases in inflation, especially in fuel oil and gasoline provide significant risk to this forecast.

Figure 4. US Bureau of Labor Statistics Consumer Price Index, Year-Over-Year Percent Change, Not Seasonally Adjusted (shaded area represents recession). January 2024 Release.

Population growth has always been positively correlated with demand for transportation-related activities. State level population estimates are showing some signs of weakness; Oregon's population is projected to grow slowly at a rate of 0.5 percent per year (Figure 5). Oregon's natural increase in population (births minus deaths) has been negative, which means that the state relies on positive net migration as the only factor contributing to Oregon's population growth. ODOT is tracking out-of-state surrendered licenses as one of key indicators of population growth as well as growth in transportation-related activities. Out-of-state surrendered license growth has been very steady, which means that we can continue counting on a slow growing Oregon population. This population change will continue to be a main factor contributing to the long-term growth in our transaction volumes.

Figure 5: Oregon Office Of Economic Analysis - Oregon's Annual Population Percent Change, 1950-2035.

## Driver and Motor Vehicle

The Driver and Motor Vehicle Services Division is responsible for the administration of driver and motor vehicle related activities. Revenues collected from the fees charged for the various DMV activities flow into the State Highway Fund, the Transportation Operating Fund, and into other funds administered by ODOT divisions such as Public Transit and Passenger Rail. Additionally, some fees (net of collection costs) are transferred to outside entities. As an example, recreational vehicle-related fees are transferred to the Oregon Parks and Recreation Department. Lastly, revenues remaining after deducting transfers and costs are apportioned to cities and counties statewide for local road repair, maintenance, and construction.

The DMV forecast is produced at the transaction level and aggregated to the summary level. The transactions are grouped into three different business lines: Vehicle, Driver, and Business Regulation (Figure 6). The Vehicle program area contains the transactions related to legal ownership and operation of a vehicle, including titling, plates, registrations, and permits. The Driver program contains transactions related to the legal right to operate a vehicle, including permits, licenses, endorsements, and the associated tests to obtain these rights to drive. The Business Regulation program is tasked with ensuring businesses that sell vehicles in Oregon are properly licensed along with those that dismantle and transport vehicles.

In total, the DMV forecast contains over 250 individual product transactions and over 100 different forecast equations. However, most of these transactions have little significant impact on the overall forecast as their volumes and fee levels are small. In FY 2025, 78 percent of the revenue was collected by the top ten DMV transactions. Passenger vehicle registrations alone (two-year and four-year registrations combined) accounted for 47 percent of DMV revenues. Other top revenue contributors are light title transactions, truck and travel trailer registrations, plate manufacturing fees, Class C driver license renewals, and records sales.

Figure 6: Total DMV Revenues by Business Line, Fiscal Year 2025 (in Millions)

Various economic and demographic variables affect DMV activities and provide a reflection of broad undercurrents in the state. The impacts from changes in population, employment, migration, and economic production are evident in many of the DMV data series. In general, demographic changes affect DMV activities more strongly than economic changes. As such, demographic changes are generally more immune to cyclical swings typical with economic variables. Of the three business lines in DMV, Vehicle and Business Regulation programs are most susceptible to economic influences, especially as they relate to new vehicle titles.

While we wait for the May referendum results, for this forecast we assumed that HB 3991 provisions referred to the voters would not be approved, which leaves us with partial implementation of HB 3991. As of Jan 2026, vehicles with higher fuel economy – hybrids and electric vehicles – started paying an extra \$30 per year in registration surcharges. Figure 7 below shows total DMV revenues by fiscal year. We are expecting slightly lower revenues compared to our previous forecast, but in general forecasts are very similar. We see a small boost to DMV revenues through FY 2027 fueled by the increase in the enhanced registration fee. The revenues dip in FY 2028 and then stay flat as Road Usage Charge (RUC) starts to phase in. Vehicles that are subject to RUC would not be paying enhanced registration charges and that would have a negative impact on DMV collections. RUC revenues will be collected by Finance and Budget Division (FBD), so while we will see a negative impact on DMV collections, FBD’s collections will increase to offset this decline. RUC revenues would be covered in more detail under FBD Revenue section of this report.

Figure 7: Total DMV Revenues by Fiscal Year (in Millions)

In preparing our forecast, we used several national and Oregon-specific indicators. The Oregon Office of Economic Analysis (OEA) supplies us with these forecasts. OEA prepares their forecasts quarterly and uses national forecasts from reputable sources, such as S&P Global. National light vehicle sales and Oregon total non-farm employment are two of the leading indicators that are used in the models for some of our key transactions. The outlook for Oregon’s total non-farm employment (Figure 8) is a bit stronger compared to the previous forecast. National light vehicle sales (Figure 9) forecast is much improved as the small recession that was expected in the previous forecast did not materialize.

We also use our internal forecast for out-of-state surrendered licenses to inform some of our main forecasts. When people move to Oregon from other states, they typically require several DMV transactions such as registering their vehicles, titling their vehicles, and getting Oregon driving credentials. Our current forecast has been revised downward due to lower-than-expected actuals in recent months. Overall, we are still expecting a very strong positive outlook for surrendered licenses, very much in line with the long term historical trendline (Figure 10).

Figure 8: Total Non-Farm Employment (quarterly frequency – seasonally adjusted)

Figure 9: Total US Light Vehicle Sales (quarterly frequency – seasonally adjusted)

Figure 10: Out-of-State Surrendered Licenses (quarterly frequency – seasonally adjusted)

Two-year passenger vehicle registration is one of the top DMV revenue transactions (Figure 11). The number of total registered passenger vehicles (Figure 11a) has declined since COVID-19 and still has not recovered to the pre-pandemic levels but it is getting there. There was a significant drop in two-year registrations at the end of 2025, but this was purely administrative in nature. For a brief while DMV stopped sending out registration renewal notices as there was uncertainty about the implementation of HB 3991 fee increases and they did not know what fee to collect with early renewals.

Figure 11: Two-Year Passenger Vehicle Registration (quarterly frequency – seasonally adjusted)

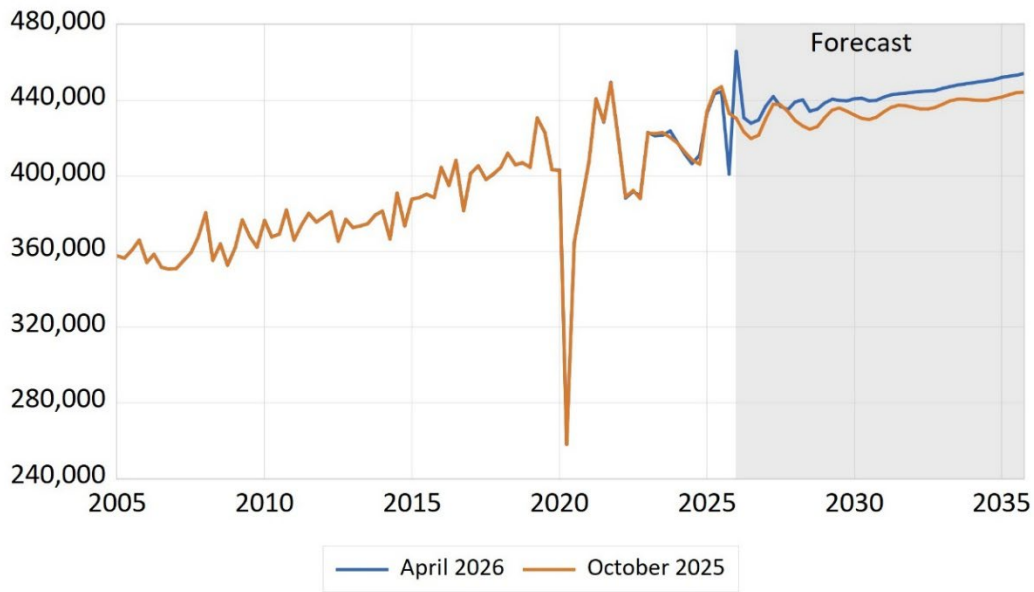

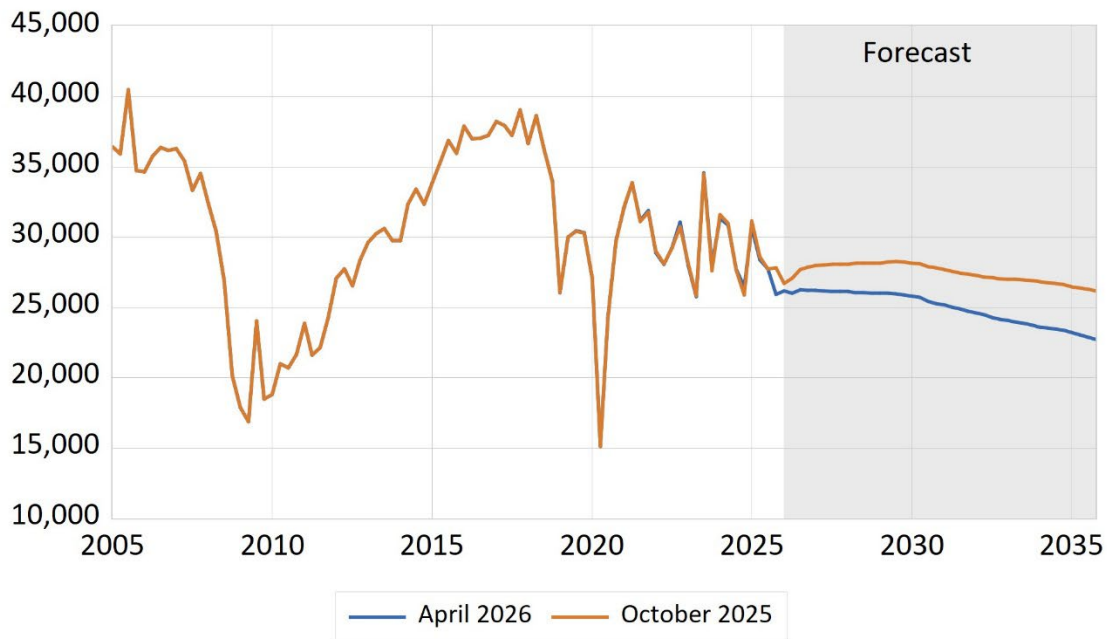

Figure 11a: Total Passenger Vehicles with Valid Registrations in Oregon (End of Quarter)

Typically, new vehicles purchased from a dealership get a four-year registration until the first renewal when they are switched to a two-year registration renewal cycle. In recent quarters, four-year registration transactions were below our expectations (Figure 12). A few factors may have contributed to that: 1) expiration of federal rebates for electric vehicles, 2) DEQ electric vehicle rebate program only being open for a short period of time in the second quarter of 2025, and 3) tariff related uncertainty that led people to purchase before the tariffs are implemented and the prices of imported vehicles go up. All these factors pushed the demand for new vehicles to the first two quarters of 2025, which resulted in a weaker demand in the last two quarters of 2025. In our previous forecast we anticipated the slowing down, however the actuals came in even lower than what we expected. Our current forecast is a bit weaker than the previous forecast but has a similar trajectory – nearly flat through 2030 and downward sloping afterwards.

Figure 12: Four-Year Passenger Vehicle Registration (quarterly frequency – seasonally adjusted)

Light vehicle title transfers happen when vehicle ownership is being passed from one party to another, for example, when a used vehicle is sold. In the last two years, the volume was relatively high for this transaction because DMV had a large backlog of title transactions accumulated because of COVID-19 related disruption in services. Transaction volumes have declined since then and are expected to be more in-line with long-term trends. In the last few quarters, the transaction volume was just a little higher than expected, but overall tracking well against our previous forecast. The current forecast is very similar to the previous one (Figure 13).

Figure 13: Light Vehicle Title Transfers (quarterly frequency – seasonally adjusted)

Driver and ID card transactions have been more challenging to forecast since COVID-19 due to volatility in the data. Class C driver license renewal is the top transaction for Driver and ID cards by volume and by revenues generated. Given the renewal cycle of every 8 years, this forecast is very cyclical and highly dependent on the 32-quarter lag of the class C driver license renewals. Because of the moratorium during the COVID-19 pandemic, there was a disruption in this series that impacted our ability to make an accurate forecast. We were able to get access to the Driver License database and that helped us to improve our forecast by inputting actual licenses summarized by expiration date rather than relying on the eight-year lag (Figure 14). April 2026 forecast is nearly identical to our previous forecast.

Original Class C Driver License (Figure 15) is also one of the top revenue transactions for Driver and ID cards. It has been impacted by HB 2015 implementation that went into effect in January 2021, which expanded the pool of eligible customers for licenses to undocumented immigrants. However, the long-term outlook is impacted by demographic changes in the state. According to OEA's population forecast, the cohort of 15- to 17-year-old youth reached its peak in 2024 and is expected to decline over the next decade. Overall, our current forecast has not changed much compared to the previous forecast.

