1.0 INTRODUCTION

This 2016 Highway Shoulder Soil Evaluation Results Report (Results Report) has been prepared by Cascadia Associates, LLC (Cascadia) as requested by the Oregon Department of Transportation (ODOT) and as detailed in Contract No. B33811. This Results Report describes the scope of the 2016 highway shoulder soil sampling program, methods and procedures, analytical results, and presents an evaluation of the statewide highway shoulder soil dataset. The 2016 highway shoulder soil sampling activities were conducted to assist ODOT, in coordination with the Oregon Department of Environmental Quality (DEQ), to determine the likelihood that highway shoulder soil generated during roadway construction and improvement projects will meet DEQ clean fill criteria (DEQ, 2014) or other applicable criteria, and to ultimately develop a management plan for beneficial uses of soil that does not meet clean fill criteria. The results of this study may be used by ODOT as a basis for modifying ODOT Directive GE 14-01(D) (e.g., limiting the need for soil sampling), for designing future studies to further reduce the scope of Directive GE 14-01(D), or to assist in the development of beneficial use determinations in coordination with DEQ.

The draft Results Report was provided to DEQ on April 19, 2017. Following a meeting with ODOT on May 3, 2017, DEQ provided feedback on the Results Report in a May 24, 2017 Memorandum *Review of 2016 Statewide Shoulder Soil Evaluation Results Report* (DEQ, 2017). DEQ feedback has been incorporated into this report.

1.1 REPORT ORGANIZATION

This report is divided into seven primary sections. Each section is summarized below.

- Section 2 provides project background including the presence of hazardous substances in highway shoulder soil in Oregon and elsewhere (Section 2.1); current ODOT procedures for management of highway shoulder soil (Section 2.2); a description of the 2015 statewide shoulder soil evaluation (Section 2.3); and 2016 sampling program scope development (Section 2.4).
- Section 3 presents the 2016 soil sampling program details including pre-sampling activities (Section 3.1); sampling methods and procedures (Section 3.2); and the laboratory analytical program and results (Section 3.3).
- Section 4 presents an evaluation of the 2016 data, along with previously collected data, including comparisons to DEQ clean fill criteria, data trends, and statistics.
- Section 5 presents conclusions following the 2016 sampling program.
- Section 6 proposes recommendations for next steps.
- Section 7 lists report references.

2.0 BACKGROUND

The following subsections provide background for this project, including the presence of traffic-related constituents in highway shoulder soil, a description of the 2015 shoulder soil sampling effort and results, and development of the 2016 highway shoulder soil sampling scope.

2.1 HAZARDOUS CONSTITUENTS IN SHOULDER SOIL

Elevated concentrations of traffic-related hazardous constituents are widespread in shoulder soil in many parts of the world, including Oregon. In most cases, the impacted soil poses no threat to human health and the environment when it is in-place (i.e., on the shoulders of highways). However, during highway construction projects, it is often necessary to excavate and export soil. If exported soil is disposed of or reused in sensitive locations (e.g., wetlands or residential areas), constituents in soil could potentially pose a risk to human and ecological health. Therefore, a management plan for shoulder soil is necessary.

2.2 MANAGEMENT OF OREGON HIGHWAY SHOULDER SOIL

Currently, highway shoulder soil under ODOT's jurisdiction is managed under ODOT Directive GE 14-01(D) (ODOT, 2014). As detailed in the directive, soil excavated from the surface to 1.5 feet below the ground surface (bgs) within the ODOT right-of-way must be characterized prior to export from the construction area. This often involves collection and laboratory analysis of soil samples. Soil that meets DEQ clean fill criteria can be managed unrestricted (e.g., used as fill for other construction projects). Excavated soil that does not meet clean fill criteria requires special management as solid waste (e.g., reuse through a solid waste letter of authorization from DEQ). In practice, soil that does not meet clean fill criteria is often disposed of at licensed landfills, leading to increased construction costs, reduced landfill capacity, and reductions in project sustainability metrics. The analysis of soil samples and the disposal fees required for compliance with ODOT Directive GE14-01(D) can be cumbersome and cost prohibitive to many roadway construction and improvement projects.

2.3 OREGON CLEAN FILL CRITERIA

The DEQ clean fill criteria are conservative standards intended to be protective of human and ecological health under most potential exposure scenarios (DEQ, 2014). The clean fill criterion for lead varies between 18 to 36 milligrams per kilogram (mg/kg) based on physiographic province. With the exception of the Portland Basin physiographic province, the clean fill criteria for lead are equal to (and derived) from the Oregon naturally occurring background metals concentrations (DEQ, 2013). By comparison, the statewide DEQ Risk Based Concentrations (RBCs) for the residential and occupational lead direct contact exposure pathways are 400 mg/kg and 800 mg/kg, respectively. RBCs are defined by DEQ as "the concentration of a chemical in a given medium (e.g., air, soil, or groundwater) which corresponds to the acceptable risk level for a defined exposure," (DEQ, 2003).

The clean fill criterion for benzo(a)pyrene is 0.015 mg/kg, which is equal to the DEQ RBC for residential exposure. The RBCs for occupational and excavation worker exposure to benzo(a)pyrene are 0.29 mg/kg and 67 mg/kg, respectively. The minimum DEQ Level II Screening Level Value (an ecological screening value) for benzo(a)pyrene in soil is 125 mg/kg.

As shown by the comparisons presented above, under many scenarios (e.g., non-residential uses), soil that does not meet clean fill screening criteria may pose no significant risk to human and ecological health. The Oregon Clean Fill Guidance (DEQ, 2014) recognizes that disposal of mildly contaminated roadside soil is not an optimal use of limited landfill capacity. Consequently, the guidance notes that if statistical analyses of soil data do not show that "the material is substantially like clean fill" interested parties should "explore other disposal options such as site-specific or material-specific disposal determinations (solid waste letter authorization, permit exemption, mine reclamation material, restricted beneficial use as fill, or restricted uses such as use as fill at Cleanup sites with deed restrictions, etc.)." In this report, the term "clean fill" is used to describe soil that meets DEQ clean fill criteria outlined in the DEQ *Clean Fill Determinations – Internal Management Directive* (DEQ, 2014).

The evaluation in this report was conducted using current clean fill criteria and RBCs. If clean fill criteria or RBCs are modified in the future, the data will be re-evaluated to confirm that concentrations of constituents in soil do not result in unacceptable risk to human receptors under given exposure scenarios.

2.4 2015 SHOULDER SOIL SAMPLING

In 2015, as an initial step in understanding roadside soil quality in Oregon, soil chemical data from 64 ODOT roadway projects were evaluated. The goal of the evaluation was to develop a general understanding of the types, magnitude, and extent of constituents in shoulder soil and to identify data gaps that could potentially be resolved through a supplemental sampling effort. Data gaps that were identified included the influence of sampling variables (e.g., depth of sample collected, physiographic province, distance from edge of pavement, and average annual daily traffic [AADT]) on the detected concentrations of constituents of interest (COIs). To address these data gaps and to expand the soil dataset, a shoulder soil sampling effort was conducted in May 2015 to improve the understanding of the distribution of constituents in shoulder soil. The locations of the samples collected for the 64 ODOT projects and the 2015 sampling effort (collectively, the "ODOT soil dataset") are shown on Figure 1.

During the 2015 evaluation of the ODOT soil dataset, data were classified based on the sampling variables, when available. As detailed in the *ODOT State-Wide Highway Shoulder Soil Data Analysis* (Apex, 2015; the "Shoulder Soil Evaluation Report"), lead and benzo(a)pyrene were determined to be the only two constituents that were both traffic-related and regularly exceeded clean fill criteria. These constituents have been identified as traffic-related constituents in a number of other studies in the United States and other countries.

The 2015 evaluation included numerous other constituents, including metals (antimony, chromium, copper, lead, mercury, selenium, and zinc); other polycyclic aromatic hydrocarbons (PAHs); pesticides; polychlorinated biphenyls (PCBs); and volatile organic compounds (VOCs). The other constituents detected in shoulder soil were determined to be either: (1) not traffic related, or (2) possibly traffic related (e.g., selenium and nickel), but consistently below the clean fill criteria. Based on these findings, lead and benzo(a)pyrene only were carried forward as constituents of concern (COC) for the 2016 shoulder soil evaluation.

The data and analysis presented in the Shoulder Soil Evaluation Report were useful for improving the understanding of the distribution of constituents in shoulder soil; however, the data were not sufficient to develop a predictive model of the distribution of constituents in soil that would provide a level of certainty necessary to modify ODOT Directive GE 14-01(D). Consequently, the Shoulder Soil Evaluation Report recommended the following next steps:

- Develop a better understanding of the magnitude and extent of lead and benzo(a)pyrene in shoulder soil through the collection and analysis of soil samples in underrepresented areas of the state or with underrepresented characteristics (e.g., depth, distance from the pavement, etc.)
- Develop region-specific soil management criteria; and
- Coordinate with DEQ on alternative(s) to the clean-fill criteria.

2.5 2016 SAMPLING PROGRAM SCOPE

The *Sampling and Analysis Plan – Statewide Highway Shoulder Soil Evaluation* was prepared and submitted to ODOT, following statistical evaluation of the pre-2016 ODOT lead and benzo(a)pyrene dataset and coordination with ODOT and DEQ, as described in the following subsections (Cascadia, 2016).

2.5.1 2016 Sampling Scope Development

To develop the next phase of sampling, the ODOT shoulder soil lead and benzo(a)pyrene dataset was evaluated with random forest and classification tree models, using the R programming language (R Core Team, 2015). The goal of this evaluation was to determine how the sampling variable (e.g., sampling depth, distance from pavement) or combination of variables influence the dataset and which combination of these variables are most likely to result in lead and benzo(a)pyrene concentrations below the clean fill criteria.

To facilitate evaluation of the dataset, four sampling variables (physiographic province, distance from the edge of pavement, depth bgs, and AADT) that were demonstrated during the 2015 shoulder soil data evaluation to affect constituent concentrations in soil were categorized (e.g., depth intervals, distance intervals, etc.) and coded in the database accordingly.

Data that could not be classified by each of the four key variables (i.e., sampling details were missing or unknown) were excluded from the evaluation. If lead or benzo(a)pyrene was analyzed but not detected, only the samples with laboratory reporting limits equal to or less than the clean

fill criteria were included in the evaluation. Samples that exhibited non-detectable concentrations, but with reporting limits greater than the clean fill criteria were excluded from the dataset.

Individual classification trees (Hothorn et al., 2006b) for lead and benzo(a)pyrene were generated. Classification trees present the combinations of sampling variables that have the strongest correlation with a pass (i.e., sampling results less than or equal to the clean fill criteria) or fail (i.e., sampling results greater than the clean fill criteria) result in the analytical data. The classification trees demonstrated that samples collected in the Basin and Range, Blue Mountains, High Lava Plains, and Cascade Mountain physiographic provinces are very likely (more than 80% chance) to meet the clean fill criterion for lead.

The ODOT soil dataset did not have balanced representation of all levels across all predictor variables. For example, in some provinces, only samples within 15 feet of the pavement were represented in the database. In those cases, inferences about the effect of distance from pavement could not be made. Thus, graphical and tabular summaries were used to identify the candidate areas (physiographic province, distance from roadway, and/or depth categories) that appeared most likely to meet the clean fill criteria. Based on these evaluations, the following soil from the following sample groups was found to exhibit COC concentrations that were usually well below the clean fill criteria (based on the 90% upper confidence limit [UCL] of the data).

- Basin and Range physiographic province, all depths, distances from pavement, all AADTs;
- Deschutes Columbia physiographic province, all depths, distance from pavement of greater than 15 feet, and all AADTs; and
- Blue Mountains physiographic province, all depths, distance from pavement of greater than 15 feet, and all AADTs.

These areas were targeted for the collection and analysis of additional soil data that would be used to develop a predictive model of lead and benzo(a)pyrene concentrations in soil.

Based on the statistical characteristics (mean, variance, and distributional form) displayed by the previously collected data, a sample size of 25 was expected to sufficiently characterize the concentration distributions in soil with a suitable level of confidence that the mean concentration was consistently below the clean fill criteria.

2.5.2 Regulatory Coordination and Associated Modifications

Representatives of ODOT, DEQ, and Cascadia met in April and May 2016 to discuss the results of previous ODOT shoulder soil studies, identify possible management options for shoulder soil that does not meet clean fill criteria, and to develop methods appropriate for characterizing shoulder soil. An outcome of those meetings was DEQ's May 4, 2016 memorandum - *Concepts for ODOT Road Shoulder Materials Management Project*. The DEQ memorandum included the following:

- Soil should be characterized using a stratified systematic random sampling program that considers covariates such as depth, distance from shoulder, and physiographic province (e.g., the classification tree random forest model discussed above).

- Pesticides, VOCs, and PCBs are not important constituents in shoulder soil. PAHs, particularly benzo(a)pyrene, are important constituents. While lead is likely the most important constituent in roadside soil, DEQ stated that analysis of the full EPA target analyte list (TAL) of metals would be useful for classification modeling, even though most of the TAL metals have not been identified as COCs.
- Sample collection and analysis using incremental sampling methods (ISM) should be considered to reduce data variability and to reduce non-detect analytical results.
- It may be possible to manage shoulder soil based on a predictive model, under which, shoulder soil could be classified into two or more management categories (e.g., solid waste or clean fill). The predictive model should find a balance between simple linear models (relatively inflexible) and complex high variance models (very flexible but not useful for generalizing future data). DEQ recommended use of a decision trees model, enhanced by random forest methodology. Among the software packages recommended by DEQ was R (R Core Team, 2015).

While not memorialized in the May 4, 2016 memorandum, another outcome of the meetings was the identification of several options for managing excavated shoulder soil that does not meet clean fill criteria. These options include mine reclamation fill, non-residential construction fill, and disposal as solid waste.

A draft Sampling and Analysis Plan (SAP) was submitted to DEQ on July 27, 2016 and DEQ reviewed the draft SAP and provided comments on August 2, 2016. Based on those comments and a follow-up meeting on August 8, 2016, the following changes were incorporated into the sampling program or data evaluation:

- Soil samples were analyzed for the primary pollutant list of PAHs in addition to benzo(a)pyrene.
- ISM processing techniques (i.e., grinding and subsampling the grab sample volume) were incorporated into the sampling program, as detailed further in Section 3.3. Composite ISM sampling can be beneficial for reducing data variability and providing a relatively unbiased estimate of the soil sample concentration mean at a particular location, the pre-2016 ODOT dataset is comprised of discrete (i.e., non-ISM) samples. Because composite ISM samples would be difficult to evaluate statistically alongside the existing discrete soil sampling data, ISM sampling was not conducted, only ISM laboratory processing techniques were used.

Additionally, DEQ recommended using mean chemical concentrations instead of the 90% UCL of the mean for development of the predictive model for shoulder soil. DEQ noted in their comments "The 90% UCL is set as the exposure estimator for risk assessments under OAR-340-122-0084. This was done to minimize the possibility of the estimated sample mean underestimating the true mean. However, for this project, a risk assessment is not being performed, so requirements in OAR-340-122-0084 do not need to be met. Moreover, the OAR allows for another criterion, if acceptable to DEQ. For this sampling and analysis plan, DEQ recommends using the mean instead of the 90% UCL for shoulder soils that will be removed and mixed."

3.0 2016 SHOULDER SOIL SAMPLING

The 2016 shoulder soil sampling program was conducted in October 2016 and included sample collection in the Basin and Range, Blue Mountains, and Deschutes Columbia physiographic provinces as shown on Table 1. As discussed in Section 2.5.1, these three physiographic provinces were selected for additional sampling in 2016 because:

- A significant number of soil samples had already been collected, and therefore, a significant portion of the characterization was complete;
- The collection of additional samples from these provinces would result in a statistically sufficient dataset (i.e., 25 samples in each distance and depth category, sufficient for characterizing the distribution and mean concentration) and was compatible with the scope and budget of the 2016 shoulder soil sampling program; and
- Previously collected data suggested that lead and benzo(a)pyrene concentrations in shoulder soil within most depth and/or distance categories were below clean fill criteria. Thus, additional soil characterization in these areas was relatively likely to demonstrate that soil along highways in a significant portion of the State of Oregon meets clean fill criteria.

The following sections describe the pre-sampling activities, methods and procedures for the sampling, laboratory analytical program, and results.

3.1 PRE-SAMPLING ACTIVITIES

Prior to the initiating the soil sampling field work, Cascadia coordinated with the permit specialists in ODOT Districts 9 through 12, where sampling was to occur, to receive authorization to conduct the sampling activities.

A project-specific health and safety plan was prepared including standard operating procedures for the sampling. The Health and Safety Plan (HASP) was included as Appendix B of the SAP. In addition to the traffic control requirements detailed in the SAP, sample location marking and sampling were performed in accordance with the *Oregon Temporary Traffic Control Handbook* (ODOT, 2016).

Following receipt of ODOT authorization, the proposed sampling locations were marked and the coordinates of each location were recorded using a Global Positioning System instrument. Sampling locations were selected at locations with more than 30 feet of ODOT right-of-way beyond the edge of pavement, safe from traffic hazards (i.e., locations with sufficient sight distance), not exhibiting indications of contamination (e.g., staining), with no obvious signs of imported fill, and not adjacent to potential contaminant source areas (e.g., industrial facilities). After the proposed sample locations were marked, Cascadia coordinated with Oregon One-Call and each location was cleared of subsurface utilities.

3.2 SOIL SAMPLING PROCEDURES

Soil sampling was conducted between October 11 and 27, 2016. Upon arrival at each sampling location, the work area was delineated with traffic cones and a "Shoulder Work Ahead" sign was deployed, in accordance with the traffic control plan.

A total of 462 soil samples were collected from 150 borings completed at 71 sampling locations. Sampling locations are shown on Figure 2. Borings were completed at one or more of the following distances from the edge of pavement at each location: 0 to 15 feet, 15 to 30 feet, and greater than 30 feet. At each boring location, a 1.5-foot-deep boring was advanced using a stainless-steel hand auger and other hand tools, as necessary. Discrete soil samples were collected from one or more of the following depth intervals: 0 to 0.5 foot, 0.5 to 1.0 foot, and 1.0 to 1.5 feet bgs.

For each sample collected, sampling location details were recorded on field forms, included in Appendix A. Recorded details include distance from roadway, elevation relative to pavement and drainage ditch (if present), number of travel lanes, presence of nearby galvanized structure or railroad, soil type, soil color, vegetation present, evidence of recent construction or soil work, and highway mile marker.