Figure 14: Class C Driver License Renewal (quarterly frequency – seasonally adjusted)

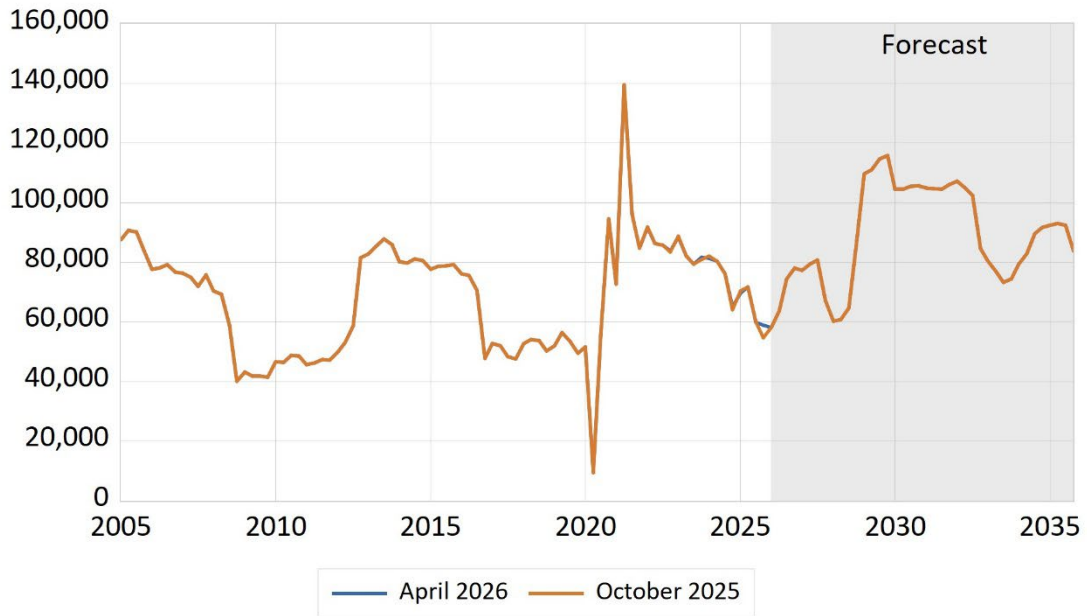

Figure 15: Original Class C Driver License (quarterly frequency – seasonally adjusted)

DMV started issuing Real ID compliant licenses and ID cards in July 2020. It is now the second largest revenue generating transaction within the Driver and ID Card section. Originally, the federal cut-off date for requiring Real ID when flying was October 2020. However, it was pushed out several times to October 2021, then to May 2023, and finally to May 2025.

The fee for a Real ID transaction is \$30, collected each time it is renewed (every eight years or if a replacement license is issued prior to expiration date). Getting Real ID credentials is an available option, and many choose to get it either when they are obtaining their original driving credentials or renewing/replacing the existing ones. On average, 70 percent of driver and ID card credential transactions in 2025 included a Real ID transaction, significantly higher than the 49 percent average in 2024. For the two months of data we have for 2026, the average is down to 61 percent, which is to be expected as the rush to get a real ID via driver license replacement transaction has passed (Figure 16). The current forecast for replacement cards has been revised downward, in line with more recent actuals.

Figure 16: Class C Driver License Replacement (quarterly frequency – seasonally adjusted)

The average volume of Real ID transactions skyrocketed in 2025. In 2024, DMV was issuing on average just over 30 thousand Real IDs a month, compared to almost 55 thousand transactions a month in 2025, an 81 percent increase over 2024. The two months of data available for 2026 indicate a lower average compared to 2025, just 38 thousand per month. Our current forecast has been adjusted downward for the short term, but it is a bit stronger for the long term (Figure 17).

Figure 17: Real ID Transactions (quarterly frequency – seasonally adjusted)

Some of the revenues collected by DMV are not Highway Fund revenues and are therefore not included in Table 3. The most prominent examples include ID card revenues, revenues from specialty plates (Smokey Bear, Gray Whale, Pacific Wonderland, etc.), Real ID revenues, snowmobile registration fees, motorhome, travel trailer, and camper registration fees. While we produce forecasts for all DMV revenues, not all of them can be used for highway construction and maintenance.

Table 3 shows the summary of DMVs Highway Fund revenues based on forecasted transaction volumes. The gross revenue portion of Table 3 is grouped into three major components reflecting the primary revenue sources: vehicle registrations, driver licenses, and vehicle titles. Overall, we expect \$15.9 million less in gross Highway revenues for 2025-27 biennium and \$13.7 million less for 2027-29 biennium due to weaker new vehicle sales forecast.

Appendix D has highway fund revenues collected by DMV for an alternative scenario (Table 3a, Appendix D), one that assumes a positive outcome of May referendum. In the alternative scenario, registration and title fee increases from HB 3991 that are currently on hold will go into effect on July 1, 2026.

Table 3: Highway Fund Revenues Collected by DMV (Millions of Dollars)

## Commerce and Compliance (CCD)

Trucking activity and the freight industry contribute to the State Highway Fund through the weight-mile tax, heavy vehicle registration fees, and other fees. Changes in economic conditions within Oregon and the nation as a whole influence each of these revenue sources. State and federal legislation can also impact trucking activity.

The weight-mile tax is the largest source of trucking-related revenue at roughly 87 percent of total revenue collected by CCD. This highway use tax applies to trucks with a gross weight over 26,000 pounds. The tax paid by a motor carrier varies with the weight of the vehicle, the number of miles traveled, and the axle configuration. The carriers generally have the option of paying on a monthly or quarterly schedule, but in some cases will pay by the trip. Certain qualifying motor carriers, such as those transporting logs, wood chips, and sand/gravel, may pay the highway use tax based on a flat monthly fee. The weight-mile revenue and transaction totals discussed in this report include the trip based, monthly, quarterly and flat fee revenue, as well as revenues from a small number of other trip-related fees.

Trucking activity experienced a boom during 2021 and 2022. Consumers continued to shift from brick-and-mortar stores to online shopping which led to an increase in goods shipped directly to homes (Figure 18). Seasonally adjusted E-commerce shares are now slightly higher than 2020 levels, continuing the trend of increasing E-commerce.

Figure 18: U.S. E-commerce as a percentage share of Retail Sales

Source: US Census Bureau Quarterly E-Commerce Report

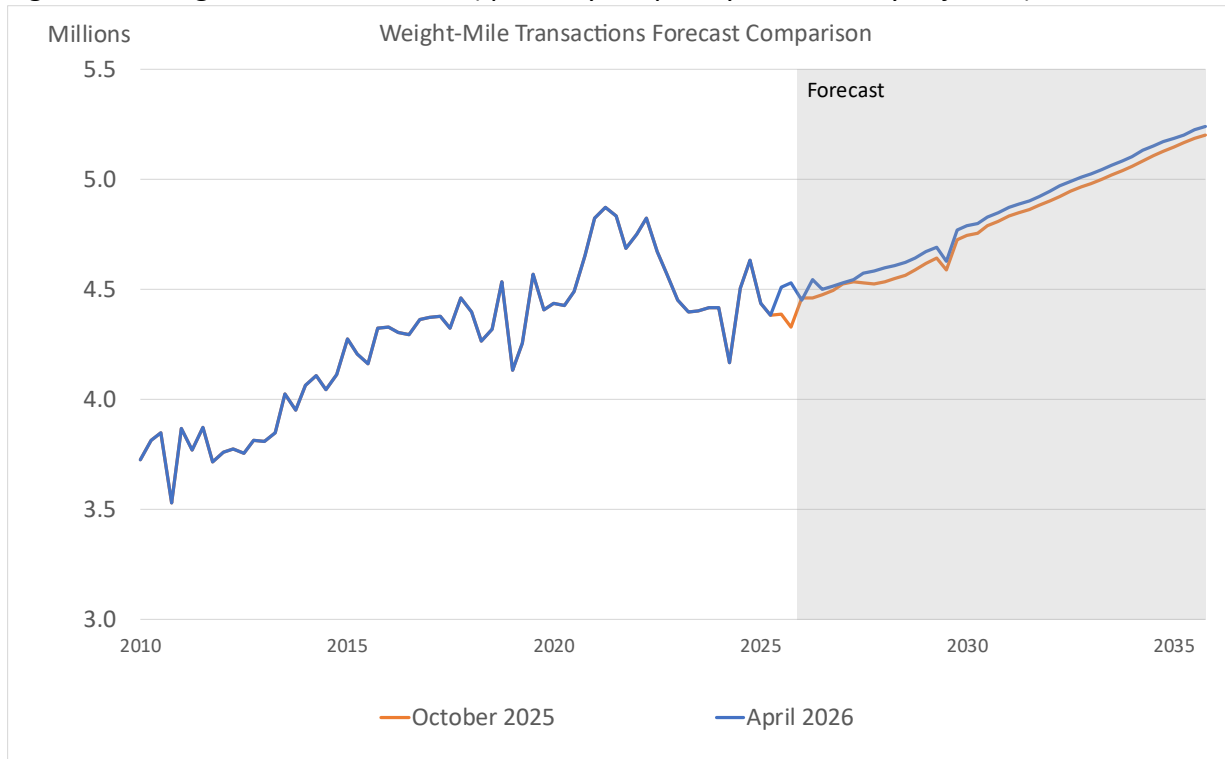

Besides a structural shift in consumer behavior towards more E-commerce, we continue to see evidence of a structural change in how trucks are operated. As consumers shifted out of brick-and-mortar stores, retailers like Amazon have instituted a more efficient way of getting goods to the consumers through utilization of large warehouses. This change may have altered how trucks deliver goods in the state. Instead of delivering to a series of retail outlets, we are now seeing heavy trucks delivering to these large warehouses and then smaller medium-duty vehicles dispatch the goods from the distribution centers to their ultimate destination. This change likely reduces the amount of heavy truck miles driven (and thus weight-mile revenue) but could allow for more efficient use of the heavy vehicles on transportation system.

An estimate of weight-mile transactions provides the basis for the current forecast of weight-mile revenues. This methodology, also used in prior forecasts, constructs a measure of weight-mile transactions by normalizing revenues by the tax rate paid for a typical heavy vehicle. Weight-mile transactions are estimated using an econometric model that takes into consideration the following external variables: Oregon construction employment, Oregon durable goods employment, real consumer spending on durable goods, industrial production of heavy trucks, and unit sales of medium and heavy trucks. The variables in the model that have the most significant impact on the forecast are real consumer spending on durable goods and Oregon construction employment.

As ODOT prepares to implement House Bill 3991, changes have been made to the weight-mile econometric model. The model currently uses an average weight-mile tax rate to normalize the revenue as described above. However, the future hybrid system will significantly reduce this tax rate. Using the model in its current state, this would imply some increase in activity from a lower tax burden on heavy truck carriers (price elasticity of the weight-mile fee). But because carriers will begin to pay diesel tax as well, the overall tax burden will only change slightly as there will be no expected increase in trucking activity from the system change. The model now uses the average weight-mile rate as well as the diesel tax rate to estimate the total tax carriers will be paying under the new system. While this is the best way to estimate the tax rates in the econometric model, the weight-mile revenues are based only on the weight-mile tax rates. Therefore, these revenues will be significantly decreased when the hybrid system goes online in 2029.

Figure 19 shows our current weight-mile transactions forecast compared to our previous forecast. Our updated model suggests that the previous projections would underpredict actual trucking activity for the duration of the forecast. The previous forecast did underpredict actual activity in the last two quarters of 2025. Changes to both employment and real consumer spending forecasts resulted in an upward revision of this forecast. Our new forecast shares a similar overall trajectory, as trucking activity is still expected to be increasing in a similar way through 2035.

Figure 19: Weight-Mile Transaction (quarterly frequency – seasonally adjusted)

Row 1 of Table 4 shows the amount of weight-mile and flat fee revenues collected by fiscal year. In FY 2025, weight-mile and flat-fee revenues totaled \$478.1 million, increasing roughly six percent over FY 2024. In FY 2026, revenues are expected to drop slightly before beginning an upward trajectory towards previous long-term trends. The changes from House Bill 3991 begin showing up in the table revenues starting in FY 2030 as the weight-mile tax rate decreases.

Row 2 of Table 4 shows heavy vehicle registration fee revenues. It includes both International Registration Plan (IRP) registration fees paid by interstate carriers and the Commercial registration fees paid by intrastate carriers. Together these heavy vehicle registration fees totaled \$63.3 million in FY 2025. This represents an increase from FY 2024 of roughly eight percent. Looking ahead, we expect revenues to dip slightly into FY 2026 and FY 2027 then bring us back to a long-run average and slightly increase through the remainder of the forecast.

Row 3 of Table 4 shows the revenues from Road Use Assessment Fees (RUAF), permits, passes, and credentials. This row also includes OTIA III Local Fund fee increments from the commercial driver permits, licenses, and tests, along with weight receipts. Overall, total revenues from these heavy vehicle sources increased to \$7.9 million in FY 2025. Looking forward, we expect very little change to forecasted revenues as they remain relatively flat.

Row 4 of Table 4 reports the total gross revenues for the Commerce and Compliance Division and row 5 shows the change from the prior forecast. For the 2025-27 biennium, there was a slight increase of \$7.1 million between forecasts and similar increases in the years leading up to

the hybrid switch in the 2029-31 biennium. Once we see that switch, we see very large decreases in projected weight-mile revenue starting in the 2029-31 biennium as the weight-mile tax rate decreases significantly.

Row 9 of Table 4 reports the revenues net of collection costs. Rows 10 through 14 of Table 4 are informational only and highlight the amounts CCD contributes to the OTIA, JTA, HB 2017, and HB 3991 programs.

## Finance and Budget Division Revenue: Motor Fuels and Road Usage Charge

This section details the forecast of revenues from motor fuels and the new mandatory Road Usage Charge (RUC) program, which is set to start enrolling vehicles July 1, 2027. HB 3991 raised the point of taxation of diesel. The legislation also included a 6-cent increase to the motor fuels tax that has been referred to the voters, and the increase is thus not currently in effect. The current-law forecast does not include the 6-cent increase as enough signatures were gathered to refer the law to the November ballot, putting a pause on the increase. In the 2026 Legislative Session, the legislature set the date for that ballot to May 2026. The result of the ballot will determine whether the 6-cent increase goes into effect July 1, 2026, or not at all<sup>1</sup>.

HB 3991 ties together motor fuels revenues and RUC revenues because RUC is an alternative method to charge for road use based on miles driven, and hybrids will receive a refund credit for any fuel they purchase once they are in the RUC Program. The following sections will cover the motor fuels tax revenues first and then cover the forecast for revenues under the newly created RUC Program.