Soil samples were placed in laboratory-supplied sample containers. Soil samples were named according to the sample location (including physiographic province, depth, and distance from pavement) and labeled accordingly. For example, the first soil sample collected in the Blue Mountains physiographic province at a depth of 0 to 0.5 foot bgs and greater than 30 feet from the edge of pavement was named BR-01->30' (0-0.5'). Field duplicates were collected with approximately 5 percent of the samples. Samples were placed directly in a cooler and stored on ice prior to transportation to the analytical laboratory.

3.3 LABORATORY ANALYTICAL PROGRAM

The soil samples were submitted to Apex Labs of Tigard, Oregon, for processing and analysis. Samples were frozen upon receipt to preserve the laboratory hold time. Samples were removed from frozen storage and brought to room temperature prior to processing. Samples were then processed following Apex Labs Representative Sampling Methodology (RSM) standard operating procedures (SOP). As noted in the laboratory report case narratives, sample handling per this Apex Labs SOP is consistent with the national Interstate Technology and Regulatory Council (ITRC) ISM and professionally recognized multi-increment sample (MIS) guidance documents. The Apex RSM protocols used included air-drying soil samples and cool grinding of the entire sample to form a well-mixed sample of approximate 50-micron diameter particles.

Following processing, the samples were analyzed for lead by EPA method 6020A and PAHs by EPA method 8270D-SIM. Laboratory data reports and a data quality review are included in Appendix B.

The laboratory results for the 2016 sampling program are presented on Table 2, along with the DEQ clean fill criteria. As shown in Table 2, lead and benzo(a)pyrene concentrations were detected in a limited number of samples at concentrations that exceed clean fill criteria. Further evaluation

of the lead and benzo(a)pyrene concentrations in the 2016 dataset and ODOT complete dataset is presented in Section 4.

Two PAHs, in addition to benzo(a)pyrene, were detected at concentrations that exceed clean fill criteria. Naphthalene, was detected in 1 of 462 samples at a concentration just slightly above the clean fill criterion (0.0892 mg/kg vs. 0.087 mg/kg criterion). One naphthalene exceedance out of 462 samples (i.e., 0.2% of samples) indicates that naphthalene is not a contaminant of concern in highway shoulder soil. Dibenzofuran was detected above the clean fill criterion of 2 µg/kg in 13 out of 462 samples, or 2.8% of samples. Of the 13 samples with exceedances, five were collected at the same sampling location (BM-21), indicating a localized source of dibenzofuran at that sampling location. Because dibenzofuran was detected infrequently and when detected, is detected at low concentrations (ranging from 2.14 to 17.9 µg/kg), further evaluation of dibenzofuran is not needed. No additional PAHs were detected above clean fill criteria.

Following review of the draft Results Report, DEQ requested that, in addition to benzo(a)pyrene concentrations, ODOT also evaluate concentrations of benzo(a)pyrene equivalents compared to clean fill criteria (DEQ, 2017). Benzo(a)pyrene equivalent concentrations for the Basin and Range, Blue Mountains, and Deschutes Columbia datasets were calculated using the toxic equivalency factors for carcinogenic PAHs in the Oregon DEQ *Human Health Risk Assessment Guidance* and are presented in Table 2 (DEQ, 2010).

4.0 EVALUATION OF SHOULDER SOIL DATA

The following sections describe the statewide highway shoulder soil dataset (Section 4.1); present an evaluation of lead and benzo(a)pyrene data for highway shoulder soil in the Basin and Range, Blue Mountains, and Deschutes Columbia physiographic provinces (i.e., the focus of the 2016 shoulder soil sampling program; Sections 4.2 through 4.4); and discuss lead and benzo(a)pyrene concentrations in highway shoulder soil in other Oregon physiographic provinces (Section 4.5).

4.1 STATEWIDE SHOULDER SOIL DATASET

Table 3 shows the number of shoulder soil samples collected and analyzed for lead and benzo(a)pyrene in each physiographic province, and in each of the three depth (0-0.5, 0.5 – 1, and 1 to 1.5 feet) and distance (<15, 15-30, and >30 feet) categories. Samples with missing location details (e.g., depth and distance from pavement), samples collected deeper than 1.5 feet, and samples collected over depth interval more than 0.5 foot are not included. Samples for which sufficient descriptive data are available have been collected in eight of the ten Oregon physiographic provinces; data are not available for the Klamath Mountains and Owyhee Uplands provinces.

As shown Table 3, 1,067 lead and 842 benzo(a)pyrene usable shoulder soil samples[1] have been collected statewide. These sample counts include samples collected for ODOT construction projects, the 2015 data gap sampling effort, and the 2016 sampling program. As shown in Table 3, the size of the sample dataset varies significantly between physiographic provinces. For example, in the Cascade Range province, lead data are available for a total of four samples. In the Basin and Range province, lead data are available for a total of 232 samples. As a result of the 2016 sampling effort, the Basin and Range, Blue Mountains, and Deschutes Columbia province datasets are more robust and sample counts are generally more consistent across predictor variable categories (e.g., depth bgs) than datasets for other provinces.

The following sections discuss the results of the data evaluation for the eight physiographic provinces: Basin and Range, Blue Mountains, Cascade Range, Coast Range, Deschutes Columbia, High Lava Plains, Portland Basin, and South Willamette Basin.

Data are not presented for the Klamath Mountains and Owyhee Uplands physiographic provinces because data are unavailable or, if available, are missing sampling information (i.e., predictor variable details). Box and whisker plots for lead and benzo(a)pyrene are presented in Figures 3 and 4, respectively. Summary statistics for each physiographic province are presented in Table 4, including the number of samples collected, number of non-detects, median, mean, 90% UCL

[1] Samples considered useable for this effort are those with sampling depth and distance from pavement specified, and with detection limits below the clean fill criteria.

concentration, and standard deviation for each depth and distance category.[2] The box and whisker plots and summary statistics are discussed in additional detail below by physiographic province.

Because the Basin and Range, Blue Mountains, and Deschutes Columbia province datasets are more complete and generally balanced across the sampling depth and distance from pavement categories, these data have been evaluated more thoroughly. The evaluation of the lead and benzo(a)pyrene data for these provinces is discussed below, in Sections 4.2 through 4.4. Additional discussion of the statistical methods used to evaluate the data, as well as tabular and graphical summaries of the data (e.g., individual classification trees) are presented in Appendix C.

As requested by DEQ, benzo(a)pyrene equivalent concentrations for the Basin and Range, Blue Mountains, and Deschutes Columbia datasets were compared to 0.015 mg/kg clean fill criteria to confirm that data trends for benzo(a)pyrene equivalents are consistent with the trends observed for benzo(a)pyrene. Tables 4.2-2 through 4.2-3, 4.3-2, and 4.4-2 through 4.4-3 show the number of benzo(a)pyrene equivalents concentrations in Basin and Range, Blue Mountains, and Deschutes Columbia physiographic provinces, respectively, that exceed clean fill criteria. As shown below, a small number of samples in the Basin and Range and Deschutes Columbia physiographic provinces contain benzo(a)pyrene equivalent concentrations greater than the clean fill criterion, but contain benzo(a)pyrene concentrations less than clean fill criterion. For the Blue Mountains physiographic province, no samples contain benzo(a)pyrene equivalent concentrations exceeding the clean fill criterion that did not already exceed clean fill criterion for benzo(a)pyrene. This evaluation did not change the data trends and associated conclusions for these three physiographic provinces.

4.2 BASIN AND RANGE

The Basin and Range dataset consists of 232 samples, which are generally evenly distributed across depth, distance from pavement, and applicable AADT categories, as shown in Table C-1 and C-2 in Appendix C.

4.2.1 Lead and Benzo(a)pyrene Concentrations in Soil

The concentrations of lead and benzo(a)pyrene in Basin and Range highway shoulder soil are consistently below clean fill criteria in all depth and distance categories. Of the Basin and Range province samples collected and analyzed for lead, 94 percent contained lead concentrations below the clean fill criterion, as shown in Table 4.2-1 below.

[2] Table 4 includes all samples collected in each physiographic province, including those with unknown sampling depth and distance and those with detection limits above clean fill criteria.

Table 4.2-1. Summary of Results for Basin and Range Province for Lead

Concentrations Relative to Clean Fill Criteria	Number of Samples	Percentage of Samples
Greater Than	15	6
Less Than or Equal to	217	94
Total	232	100

Of the samples collected in the Basin and Range province and analyzed for benzo(a)pyrene, 97 percent contained concentrations below the clean fill criterion, as shown below. Note that 10 samples with non-detect results for benzo(a)pyrene had laboratory detection limits greater than the clean fill criteria and are not included in the 222-sample total above or in Table 4.2-2.

Table 4.2-2. Summary of Results for Basin and Range Province for Benzo(a)pyrene

Concentrations Relative to Clean Fill Criteria	Number of Samples	Percentage of Samples
Greater Than	5	3
Less Than or Equal to	217	97
Total	222	100

Table 4.2-3. Summary of Results for Basin and Range Province for Benzo(a)pyrene Equivalents

Concentrations Relative to Clean Fill Criteria	Number of Samples	Percentage of Samples
Greater Than	14	6
Less Than or Equal to	208	94
Total	222	100

The mean, median, and upper quartile concentrations of lead and benzo(a)pyrene are well below the clean fill criteria (Table 4). Uncertainty in the mean estimates is reflected in the 90% UCLs[3] shown in Table 4. These values are also generally below the clean fill criteria, providing additional assurance that the true mean is below the screening level.

4.2.2 Lead Predictors

While the vast majority of samples collected in the Basin and Range physiographic province contained lead concentrations below the screening criterion, the associated classification tree

[3] Confidence intervals for the mean are reported for both the parametric Student's-t estimate, and the non-parametric Chebyshev estimate. Based on Shapiro-Wilk's goodness-of-fit test for normality ($\alpha = 0.05$) and skewness and kurtosis summary statistics, very few of the data groups appeared to be approximately normally distributed. The non-parametric Chebyshev's interval is always applicable, although it is a conservative upper bound for the mean estimate, often providing greater than 90% coverage.

shows that AADT was the only variable that is a significant predictor of lead concentrations exceeding the clean fill criterion (Figure C-8 in Appendix C). That is, shoulder soil samples collected on highways with AADT of 2,500 or less contained lead concentrations below clean fill the criterion in 98 percent of samples, whereas samples collected from highways with AADTs greater than 2,501 vehicles contained lead concentrations below the clean fill criterion in 86 percent of samples collected. The lead results by AADT category for the Basin and Range Province are shown in Table 4.2-3 below.

Table 4.2-3. Summary of Lead Results for Basin and Range Province by AADT Category

Concentrations Relative to Clean Fill Criteria	AADT Category				Total
	1 (0-1,000)	2 (1,001-2,500)	3 (2,501-5,000)	4 (5,001-10,000)	
Greater Than	2	0	3	10	15
Less Than or Equal to	96	38	57	26	217
Total	98	38	60	36	232

4.2.3 Benzo(a)pyrene Predictors

The five benzo(a)pyrene samples (out of 222 collected with sufficiently low detection limits) from the Basin and Range province that exceeded the clean fill criterion were randomly distributed across depth, distance from pavement, and AADT categories. Thus, the classification tree shown on Figure C-11 does not identify any variable as a predictor of benzo(a)pyrene concentrations exceeding the clean fill criterion.

4.3 BLUE MOUNTAINS

Similar to the other physiographic provinces sampled during the 2016 program, the 230 samples that have been collected in the Blue Mountains physiographic province are generally evenly distributed across depth, distance from pavement, and applicable AADT categories, as shown in Table C-1 and C-2.

4.3.1 Lead and Benzo(a)pyrene Concentrations in Soil

Concentrations of lead and benzo(a)pyrene in Blue Mountains highway shoulder soil are consistently below clean fill criteria, as shown in Figures 3 and 4, respectively. As shown in Table 4.3-1, 87 percent of the samples contained lead concentrations below the clean fill criterion.

Table 4.3-1. Summary of Results for Blue Mountains Province for Lead

Concentrations Relative to Clean Fill Criteria	Number of Samples	Percentage of Samples
Greater Than	31	13
Less Than or Equal to	199	87
Total	230	100

Of the 201 samples collected and analyzed for benzo(a)pyrene, 97 percent of samples contained concentrations below the clean fill criterion. Note that 29 samples with non-detect results for benzo(a)pyrene had laboratory detection limits greater than the screening level and are not included in the percentages in Table 4.3-2.

Table 4.3-2. Summary of Results for Blue Mountains Province for Benzo(a)pyrene and Benzo(a)pyrene Equivalents

Concentrations Relative to Clean Fill Criteria	Number of Samples	Percentage of Samples
Greater Than	7	3
Less Than or Equal to	194	97
Total	201	100

The mean, median, and upper quartile concentrations of lead and benzo(a)pyrene are consistently below the clean fill criteria, except for the upper quartile concentrations of lead in the 0 to 15-foot distance interval. The upper quartile lead concentrations are similar to the screening criterion concentration. Uncertainty in the mean estimates is reflected in the 90% UCLs (Table 4). These upper bound estimates for the mean are also generally below the clean fill criteria, with a few exceptions. These exceptions coincide with the predictions made from the classification tree model discussed below.

4.3.2 Lead Predictors

Although few samples in the Blue Mountains physiographic province contained lead concentrations above the screening criterion, the classification tree shows that distance from pavement is the only statistically significant predictor of lead concentrations exceeding the clean fill criterion (Figure C-9). As shown in Table 4.3-3 below, shoulder soil samples within 15 feet of the edge of pavement contained lead concentrations below the clean fill criterion in 74 percent of samples collected, whereas samples collected between 15 and 30 feet or greater than 30 feet from the edge of pavement are more likely to contain lead at concentrations below the clean fill criterion (89 percent and 96 percent, respectively).

Table 4.3-3. Summary of Results for Blue Mountains Province for Lead by Depth and Distance from Pavement

	Number of Samples				Percentages			
Distance from Pavement Categories (Feet from Pavement)	**1 (<15')**	**2 (15-30')**	**3 (>30')**	**Total**	**1 (<15')**	**2 (15-30')**	**3 (>30')**	**Total**
Greater Than	20	8	3	31	26%	11%	4%	13%
Less Than or Equal to	57	68	74	199	74%	89%	96%	87%
Total	77	76	77	230	100%	100%	100%	100%

4.3.3 Benzo(a)pyrene Predictors

A very small number of Blue Mountains shoulder soil samples exhibited benzo(a)pyrene concentrations that exceed the clean fill criterion (7 out of 201 samples). Samples that exceed the benzo(a)pyrene criterion appear to be randomly distributed across depth, distance from pavement, and AADT categories. Based on the very few exceedances of the benzo(a)pyrene criterion, no variable is a clear predictor of elevated benzo(a)pyrene concentrations in soil. The classification tree results are shown on Figure C-12.

4.4 DESCHUTES COLUMBIA

As shown in Tables C-1 and C-2, the 236 lead and 217 benzo(a)pyrene samples collected in the Deschutes Columbia physiographic province are generally evenly distributed across depth, distance from pavement, and applicable AADT categories. Because Interstate 84 and Oregon Hwy 97, cross the Deschutes Columbia province, some higher AADT categories are included in the Deschutes Columbia dataset. Note that 19 samples with non-detect results for benzo(a)pyrene had laboratory detection limits greater than the clean fill criteria and are not included in the 217 sample total for benzo(a)pyrene samples in this province.

4.4.1 Lead and Benzo(a)pyrene Concentrations in Soil

Concentrations of lead and benzo(a)pyrene in Deschutes Columbia highway shoulder soil are consistently below clean fill criteria, with the exception of the samples collected within 15 feet of the pavement (all depths) and, to a lesser extent, the samples collected from the surface to 0.5 feet bgs between 15 and 30 feet from the pavement surface (Figures 3 and 4).

Within 15 feet of the pavement surface, 60 percent of samples exceeded the clean fill criterion for lead (49 out of 81 samples; Table 4.4-1) and 26 percent exceeded the benzo(a)pyrene clean fill criterion (16 out of 62 samples; Table 4.4-2). In the shallow depth interval between 15 and 30 feet from the pavement surface, 38 percent and 19 percent of samples exceeded the lead and benzo(a)pyrene clean fill criteria, respectively. In other distance and depth intervals, 94 percent and 93 percent of samples were below clean fill criteria for lead and benzo(a)pyrene, respectively.

Table 4.4-1: Summary of Results for Deschutes Columbia Province for Lead by Depth and Distance from Pavement

Distance from Pavement Category (Feet):	**1 (< 15')**			**2 (15-30')**			**3 (> 30')**

Greater Than Clean Fill Criteria	5	7	5	8	2	2	3	4	2	38
Less Than or Equal to Clean Fill Criteria	13	11	21	18	23	24	22	23	24	179
Total	18	18	26	26	25	26	25	27	26	217

The mean and median concentrations of lead in soil samples collected within 15 feet of the pavement (all depths) are equal to or exceed the clean fill criterion, as shown on Figure 3 and Table 4. The mean and median lead concentrations in shallow soil (0 to 0.5-foot depth) between 15 and 30 feet from the pavement surface also exceed the clean fill criterion. When uncertainty in the mean estimates as reflected by the 90% UCLs (Table 4) is considered, no additional groups of samples (i.e., depth and distance from pavement categories) are expected to have mean concentrations above the clean fill criterion for lead.

Mean concentrations of benzo(a)pyrene were generally more favorable, with only the mean concentration in the 0.5 to 1-foot depth interval within 15 feet of the pavement surface exceeding the clean fill criterion. For benzo(a)pyrene, the 90% UCL indicates that three additional groups of samples may have mean concentrations above the clean fill criterion. These are the samples from the 0 to 0.5-foot depth interval within 30 feet of the pavement, and from the surface to 0.5-foot and 1 to 1.5-foot depth intervals within 15 feet of the pavement.

4.4.2 Lead Predictors

Distance from pavement and sample depth are significant predictor variables influencing lead concentrations in Deschutes Columbia soil, as shown on the associated classification tree (Figure C-10) and as discussed in Section 4.4.1. That is, the greater distance from pavement and greater depth of sample, the more likely the lead concentration would be below the clean fill criterion.

4.4.3 Benzo(a)pyrene Predictors

The classification tree for benzo(a)pyrene is similar to the lead classification tree, although fewer benzo(a)pyrene concentrations exceed the clean fill criterion. For example, only 29 out of 217 benzo(a)pyrene concentrations in Deschutes Columbia soil exceed the clean fill criterion.