Motor Fuels revenues are derived from the tax paid on the sale of both motor vehicle fuels (gasoline) and use fuels (predominately diesel<sup>2</sup>). Currently, the two types of fuel are taxed at the same rate, the tax is collected in different parts of the supply chain. Gasoline is taxed at the point of first sale, when the dealer or distributor purchases the fuel from the terminal. Diesel fuel is taxed later in the supply chain, at the retail level, though HB 3991 raises the point of taxation of diesel starting July 1, 2029, to be the same as gasoline. The current system of taxing at the retail level gives retailers the option of not imposing the tax on heavy trucks that pay the weight-mile tax, which is paid by vehicles in the 26,000-pound and above weight classes. Generally, a vehicle up to 26,000 pounds will pay the fuels tax and register their vehicle through DMV, and vehicles over this weight will pay the weight-mile tax and register their vehicle through CCD. When the HB 3991 changes take effect, all gasoline and diesel will be taxed at the point of first sale, with no pump-level exemptions for heavy trucks that pay the weight-mile tax.

Prior to COVID-19, gasoline comprised roughly 89 percent of taxable fuel, while diesel comprised the remaining eleven percent. The post-COVID-19 pandemic shift in travel patterns and the advance of electric vehicles resulted in an increase of diesel's share of total motor fuels revenue. In fiscal year 2025, diesel's share of motor fuel sales was 14.9 percent (diesel 85.1 percent). Light trucking activity, which would include delivery vehicles, has steadily increased following the 2020 COVID-19 pandemic, which resulted in more people staying home and not going to brick and mortar stores. The post-COVID logistics changes appear to include an increased number of distribution centers requiring less weight-mile paying truck activity and more diesel consuming medium-duty vehicle activity. Additionally, there has been an increase

---

<sup>1</sup> Appendix D to this document provides a forecast assuming the results of the referendum implement the HB 3991 6-cent per gallon tax increase.

<sup>2</sup> This section will use both diesel and use fuel interchangeably to refer to taxable diesel. Oregon will tax diesel sold to weight-mile trucks starting July 1, 2029.

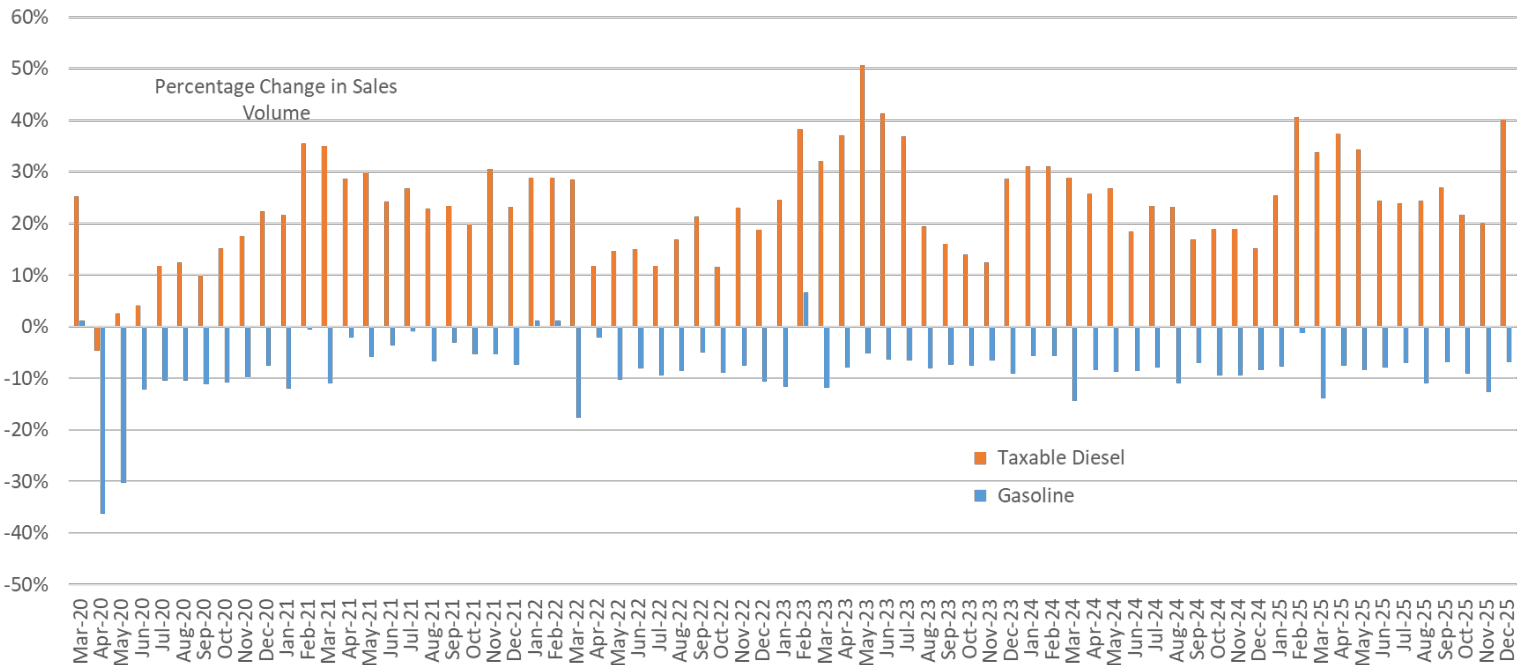

in the number of light-duty registered diesel vehicles in recent years. Taxable diesel's share of total revenues has leveled off in recent quarters, not growing as sharply as it did just after 2020.

However, revenues from diesel will increase dramatically in FY 2030 when the new hybrid system of taxing weight-mile vehicles becomes effective. Taxing all diesel at the first point of sale effectively imposes the tax on heavy trucks, so taxable gallons sold will include gallons Oregon previously did not consider for fuel revenues. The final forecast will show a large increase in total taxable motor fuels starting in FY 2030, though the increase in revenues from sale of those gallons will be offset by a reduction in weight-mile fees.

On the gasoline side, light duty vehicle registrations are lower than pre-2020 levels, and those vehicles have become more fuel-efficient. Work from home remains more common than before 2020, reducing demand for daily commuting. Meanwhile, average statewide fuel efficiency has increased in this segment as the share of hybrid, plug-in hybrid electric (PHEV), and battery electric vehicles (BEVs) have grown. Figure 20 below shows the difference in sales volume for both gasoline and taxable diesel compared to the same month in 2019. While some months show gasoline over-performance, it is exclusively attributed to a data issue caused by delayed reporting from sellers and is counterbalanced by make-up reporting in the subsequent month. HB 3991 implements a Road Usage Charge (RUC) program for hybrid vehicles, PHEVs, and BEVs which will exempt them from paying fuel tax in 2027, but the tax will still be collected at the distribution level. Those vehicles will be given credits for fuel tax paid from the RUC program, so the change for those vehicles will not affect the forecast of total gallons sold.

Combined fuel sales have not reached pre-2020 trends, and challenges to future growth exist. The total stock of passenger vehicles is not expected to reach 2019 levels in the forecast period (2025-35). That stock of vehicles is also projected to use less fuel due to market forces as well as national and statewide rulemaking like Oregon's Advanced Clean Cars II, which have led to improved fuel efficiency and more hybrid and EV stock. People may also drive fewer miles in Oregon on the whole. While many workers have returned to the office, Oregon's Office of Economic Analysis has projected that working from home in Oregon is here to stay. Vehicles needing less fuel to drive fewer miles puts downward pressure on the demand for fuel. The impact of the conflict in Iran and the closure of the Strait of Hormuz is not included in this forecast, but if higher gasoline prices are persistent, that will also impact the quantity of fuel sold.

Figure 20: Percentage change in Gasoline and Taxable Diesel sales over same month in 2019

Fuel prices had been projected to continue falling from their 2022 peak, but prices instead stabilized and rose slightly since the previous forecast. The April forecast has fuel prices rising, and recent current events not accounted for in that forecast will surely lead to higher future prices, which will have downward pressure on fuel sales for both gas and diesel. Gasoline sales are projected to be lower based largely on this impact. Diesel sales are expected to remain relatively flat and then decline after their jump to higher levels following COVID-19, though recent actuals came in above previous expectations, and so this forecast is adjusted up slightly.

This forecast includes two separate econometric models for gasoline and diesel. Each model uses distinct explanatory variables that are tested to determine economically significant impact on their demand. We first implemented this modeling approach with the April 2024 forecast. Having two separate models have so far improved forecast accuracy, and they offer additional information on the way these two fuels are consumed in Oregon. These two regression models and the resulting forecasts are discussed below in more detail.

### Gasoline Model

The inputs into the Gasoline Model include: the price of fuel, stock of passenger non-battery electric vehicles (non-BEV), stock fuel efficiency of the non-BEV light vehicle fleet, and Oregon total non-farm employment. Using non-BEV stock means the effect of the forecasted market shift to battery electric vehicles (BEVs) only enters the model through fleet fuel efficiency and through the reduction of vehicle stock that uses gasoline.

The stock of passenger vehicles is one of the strongest variables in our model. Since it is a long-term forecast, it is only updated once a year. Currently, we are using the April 2025 stock

forecast for non-BEV passenger vehicles, updated with recent actuals (Figure 21). The April 2025 stock forecast took into consideration Oregon’s adopting of the Advanced Clean Cars II (ACC II) rules from California. These rules require manufacturers to sell an increasing share of zero emission vehicles (BEVs and plug-in hybrid electric vehicles), reaching 100 percent of new light-duty vehicle sales by 2035. Our stock forecast utilizes light-duty vehicle sales by technology forecast for Pacific region from EIA’s Annual Energy Outlook. This forecast assumes that the share of zero emission vehicles in new vehicle sales will reach about 75 percent by 2035. The reason for that is the demand side of things and caveats in ACC II rules. Total stock of zero emission vehicles has been slightly above our previous expectations, which puts downward pressure on fuel sales, but this effect is dominated by the downward pressure from the overall economic forecast.

Figure 21: Non-BEV Passenger Vehicle Stock (April 2025 Forecast)

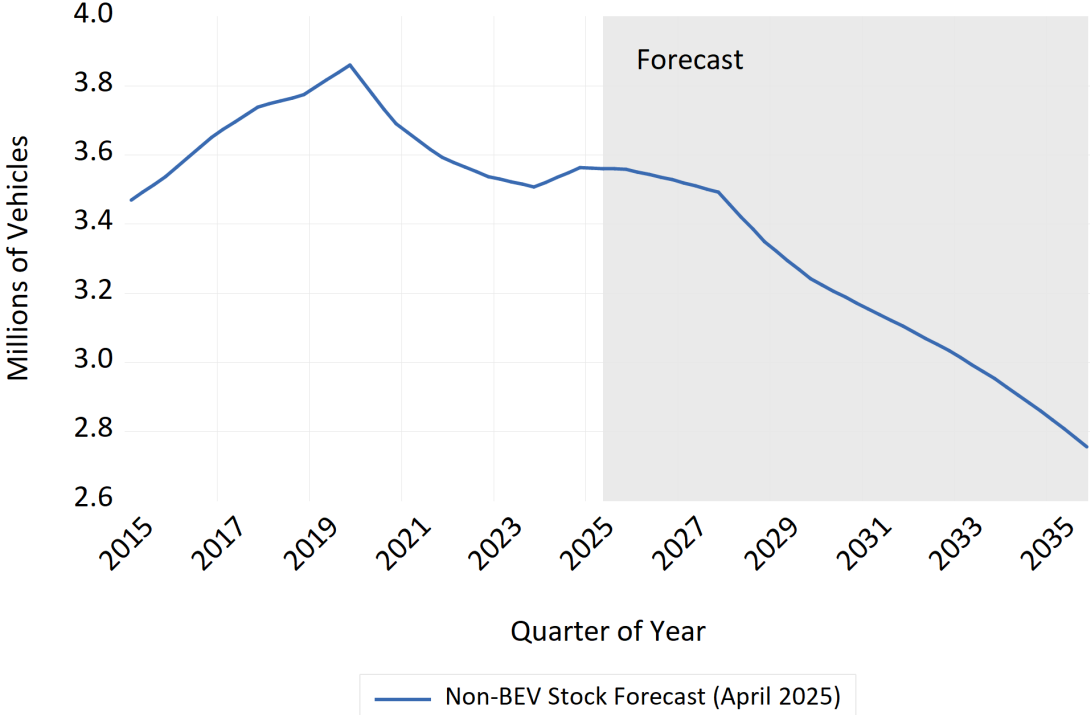

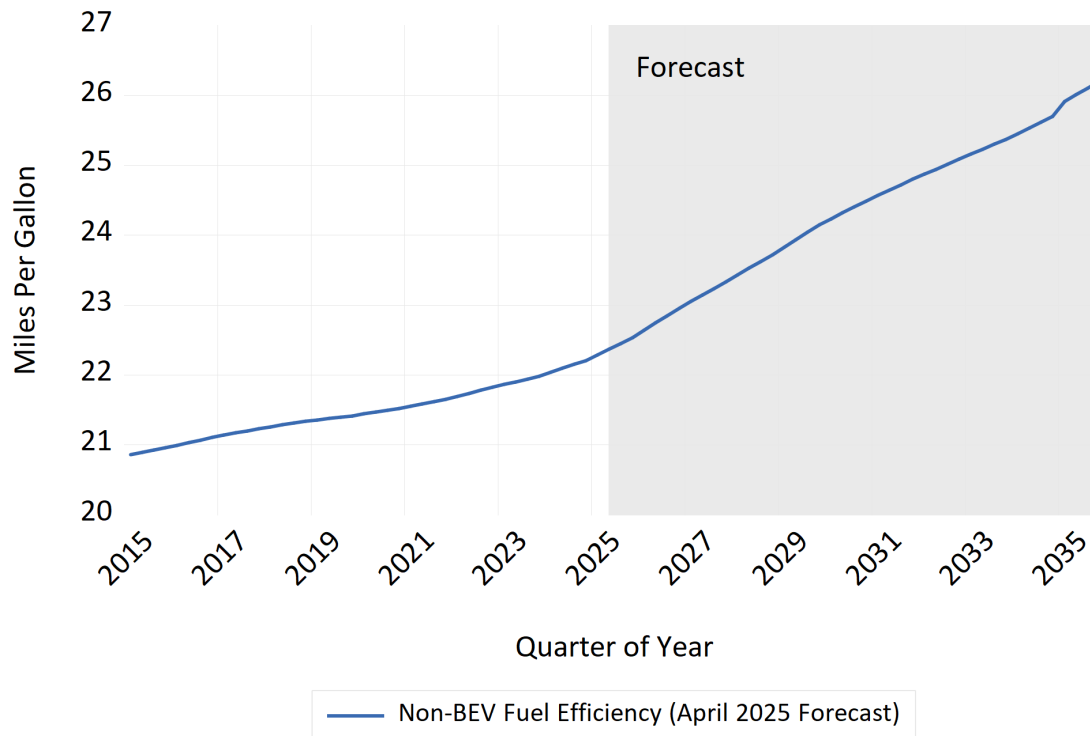

Figure 22: Fuel Efficiency (MPG) of Non-BEV Passenger Vehicle Stock

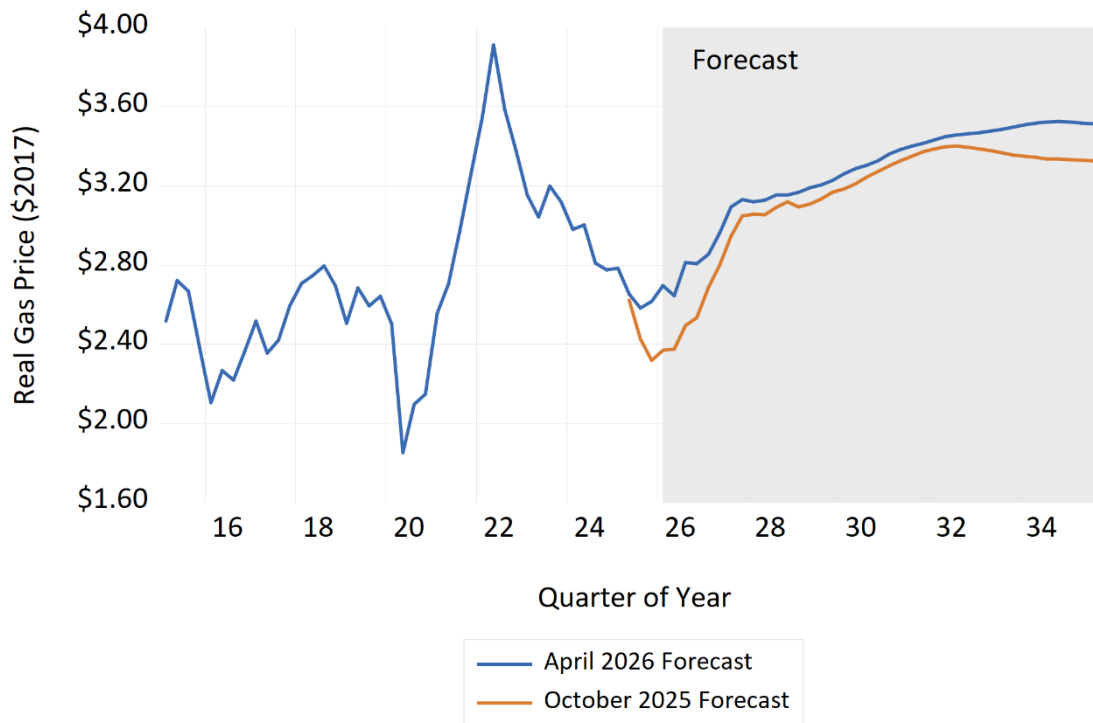

Fuel efficiency is another input variable to our model. It is based on the April 2025 stock forecast (Figure 22). The ramp up in fuel efficiency reflects both technological improvements in vehicle design as well as an increasing share of hybrid vehicles and PHEVs.

Another input to the Gasoline Model forecast is the price of fuel. The real gasoline price forecast stabilized and rose relative to the dip predicted in the October 2025 forecast (Figure 23). While fuel demand is relatively unaffected by the price of fuel in the short run, large and persistent changes have an impact. The real price of gasoline is expected to remain slightly below previous expectations in the near term but is now forecast slightly lower in the long term.

HB 3991 would have raised the gas tax from \$0.40 per gallon to \$0.46 per gallon starting on December 31, 2025. The April 2026 forecast does not assume this increase as it has been referred to the voters. Figure 23 shows the raised forecast of real fuel prices (blue line) relative to the previous forecast (orange line).

Figure 23: Real Price of Gasoline

Climate action is also expected to have an impact on prices. The Climate Protection Program (CPP), passed by the Environmental Quality Commission in December 2021, with recent revisions in place, sets explicit limits on greenhouse gas emissions by the transportation sector each year. These limits will effectively set a cap on the amount of fossil fuel sold each year. To achieve these limits, electrification of the vehicle fleet becomes a long-term key strategy, along with developing alternative fuels. In addition, fuel prices can become an important mechanism to encourage less consumption.

While we do not know precisely when prices will increase to incentivize less consumption, based on conversations with fuel suppliers, it is likely to happen in the near future. Additionally, it is possible that the current conflict with Iran will result in a similar or even larger increase in fuel prices, and subsequent reduction in fuel consumption. If fuel sales are reduced due to those effects, the CPP goals may be achieved without fuel sellers needing to take action. Either way, the result of higher prices over the coming year will reduce fuel consumption.

To capture the CPP price impact in the gasoline model, beginning in 2026, prices increase about two percent each quarter until reaching 20 percent in 2028. Based on CPP rules, if price increases in Oregon are 20 percent higher than the average price increases in Washington, Idaho, and Nevada, the Environmental Quality Commission can take action to address the increase. Thus, the model assumes the average fuel prices do not increase more than 20 percent a year, instead they maintain a constant 20 percent increase over the remainder of the forecast from the baseline price without any additional price effects<sup>3</sup>. Note that previous

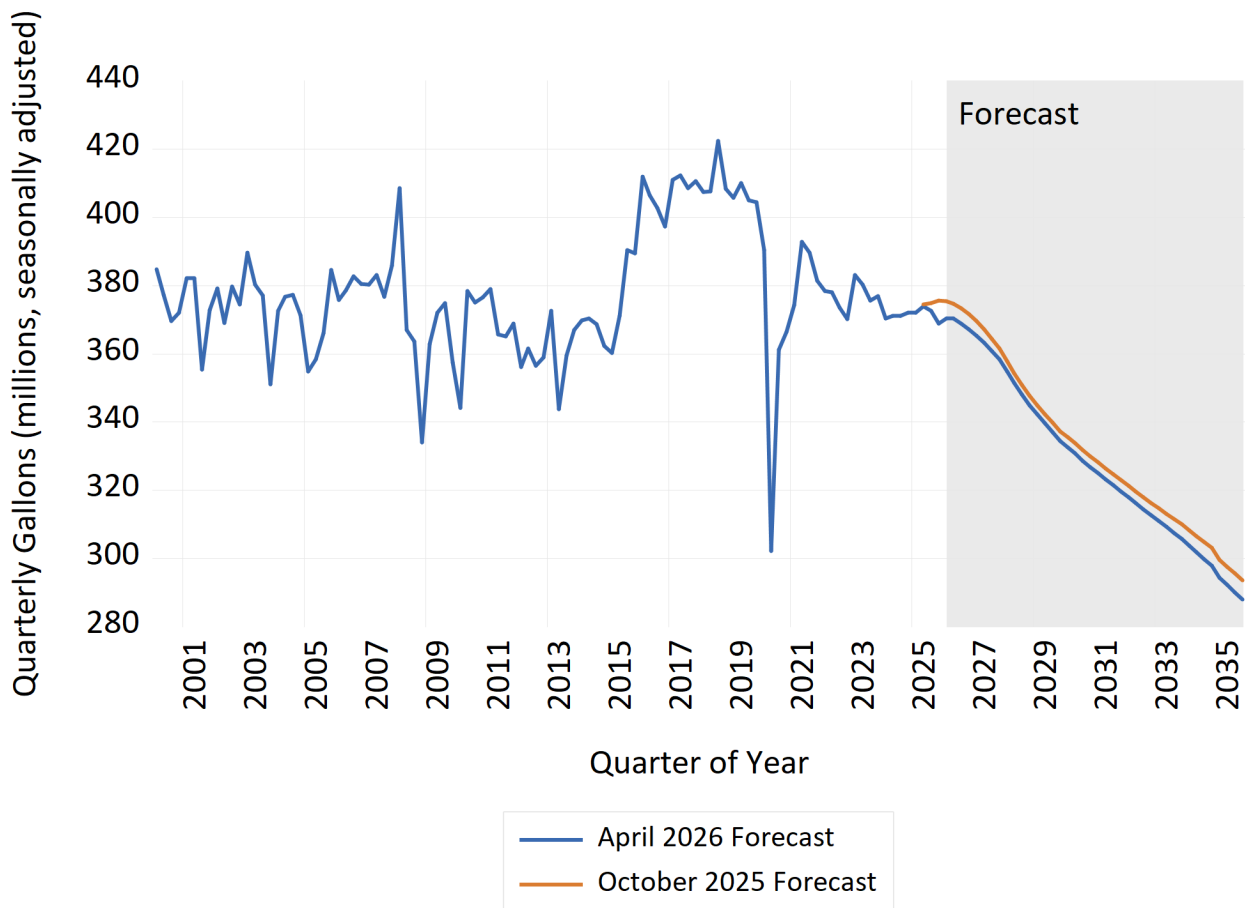

<sup>3</sup> 340-273-8100 Program Review of CPP Draft Rules <https://www.oregon.gov/deg/rulemaking/Pages/CPP2024.aspx>

forecasts have also included this assumption, and it is separate from impacts from HB 3991. CPP impacts on fuel prices are still unknown and represent a risk factor for this forecast.

Finally, DAS' forecast of Oregon non-farm employment saw a slight upward change between forecasts. This variable has consistently been a strong predictor of gasoline use. If economic growth improves, non-farm employment would see upward pressure, which would increase driving and fuel use.

Figure 24 shows a comparison of the gasoline forecast between October 2025 and April 2026. Actuals came in lower than the previous forecast, and the forecast is adjusted down, averaging a reduction of 1.1 percent per fiscal year for the forecast period.

Figure 24: Taxable Gasoline Forecast April 2026

### Use Fuel Model

Use fuel sales were up 5.0 percent in CY 2025 compared to CY 2024, while gasoline sales were only up 0.3 percent for the same period. Use fuel sales remain approximately 25 percent higher than use fuel sales in FY 2019. Differential consumption between gas and diesel sales in the months and years following the COVID-19 pandemic shutdowns led to the development of a new model for diesel sales. The use fuel model inputs include the stock of diesel vehicles registered in Oregon excepting those in the weight-mile program, the price of diesel, and

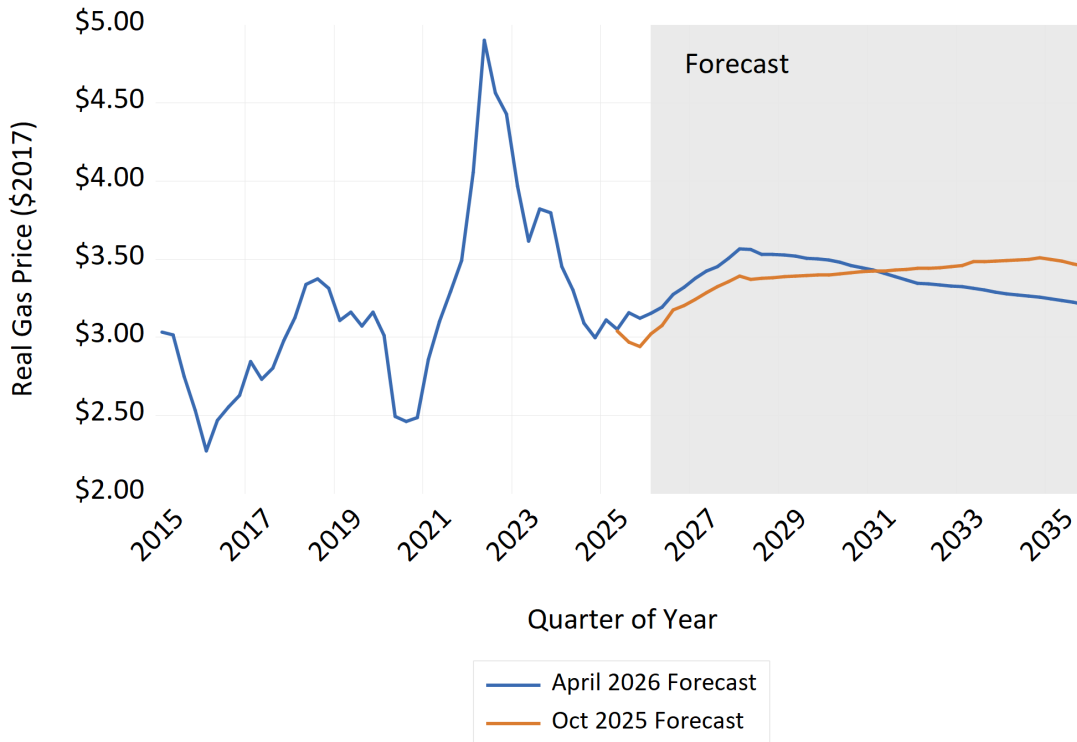

Oregon specific employment levels in manufacturing, durable goods, transportation, trucking and warehousing industries. Note that this model only estimates diesel sold to medium heavy and light duty diesel vehicles, not vehicles over 26,000 pounds that are in the current weight-mile program.