4.5 OTHER PHYSIOGRAPHIC PROVINCES

Dataset sizes for the seven other Oregon physiographic provinces vary as do the apparent concentrations relative to clean fill criteria. This section summarizes the existing dataset in each remaining physiographic province and the lead and benzo(a)pyrene concentration trends, if any, observed in those datasets.

When interpreting the initial trends, it is important to note that significant data gaps are present in the seven remaining physiographic provinces because the datasets do not have balanced representation of all levels across all predictor variables. Optimally, a dataset of at least 25 samples in each depth and distance category (i.e., 225 samples per province) would be available for analysis.

In some provinces, for example, only samples within 0 to 15 feet of the pavement are represented in the database, so inference about the effect of distance from pavement cannot be made in this case.

4.5.1 Cascade Range

The Cascade Range dataset contains four lead samples that can be categorized into the depth and distance intervals, as shown on Table 4. Additional data were available, but no distance/depth information was available for the data or the samples were collected over a large (>1-foot depth interval). No benzo(a)pyrene samples that could be characterized by depth and distance have been collected in the Cascade Range.

As shown on Figure 3, the four samples for this province were collected within 15 feet from the pavement and this small dataset shows a tendency to be below clean fill criterion for lead. It is important to note that this trend is based on a very small number of samples. Additional sampling and analysis would be necessary to develop a statistically sufficient dataset that could be used to infer whether concentrations of lead and benzo(a)pyrene in soil in this province are above or below clean fill criteria.

4.5.2 Coast Range

The Coast Range dataset contains lead and benzo(a)pyrene data for 40 samples that can be categorized into predictor variable categories.

As shown on Figures 3 and 4, all of the lead and benzo(a)pyrene samples in this province were collected within 15 feet from the pavement. The lead concentrations (mean, median, and 90% UCL) are typically above clean fill criterion, whereas the benzo(a)pyrene concentrations are typically below clean fill criterion, as shown in Table 4. Additional sampling and analysis would be necessary to evaluate lead and benzo(a)pyrene concentrations in soil more than 15 feet from the pavement.

While the lead concentrations in Coast Range soil within 15 feet of the pavement commonly exceed the clean fill criterion, it is important to note that the median, mean, and 90% UCL lead concentrations are below the residential RBC for lead of 400 mg/kg. Only one of 40 samples contains a lead concentration above the residential RBC (420 mg/kg). These data indicate that, in the Coast Range, the lead concentrations in soil are protective of human health under DEQ's most restrictive residential use standard.

4.5.3 High Lava Plains

The High Lava Plains physiographic province dataset contains 31 lead and benzo(a)pyrene samples that can be categorized into predictor variable categories. As shown on Figures 3 and 4, lead and benzo(a)pyrene samples were collected across a range of depth and distance categories, but the majority of the samples (19 samples) were collected within 15 feet from the pavement surface.

Benzo(a)pyrene was detected in only one out of 31 samples collected; that concentration exceeded the clean fill criterion. The mean lead concentrations are below the clean fill criterion, but the 90% UCL lead concentration in the less than 15-foot distance interval are above the clean fill criterion. Additional sampling and analysis would be necessary to evaluate lead and benzo(a)pyrene concentrations in soil across predictor variable categories.

Like the Coast Range province, all lead concentrations in the High Lava Plains dataset are below the DEQ residential RBC of 400 mg/kg, indicating that the soil would not pose a risk to human health if it were transported and used in a residential setting.

4.5.4 Klamath Mountains

The Klamath Mountains province dataset consist of eleven soil samples. Predictor information (e.g., depth and distance from the pavement surface) are unavailable for these samples. Thus, the dataset is insufficient for evaluating roadside soil quality.

To provide an evenly distributed, statistically sufficient dataset that could be used to predict lead and benzo(a)pyrene shoulder soil concentrations, approximately 225 samples would be need to be collected across predictor variable categories. A first step toward development of such a database could be the collection of a smaller number of samples distributed across predictor variable categories. If the initial trends appeared promising (i.e., data are often below clean fill criteria or other alternative management criteria in all or a subset of categories), additional samples could be collected to confirm these trends.

4.5.5 Owyhee Uplands

No lead or benzo(a)pyrene data are present in the Owyhee Upland physiographic province. The collection and analysis of soil data (i.e., approximately 225 samples) is necessary to establish lead and benzo(a)pyrene trends in soil.

The Owyhee Uplands physiographic province abuts the Basin and Range and Blue Mountains physiographic provinces, which have been demonstrated to contain lead and benzo(a)pyrene in shoulder soil at concentrations less than clean fill criteria. Based on the similar AADT categories and clean fill criterion for lead (30 mg/kg) in the Owyhee Uplands province, relative to the Basin and Range and Blue Mountain provinces, it is likely that the concentrations of lead and benzo(a)pyrene would meet the clean fill criteria.

4.5.6 Portland Basin

The Portland Basin dataset includes 189 lead soil samples and 107 benzo(a)pyrene soil samples (Table 4). Of these, the vast majority (172 lead samples and 93 benzo(a)pyrene samples) were collected within 15 feet of the pavement.

As shown on Figure 4, benzo(a)pyrene concentrations are typically above the clean fill criterion in the Portland Basin samples. The mean concentrations of benzo(a)pyrene in all depth and distance categories with sufficient data for mean calculation, are above the clean fill criterion. Similarly, the mean lead concentrations in soil are above the clean fill criterion in every depth and distance category with sufficient data to calculate a mean, except the 1- to 1.5-foot interval less than 15 feet from the pavement (Figure 3).

Soil in the Portland Basin (particularly within 15 feet of the pavement) commonly contains lead and benzo(a)pyrene concentrations that exceed clean fill criteria. Unlike other physiographic provinces in Oregon, the clean fill criterion for lead is not based on the background metals concentration. While the background concentration for lead in the Portland Basin is 79 mg/kg, the clean fill criterion for lead is much lower, at 28 mg/kg. The mean lead concentrations in soil in all depth and distance categories are below 79 mg/kg, and only 22 percent of lead concentrations are above 79 mg/kg. Based on the size of the Portland Basin dataset, it is unlikely that additional sampling and analysis would lead to an alternative conclusion.

Due to the elevated concentrations of lead and benzo(a)pyrene concentrations in Portland Basin soil, relative to clean fill criteria, alternative screening criteria should be considered for future soil management efforts. For example, the mean and 90% UCL concentrations for lead and benzo(a)pyrene in soil, in all depth and distance categories, are less than the RBC for construction worker exposure. These observations suggest that Portland Basin soil could be safely managed at a non-residential/non-commercial facility (e.g., a mine reclamation site).

4.5.7 South Willamette Valley

The South Willamette Valley dataset includes lead data for 105 soil samples and benzo(a)pyrene data for 93 soil samples. Similar to the Portland Basin, the majority of these samples (65 lead samples and 62 benzo(a)pyrene samples) were collected within 15 feet of the pavement.

As shown in Figure 3, the lead concentrations typically exceed the clean fill criterion in the samples collected within 15 feet of the pavement. The mean concentrations of lead in samples collected deeper than 0.5 feet and greater than 15 feet from the pavement are less than clean fill criterion. Benzo(a)pyrene was not detected above the laboratory detection limit in most samples collected in the South Willamette Valley province. As shown in Figure 4, the limited number of benzo(a)pyrene concentrations that exceed the clean fill criterion were detected in the 0 to 0.5-foot depth interval, within 15 feet of the pavement.

Similar to the Portland Basin, the dataset for the Willamette Valley, especially within 15 feet of the pavement, is large. It is unlikely that additional sampling and analysis would generate data that would indicate that soil within 15 feet of the pavement meets clean fill criteria. The data set for soil more than 15 feet from the pavement is significantly smaller. It is possible that additional testing and analysis of soil more than 15 feet from the pavement may indicate that concentration trends in those areas.

While the lead and benzo(a)pyrene concentrations in Willamette Valley soil within 15 feet of the pavement commonly exceed the clean fill criteria, it is important to note that the mean, 90% UCL, and maximum lead and benzo(a)pyrene concentrations in all depth categories are below the RBC for construction worker exposure.

5.0 CONCLUSIONS

Following completion of the 2016 highway shoulder soil sampling program, statistically significant and balanced datasets for lead and benzo(a)pyrene concentrations in shoulder soil have been developed for the Basin and Range, Blue Mountains, and Deschutes Columbia physiographic provinces. The following summarizes conclusions for these physiographic provinces, as well as the remaining provinces in Oregon, as to how the data compare to clean fill criteria and other risk-based screening criteria.

- Highway shoulder soil in the Basin and Range and Blue Mountains physiographic provinces typically contains lead and benzo(a)pyrene at concentrations less than clean fill criteria.
- In the Deschutes Columbia physiographic province, highway shoulder soil typically contains lead and benzo(a)pyrene concentrations that are less than clean fill criteria, with the exception of soil within 15 feet of the pavement and shallow soil (surface to 6 inches bgs) within 30 feet of the pavement.
- While the datasets are limited for the Portland Basin and South Willamette Valley, concentrations of lead and benzo(a)pyrene in highway shoulder soil in these provinces generally exceed clean fill criteria; however, concentrations in these provinces are nearly always lower than construction worker RBCs.
- The soil datasets for the Cascade Range, Coast Range, High Lava Plains, Klamath Mountains, and Owyhee Uplands physiographic provinces are limited insufficient to draw conclusions regarding lead and benzo(a)pyrene concentrations in shoulder soil. While the dataset in the High Lava Plains physiographic province is limited, the mean concentrations of lead and benzo(a)pyrene in the dataset are below clean fill criteria. The Coast Range dataset is also limited in extent, but the mean and 90% UCL concentrations of lead and benzo(a)pyrene in that province dataset are below residential RBCs. Little to no shoulder soil data are available for the remaining physiographic provinces (Coast Range, Klamath Mountains, and Owyhee Uplands).

Recommendations, based on the evaluation of the statewide highway shoulder soil dataset, are provided in Section 6.

6.0 RECOMMENDATIONS

The following recommendations have been developed based on the evaluation of the statewide shoulder soil dataset, and are intended to improve the management of highway shoulder soil in Oregon. We recommend that ODOT solicits feedback from DEQ as modifications to soil management procedures are developed.

6.1 REGION-SPECIFIC MANAGEMENT OF HIGHWAY SHOULDER SOIL

Highway shoulder soil in Oregon is currently managed in accordance with ODOT Directive GE 14-01(D). That directive assumes that the upper 1.5 feet of soil adjacent to ODOT highways does not meet Oregon clean fill criteria, and, in the absence of contradictory data, requires that exported soil be managed as solid waste. The evaluation presented herein indicates that shoulder soil in some areas of Oregon consistently meets clean fill criteria. Consequently, ODOT Directive GE 14-01(D) should be modified. Specific recommendations for modifications to ODOT Directive GE 14-01(D) are presented below.

6.1.1 Basin and Range, Blue Mountains, and Deschutes Columbia Physiographic Provinces

Highway shoulder soil in the Basin and Range, Blue Mountains, and Deschutes Columbia physiographic provinces has been adequately characterized. With the exception of soil within 15 feet of the pavement (all depths) and surface soil (0 to 6 inches bgs) within 30 feet of the pavement in the Deschutes Columbia physiographic province, lead and benzo(a)pyrene (and benzo(a)pyrene equivalent) concentrations in highway shoulder soil in these three physiographic provinces are consistently below clean fill criteria. Additionally, lead and benzo(a)pyrene concentrations in shoulder soil are consistently below occupational RBCs.

Therefore, unless there is reason to believe that soil is impacted by hazardous substances (e.g., known nearby sources of hazardous substances or field indications of contamination), soil in these three provinces can likely be managed as clean fill, without additional testing. Soil in the above referenced intervals in the Deschutes Columbia physiographic province (i.e., soil within 15 feet of the pavement or surface soil within 30 feet of the pavement) can be managed in accordance with ODOT Directive GE 14-01(D) or as discussed in Section 6.2.

6.1.2 High Lava Plains and Owyhee Uplands

Limited shoulder soil data are available for the High Lava Plains physiographic province and no data are available for the Owyhee Uplands physiographic province; therefore, a statistical evaluation was not performed for soil in these provinces. However, the concentrations of lead and benzo(a)pyrene in shoulder soil in these provinces are expected to be similar to the concentrations in highway shoulder soil in the Basin and Range, Blue Mountains, and Deschutes Columbia physiographic provinces (i.e., generally less than clean fill criteria) because these provinces all exhibit similar traffic and physiographic characteristics.

Traffic volumes in the High Lava Plains and the Owyhee Uplands physiographic provinces are very low (less than 2,500 AADT), except for a segment of Highway 97 near the City of Bend. Lead and benzo(a)pyrene concentrations in highway shoulder soil in the Basin and Range, Blue Mountains, and Deschutes Columbia physiographic provinces along highways that exhibited similarly low traffic volumes (i.e., less than 2,500 AADT) generally meet the clean fill criteria.

The natural background concentrations for lead in the High Lava Plains (21 mg/kg) and the Owyhee Uplands (30 mg/kg) provinces are similar to the natural background concentrations in the contiguous Blue Mountains (21 mg/kg) and Basin and Range provinces (29 mg/kg). Lead concentrations in the Basin and Range and Blue Mountains province are nearly always less than the corresponding background concentrations.

While the dataset for the High Lava Plains is limited, the data that are available indicate that the mean concentrations of lead and benzo(a)pyrene in highway shoulder soil are below the clean fill criteria. As shown on Figure 1, the High Lava Plains soil data were collected adjacent to highways that exhibit relatively high traffic volumes for the region (e.g., greater than 15,000 AADT), and therefore, the High Lava Plains soil data likely offer a conservative representation of lead and benzo(a)pyrene concentrations in highway shoulder soil within this province.

Overall, the limited data that are available, when considered with the similar physiographic and traffic conditions, suggest that highway shoulder soil in the High Lava Plains and the Owyhee Uplands meets clean fill criteria. We recommend that ODOT solicit input from DEQ regarding the characterization of shoulder soil in the High Lava Plains and the Owyhee Uplands provinces, and specifically to develop a region-wide highway shoulder soil management plan.

6.1.3 Western Oregon

Highway shoulder soil datasets in the western portion of Oregon (Cascade Range, Coast Range, Klamath Mountains, Portland Basin, and South Willamette Valley physiographic provinces) are limited, or are characterized by soil concentrations that do not meet clean fill criteria.

While soil in some parts of western Oregon commonly exceeds clean fill criteria for lead and/or benzo(a)pyrene, that soil very rarely exceeds RBCs for worker health. Only 0.5 percent of lead results (2 samples out of 338) and 5.6 percent of benzo(a)pyrene results (10 samples out of 180) of samples collected in western Oregon exceed the occupational RBCs and no concentrations exceed the construction worker RBCs. These results indicate that: (1) in-place shoulder soil, in general, poses no significant risk to human health, and (2) when exported, shoulder soil in western Oregon can be safely reused for non-residential applications.

We recommend that ODOT coordinate with DEQ to determine if additional soil analysis and evaluation may be useful for further characterizing selected areas of western Oregon (e.g., the Coast Range or Klamath Mountains). The objective of additional characterization would be to determine if highway shoulder soil in selected areas of western Oregon meets clean fill criteria, like some eastern Oregon physiographic provinces.

We also recommend that ODOT coordinate to develop alternatives for management of highway shoulder soil that does not meet clean fill criteria. Section 6.2 presents some soil management alternatives.

6.2 MANAGEMENT OF HIGHWAY SHOULDER SOIL THAT DOES NOT MEET CLEAN FILL CRITERIA

Currently, in Oregon, exported soil that does not meet clean fill criteria is managed as solid waste. Solid waste must be disposed of at a licensed disposal facility or under a Solid Waste Letter of Authorization (SWLA) that is issued by DEQ. These management requirements can add significant costs to highway construction projects and are contrary to the DEQ strategy for solid waste prevention.

Exported highway shoulder soil is a desirable, valuable material that can be reused in a manner that will not create an adverse impact to public health, safety, welfare, or the environment. Consequently, exported soil can likely be managed under a DEQ beneficial use determination (BUD). Beneficial use determinations provide an alternative to management of soil as a solid waste. Beneficial use determinations fall into two categories: (1) standing BUDs, and (2) case-specific BUDs.

No standing BUD is in effect that would apply to Oregon highway shoulder soil. We recommend that ODOT pursue a case-specific BUD for management of highway shoulder soil. The specific details of the case-specific BUD would be developed in coordination with DEQ; however, we recommend that the case-specific BUD be developed to provide as broad coverage as possible (e.g., shoulder soil in general) and to provide as wide a range of reuse options as possible (e.g., non-residential fill, mine reclamation, etc.) for soil not meeting clean fill criteria.

6.3 GUIDANCE FOR FUTURE HIGHWAY SHOULDER SOIL SAMPLING

The C*lean Fill Determinations – Internal Management Directive* guidance provides the general framework and threshold chemical concentrations for characterization of soil as clean fill (DEQ, 2014). The *Clean Fill Determinations – Internal Management Directive* guidance regarding the number and locations of samples that should be collected for soil characterization is extremely limited. This limited guidance causes uncertainty and can result in the mischaracterization of soil quality at highway shoulder construction projects. For example, guidance is not provided for characterizing stockpiles (e.g., number and type of samples per volume of stockpile), nor is guidance provided for characterizing soil in which constituent concentrations vary with depth. Also, data collected during this study indicate that constituent concentrations in highway shoulder soil can exhibit significant variability within a small area. Data variability can pose challenges for soil characterization and reuse planning.

We recommend that the ODOT develop standard operating procedures for the collection and analysis of shoulder soil samples and when using the *Clean Fill Determinations – Internal Management Directive*. Standard operating procedures will ensure consistency in sample collection, processing, and analysis. At a minimum, standard operating procedures should include:

- Sampling methods;
- Frequency and number of samples to be collected;
- Recommended sampling depths;
- Field screening methods (i.e., staining, odor);
- Recording sampling details (e.g., depth intervals, distance from pavement, and geographic coordinates, etc.);
- Laboratory sample processing (e.g., ISM methodologies including drying, grinding, and subsampling); and
- Laboratory methods and reporting limit goals.

6.4 CLEAN FILL CRITERION FOR PORTLAND BASIN

In our opinion, the clean fill criterion for lead in the Portland Basin region in the *DEQ Clean Fill Determinations – Internal Management Directive* should be reviewed, and possibly modified. With the exception of the Portland Basin physiographic province, the Oregon clean-fill criteria for lead are equal to the naturally occurring background concentrations as determined by DEQ (DEQ, 2013). DEQ concluded that the background concentration of lead in the Portland Basin is 79 mg/kg (DEQ, 2013); however, in *Clean Fill Determinations – Internal Management Directive* DEQ established a clean fill criterion of 28 mg/kg for lead in the Portland Basin. The clean fill criterion for lead is approximately one-third the background concentration. For consistency, we recommend that the clean fill criterion for lead in the Portland Basin be increased to 79 mg/kg, consistent with the background concentration.

While DEQ concluded in the *Clean Fill Determinations – Internal Management Directive* that the background lead concentration may be elevated due to anthropogenic contributions, the background concentration of 79 mg/kg is still well below the most conservative RBC for residential exposure of 400 mg/kg, and therefore, is protective of human health. Even though the Portland Basin background lead concentration is above some ecological risk-based criteria, reuse of shoulder soil containing up to 79 mg/kg of lead within the Portland Basin should not result in increased risk to ecological receptors.

Oregon Clean Fill Screening Level					--	1,100	14,000	15	150

Notes:

1. PAHs = polycyclic aromatic hydrocarbons by EPA Method 8270D-SIM
2. Lead by EPA method 6020
3. Sample volume was dried and ground prior to analysis.
4. < = Analyte not detected above laboratory method detection limit shown
5. Bold denotes analyte detected above detection limit.
6. Shaded values indicate concentrations detected above the Oregon Clean Fill Screening Level.
7. µg/kg = microgram per kilogram (part per billion)
8. mg/kg = milligram per kilogram (part per million)
9. feet bgs = feet below ground surface
10. J = Estimated Result. Result detected below the lowest point of the calibration curve, but above the specified MDL.
11. M-02 = Due to matrix interference, this analyte cannot be accurately quantified. The reported result is estimated.
12. Q-42 = Matrix Spike and/or Duplicate analysis was performed on this sample. % Recovery or RPD for this analyte is outside laboratory control limits.
13. J1= Surrogate recovery is outside of established control limits, result is estimated.
14. J2 = The relative percent difference between the primary and duplicate sample is greater than 30%. This result should be considered an estimate.
15. As requested by DEQ, benzo(a)pyrene equivalents were calculated using the toxic equivalency factors for carcinogenic PAHs in the DEQ October 2010 *Human Health Risk Assessment Guidance* .

Notes:

1. B(a)p = benzo(a)pyrene
2. Only discrete samples with distance from pavement information and sample depths that can be categorized in the 0 - 0.5, 0.5 - 1, and 1 - 1.5-foot interval are included in this total.
3. Non-detect benzo(a)pyrene results with detection limits higher than the clean fill criteria are not included in these totals.
4. bgs = below the ground surface

Notes:

1. Summary Stats (mean, median, and se) use the Kaplan-Meier for data groups with censored values (non-detects). Summary statistics are only calculated when there are at least 3 detected values, otherwise only the range is reported.
2. The Owyhee Uplands physiographic province is not included in this table because there is no shoulder soil sampling data available for the province.
3. This summary includes all samples, even those non-detects with DLs that exceeded the clean fill criteria which were excluded from the sample sizes shown in Table 3.
4. Note: very few of the qqplots within each group actually look normal - some have outliers; some are just skewed; others look like a mixture of multiple sub-populations. BAP data in particular do not follow a normal distribution because of so many non-detects. Consequently, for a UCL estimate, Student's-t interval is inappropriate for most groups; Chebyshev's is highly conservative, but coverage is assured.
5. Non-normality of the data in this group, including the possiblity of outliers, is suggested when the absolute value of skewness > 2, or kurtosis > 3.
6. Samples categorized as "Other" are either missing sampling details or could not be classified within the depth and distance from pavement categories used in this evaluation.
7. NA = No data are available or could not be calculated with the existing dataset (see note 1).

Shoulder Soil Data Lead Box Plots

2016 Highway Shoulder Soil Sampling Results Report
Oregon Department of Transportation

NOTE: Soil concentrations are shown relative to each physiographic province-specific lead clean fill criteria. A value of 1.0 on the Y-axis corresponds to the clean fill criterion. Concentrations are shown on a logarithmic scale.

APPENDIX B

LABORATORY ANALYTICAL REPORTS AND DATA QUALITY REVIEW

LABORATORY DATA QUALITY ASSURANCE REVIEW

This appendix presents a quality assurance review of laboratory analytical data collected for the 2016 ODOT Highway Shoulder Soil Sampling Project. Soil analyses were performed by Apex Labs of Tigard, Oregon, under Work Orders A6J0556, A6J0562, A6J0598, A6J0754, A6J0823 A6J0849, A6J0892, A6J0893, A6J0925, A6J0950 (reported as Work Order A6J0556); Work Orders A6J0986, A6J0990, A6J1004, A6J1008, A6J1010, A6J1011, A6J1012, and A6J1013 (reported as Work Order A6J0986); and Work Orders A6K0211, A6K0212, A6K0213, A6K0214, A6K0215, A6K0216 (reported as Work Order A6K0211).

A total of 462 soil samples were submitted for analysis of lead by EPA method 6020A and PAHs by EPA method 8270D-SIM. Upon arrival at the lab, the samples were processed as follows, as noted in the laboratory case narrative in each lab report.

- Sample Storage: Soil samples for this work order were frozen upon receipt at the laboratory. Samples were removed from frozen storage and brought to room temperature prior to processing. Samples were returned to frozen storage immediately following processing, to maximize hold times. Freezer conditions of storage are consistent with the guidelines provided in the Oregon DEQ approved Sediment Evaluation Framework (SEF) for the Pacific Northwest, July 2016. The accepted holding times for frozen samples in the SEF is two years for Lead (Pb) and one year for PAHs from date sample is collected. These hold times have been applied to all samples reported.
- Representative Sample Methodology: In order to reduce fundamental sampling error all samples were processed following Apex Labs Representative Sampling Methodology (RSM) SOP G-105. Sample handling per this SOP is consistent with the national ITRC ISM and professionally recognized MIS guidance documents.
  The RSM protocols used included air drying soils and cool grinding of the entire sample to form a well-mixed sample of approximate 50-micron diameter particles. The air drying and cool grinding can lead to depletion of volatile and some semi-volatile compounds. Results for low molecular weight PAHs should be considered Estimate Values with a potential low bias.
  The specific compounds that may be affected are the aromatics with two and three structural rings are: Anthracene, Acenaphthene, Acenaphthylene, Fluorene, Naphthalene, and Phenanthrene.
  Target carcinogenic PAHs are not adversely impacted by RSM preparation and the reported samples are not qualified.

The following describes the results of the data quality review and any qualifiers that were added to the data by the laboratory or Cascadia as a result of the data quality review.

- Samples were received by the analytical laboratory in good condition and in the appropriate, laboratory-supplied sample containers.
- Samples were received by the laboratory within the recommended temperature range.
- The samples were analyzed within their respective method holding times. As noted previously, the samples were frozen upon receipt to preserve the laboratory hold times, in accordance with established protocol.
- Several data values in the three laboratory data reports were reported as estimates, because the concentration was detected below the lowest point of the calibration curve, but above the specified MDL. As a result, the affected data are flagged with the "J" qualifier in the laboratory report and in the data tables.
- Several data values in all laboratory reports were flagged with the M-02 qualifier to indicate that the analyte cannot be accurately quantified due to matrix interference. The reported result is estimated. As a result, the affected data are flagged with the M-02 qualifier in the data tables in addition to the report. None of the data flagged with the M-02 were detected at concentrations close to or above the associated clean fill criteria, so the data evaluation was not affected.
- Several data values in the three laboratory data reports were flagged with the R-02 or R-04 qualifier, indicating that the reporting limit for this analyte has been raised to account for interference from coeluting organic compounds present in the sample or due to dilution necessary for analysis, respectively. The data quality was not affected and the data were not flagged as a result.
- Several laboratory analyses in the three laboratory data reports were flagged with the H-08 qualifier indicating that the hold time was extended by freezing at -18 degrees C. Total time at 4 degrees C was less than the standard hold time. The data quality was not anticipated to be affected and the data were not flagged as a result in the data tables.
- Several PAHs were detected in the method blanks associated with batch 6110268 for Work Order A6J0556. The associated results were flagged with the B-02 qualifier, indicating that the analyte detected in an associated blank at a level between one-half the MRL and the MRL. The laboratory notes that results reported below the MRL may include a potential high bias if associated with a B or B-02 qualified blank. No PAHs were detected in the samples associated with the batch, and no data were qualified.
- A number of PAH analyses in the Work Order A6J0556 report were flagged with the C-05 qualifier, meaning that the extract has undergone a GPC (Gel-Permeation Chromatography) cleanup per EPA 3640A. Reporting levels may be raised due to dilution necessary for cleanup. The data quality was not affected, and the data are not flagged as a result.
- One of the laboratory duplicate samples for Work Order A6J0556, associated with sample BR-20-15-30' (0-0.5') _Prepared was flagged with the T-02 qualifier, meaning that the results for the results of the lab duplicate are estimated due to the analysis

taking place more than 12 hours after the method required mass spectrometer tune check was performed. Similarly, one of the matrix spike/matrix spike duplicate (MS/MSD) samples for Work Order A6J0986 and batch 6110476 associated with sample DC-05->30' (1-1.5') _Prepared was flagged with the T-02 qualifier. For both of these samples, the primary sample data quality was not affected and no data are flagged as a result.

- One of the grind blanks for Work Order A6J0556 and batch 6110268 and one of the grind blanks for Work Order A6J0986 and batch 6110865 was flagged with the T-03 qualifier. This qualifier means that the sample was analyzed outside of the method specified 12-hour tune window and that results are estimated. An additional grind blank was analyzed for the batch 6110268 that met data quality requirements. Data quality was not affected and the data are not flagged as a result.
- The surrogate recoveries for the PAH analysis for sample BM-01->30' (0-0.5') Prepared of Work Order A6J0986 were outside of the lower bound of the quality control range. The associated data are flagged with the J1 qualifier, indicating that the results are estimated and could potentially be biased low.
- The matrix spike (MS) recoveries for Work Order A6J0556 and batch 6120859 for anthracene, benz(a)anthracene, benzo(a)pyrene, and benzo(b)fluoranthene were outside of upper quality control limits and were flagged with the Q-01 or Q-02 qualifier. Similarly, the MS recovery for Work Order A6J0986 and batch 6110717 for benzo(g,h,i)perylene and MS recovery for Work Order A6K0211 and batch 6120419 for phenanthrene were outside of quality control limits. The affected PAH results for the associated samples, B-24-15-30' (0.5-1'), DC-13->30' (1-1.5') _Prepared, and BM-19-15-30' (0.5-1') _Prepared were flagged with the Q-42 qualifier as estimated, indicating that the matrix spike relative percent difference (RPD) was outside laboratory control limits accordingly. None of the data flagged with the Q-42 were detected at concentrations close to or above the associated clean fill criteria, so the data evaluation was not affected.
- One of two surrogate recoveries for a number of Work Order A6K0211 samples were flagged with the Q-03 qualifier meaning that re-extraction and analysis, or analysis of laboratory duplicate, confirms surrogate failure due to sample matrix effect. The surrogate was just slightly outside of quality control limits. The remaining surrogate recover was within quality control limits. Data quality are not affected and no data are flagged as a result.
- For Work Order A6J0556, a few of the PAH laboratory duplicate values for one of the laboratory duplicate analyses associated with sample BR-20-15-30' (0.5-1') _Prepared in batch 6110353 were outside of quality control limits. The associated QC results were flagged with the Q-05 qualifier indicting that the analyses are not controlled on RPD

values from primary and duplicate concentrations that are below 5 times the method reporting limit.

- For Work Order A6J0556, the batch 6110298 RPD for the MS/MSD for naphthalene was above established quality control limits and was flagged with the Q-24 qualifier. Similarly, the Work Order A6K0211 batch 6120166 RPD for the laboratory control sample/laboratory control sample duplicate (LCS/LCSD) RPD for indeno(1,2,3-cd)pyrene MS/MSD for naphthalene was above established quality control limits and was flagged with the Q-24 qualifier. Because the MS and MSD recoveries and LCS and LCSD recoveries were within quality control limits, no data are flagged as a result.
- The RPD between primary and field duplicate samples was evaluated and is summarized in Table B-1. Analytes with greater than 30 percent RPD were flagged accordingly with the J2 qualifier in Table 2, indicating that the results should be considered estimated.

After a review of the laboratory narratives, data, and quality control data, Cascadia has determined that the data are appropriate for evaluating soil conditions at the site.

Table B-1
Field Duplicate Evaluation
2016 Statewide Highway Shoulder Soil Sampling Results Report

Sample ID	Analyte	Units	Primary Sample Result	Duplicate Sample Result	RPD
BR-02-15-30' (0-0.5')	Lead	mg/kg	5.54	5.73	3.4%

RE: ODOT Clean Fill Project -- RSM / ODOT Clean Fill Project

Enclosed are the results of analyses for work order A6J0556, which was received by the laboratory on 10/17/2016 at 8:30:00AM.

Thank you for using Apex Labs. We appreciate your business and strive to provide the highest quality services to the environmental industry.

If you have any questions concerning this report or the services we offer, please feel free to contact me by email at: ldomenighini@apex-labs.com, or by phone at 503-718-2323.

Apex Laboratories

Lisa Domenighini, Client Services Manager

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

RE: Laboratory Case Narrative Work Order A6J0556, A6J0562, A6J0598, A6J0754, A6J0823 A6J0849, A6J0892, A6J0893, A6J0925, A6J0950

Sample Storage:
Soil samples for this work order were frozen upon receipt at the laboratory. Samples were removed from frozen storage and brought to room temperature prior to processing. Samples were returned to frozen storage immediately following processing, in order to maximize hold times. Freezer conditions of storage are consistent with the guidelines provided in the Oregon DEQ approved Sediment Evaluation Framework (SEF) for the Pacific Northwest, July 2016. The accepted holding times for frozen samples in the SEF is two years for Lead (Pb) and one year for PAHs from date sample is collected. These hold times have been applied to all samples reported.

Representative Sample Methodology:
In order to reduce fundamental sampling error all samples were processed following Apex Labs Representative Sampling Methodology (RSM) SOP G-105. Sample handling per this SOP is consistent with the national ITRC ISM and professionally recognized MIS guidance documents.

The RSM protocols used included air drying soils and cool grinding of the entire sample to form a well-mixed sample of approximate 50 micron diameter particles. The air drying and cool grinding can lead to depletion of volatile and some semi-volatile compounds. Results for low molecular weight PAHs should be considered Estimate Values with a potential low bias.

The specific compounds that may be affected are the aromatics with two and three structural rings are: Anthracene, Acenaphthene, Acenaphthylene, Fluorene, Naphthalene, and Phenathrene.

Target carcinogenic PAHs are not adversely impacted by RSM preparation and the reported samples are not qualified.

If you have any questions concerning this report, please feel free to contact me
By email at: kpatton@apex-labs.com, or by phone at 503-718-2323.

ANALYTICAL CASE NARRATIVE

Work Order: A6J0598

Amended Final Report Revision 1
This report supersedes all previous reports.
EPA 8270D SIM PAH: Quality Control Sample Results Reissued
Results for Laboratory Batch QC sample A6J0598-41 (Grind Blank) was initially reported as Estimated Values due to the analysis taking place more than 12 hours after the method required mass spectrometer tune check was performed.
Affected sample have been reanalyzed, and is included in this amended report.
The originally reported sample results were not affected, and are reported again here along with the reanalyzed QC samples.

Amended Report Revision 1:

EPA Method 8270SIM PAH Data Correction

This report supersedes all previous reports.

Samples "BR-10-0-15' (0.5-1')" (A6J0754-31) and "BR-11-0-15' (0-0.5')" (A6J0754-40):

Due to non-target analyte matrix interference, data originally reported with elevated Method Reporting Limits (MRLs). Samples were re-extracted and the extracts were cleaned up by EPA Method 3640 Gel Permeation Cleanup. The re-analysis data is included in this report and MRLs for Benzo(a)pyrene now meet project specific requirements. Only the analytes with lowered MRLs are included. For additional PAH analytes refer to previously issued report.

Portland, OR 97219	Project Manager: Kirsten K. White	03/21/17 09:46

ANALYTICAL CASE NARRATIVE

Work Order: A6J0950

Amended Report Revision 1
This report supersedes all previous reports.
EPA 8270D SIM PAH: Quality Control Sample Results Reissued and data correction.

Samples "BR-24-15-30' (0-0.5')" (A6J0950-20) and "BR-24-15-30' (0.5-1')" (A6J0950-21):
Due to non-target analyte matrix interference, data originally reported with elevated Method Reporting Limits (MRLs). Samples were re-extracted and the extracts were cleaned up by EPA Method 3640 Gel Permeation Cleanup. The re-analysis data is included in this report and MRLs for Benzo(a)pyrene now meet project specific requirements.
Results for certain Laboratory Batch QC samples (Matrix Spike, Matrix Spike Duplicate and/or Sample Duplicate) were initially reported as Estimated Values due to the analysis taking place more than 12 hours after the method required mass spectrometer tune check was performed. Affected Batch QC Samples have been reanalyzed, and are included in this amended report.
The originally reported sample results were not affected, and are reported again here along with the reanalyzed QC samples.

Mark Zehr
Organics Manager
12/14/2016 - 1/3/2017

503-718-0333 Fax

Cascadia Associates	Project: **ODOT Clean Fill Project -- RSM**	
6915 SW Macadam, Suite 255	Project Number: ODOT Clean Fill Project	**Reported:**
Portland, OR 97219	Project Manager: Kirsten K. White	03/21/17 09:46

Notes and Definitions

Qualifiers:

A-01	Reanalyzed for Dry Weight
A-01a	Sample is Blank QC for the RSM grinding process and does not count toward the 20 client sample batch limit.
A-01b	Sample is blank QC for the RSM grinding process and does not count toward the client sample batch limit.
B-02	Analyte detected in an associated blank at a level between one-half the MRL and the MRL. (See Notes and Conventions below.)
C-05	Extract has undergone a GPC (Gel-Permeation Chromatography) cleanup per EPA 3640A. Reporting levels may be raised due to dilution necessary for cleanup. Sample Final Volume includes the GPC dilution factor, see the Prep page for details.
H-08	Sample hold time extended by freezing at -18 degrees C. Total time at 4 degrees C was less than the standard hold time.
J	Estimated Result. Result detected below the lowest point of the calibration curve, but above the specified MDL.
M-02	Due to matrix interference, this analyte cannot be accurately quantified. The reported result is estimated.
Q-01	Spike recovery and/or RPD is outside acceptance limits.
Q-02	Spike recovery is outside of established control limits due to matrix interference.
Q-05	Analyses are not controlled on RPD values from sample and duplicate concentrations that are below 5 times the reporting level.
Q-16	Reanalysis of an original Batch QC sample.
Q-19	Blank Spike Duplicate (BSD) sample analyzed in place of Matrix Spike/Duplicate samples due to limited sample amount available for analysis.
Q-24	RPD for spike and spike duplicate is above established control limit. Recoveries for both spike and spike duplicate are within control limits.
Q-42	Matrix Spike and/or Duplicate analysis was performed on this sample. % Recovery or RPD for this analyte is outside laboratory control limits. (Refer to the QC Section of Analytical Report.)
R-02	The Reporting Limit for this analyte has been raised to account for interference from coeluting organic compounds present in the sample.
R-04	Reporting levels elevated due to dilution necessary for analysis.
T-02	This Batch QC sample was analyzed outside of the method specified 12 hour tune window. Results are estimated.
T-03	This sample was analyzed outside of the method specified 12 hour tune window. Results are estimated.
X	See Case Narrative.