The stock of diesel vehicles registered in Oregon is tracked historically and forecast as part of the stock forecast. However, this forecast includes only passenger vehicles and is missing medium-duty vehicles registered with DMV. We plan to develop a stock forecast for medium-duty vehicles as well with future iterations of the stock forecast. Light-duty diesel vehicles have remained popular in Oregon in recent years, increasing their share of total registered vehicles to 7.0 percent in the most recent registration data, while gas-only vehicles have declined from 88.2 percent to 80.5 percent since 2015. There has been a large increase in online ordering and deliveries by medium-duty trucks since 2020 as well. All else equal, a larger share of diesel engines is expected to increase the share of fuel revenues from diesel, which is what recent data has shown.

Diesel price as a model input is created using Energy Information Administration data for western states, excluding California. Diesel prices are expected to have less impact on consumption for diesel trucks because these trucks often serve a commercial or purpose-driven role. Figure 25 shows the April 2026 real diesel price forecast compared to the October 2025 forecast. Prices are expected to decline in real terms more than in the previous forecast, with an update coming from adjusting to a more region-specific forecast series. The model assumes that diesel prices will also be affected by the CPP discussed in the gasoline section, which is reflected in prices rising in 2026 before leveling off to a slow rise in the out years of the forecast. Diesel prices came in higher than previously forecasted, putting downward pressure on the forecast for diesel sales, which is offset by real price declines in the out years putting upward pressure in those years.

If the voter referendum approves it, HB 3991 would increase the tax on diesel by 6 cents per gallon starting in July of 2026, a change discussed in the Appendix of this document. The impact of the CPP and the conflict in Iran and the Strait of Hormuz are the biggest risk factors in the near-term future for this forecast.

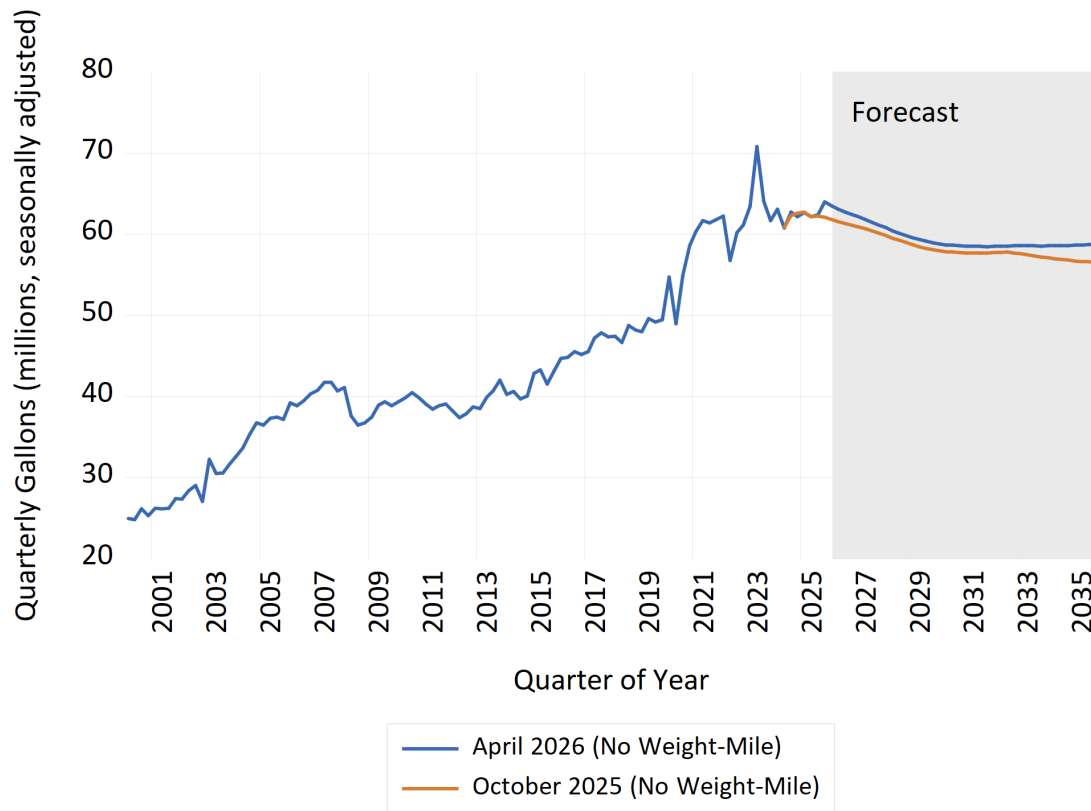

Figure 25: Diesel Price Forecast Comparison (Real 2017 Dollars)

The inputs for Oregon employment in manufacturing, durable goods, transportation, trucking, and warehousing come from Oregon’s OEA statewide economic forecast. These inputs show a stronger statistically significant relationship to diesel consumption than overall Oregon employment. All else equal, higher employment in these industries is expected to increase diesel use in the state. Transportation, trucking and warehousing employment was forecast above the October 2025 forecast, and it is expected to hold this shift upward in the forecast years. Higher employment in this sector is significantly associated with higher diesel fuel consumption in Oregon, and results in upward pressure on the forecast.

The April 2026 taxable diesel forecast expects slightly declining ongoing diesel consumption in the state following a dramatic shift up in the level of usage in previous years, and it is shifted above the previous, October 2025, forecast (Figure 26). The shift up is based on recent actuals being stronger than previously expected and stronger trucking sector economic activity. Declining consumption reflects a reduction in diesel vehicles for sale in keeping with Advanced Clean Cars II rulemaking. Even with stable-to-slightly increased light and medium-duty trucking activity, improvements in fuel efficiency also put downward pressure on demand. This forecast is more optimistic than the forecast decline in gasoline sales, which implies that revenues from taxable diesel will continue to grow as a share of the total state revenues from taxable fuels.

Figure 26: Taxable Diesel Forecast April 2026

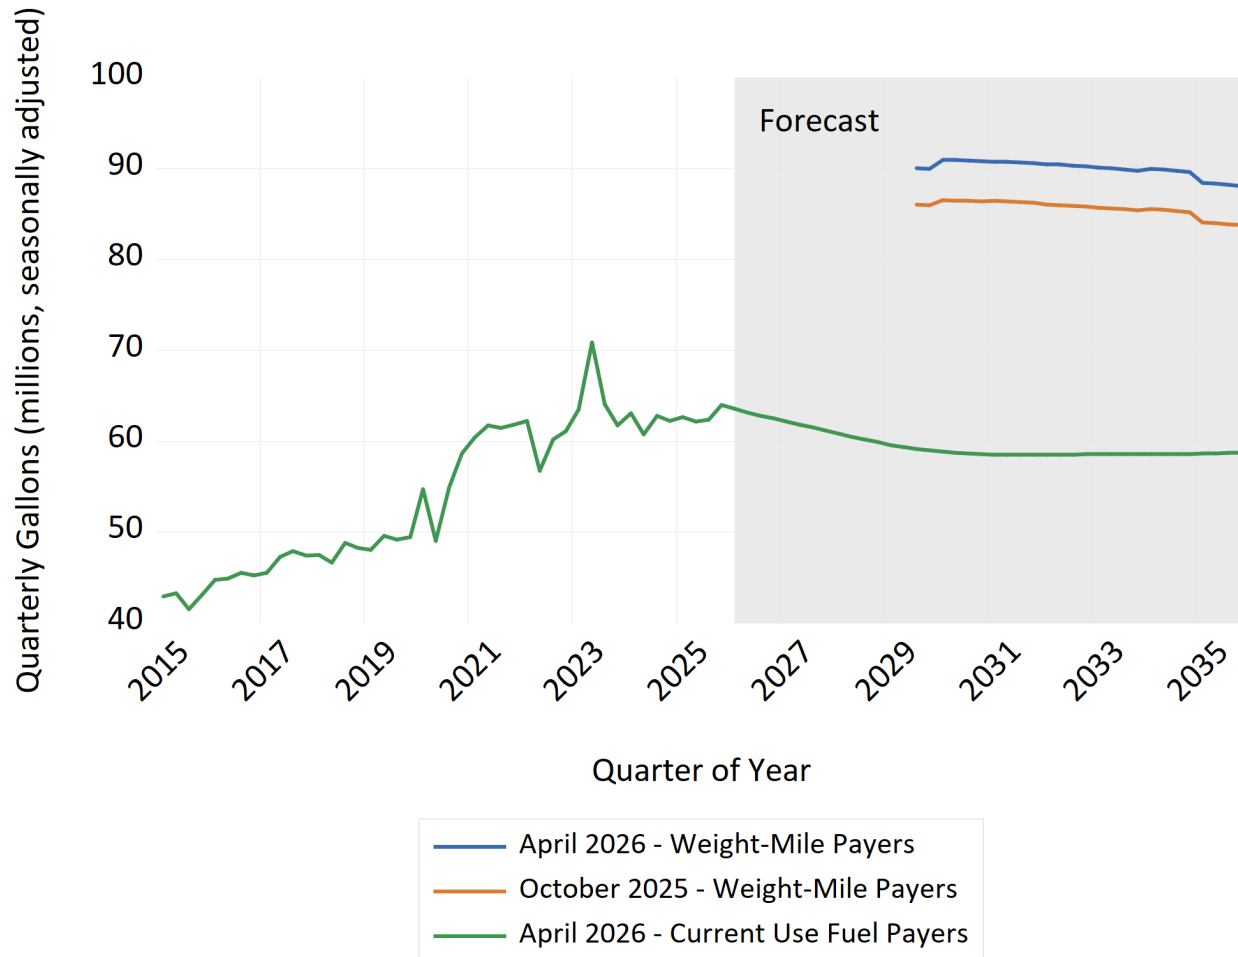

### Diesel Tax Revenue from Weight-Mile Participants

HB 3991 will shift the point of taxation on diesel starting July 1, 2029. At that point, heavy trucks on the weight-mile program will begin to pay fuel tax, with an off-setting reduction in their weight-mile fees. The change results in a huge increase in the number of gallons of fuel that will be taxed in Oregon. A separate model is needed because trucks in the weight-mile program are inherently different from light-duty diesel trucks, and their demand for fuel will be more similar to the weight-mile forecast.

The April 2026 forecast estimates diesel revenue for the participants using miles driven by weight-mile program participants and fuel efficiency of those vehicles. From that, the gallons of fuel sold can be derived by dividing the miles driven by the miles per gallon (mpg) for the truck fleet. We utilize data from International Fuels Tax Administration (IFTA) and the Highway Cost Allocation Study to calculate Mileage-weighted mpg. Fuel efficiency is expected to increase over time for these trucks, as forecast by the EIA’s Annual Energy Outlook suggests, which puts downward pressure on fuel demand. Figure 27 shows the forecast of diesel gallons sold (blue line) above the current use fuel forecast with HB 3991 (April 2026 blue line, October 2025 orange line). Adding the amounts represented by each line would give the forecast total of all diesel gallons sold. The forecast miles have been revised upwards due to lower fuel efficiency expectations in the weight-mile vehicle fleet in Oregon compared to the previous forecast.

Figure 27: Weight-Mile Vehicles Diesel Gallons Forecast April 2026

### Motor Fuels Revenue - Combined Forecast

Figure 28 shows the forecast of gallons sold for Motor Fuels compared to the prior forecast, but excluding diesel gallons forecast to be sold to weight-mile participants. Fuel sales in the final two quarters of calendar year 2025 tracked just below the October 2025 forecast amounts, leading to a near-term upward adjustment from the previous forecast. In the outer years, the current forecast shows fuel sales shifted below the previous forecast based on updates to the economic outlook.

Diesel sales reached a record high in quarter two (Q2) of 2023 before seeing a sharp decline in the final two quarters of the calendar year. Similarly, gasoline sales jumped to post-COVID highs in Q2 of 2023 but dropped from that peak in the next quarter, even as real gas prices remained low relative to their 2022 peak. Both gasoline and taxable diesel sales showed signs of stabilizing in calendar year 2025. All else equal, with the stock of non-BEV vehicles predicted to steadily grow over the coming ten years, fuel use will decline. The downward slope of the forecast in the out years reflects the impacts of the CPP, high gas prices, and increasing non-BEV stock. 2026 will see dramatic changes in policy around fuel sales, and these changes represent higher than typical forecast risk in the near term.