Notes and Conventions:

DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit

AMENDED REPORT

12232 S.W. Garden Place
Tigard, OR 97223
503-718-2323 Phone
503-718-0333 Fax

Cascadia Associates	Project: **ODOT Clean Fill Project -- RSM**	
6915 SW Macadam, Suite 255	Project Number: ODOT Clean Fill Project	**Reported:**
Portland, OR 97219	Project Manager: Kirsten K. White	03/21/17 09:46

NR	Not Reported
dry	Sample results reported on a dry weight basis. Results listed as 'wet' or without 'dry'designation are not dry weight corrected.
RPD	Relative Percent Difference
MDL	If MDL is not listed, data has been evaluated to the Method Reporting Limit only.
WMSC	Water Miscible Solvent Correction has been applied to Results and MRLs for volatiles soil samples per EPA 8000C.
Batch QC	Unless specifically requested, this report contains only results for Batch QC derived from client samples included in this report. All analyses were performed with the appropriate Batch QC (including Sample Duplicates, Matrix Spikes and/or Matrix Spike Duplicates) in order to meet or exceed method and regulatory requirements. Any exceptions to this will be qualified in this report. Complete Batch QC results are available upon request. In cases where there is insufficient sample provided for Sample Duplicates and/or Matrix Spikes, a Lab Control Sample Duplicate (LCS Dup) is analyzed to demonstrate accuracy and precision of the extraction and analysis.
Blank Policy	Apex assesses blank data for potential high bias down to a level equal to ½ the method reporting limit (MRL), except for conventional chemistry and HCID analyses which are assessed only to the MRL. Sample results flagged with a B or B-02 qualifier are potentially biased high if they are less than ten times the level found in the blank for inorganic analyses or less than five times the level found in the blank for organic analyses. For accurate comparison of volatile results to the level found in the blank; water sample results should be divided by the dilution factor, and soil sample results should be divided by 1/50 of the sample dilution to account for the sample prep factor. Results qualified as reported below the MRL may include a potential high bias if associated with a B or B-02 qualified blank. B and B-02 qualifications are not applied to J qualified results reported below the MRL.
---	QC results are not applicable. For example, % Recoveries for Blanks and Duplicates, % RPD for Blanks, Blank Spikes and Matrix Spikes, etc.
***	Used to indicate a possible discrepancy with the Sample and Sample Duplicate results when the %RPD is not available. In this case, either the Sample or the Sample Duplicate has a reportable result for this analyte, while the other is Non Detect (ND).

RE: ODOT Clean Fill Project -- RSM / ODOT Clean Fill Project

Enclosed are the results of analyses for work order A6J0986, which was received by the laboratory on 10/22/2016 at 10:35:00AM.

Thank you for using Apex Labs. We appreciate your business and strive to provide the highest quality services to the environmental industry.

If you have any questions concerning this report or the services we offer, please feel free to contact me by email at: ldomenighini@apex-labs.com, or by phone at 503-718-2323.

RE: Laboratory Case Narrative Work Order A6J0986,A6J0990,A6J1004, A6J1008, A6J1010, A6J1011, A6J1012, A6J1013

Sample Storage:
Soil samples for this work order were frozen upon receipt at the laboratory. Samples were removed from frozen storage and brought to room temperature prior to processing. Samples were returned to frozen storage immediately following processing, in order to maximize hold times. Freezer conditions of storage are consistent with the guidelines provided in the Oregon DEQ approved Sediment Evaluation Framework (SEF) for the Pacific Northwest, July 2016. The accepted holding times for frozen samples in the SEF is two years for Lead (Pb) and one year for PAHs from date sample is collected. These hold times have been applied to all samples reported.

Representative Sample Methodology:
In order to reduce fundamental sampling error all samples were processed following Apex Labs Representative Sampling Methodology (RSM) SOP G-105. Sample handling per this SOP is consistent with the national ITRC ISM and professionally recognized MIS guidance documents.

The RSM protocols used included air drying soils and cool grinding of the entire sample to form a well-mixed sample of approximate 50 micron diameter particles. The air drying and cool grinding can lead to depletion of volatile and some semi-volatile compounds. Results for low molecular weight PAHs should be considered Estimate Values with a potential low bias.

The specific compounds that may be affected are the aromatics with two and three structural rings are: Anthracene, Acenaphthene, Acenaphthylene, Fluorene, Naphthalene, and Phenathrene.

Target carcinogenic PAHs are not adversely impacted by RSM preparation and the reported samples are not qualified.

If you have any questions concerning this report, please feel free to contact me
By email at: kpatton@apex-labs.com, or by phone at 503-718-2323.

ANALYTICAL CASE NARRATIVE

Work Order: A6J0986

Amended Report Revision 1:

Change to Sample Identification and Missing Sample Results:

This report supersedes all previous reports.

Due to laboratory login error, the sample ID was incorrect for sample A6J0986-38. Sample was originally reported as; DC-03->30' (0.5-1')_As_Received . That sample ID has been changed, and is now reported as DC-03->30 (0.5-1')_Prepared.

The original report did not include final results for 8270D SIMPAH for sample DC-03-15-30' (0.5-1')_Prepared, Apex # A6J0986-35.

Cascadia Associates	Project: **ODOT Clean Fill Project -- RSM**	
6915 SW Macadam, Suite 255	Project Number: ODOT Clean Fill Project	**Reported:**
Portland, OR 97219	Project Manager: Kirsten K. White	01/17/17 07:11

Notes and Definitions

Qualifiers:

A-01	Sample is blank QC for the RSM grinding process and does not count toward the 20 client sample batch limit.
H-08	Sample hold time extended by freezing at -18 degrees C. Total time at 4 degrees C was less than the standard hold time.
J	Estimated Result. Result detected below the lowest point of the calibration curve, but above the specified MDL.
M-02	Due to matrix interference, this analyte cannot be accurately quantified. The reported result is estimated.
Q-05	Analyses are not controlled on RPD values from sample and duplicate concentrations that are below 5 times the reporting level.
Q-19	Blank Spike Duplicate (BSD) sample analyzed in place of Matrix Spike/Duplicate samples due to limited sample amount available for analysis.
Q-24	RPD for spike and spike duplicate is above established control limit. Recoveries for both spike and spike duplicate are within control limits.
Q-42	Matrix Spike and/or Duplicate analysis was performed on this sample. % Recovery or RPD for this analyte is outside laboratory control limits. (Refer to the QC Section of Analytical Report.)
R-02	The Reporting Limit for this analyte has been raised to account for interference from coeluting organic compounds present in the sample.
R-04	Reporting levels elevated due to dilution necessary for analysis.
S-06	Surrogate recovery is outside of established control limits.
T-02	This Batch QC sample was analyzed outside of the method specified 12 hour tune window. Results are estimated.
T-03	This sample was analyzed outside of the method specified 12 hour tune window. Results are estimated.

Notes and Conventions:

DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis. Results listed as 'wet' or without 'dry'designation are not dry weight corrected.
RPD	Relative Percent Difference
MDL	If MDL is not listed, data has been evaluated to the Method Reporting Limit only.
WMSC	Water Miscible Solvent Correction has been applied to Results and MRLs for volatiles soil samples per EPA 8000C.
Batch QC	Unless specifically requested, this report contains only results for Batch QC derived from client samples included in this report. All analyses were performed with the appropriate Batch QC (including Sample Duplicates, Matrix Spikes and/or Matrix Spike Duplicates) in order to meet or exceed method and regulatory requirements. Any exceptions to this will be qualified in this report. Complete Batch QC results are available upon request. In cases where there is insufficient sample provided for Sample Duplicates and/or Matrix Spikes, a Lab Control Sample Duplicate (LCS Dup) is analyzed to demonstrate accuracy and precision of the extraction and analysis.
Blank Policy	Apex assesses blank data for potential high bias down to a level equal to ½ the method reporting limit (MRL), except for conventional chemistry and HCID analyses which are assessed only to the MRL. Sample results flagged with a B or B-02 qualifier are potentially biased high if they are less than ten times the level found in the blank for inorganic analyses or less than five times the level found in the blank for organic analyses.

Cascadia Associates	Project: **ODOT Clean Fill Project -- RSM**	
6915 SW Macadam, Suite 255	Project Number: ODOT Clean Fill Project	**Reported:**
Portland, OR 97219	Project Manager: Kirsten K. White	01/17/17 07:11

For accurate comparison of volatile results to the level found in the blank; water sample results should be divided by the dilution factor, and soil sample results should be divided by 1/50 of the sample dilution to account for the sample prep factor.

Results qualified as reported below the MRL may include a potential high bias if associated with a B or B-02 qualified blank. B and B-02 qualifications are not applied to J qualified results reported below the MRL.

--- QC results are not applicable. For example, % Recoveries for Blanks and Duplicates, % RPD for Blanks, Blank Spikes and Matrix Spikes, etc.

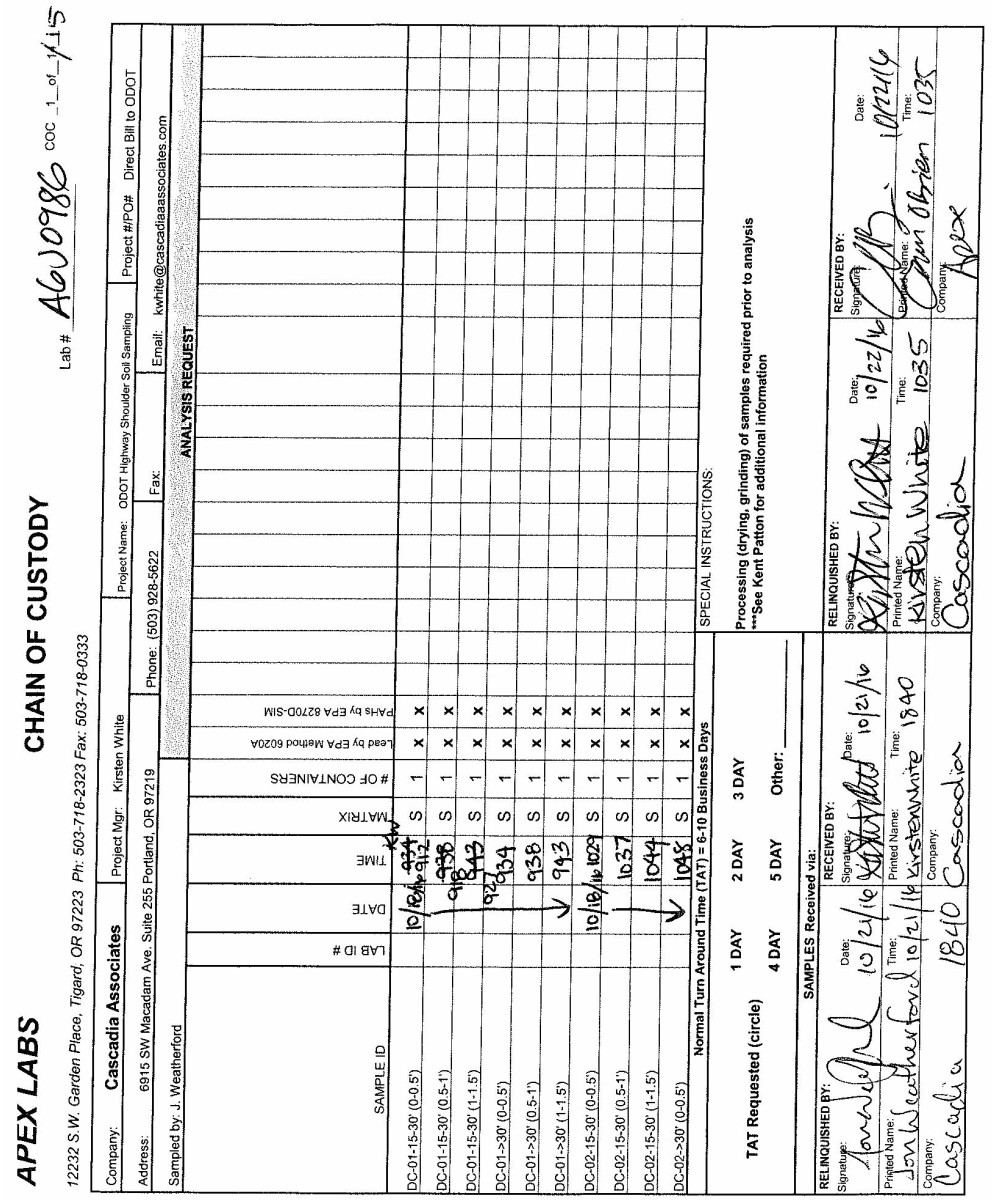

*** Used to indicate a possible discrepancy with the Sample and Sample Duplicate results when the %RPD is not available. In this case, either the Sample or the Sample Duplicate has a reportable result for this analyte, while the other is Non Detect (ND).

Date/Time Received: 10/27/16 @ 1035 By: CAB

Delivered by: Apex___ Client X ESS___ FedEx___ UPS___ Swift___ Senvoy___ SDS___ Other___

Cooler Inspection Inspected by: CAB : 10/27/16 @ 1040

Chain of Custody Included? Yes X No___ Custody Seals? Yes___ No V

Signed/Dated by Client? Yes X No___

Signed/Dated by Apex? Yes X No___

	Cooler #1	Cooler #2	Cooler #3	Cooler #4	Cooler #5	Cooler #6	Cooler #7
Temperature (deg. C)	4.4	5.1	5.6				
Received on Ice? (Y/N)	(Y)						
Temp. Blanks? (Y/N)	(Y)						
Ice Type: (Gel/Real/Other)	(Real)						
Condition:							

Cooler out of temp? (Y/N) Possible reason why:

If some coolers are in temp and some out, were green dot applied to out of temperature samples? Yes/No/NA

Samples Inspection: Inspected by: CAB : 10/27/16 @ 1510

All Samples Intact? Yes X No___ Comments:

Bottle Labels/COCs agree? Yes V No___ Comments:

Containers/Volumes Received Appropriate for Analysis? Yes X No___ Comments:

Do VOA Vials have Visible Headspace? Yes___ No___ NA V

Comments

Water Samples: pH Checked and Appropriate (except VOAs): Yes___ No___ NA V

Comments:

Additional Information:

Labeled by: 10/27/16 Witness: CAB Cooler Inspected by: CAB See Project Contact Form: Y

RE: Laboratory Case Narrative Work Order #s, A6K0211, A6K0212, A6K0213, A6K0214, A6K0215, A6K0216

Sample Storage:
Soil samples for this work order were frozen upon receipt at the laboratory. Samples were removed from frozen storage and brought to room temperature prior to processing. Samples were returned to frozen storage immediately following processing, in order to maximize hold times. Freezer conditions of storage are consistent with the guidelines provided in the Oregon DEQ approved Sediment Evaluation Framework (SEF) for the Pacific Northwest, July 2016. The accepted holding times for frozen samples in the SEF is two years for Lead (Pb) and one year for PAHs from date sample is collected. These hold times have been applied to all samples reported.

Representative Sample Methodology:
In order to reduce fundamental sampling error all samples were processed following Apex Labs Representative Sampling Methodology (RSM) SOP G-105. Sample handling per this SOP is consistent with the national ITRC ISM and professionally recognized MIS guidance documents.

The RSM protocols used included air drying soils and cool grinding of the entire sample to form a well-mixed sample of approximate 50 micron diameter particles. The air drying and cool grinding can lead to depletion of volatile and some semi-volatile compounds. Results for low molecular weight PAHs should be considered Estimate Values with a potential low bias.

The specific compounds that may be affected are the aromatics with two and three structural rings are: Anthracene, Acenaphthene, Acenaphthylene, Fluorene, Naphthalene, and Phenathrene.

Target carcinogenic PAHs are not adversely impacted by RSM preparation and the reported samples are not qualified.

If you have any questions concerning this report, please feel free to contact me
By email at: kpatton@apex-labs.com, or by phone at 503-718-2323.

ANALYTICAL CASE NARRATIVE

Work Order: A6K0211

Amended Report Revision 1:

Change to Sample Identification:

This report supersedes all previous reports.

Due to laboratory login error, the sample ID was incorrect for sample A6K0211-36. Sample was originally reported as; BM-06->30' (0-0.5')_As Received . That sample ID has been changed, and is now reported as; BM-06->30' (0-0.5')_Prepared.

Cascadia Associates	Project: **ODOT Clean Fill Project -- RSM**	
6915 SW Macadam, Suite 255	Project Number: ODOT Clean Fill Project	**Reported:**
Portland, OR 97219	Project Manager: Kirsten K. White	01/16/17 15:27

Notes and Definitions

Qualifiers:

A-01	Sample is blank QC for the RSM grinding process and does not count toward the 20 client sample batch limit.
DW>100	Calculated Dry Weight for this sample was slightly greater than 100%, due to limitations of the method with extremely dry samples. Result was set to 100% for calculation purposes.
H-08	Sample hold time extended by freezing at -18 degrees C. Total time at 4 degrees C was less than the standard hold time.
J	Estimated Result. Result detected below the lowest point of the calibration curve, but above the specified MDL.
M-02	Due to matrix interference, this analyte cannot be accurately quantified. The reported result is estimated.
Q-01	Spike recovery and/or RPD is outside acceptance limits.
Q-19	Blank Spike Duplicate (BSD) sample analyzed in place of Matrix Spike/Duplicate samples due to limited sample amount available for analysis.
Q-24	RPD for spike and spike duplicate is above established control limit. Recoveries for both spike and spike duplicate are within control limits.
Q-42	Matrix Spike and/or Duplicate analysis was performed on this sample. % Recovery or RPD for this analyte is outside laboratory control limits. (Refer to the QC Section of Analytical Report.)
R-02	The Reporting Limit for this analyte has been raised to account for interference from coeluting organic compounds present in the sample.
R-04	Reporting levels elevated due to dilution necessary for analysis.
S-03	Reextraction and analysis, or analysis of laboratory duplicate, confirms surrogate failure due to sample matrix effect.

Notes and Conventions:

DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis. Results listed as 'wet' or without 'dry'designation are not dry weight corrected.
RPD	Relative Percent Difference
MDL	If MDL is not listed, data has been evaluated to the Method Reporting Limit only.
WMSC	Water Miscible Solvent Correction has been applied to Results and MRLs for volatiles soil samples per EPA 8000C.
Batch QC	Unless specifically requested, this report contains only results for Batch QC derived from client samples included in this report. All analyses were performed with the appropriate Batch QC (including Sample Duplicates, Matrix Spikes and/or Matrix Spike Duplicates) in order to meet or exceed method and regulatory requirements. Any exceptions to this will be qualified in this report. Complete Batch QC results are available upon request. In cases where there is insufficient sample provided for Sample Duplicates and/or Matrix Spikes, a Lab Control Sample Duplicate (LCS Dup) is analyzed to demonstrate accuracy and precision of the extraction and analysis.
Blank Policy	Apex assesses blank data for potential high bias down to a level equal to ½ the method reporting limit (MRL), except for conventional chemistry and HCID analyses which are assessed only to the MRL. Sample results flagged with a B or B-02 qualifier are potentially biased high if they are less than ten times the level found in the blank for inorganic analyses or less than five times the level found in the blank for organic analyses.

AMENDED REPORT

12232 S.W. Garden Place
Tigard, OR 97223
503-718-2323 Phone
503-718-0333 Fax

Cascadia Associates	Project: **ODOT Clean Fill Project -- RSM**	
6915 SW Macadam, Suite 255	Project Number: ODOT Clean Fill Project	**Reported:**
Portland, OR 97219	Project Manager: Kirsten K. White	01/16/17 15:27

For accurate comparison of volatile results to the level found in the blank; water sample results should be divided by the dilution factor, and soil sample results should be divided by 1/50 of the sample dilution to account for the sample prep factor.

Results qualified as reported below the MRL may include a potential high bias if associated with a B or B-02 qualified blank. B and B-02 qualifications are not applied to J qualified results reported below the MRL.

--- QC results are not applicable. For example, % Recoveries for Blanks and Duplicates, % RPD for Blanks, Blank Spikes and Matrix Spikes, etc.

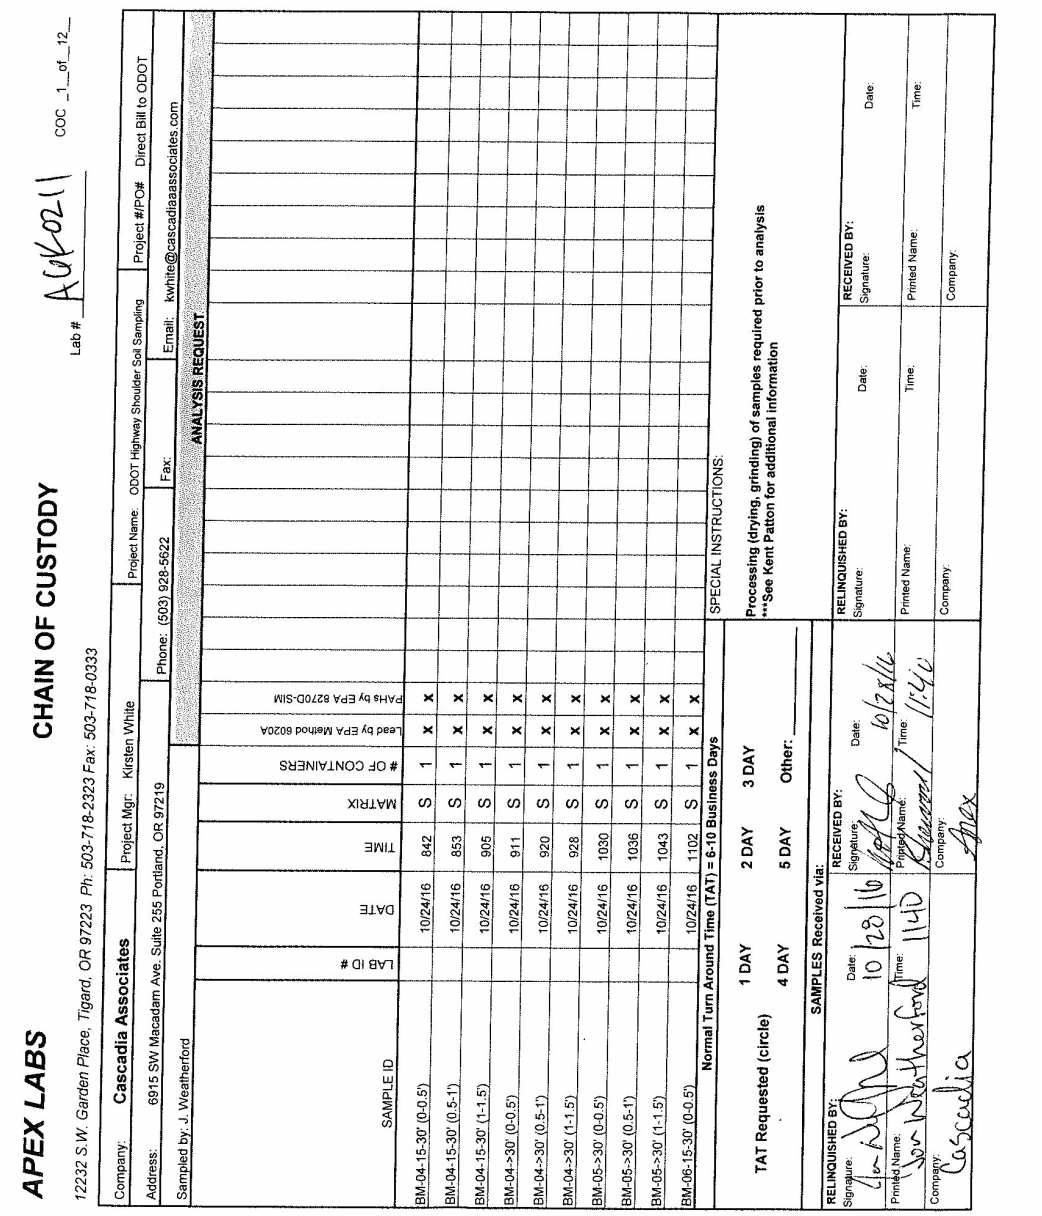

*** Used to indicate a possible discrepancy with the Sample and Sample Duplicate results when the %RPD is not available. In this case, either the Sample or the Sample Duplicate has a reportable result for this analyte, while the other is Non Detect (ND).

Cascadia Associates, LLC

APPENDIX C

2016 HIGHWAY SHOULDER SOIL STATISTICAL EVALUATION - SUPPORTING INFORMATION

Supporting Information - Shoulder Soil Statistical Evaluation

Lorraine Read, MS
Terrastat Consulting Group

Terrastat Consulting performed a statistical evaluation of soil chemical analytical data for three physiographic provinces in Oregon: the Deschutes Columbia province, the Blue Mountains province, and the Basin and Range province. The evaluation was performed at the request of Cascadia Associates, LLC (Cascadia), on behalf of the Oregon Department of Transportation (ODOT). The statistical evaluation included chemical analytical data for soil samples that were collected in 2016 (Cascadia), 2015 (Apex Companies, LLC), and other samples collected over a range of years by ODOT personnel.

Soil chemical analytical data are available for other physiographic provinces in Oregon; however, those data are not included in this evaluation because, based on a preliminary review of the data (*Sampling and Analysis Plan – Statewide Shoulder Soil Evaluation*, Cascadia, 2016), it was determined the sample populations in other provinces are insufficient for statistical testing and/or previous evaluations of the data were sufficient to characterize the sample populations with respect to State of Oregon clean fill criteria (Oregon Department of Environmental Quality [DEQ], 2014).

Soil samples were collected and analyzed in 2016 to generate a complete data set (when combined with previously collected data), for the three physiographic provinces listed above. These three provinces were previously identified (in the *Sampling and Analysis Plan – Statewide Shoulder Soil Evaluation*) as having roadside soil concentrations of lead and benzo(a)pyrene that were generally below the clean fill criteria. Chemical analytical data collected in 2016 filled in the holes of a crossed two-factor design for the two factors that had the most influence on soil concentrations in the existing data set (i.e., sample depth and distance from pavement).

Following the collection and analysis of soil samples in 2016, Terrastat performed a statistical analysis of roadside soil that meet the following parameters:

- **Three provinces**: Basin and Range, Blue Mountains, and Deschutes-Columbia.
- **Three sample depth intervals**: **1** = 0 – 0 .5 feet; **2** = 0.5 – 1 feet; and **4** = 1 - <2 feet.
- **Three distance from pavement intervals**: **1** = 0 - 15 feet; **2** = 15 - 30 feet; and **3** = 30+ feet.

Cross-tabulations of the sample counts in the updated 2016 database for lead and benzo(a)pyrene indicate a balanced design within each combination of distance and depth in each of the three provinces (Table C-1).

Traffic volume, or Average Annual Daily Traffic (AADT), was not a controlled variable in the 2016 survey primarily because not all AADT categories were represented in the test provinces. Instead, sampling locations sought to capture a range of geographic locations and AADT classifications in the test provinces (Table C-2). Most of these data were collected in 2016 (i.e., out of a total sample size of 698, 462 were from the 2016 sampling event and 236 were from previous sampling efforts).

Table C-1. Cross-tab of sample counts for each of lead and benzo(a)pyrene[1] by Distance from Pavement Interval x Sample Depth Interval, for the three provinces evaluated in this appendix.

Distance from Pavement (ft)	Basin and Range Sample Depth Interval			Blue Mountains Sample Depth Interval			Deschutes Columbia Sample Depth Interval		
	1 (0-0.5')	2 (0.5-1')	4 (1-1.5')	1 (0-0.5')	2 (0.5-1')	4 (1-1.5')	1 (0-0.5')	2 (0.5-1')	4 (1-1.5')
0-15	31	26	22	24	24	29	24	24	33
15-30	26	24	25	24	24	28	26	25	26
>30	28	25	25	26	25	26	25	27	26
Total:	85	75	72	74	73	83	75	76	85

Table C-2. Cross-tab of sample counts for each of lead and benzo(a)pyrene[1] by AADT category x Sample Depth Interval, for the three provinces evaluated in this appendix.

AADT category	Basin and Range Sample Depth Interval			Blue Mountains Sample Depth Interval			Deschutes Columbia Sample Depth Interval		
	1 (0-0.5')	2 (0.5-1')	4 (1-1.5')	1 (0-0.5')	2 (0.5-1')	4 (1-1.5')	1 (0-0.5')	2 (0.5-1')	4 (1-1.5')
0 - 1000	39	31	28	22	21	23	14	14	21
1001-2500	14	12	12	15	15	19	13	14	14
2501-5000	20	20	20	12	13	12	20	20	20
5001 - 10000	12	12	12	25	24	29	7	6	6
10001 - 15000							13	13	16
15001 - 20000							4	4	4
20001 - 30000							4	5	4
Total:	85	75	72	74	73	83	75	76	85
Grand Total =	698								

The number of samples that passed the DEQ clean fill criteria (that is, a concentration less than the criteria, or screening level [≤ SL]), failed (concentration result > SL), or were uncertain (not detected, with a detection limit greater than the SL [DL > SL]) with respect to the province-appropriate screening levels, by analyte, are shown in Table C-3.

[1] Includes non-detected sample results with detection limits that exceeded the clean fill criteria ("uncertain" samples, described below).

Table C-3. Sample count of Pass/Fail/Uncertain results for soils compared to province-appropriate screening levels (SL).

Analyte	Pass (result ≤ SL)	Fail (result > SL)	Uncertain (ND > SL)	Total
Benzo(a)pyrene	599	41	58	698
Lead	585	113	0	698

As shown on Table C-3, relatively few samples exhibited chemical concentrations that exceed the screening criteria. Benzo(a)pyrene concentrations in 6.4% of the samples (41/640) and lead concentrations in 16% of the samples (113/698) exceeded screening criteria.

To aid in the visualization of chemical concentrations in soil, relative to screening criteria for multiple provinces (with different screening criteria), the Elevation Above the Screening Level (EASL) was calculated for each concentration of lead and benzo(a)pyrene. EASL is defined as the concentration results divided by the corresponding screening criterion.

EASL values were calculated for values below detection limit (DL) only when the DL was less than the screening level (as DL/SL). Sample concentrations that were reported as non-detect by the laboratory were labeled as "uncertain" when the DL was greater than the SL. There were no non-detectable concentrations in the lead dataset. A total of 547 benzo(a)pyrene results were reported as non-detectable. Of those 547 results, 58 were labeled 'uncertain' because of elevated DLs. The distribution of EASL values are shown for lead, distinguishing between the previous ODOT dataset (referred to as the '2015' dataset) and the 2016 survey (Figure C-1), and for the complete 2016 data base (Figure C-2). Similar results for benzo(a)pyrene, excluding the uncertain outcomes, are shown in Figures C-3 and C-4.

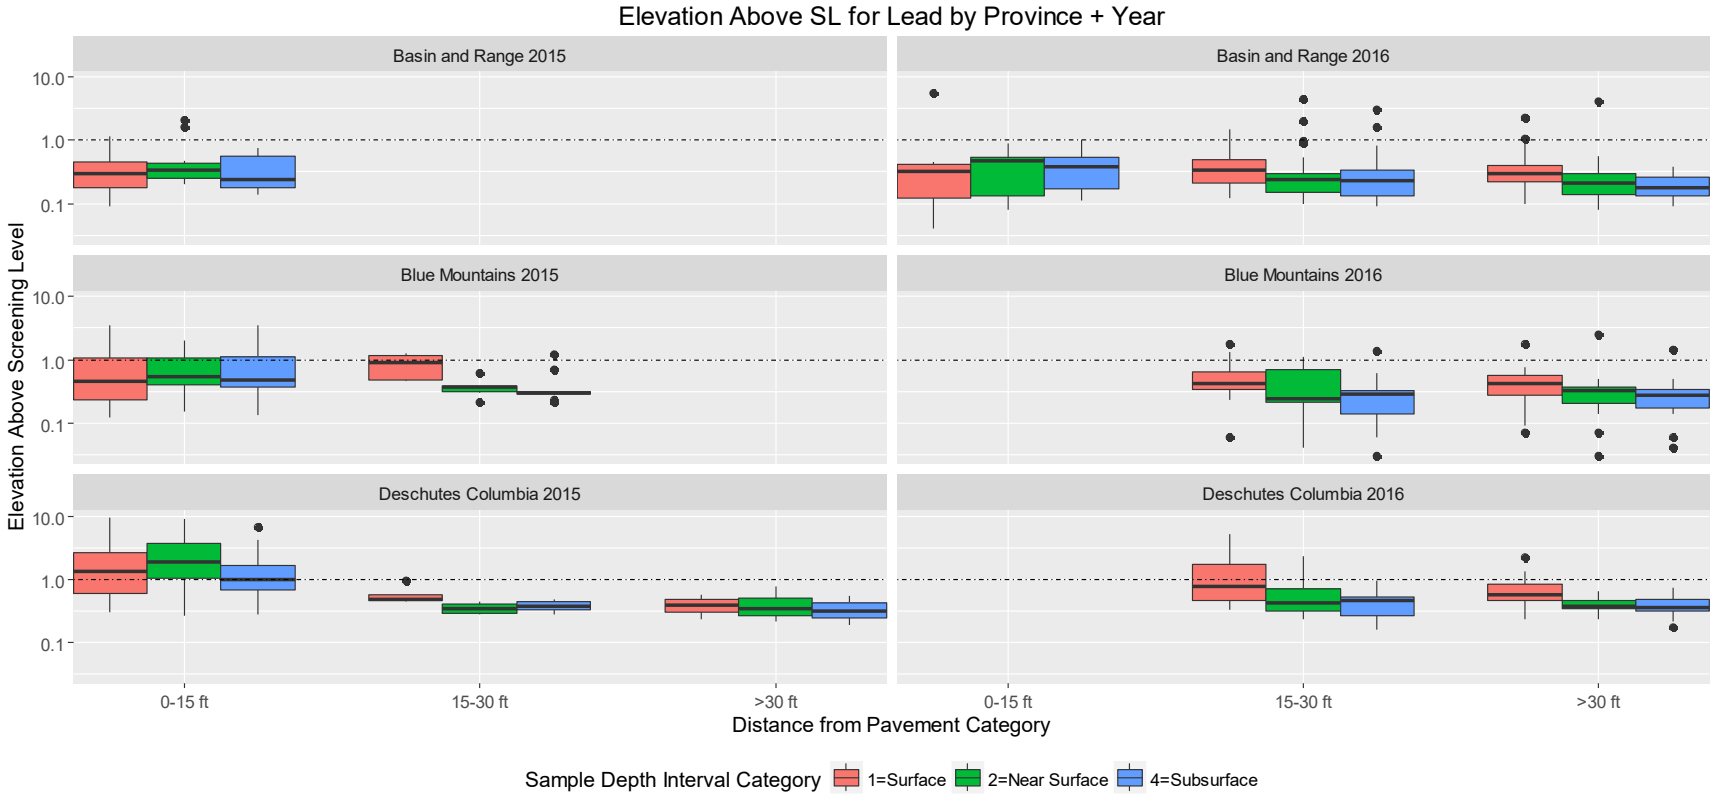

Figure C-1. Distribution of lead EASL results, by distance from pavement and sample depth interval, for each province and year. Note that the y-axes are log10 scaled. Each row represents the data for a different physiographic province with the previous data set results that motivated the 2016 survey in the left column, and the data collected in 2016 in the right column; the sample depth interval categories are color coded; and the distance from pavement category is indicated on the x-axes. The dashed line on each plot is at 1.0, (i.e., values above this line exceeded the SL and failed the DEQ clean fill criteria for lead).