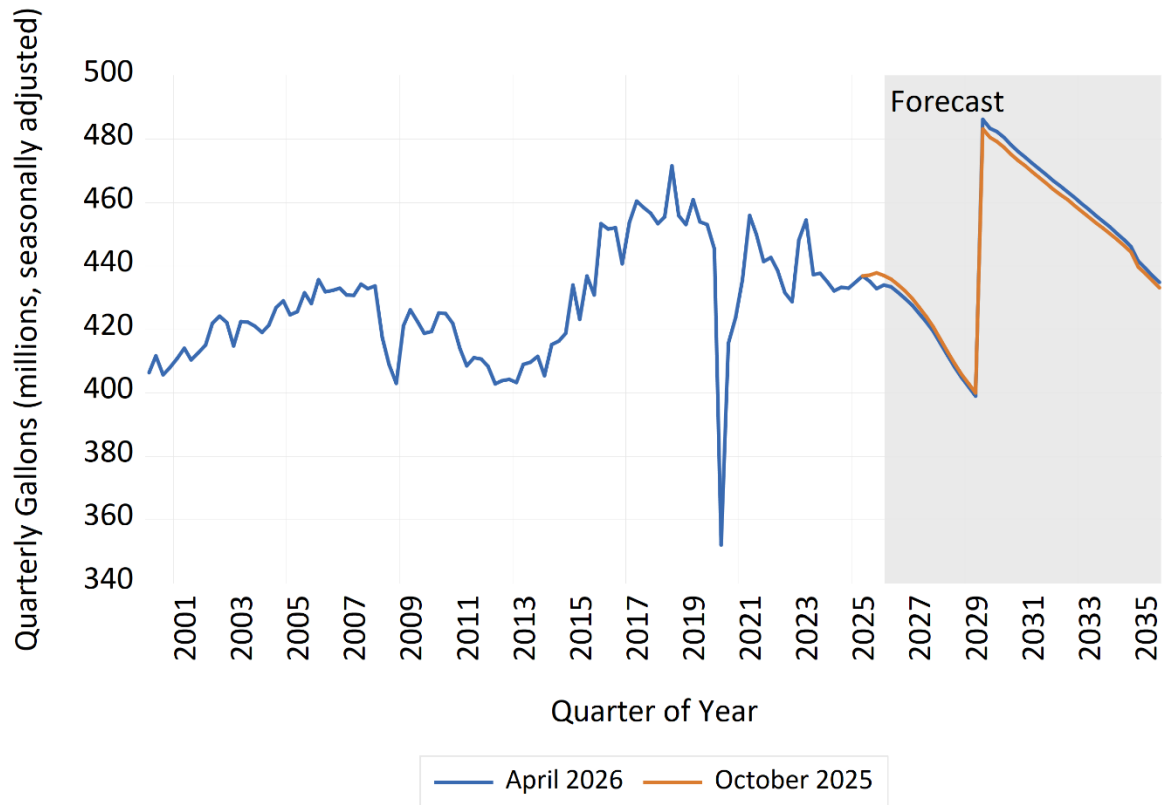

Figure 28: Motor Fuels forecast (millions of gallons of taxable fuel, no weight-mile)

Sales are expected to be slightly below the previous forecast through the end of 2035, a cumulative reduction of the forecast of gallons sold of 1.1 percent for FY 2027 through FY 2035.

HB 3991 shifts the diesel point of taxation so that it will be paid by all road-using vehicles, including weight-mile participants. Figure 29 shows the forecast of total taxable gallons sold with the shift from changing the diesel point of taxation. The increase in fuel tax revenues is \$144.9 million in FY 2030, the first year of the change, and declines slightly to \$142.4 million in FY 2035 due to macroeconomic factors. This increase in revenues is offset by a reduction in weight-mile fees and revenues, so should not be interpreted as standalone “new” revenue to ODOT.

Figure 29: Motor Fuels forecast (millions of gallons of taxable fuel, including weight-mile)

### Road Usage Charge (RUC) Revenue

HB 3991 makes Oregon the second state (after Hawaii) to implement a mandatory Road Usage Charge (RUC) Program for all battery electric vehicles (BEVs), hybrid vehicles, and plug-in hybrid electric vehicles (PHEVs), with a graduated roll out of when vehicles will be required to enroll in the new program. The RUC Program will charge these vehicles a per-mile rate of 5 percent of the prevailing state gas tax, or 2 cents per mile at the current 40 cents per gallon tax. RUC program vehicles paying per-mile will receive a fuel tax credit based on reported mileage and mpg estimates. Vehicle owners can also choose to opt out of per-mile payments and instead pay a \$340 annual flat fee, though opting out will likely make them ineligible for fuel tax refunds since that is based on reported mileage.

A number of definitions and assumptions are required to forecast revenues from the new RUC program. Figure 30 offers details on the four main components: EV Miles, Hybrid Miles, Flat Rate Payers, and Revenue Miles.

Figure 30: Components of the RUC Program forecast

<i>Forecast Component</i>	<i>Description</i>	<i>Data Source</i>
<b>EV Miles</b>	Miles driven by EVs based on forecast of EV stock and average miles driven.	ODOT Stock Forecast (April 2025) and Oregon DMV Data
<b>Hybrid Miles</b>	Miles driven by hybrids and PHEVs based on forecast of gallons and fuel efficiency of the stock.	ODOT Stock Forecast (April 2025), Oregon DMV Data, and ODOT Fuels Forecast (October 2025)
<b>Flat Rate Payers</b>	Share of vehicles in RUC opting to pay the annual flat fee based on a cutoff of 15,000 annual miles.	Oregon DMV Data, National Household Travel Survey (2022)
<b>Revenue Miles</b>	Miles driven by all RUC vehicles who do not opt into the flat rate, based on a weighted average of miles driven.	Oregon DMV Data, National Household Travel Survey (2022)

These components are built from the ODOT Stock Forecast (April 2025) which includes forecasts of the stock of EVs, hybrids, and PHEVs separately. Oregon DMV Data provides information used to estimate total annual miles driven by EVs as well as average fuel efficiency of each vehicle type in RUC, weighted by the share of the total. ODOT’s Fuels Forecast (April 2026) is used to forecast gallons consumed by hybrids and PHEVs, which, when multiplied by weighted fuel efficiency, gives an estimate of miles driven. Finally, US DOT National Household Travel Survey (NHTS, 2022) data is used to estimate the share of each vehicle type that drives over 17,000 miles, the point above which it would be more expensive to stay on the per-mile option. Revenue Miles, the miles that are subject to the 2 cent per mile charge, are calculated after determining the prior components so that miles driven by flat rate payers can be netted out of the final total.

The RUC Program will begin on July 1, 2027, when existing EVs begin to be enrolled as they renew their registration. Starting January 1, 2028, all newly purchased EVs will begin to be enrolled at time of sale. On July 1, 2028, all hybrids and PHEVs will be enrolled either at time of purchase or as they renew their registration. The structure of this roll out is taken into account in the forecast and is based on the stock forecast.

Figure 31 shows total RUC revenue miles for EVs and hybrids/PHEVs, which does not include miles driven by annual flat fee payers. The April 2026 forecast has shifted downwards as the forecast model has been updated to better reflect assumptions about enrollment and driving of RUC vehicles in Oregon. The vertical dashed line indicates when hybrids are required to enroll in the RUC program, and when RUC revenue miles will begin to sharply increase as vehicles roll into the program. HB 3991 stipulates that RUC Program vehicles will receive a refund credit for paid fuels taxes.

Figure 31: April 2026 Forecast – RUC Revenue Miles Total

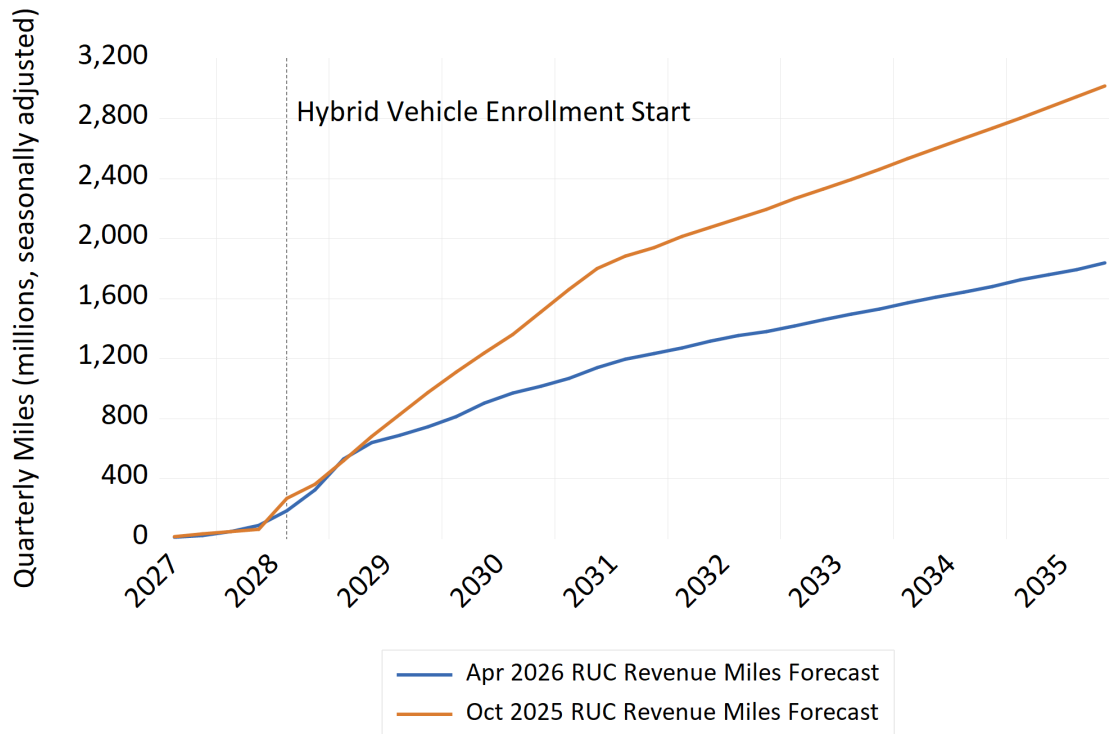

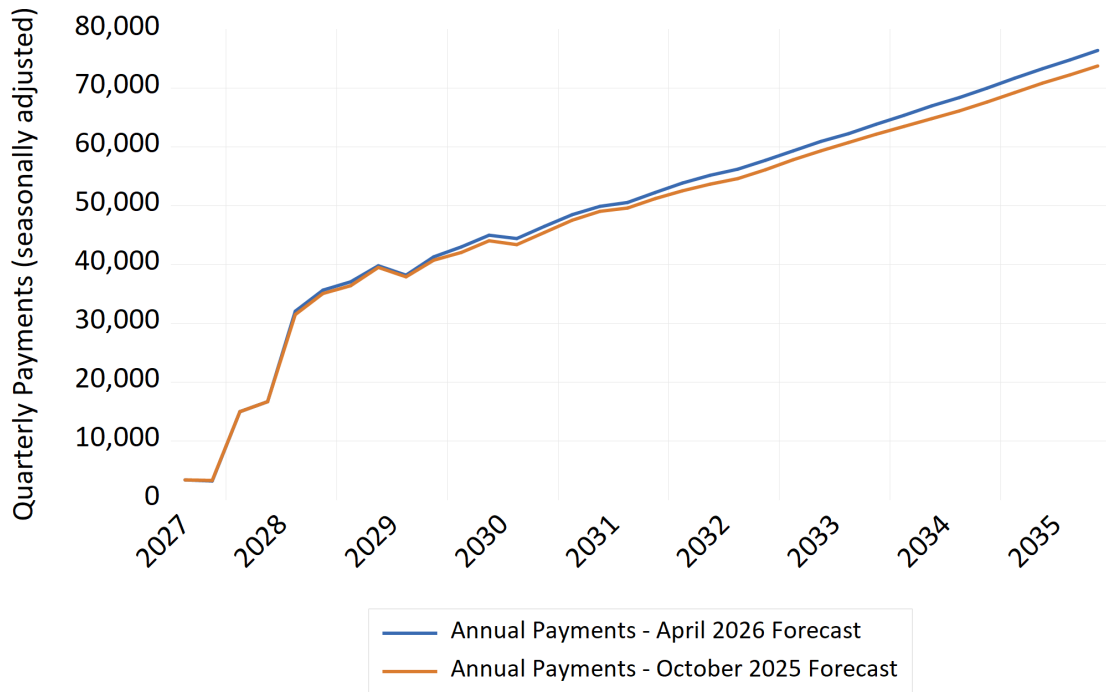

Figure 32 shows the forecast of the annual payment counts for RUC annual flat fee option. In this chart, a new vehicle purchased in Q3 of 2028 would be counted as four total payments, while a vehicle renewing its registration would be counted as two total payments. This methodology is consistent with how ODOT is planning to manage flat fee payers, assuming that they will be handled by DMV at the time of registration rather than by a third-party administering RUC per-mile payers, which is more costly. However, the details are still being worked on and this might still change. With this method the participants are pre-paying two years or four years in advance and that is why the payments ramp up quickly as vehicles first enter the program. They taper off later to growth rates that match the growth of EV and hybrid vehicle stock.

Figure 32: April 2026 Forecast of RUC Annual Flat Fee Payments

Revenue miles and annual flat fee payments ramp up in keeping with the structure of the policy, slowly in fiscal year 2028, then faster once hybrids are included. Once all vehicles have been enrolled in the program, either through new purchase enrollment or at time of registration renewal, growth slows. RUC revenue miles and annual payments will continue to grow as the share of Oregon’s fleet continues to transition away from gasoline only vehicles and with population growth. The forecast assumes that vehicle miles traveled per vehicle stay consistent for the forecast period.

Gross revenues start at \$98 million for the 2027-29 Biennium, and grow to \$444 million in the 2033-2035 Biennium, the final period of the April 2026, forecast.

### Summary of Revenues for Motor Fuels and RUC

Row 1 of Table 5 shows the total gross revenues from the Motor Fuels taxes FY 2025 finished with a fuel sales revenue up 1.8 percent over FY 2024, though there was a rate increase that was not in effect for the start of FY 2024 accounting for some of that increase. The first six months of forecast data from the October 2025 forecast under-predicted fuel sales by 1.0 percent compared to actual sales. We project revenues to be lower in FY 2026 by \$4.0 million (0.6 percent) relative to the previous forecast, and \$6.8 million lower in FY 2027 (1.0 percent). The revenue decrease is driven mostly by the recent underperformance of actuals relative to the previous forecast. This comparison is to the previous forecast made that did not include the 6-cent fuel tax increase in HB3991.

Row 2 and 3 of Table 5 show the total gross revenues from the RUC Program's per mile charges and annual flat fee collections. These revenues begin in FY 2028 at \$16.1 million, and are \$82.3 million in FY 2029, the first year that includes both EVs and hybrid vehicles.

FY 2025 finished with \$694.4 million in gross revenues, an increase of 1.79 percent over FY 2024 as demand continued its recovery from the pandemic. The third quarter of FY 2024 included the final HB 2017 fuels tax rate increase to \$0.40 per gallon, which helped bolster revenues. Revenues will increase through FY 2027 due to HB 3991's changes to fuel taxes.

Row 5 shows the change from the prior forecast. The changes in row 5 stem from changes in the gallons forecast for FY 2026 through FY 2027, and updates to the RUC forecast and weight-mile diesel sales forecast in FY 2028 and beyond.

Rows 6 through 18 of Table 5 list the costs associated with the Fuels Tax and RUC programs and the statutory transfers that occur prior to apportionment.

Rows 20 through 24 of Table 5 highlight the amounts that the Motor Fuels and RUC taxes contribute to the OTIA, JTA, HB 2017, and HB 3991 programs, either as a portion of the OTIA I set-aside shown in row 20 or as the incremental revenues from the OTIA III, JTA, and HB 2017 programs shown in rows 21 through 23. Note that the OTIA III legislation did not increase the Motor Fuels tax rate, so the incremental amount is zero. Row 24 shows incremental revenues from HB 3991 programs.

\*RUC: Road Usage Charge - Passenger Vehicles

## Other Revenues

In addition to the traditional highway revenues, ODOT also collects and distributes the following revenues:

1. HB 2017 Tax Programs
2. Aviation Fuel Tax
3. Gross Railroad Revenues
4. Other Highway Revenues

### HB 2017 Tax Programs

The 2017 Oregon Legislature passed House Bill 2017, marking a significant investment in transportation to promote a clean environment, strong communities with good quality of life, a vibrant economy with good jobs, and safe, healthy people. This effort is referred to as Keep Oregon Moving. In addition to increasing the traditional Highway Fund taxes and fees, three new taxes were introduced to provide additional funding for Keep Oregon Moving:

1. Statewide **Transit Payroll Tax** for investments in public transportation.
2. **Vehicle Privilege Tax** (on new vehicles purchased and registered in Oregon) dedicated to the Connect Oregon program and to promote electric vehicle sales. New vehicles purchased outside of Oregon and registered in Oregon are subject to a similar tax called **Vehicle Use Tax**. However, these funds go to Highway Fund and thus are treated as a separate line item.
3. **Bike Excise Tax** is dedicated to the Multimodal Active Transportation (MAT) fund dedicated to bicycle and pedestrian projects.

The Vehicle Privilege/Use Tax and Bike Excise Tax were implemented in January 2018. The Transit Payroll Tax went into effect in July 2018. The most significant recent statutory update is the legislature restructuring the amounts transferred to the Department of Environmental Quality (DEQ), [Senate Bill 1558 \(2022\)](#). With the change, ODOT now receives the remainder of privilege tax revenues after DEQ has received the greater of \$12 million or 45 percent of calendar year privilege tax revenues.

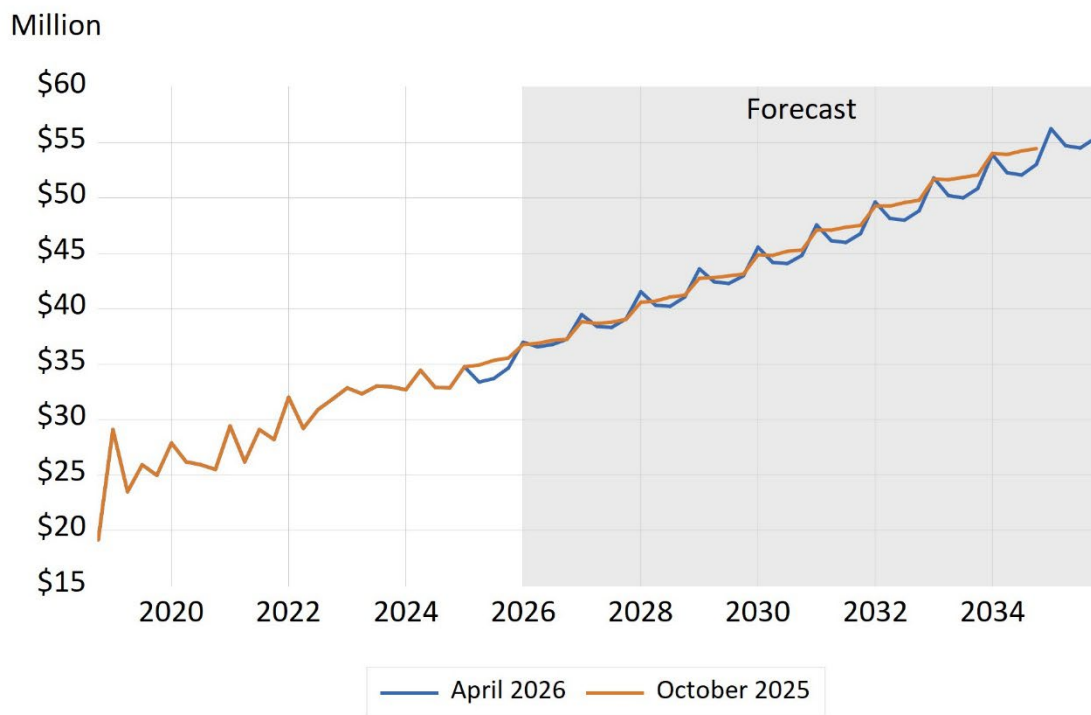

### Transit Payroll Tax

The Transit Payroll Tax is a statewide payroll tax and is the largest of the HB 2017 taxes. A rate of one-tenth of one percent is imposed on the wages of employees who are Oregon residents regardless of where they work as well as residents of other states who work in Oregon. A provision in HB 3991 was set to increase the rate to two-tenths of one percent through Dec 31, 2027, however that provision is currently on hold and has been referred to May referendum. Our current forecast assumes that the fee increases that are on hold will not be approved by the voters. The revenues from this tax are distributed to state transit agencies. About 90 percent is distributed by formula to the statutorily defined Qualified Entities based on their respective share of state payrolls.

Previously, our forecasts for the transit payroll tax were based on accrual method. However, starting with our October 2024 forecast we made a decision to switch to cash basis forecast,

which has two advantages: 1) we do not have to worry about constant revisions in the accrual-based actuals as the data keeps maturing, especially when the annual tax submissions come through, and 2) cash flow forecast works better for our budgeting group and entities that receive the funds. Our current forecast for 2025-27 biennium is \$4.4 million higher compared to the previous forecast (Table 6). The payroll forecast has not changed much; however, the collection costs went down significantly and that is the primary reason for the increase in the cash flow to ODOT (Figure 33). Appendix D has Table 6a with an alternative forecast for transit, one that assumes a positive outcome of May referendum. In the alternative scenario, the transit payroll tax rate increases to two-tenths of one percent on July 1, 2026 through Dec 31, 2027.

Figure 33: Transit Payroll Tax Distributions to ODOT - Forecast Comparison (Quarterly)

### Vehicle Privilege and Use Tax

Vehicle Privilege and Use Taxes apply to manufacturer or dealer new vehicle sales, while private vehicle sales are excluded. The tax amount of 0.5 percent of the vehicle’s sale price is assessed on the following vehicle types: passenger vehicles, trucks, trailers (except 1,800 lbs. or less), travel trailers, motor homes, campers, motorcycles, mopeds, buses, bus trailers, and fixed load trailers. Only vehicles with odometer reading of 7,500 miles or less (if there is an odometer) and gross vehicle weight rating of 26,000 lbs. or less are subject to this tax. For sales occurring in Oregon, the vehicle dealer is required to pay the **Privilege Tax**. An Oregon resident purchasing a new vehicle out-of-state pays the **Use Tax**. The rates are the same for both taxes. However, Use

Tax revenue is Highway Fund revenue while Privilege Tax revenue is dedicated to ODOT's Connect Oregon program and to Department of Environmental Quality EV rebate programs.

First, we estimate the number of vehicle sales subject to privilege and use tax (Figure 34). Our regression model utilizes S&P Global forecast for US Light Vehicle Sales and DMV forecasts for four-Year Vehicle Registrations. The new vehicle sales are expected to be lower in the next few years compared to our previous forecast. The main reason for that is the weaker forecast for new vehicle sales in Oregon.

Figure 34: Vehicle Sales subject to Privilege or Use Tax - Forecast Comparison (Quarterly)

As with transit payroll tax, we switched to a cash-flow forecast method. The cash-flow for vehicle privilege tax and use tax are estimated using historical cash-flow data, subject vehicle sales forecast, and National Average Light Vehicle Price forecast from S&P Global. The forecast for average light vehicle price is expected to be higher compared to the previous forecast. With the lower vehicle sales expectations and higher vehicle price expectations, both use tax and privilege tax revenues are forecasted to be roughly the same as our previous estimates (Figure 35 - 36).

Figure 35: Vehicle Privilege Tax - Forecast Comparison (Quarterly)

Figure 36: Vehicle Use Tax - Forecast Comparison (Quarterly)

## Bicycle Tax

The Oregon Bicycle Excise Tax is a flat tax of \$15, collected at the point of sale starting January 1, 2018. Revenue from the Bicycle Excise Tax goes into the Multimodal Active Transportation Fund to provide grants for bicycle and pedestrian transportation projects. This tax was initially applied to bicycles with a wheel diameter of 26-inches or larger and excluded electric-assist bicycles. However, during the 2018 Legislative Session, these restrictions were removed (HB 4059) and now all new bicycles of \$200 and higher are subject to the tax. While the tax is owed by the purchaser, the seller is ultimately responsible for collecting it, filing quarterly returns with the Department of Revenue, and making payments.

Our current forecast for bicycle sales is a bit weaker for the current and next fiscal years, but we are expecting more bike sales in the long run (Figure 37). We have switched to a cash-flow forecast for this series as well. The bicycle sales peaked around the COVID years and have been declining ever since, but we do expect there to be more sales in the future as the replacement cycle for existing bikes kicks in. Literature suggests a replacement cycle of 10-15 years for casual riders.

Figure 37: Bicycle Sales Subject to Tax – Forecast Comparison (Quarterly)

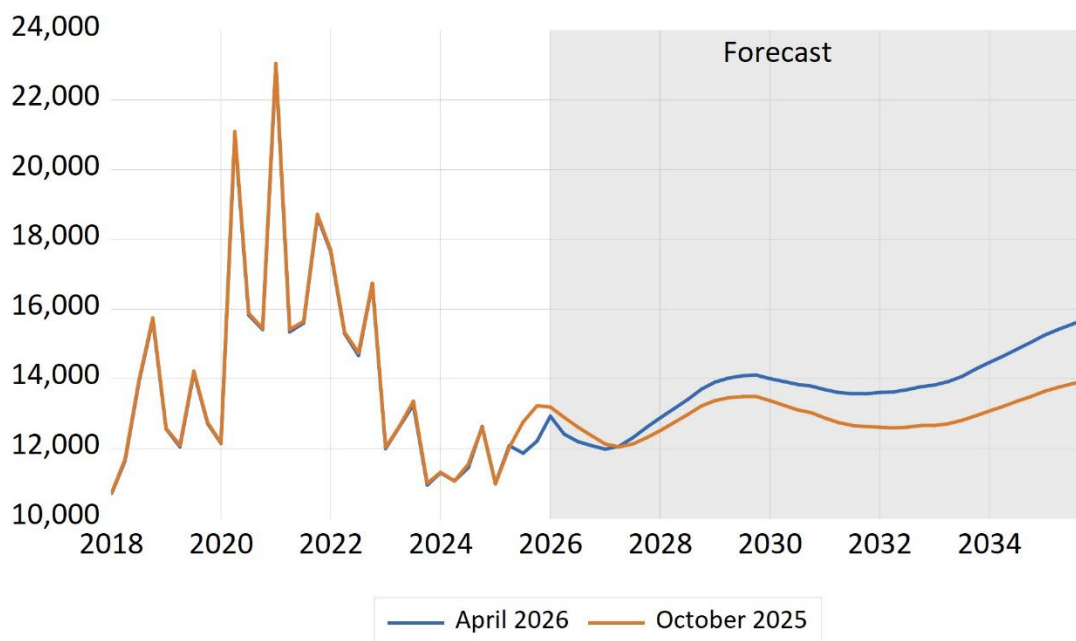

Table 6 provides a summary of HB 2017 taxes. Total net revenues to ODOT for the current biennium (2025-27) are 0.3 percent higher compared to October 2025 forecast. Revenues for the 2027-29 biennium are 1.3 percent higher. See Table 6a, Appendix D for the alternative scenario.

Table 6: Total & Net HB 2017 - Transit, Privilege, Use, and Bike - Tax Revenues (Millions of Dollars)

\* This is a summary of a monthly cash flow forecast and it's based on one month lag in total receipts received by DOR minus administrative costs. For that reason, the net tax revenues to ODOT is not a simple subtraction of FY summary collection costs from FY total tax collections.

## Aviation Fuel Tax

The April 2026 forecast shows an upward revision of the forecast of revenues from jet fuel and aviation gas taxes relative to October 2025. The forecast anticipates 1.13 percent higher revenues for the 2025-27 biennium followed by 0.82 percent higher revenues for the 2027-29 biennium. The net change in revenues forecast relative to October 2025's forecast is an increase of \$0.56 million (1.0 percent increase) for FY 2025-33. A major risk factor for this forecast is uncertainty around jet fuel prices and supply as there continues to be a conflict between the United States and Iran. This forecast was produced with data prior to the beginning of that conflict and does not attempt to incorporate those potential effects.

Jet operations have continued their upward trend, approaching the pre-COVID historical peaks in the final two quarters of 2025, and exceeded the previous forecast of jet fuel sales. The calendar year 2025 saw an 8.9 percent year-over-year increase relative to 2024 in the total number of operations for Oregon's largest reporting airports. However, much of that growth stemmed from general aviation flights, which do not use as much fuel as commercial carrier flights. Load factors, which measure how efficiently airlines fill planes with passengers, were similar in CY 2025 to CY 2024. All else equal, moving a similar number of passengers with a lower load factor increases fuel use and revenues, and improves the jet fuel tax revenue forecast. If load factors have hit their ceiling, there are fewer headwinds for future sales.