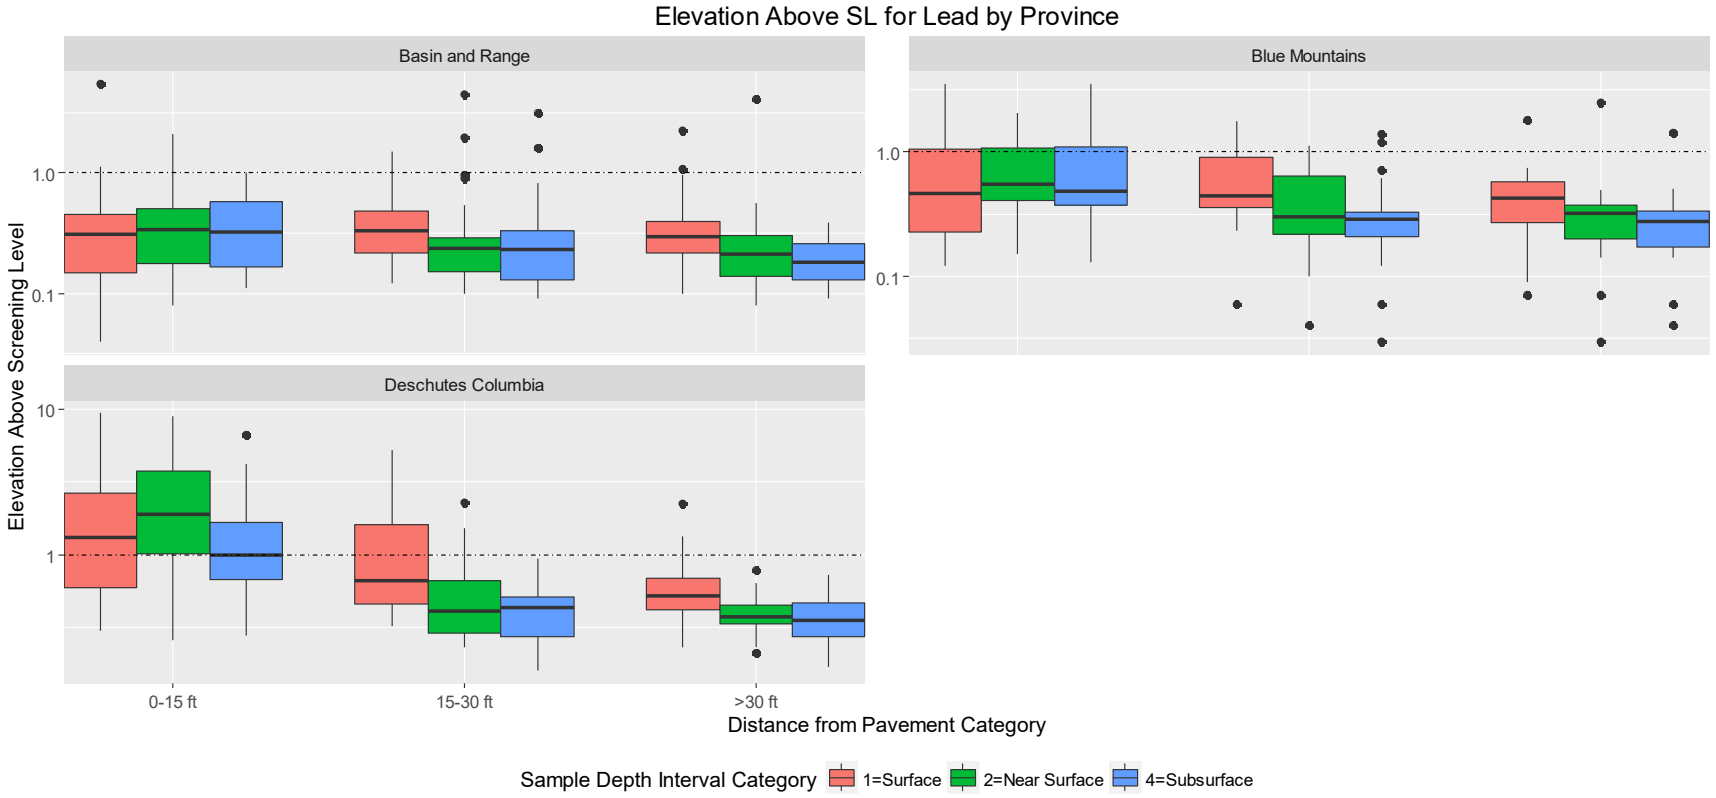

Figure C-2. Distribution of lead EASL results, by distance from pavement and sample depth interval, for each province using the updated 2016 data base. Note that the y-axes are log10 scaled. Each panel represents the data for a different physiographic province (a combination of the '2015' and '2016' data shown in Figure C-1); the sample depth interval categories are color coded; and the distance from pavement category is indicated on the x-axes. The dashed line on each plot is at 1.0, (i.e., values above this line exceeded the SL and failed the DEQ clean fill criteria for lead).

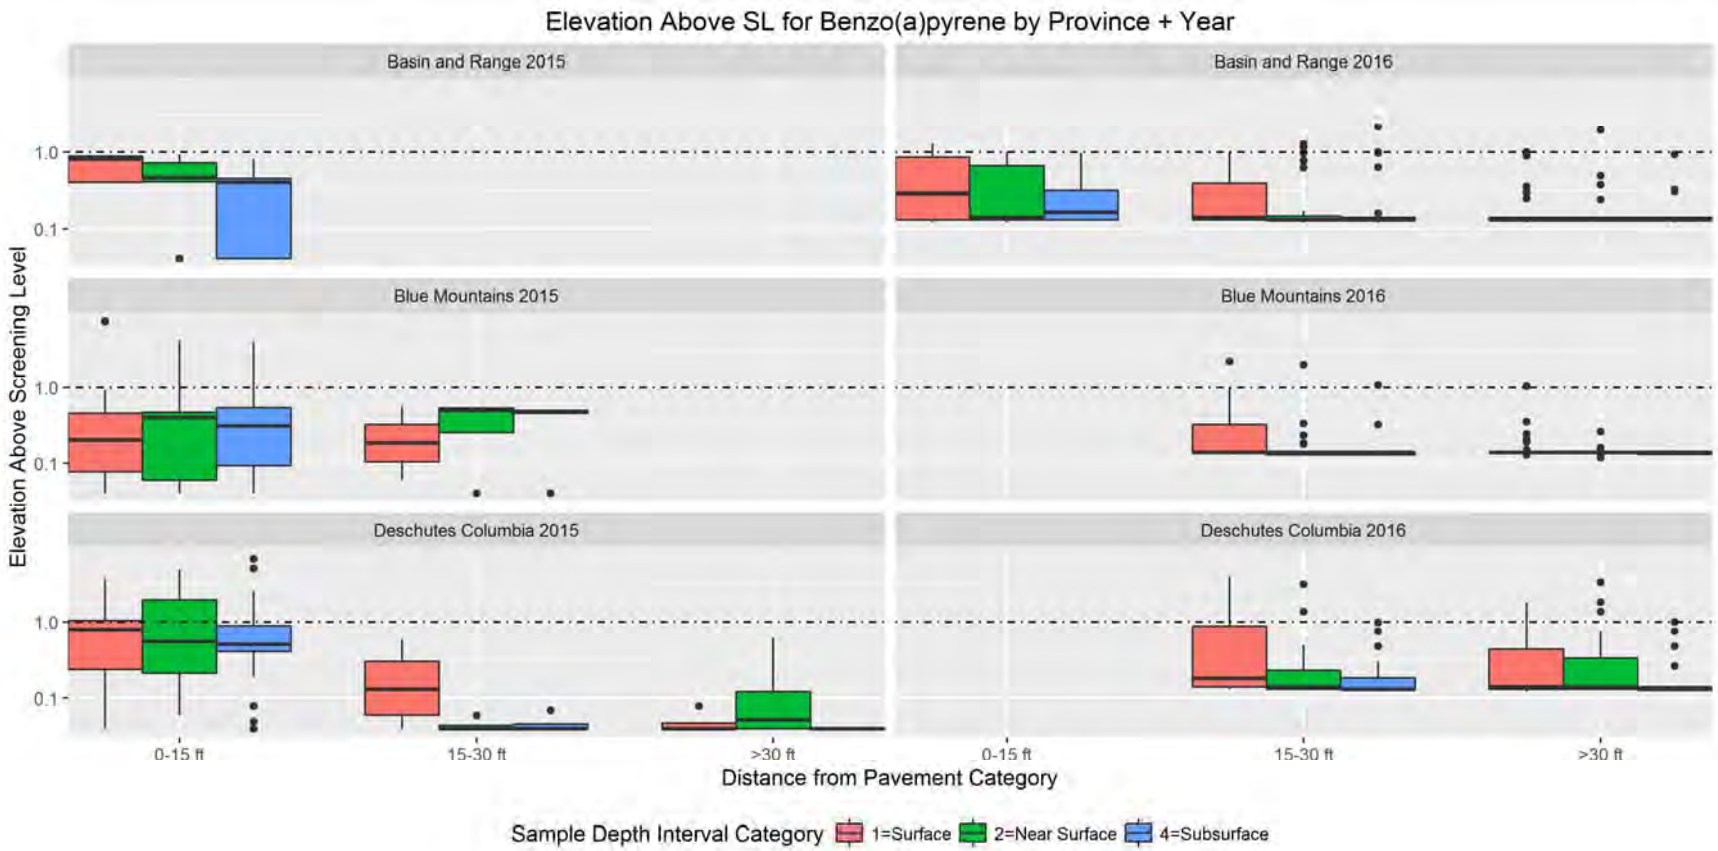

Figure C-3. Distribution of benzo(a)pyrene EASL results, by distance from pavement and sample depth interval, for each province and year. Note that the y-axes are log10 scaled. Each row represents the data for a different physiographic province with the previous data set results that motivated the 2016 survey in the left column, and the data collected in 2016 in the right column; the sample depth interval categories are color coded; and the distance from pavement category is indicated on the x-axes. The dashed line on each plot is at 1.0, (i.e., values above this line exceeded the SL and failed the DEQ clean fill criteria for benzo(a)pyrene). Non-detected concentrations with DLs below the SL were included in this figure using the reported DL/SL ratio; however, non-detected concentrations with DLs greater than the SL, were excluded.

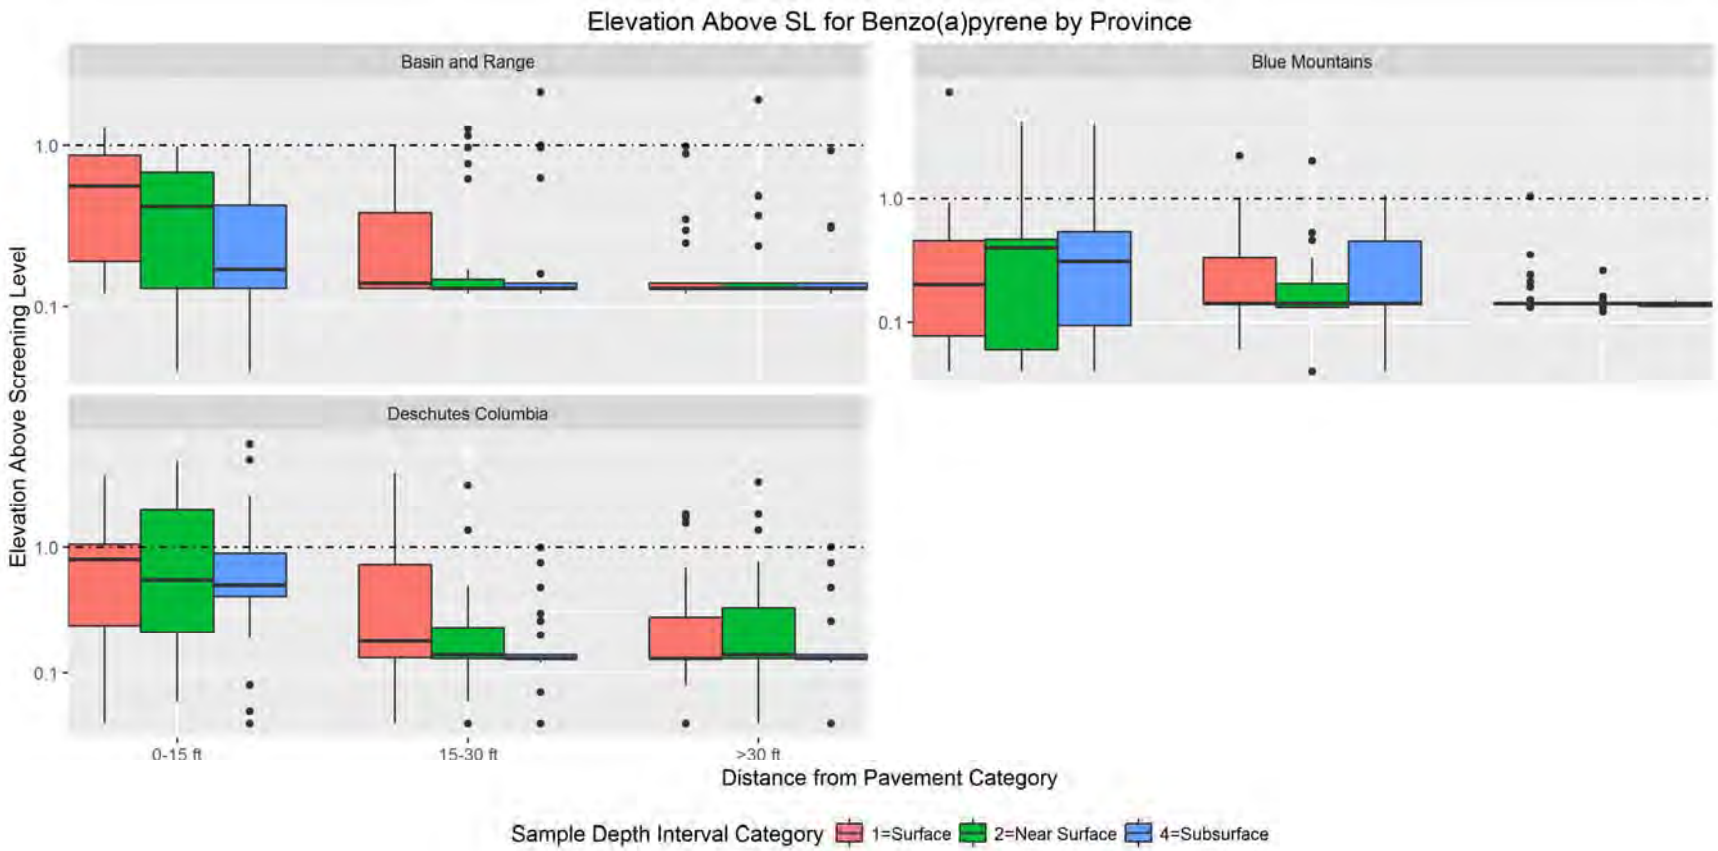

Figure C-4. Distribution of Benzo(a)pyrene EASL results, by distance from pavement and sample depth interval, for each province using the updated 2016 data base. Note that the y-axes are log10 scaled. Each panel represents the data for a different physiographic province (a combination of the '2015' and '2016' data shown in Figure C-3); the sample depth interval categories are color coded; and the distance from pavement category is indicated on the x-axes. The dashed line on each plot is at 1.0 (i.e., values above this line exceeded the SL and failed the DEQ clean fill criteria for benzo(a)pyrene). Non-detected concentrations with DLs below the SL were included in this figure using the reported DL/SL ratio; however, non-detected concentrations with DLs greater than the SL, were excluded.

To assess the factors (e.g., distance from pavement, depth, AADT, and province) that affect lead and benzo(a)pyrene concentrations in soil, non-parametric random decision forests were run on the lead and benzo(a)pyrene datasets separately. Decision forests (e.g., Ho 1995, Breiman 2001) are an ensemble learning method used for classification and regression. Decision forests use randomization and bootstrapping and a recursive partitioning framework to identify the best predictors of the categorical outcome (i.e., the sample passes or fails the clean fill screening criterion).

The decision forest algorithm (*cforest*{party}, Hothorn et al. 2006, Strobl et al. 2007, and Strobl et al. 2008) was used to generate 10,000 trees (allowing up to three variables within each tree) for predicting pass or fail relative to the screening criterion. For each tree, two-thirds of the data were randomly selected for use as the training dataset to establish the decision rules for predicting the pass/fail response. The remaining one-third of the data was used as independent verification to measure the predictive accuracy of the tree fit during that iteration of the forest algorithm. This approach allowed computation of the relative "importance" of each variable, with a higher importance value indicative of a better predictor of pass/fail response, aggregated over all trees in the forest. The variable importance was measured by the decrease in prediction accuracy on the observations left out of the training dataset using the real data versus a random re-shuffling of the data. Thus, a small decrease in prediction accuracy indicated that the observed relationship was no better than a random permutation of the data, whereas a large decrease indicated that the variable was a good predictor.