The final key to an upward revision in the forecast relative to the previous forecast is from macroeconomic indicators. Oregon's statewide forecast expects slightly higher employment and wages going forward than in the October 2025 forecast. Along with higher fuel prices, government funding issues for the Department of Homeland Security and Transportation Security Administration could put stress on the aviation system would also likely drag down jet fuel sales. While these factors were not built into our forecast separately, they should be seen as forecast risk.

Aviation Gas flights and revenues have decreased in recent months, and the forecast is adjusted downward to be consistent with recent actuals and higher recent fuel prices than was previously expected.

Figure 33 shows the current Jet Fuel Tax revenue forecast for April 2026 (blue line) relative to the previous forecast from October 2025 (orange line), and actual revenues prior to that. Figure 34 shows the current and previous Aviation Gasoline Tax revenue forecast. The passage of HB 2434 in the 2021 legislative session removed the sunset of current jet fuel and aviation gas rates, locking in the \$0.03 and \$0.11 respective rates going forward from January 2022.

Figure 33: Jet Fuel Monthly Revenue - Forecast Comparison

Figure 34: Aviation Gasoline Monthly Revenue – Forecast Comparison

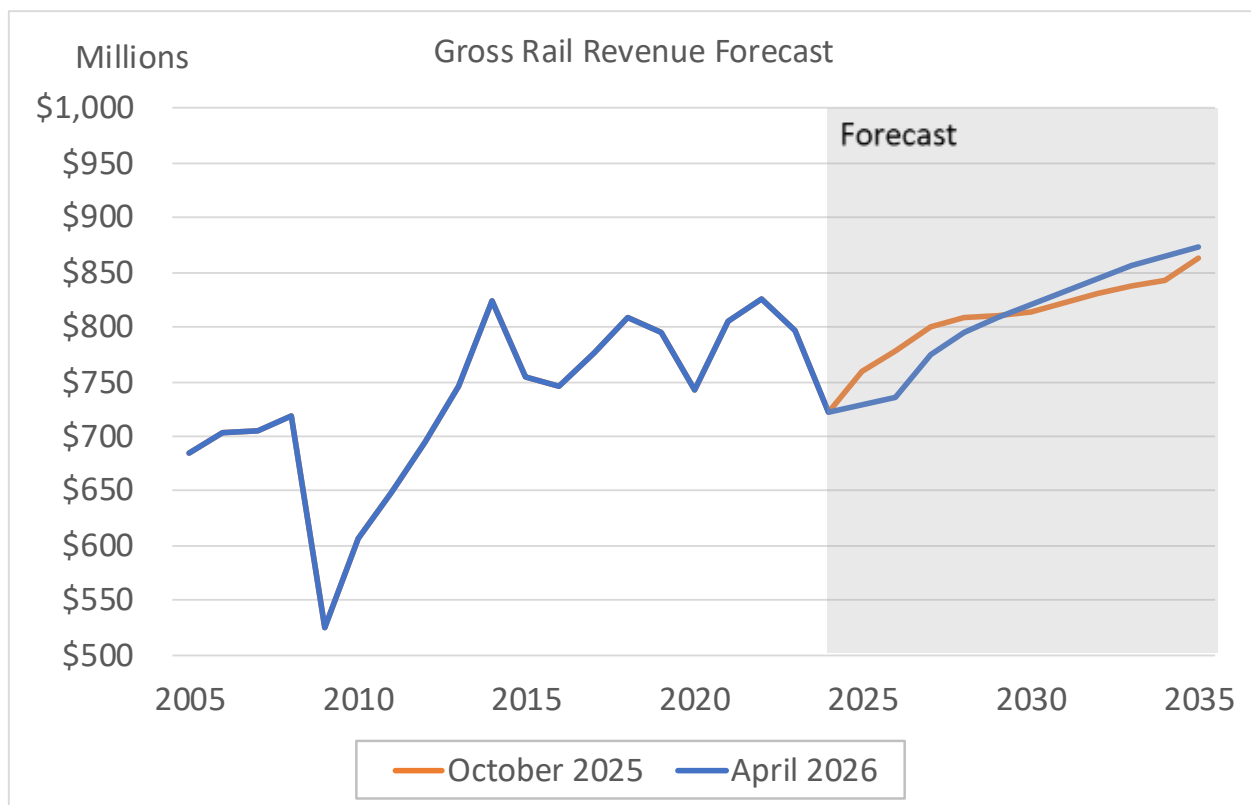

### Gross Railroad Revenues Tax

ODOT collects annual (calendar year) fees on gross operating revenues of railroads that do not exceed 0.35 percent of any railroad’s gross operating revenues (ORS 824.010). Funds collected from this fee are separate from the General Fund and are directed to be used to defray costs to ODOT for carrying out its legal duties related to railroads, or to obtain matching funds for track improvement or rehabilitation. ODOT sets the rate and requests payment, after which railroads pay the fee and issue an accompanying statement of revenues upon which they based their fee payment. The fee is collected on any gross operating revenues associated with transportation of passengers (excludes Amtrak) and property.

The forecast methodology starts with forecasting of railroad gross operating revenues as reported by the railroads. Then, the forecast of the fees ODOT collects are calculated from the forecast of gross operating revenues. Inputs to the forecast include forecast from S&P Global for the highest value goods reported to be carried on Oregon railroads.

The April 2026 forecast is mixed when compared to our previous forecast. This forecast does not include a new data point, as the 2025 data for railroad gross operating revenues are not available. Therefore, the change in forecast comes from changes to underlying model variables. Uncertainty of economic conditions related to tariffs continues to present forecast risk, as do current signals higher inflation, especially from fuel costs. If consumer spending on durable goods stays strong in the future, it may improve the gross rail revenue forecast.

Figure 40: Actual and Forecast Gross Rail Revenue Fees Collected

### Other Highway Revenues

There are other sources of highway revenue that do not fall under any previous category. These revenue sources include equipment sales, rental fees, property sales, billboard fees, material testing revenue, and interest income. Cumulatively, these revenue sources totaled \$66,747,400 in 2025, which was a 20 percent increase from 2024 revenues (\$55,400,305). The three largest individual sources of these “Other” revenues are damage recovery, outside services, and interest from the State Highway Fund. This interest totaled \$36,130,326 in 2025. ODOT’s efforts to recover damages sustained to its property from individuals and businesses collected \$10,110,494 in revenue in 2025. As ODOT continues to pursue the recovery of these damages, we can expect this to be a significant source of revenue. Revenue from outside services charges was \$14,367,258 in 2025. Interest from our highway fund is directly tied to the Oregon State Treasury Short Term Fund (<https://www.oregon.gov/treasury/public-financial-services/oregon-short-term-funds/pages/default.aspx>). These rates are used to forecast rates into the future to estimate total interest amounts.

Figure 41: All “Other Highway” revenue forecast changes.

## Highway Revenue Forecast Summary

Tables 7 and 8 provide the summary of April 2026 forecast for Highway Fund revenues.

Rows 1 through 3 contain the individual gross revenues from each of the three main sources of State Highway Funds, and row 4 shows the total gross revenue from all three sources combined.

Rows 5 through 18 of Table 7 are memo items creating summaries of different bill components related to forecast revenues. Note that HB 2017 not only created new revenues, but it also included some dedicated funds prior to apportionment and created new bonding potential. Row 15 includes the debt service for bonds to support the projects from Section 71 of the bill. The 2019 Legislature authorized the sale of these bonds, with the first round of bonds sold in late summer of 2020 and the second round sold in June of 2023.

Rows 19 through 27 of Table 7 summarize the net revenues for each OTIA, JTA, HB 2017, and HB 3991 programs disaggregated by amounts to the local governments or to the state. Row 28 represents the total net revenue for distribution.

The purpose of Table 8 is to distribute the totals from row 28 in Table 7 into county, city, and state apportionments by apportionment formula, whether it is pre-OTIA, OTIA I&II, OTIA III, JTA, HB 2017 or HB 3991.

Appendix A provides a summary of HB 3991. Appendix B provides the list of all the forecasted items including current fees for each item and the fund where the revenues are directed. Appendix C shows the accuracy of our last 20 forecasts for Highway Fund, using two common measures – Mean Percentage Error (MPE) and Mean Absolute Percentage Error (MAPE). Appendix D provides publication tables 3, 4, 5, 6, 7 and 8 for a scenario where voters approve the HB 3991 provisions that are put on hold.

The following provisions of HB 3991 will not be effective unless approved by the voters in the May 2026 election. The potential start dates if approved are provided in parenthesis:

- ✓ Gas tax increase from 40 cents to 46 cents (Jul 1, 2026).
- ✓ Base vehicle registration fee increase of \$42 per year (Jul 1, 2026).
- ✓ Base vehicle title fee increase of \$139 (Jul 1, 2026).
- ✓ Statewide payroll transit tax increase from 0.1 percent to 0.2 percent (Jul 1, 2026 - Dec 31, 2027).

A separate monthly forecast of the County/City Apportionments is available under “Highway Revenue Apportionment Forecasts” at <http://www.oregon.gov/ODOT/Data/Pages/Revenue-Forecasts.aspx>.

## Appendix A - HB 3991 Summary

House Bill 3991 contains substantial changes to ODOT revenue sources. These include fee and tax increases that cover virtually all types of vehicles on Oregon roads. During this time, this increase was paused due to a referendum vote on portions of HB 3991. The portions in the referendum that are put to the voters for approval are the fuels tax increase, base registration and title fee increases, and the payroll tax increase. All other portions of the bill are in place and are not subject to the referendum vote. While we will know the outcome of the vote in May, the presumption in this forecast document is that voters will not pass the fee increases. The pause in fee implementation has already pushed back some initial implementation dates.

The bill that passed in late 2025 had a planned fuels tax rate increase to 46 cents (currently 40 cents) scheduled to be implemented on January 1st 2026. While the fuels tax rate applies to both gasoline and diesel, there are also changes planned for the diesel alone. The point of taxation for diesel fuel will be moved to the first point of sale, and not the consumer-side pump as it stands today. This change means that taxes can be applied at first sale, and that all downstream sales have already had tax collected on the fuel. This is to support a move to hybridize our heavy vehicle taxes so carriers will begin paying both the weight-mile tax and diesel taxes. This system is not meant to significantly increase the tax burden on carriers as the weight-mile tax rate will be reduced accordingly. These changes are scheduled to be implemented on July 1st, 2029.

A road usage charge program is included in House Bill 3991. This system applies to battery electric vehicles, and hybrid vehicles starting July 1st, 2027. The tax rate for the road usage charge is 5 percent to the fuels tax rate. In 2027 this would be 2 cents per mile, assuming a fuels tax rate of 40 cents per gallon. The program also allows for a flat fee to be paid in lieu of per-mile tracking. Vehicles subject to the road usage charge will not pay enhanced registration fees and will be reimbursed for fuel taxes that they pay at the pump. This program also sunsets our current voluntary RUC program effective July 1, 2031.

House Bill 3991 contained provisions for significant DMV fee increases. While base registration fee increases of \$42 per year and title fee increases of \$139 are paused, enhanced registration fees for electric vehicles and vehicles with fuel efficiency above 40 miles-per-gallon have increased by \$30 per year as of Dec 31, 2025.

The statewide payroll transit tax was set to increase from 0.1 percent to 0.2 percent through Dec 31, 2027. This would have provided a significant boost to state transit systems. This increase has been referred to the voters as well.

The implementation of hybrid system for vehicles over 26,000 lbs. will affect all heavy truck carriers. The weight-mile fee table has been simplified to reduce the number of rates from 85 to 10. While the weight-mile rates for diesel trucks will be reduced to offset any diesel taxes paid, a separate (and also simplified) table was created to cover any future electric heavy vehicles. The road user access fee will also be reduced to offset the diesel tax heavy trucks will

pay. Fees for trucks paying a flat fee have been adjusted for both log trucks and sand and gravel trucks. 61

There are many other components of House Bill 3991, including changes to the Highway Cost Allocation Study (HCAS), performance audits, accountability committees, and budget allocations. While these are integral to the future of the state transportation system being efficient and effective, they have minimal impact on revenues as they relate to this forecast document. House Bill 3991 can be found in its enrolled form here:

## Appendix C – Highway Fund Forecast Quality

The two common measures for assessing forecast quality are: **statistical bias** and **accuracy**.

**Statistical bias** indicates the tendency of a forecast to over- or under-estimate real outcomes. Mean Percentage Error (MPE) – the arithmetic average of the forecasting errors is used for this purpose. A small MPE can be produced by either small errors or errors (even large ones) which are offset by errors in the opposite direction. MPE imperfectly measures the quality of a forecast. However, for budgeting purposes, MPE is probably the best measure of quality since what matters is total spending over time, and savings from one month are frequently used to offset excess costs in another month.

The **accuracy** of a forecast is the degree to which its values are narrowly dispersed around actual outcomes. Narrower dispersion indicates greater accuracy. Mean Absolute Percentage Error (MAPE) – the average of the forecasting errors without regard to arithmetic sign is used to evaluate accuracy. It does not allow underestimates and overestimates to offset each other. From a technical perspective, MAPE is usually considered a better measure of quality than MPE.

Table A1 – Quality of the first 6-months of the forecast – Total Highway Fund Revenue

Forecast Cycle	Average Monthly Revenue		MPE	MAPE
	Actual	Forecast		
Dec-15	\$98,935,140	\$98,071,897	0.7%	5.2%
Jun-16	\$105,171,660	\$105,546,041	-0.4%	2.2%