Using the updated 2016 data base, the plots of the importance values (Figure C-5) indicate that distance from pavement category was the most important variable associated with soil concentrations of lead and benzo(a)pyrene that exceeded the screening level, followed by province, AADT, and sample depth interval. Classification trees for lead (Figure C-6) and benzo(a)pyrene (Figure C-7) were created for the complete data base that included all three provinces. Individual classification trees for lead by province are shown in Figures C-8 through C-10, and for benzo(a)pyrene in Figures C-11 through C-13

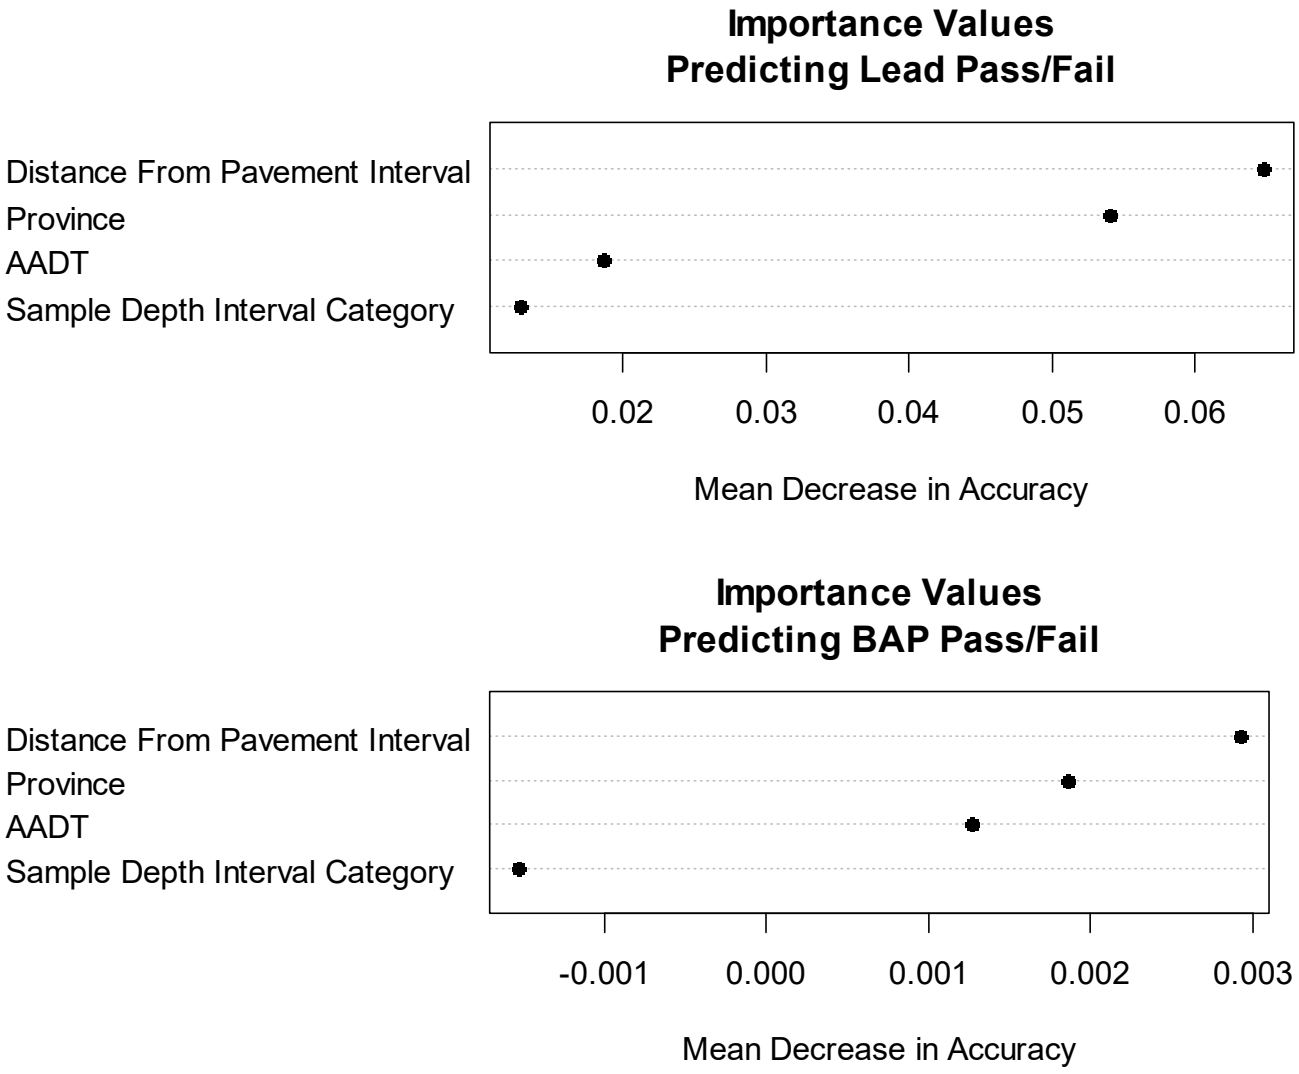

Figure C-5. Variable importance plots for random forests, using only the four variables listed, for Lead (top) and Benzo(a)pyrene (bottom).

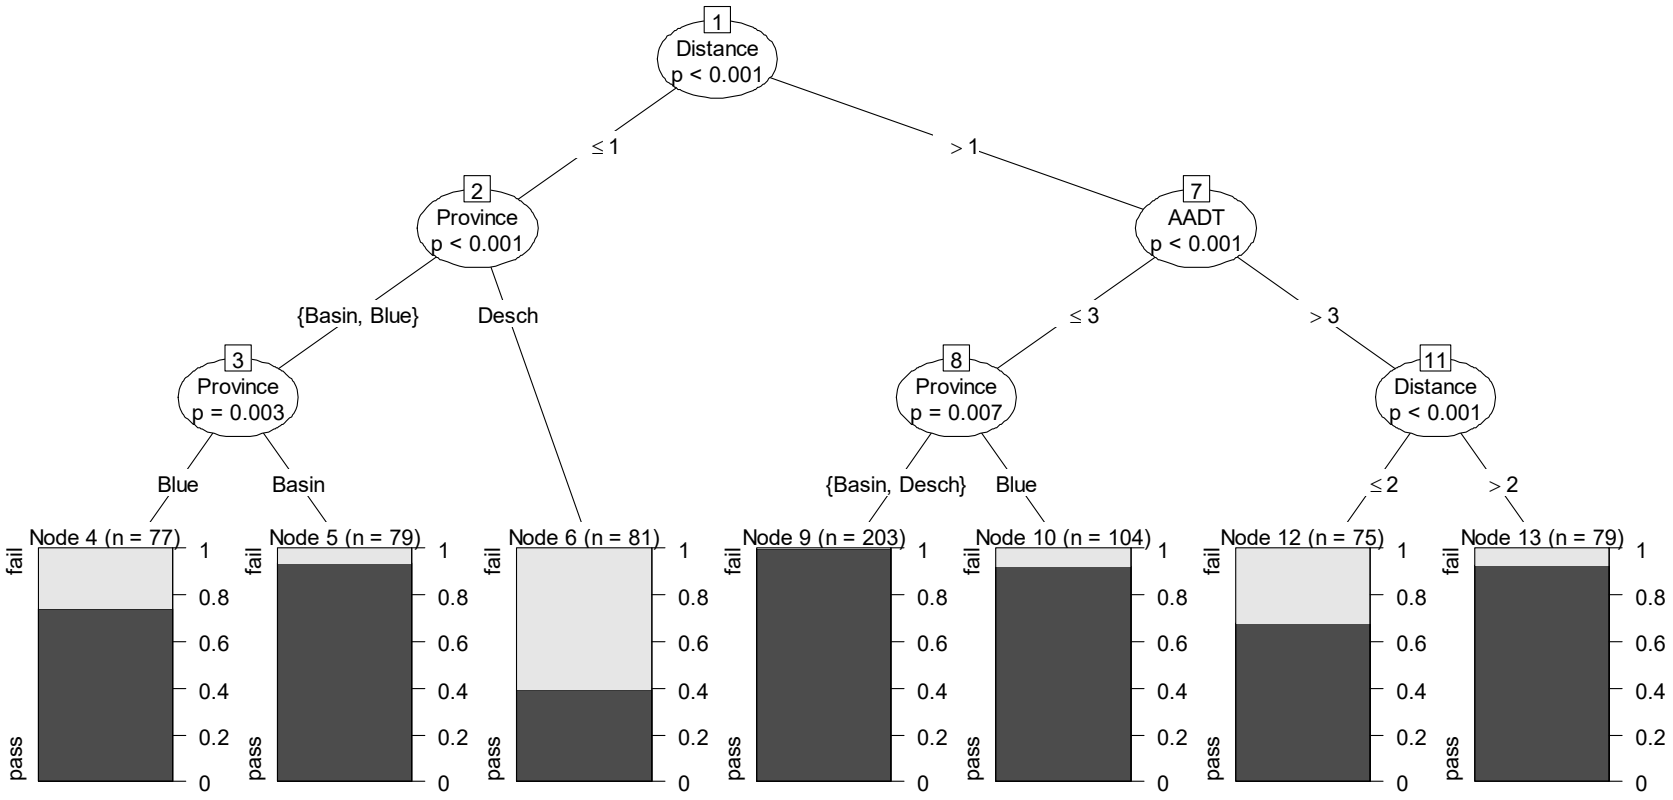

Figure C-6. Classification tree predicting lead pass/fail relative to the province-specific lead screening levels. Total sample size is 698 (uses only samples with known AADT classification, known distance from pavement intervals: 1 (0-15'), 2 (15-30'), or 3 (>30'), and sample depth intervals: 1 (surface 0-0.5'), 2 (near surface 0.5-1'), or 4 (subsurface 1-2') were used). Data are in three provinces: Basin and Range, Blue Mountains, and Deschutes-Columbia.

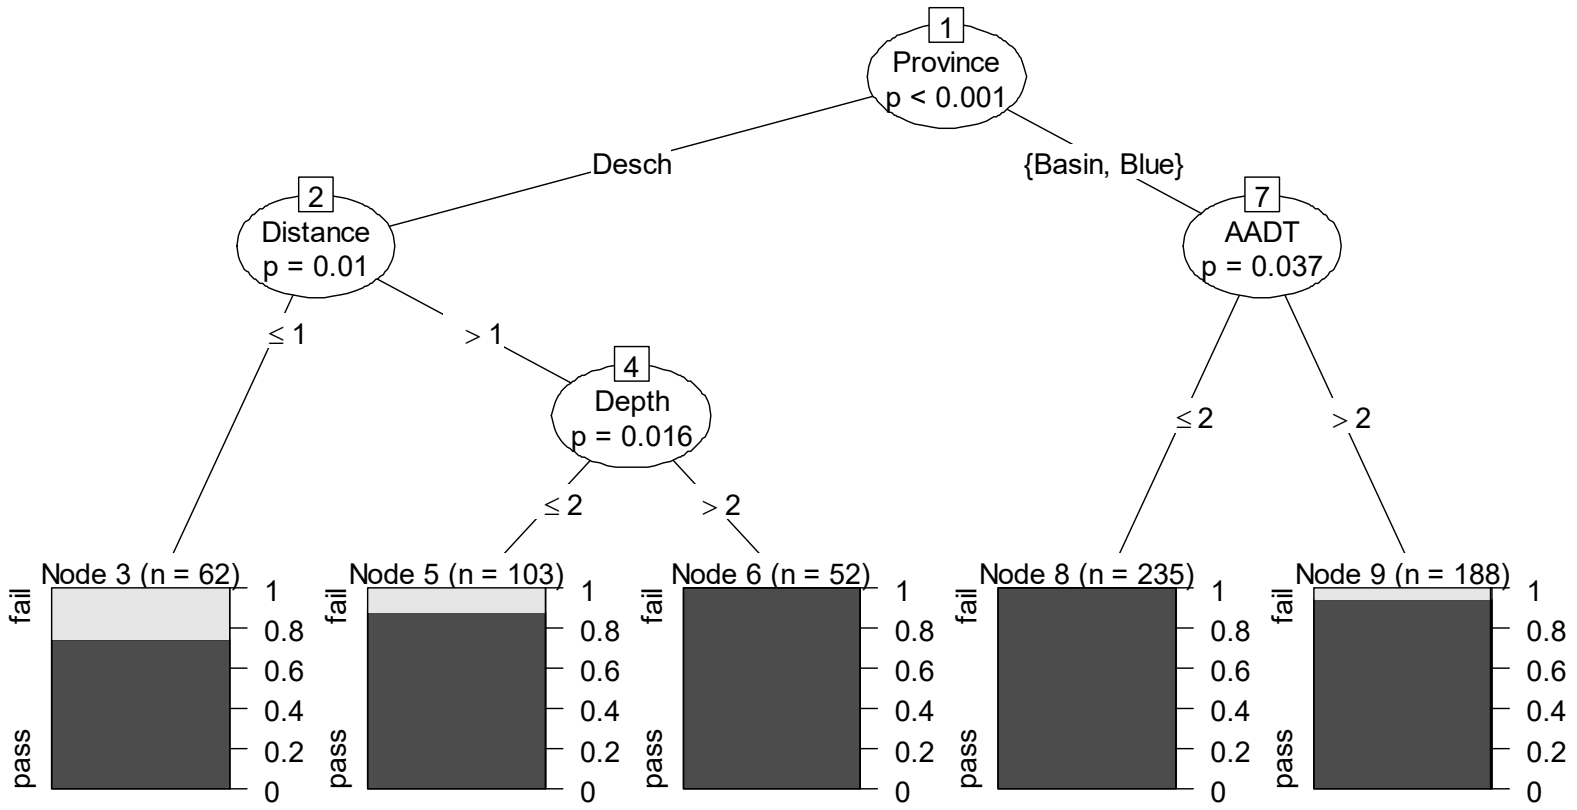

Figure C-7. Classification tree predicting Benzo(a)pyrene pass/fail relative to the screening level. Total sample size is 640 (58 uncertain results with DL > SL were dropped; only samples with known AADT classification, known distance from pavement intervals: 1 (0-15'), 2 (15-30'), or 3 (>30'), and sample depth intervals: 1 (surface 0-0.5'), 2 (near surface 0.5-1'), or 4 (subsurface 1-2') were used). Data are in three provinces: Basin and Range, Blue Mountains, and Deschutes-Columbia.

Province specific classification trees are shown below for lead (Figures C-8 through C-10), and for benzo(a)pyrene (Figures C-11 through C-13).

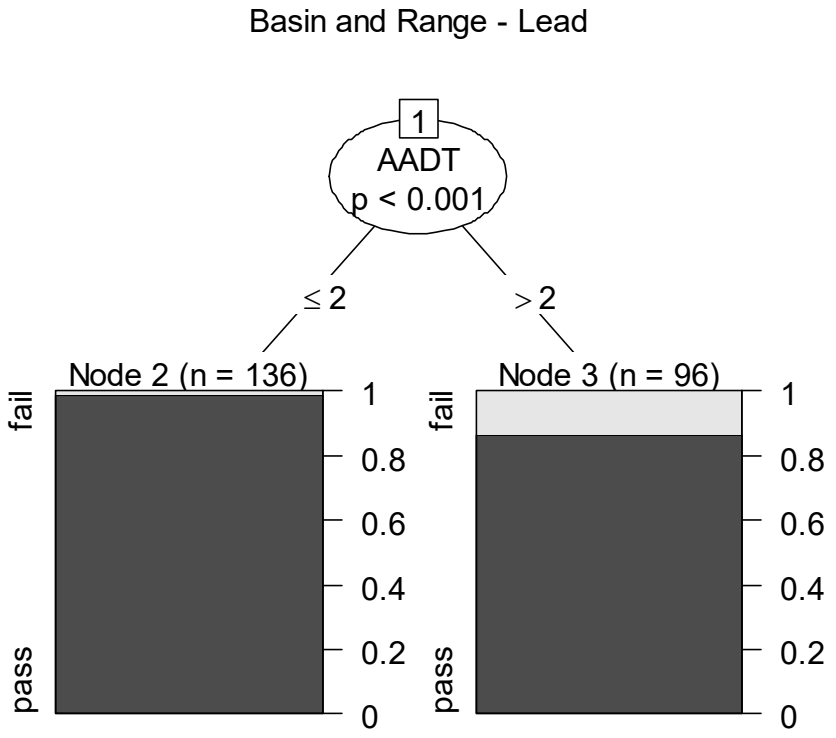

Figure C-8. Classification tree predicting Lead pass/fail relative to the screening level. Total sample size is 232. Data restricted to Basin and Range province, only.

A summary of the data that follows the breakdown indicated in this classification tree (Figure C-8) indicate that a dominant proportion of failures occurs in AADT category 4 (5,001 – 10,000 trips per day; Table 4). However, within this category, more of the samples passed than failed (72% passed, 28% failed), so this AADT category is not an indicator of likely failure, only of a higher proportion of failures.

Table C-4. Summary of outcomes in Basin and Range Province for Lead

Record counts:

	AADT Category				
EASL ≤ 1?	**1 0-1000**	**2 1001-2500**	**3 2501-5000**	**4 5001-10000**	**Grand Total**
Failed	2		3	10	15
Passed	96	38	57	26	217
Total	98	38	60	36	232

Proportions:

	AADT Category			
1	**2**	**3**	**4**
2%	0%	5%	28%
98%	100%	95%	72%
100%	100%	100%	100%

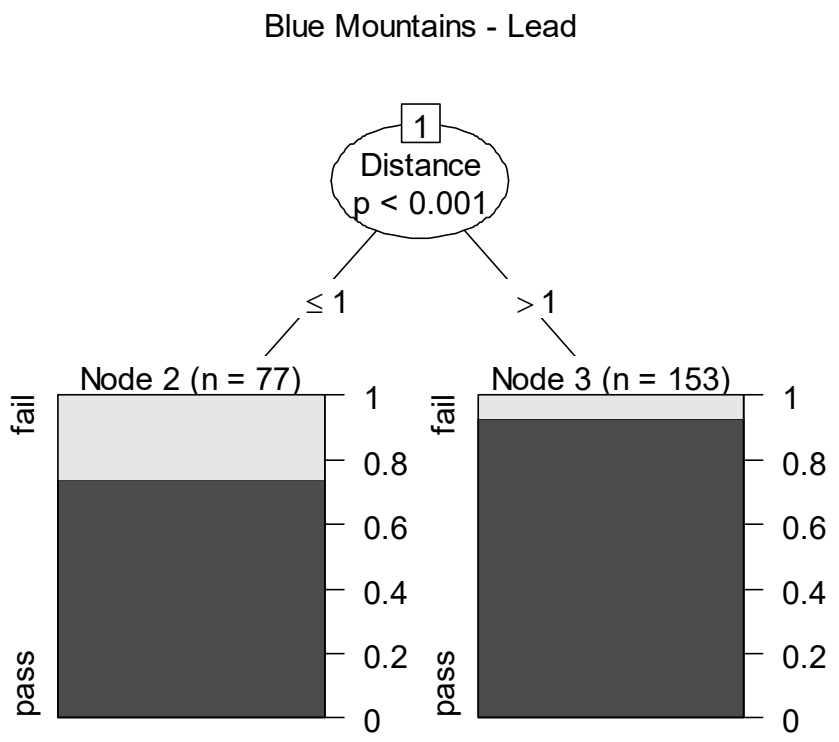

Figure C-9. Classification tree predicting Lead pass/fail relative to the screening level. Total sample size is 232. Data restricted to Blue Mountains province, only.

A summary of the data that follows the breakdown indicated in this classification tree (Figure C-9) indicate that a dominant proportion of failures occurs closest to the pavement (< 15'), although overall there was a high proportion of passing than failing observations in all categories (Table C-5).

Table C-5. Summary of outcomes in Blue Mountains Province for Lead

	Record counts:				Proportions:			
	Distance from Pavement				Distance from Pavement			
EASL ≤ 1?	**1 (<15')**	**2 (15-30')**	**3 (>30')**	**Grand Total**	**1 (<15')**	**2 (15-30')**	**3 (>30')**	**Grand Total**

Figure C-10. Classification tree predicting Lead pass/fail relative to the screening level. Total sample size is 236. Data restricted to Deschutes-Columbia province, only.

A summary of the data that follows the breakdown indicated in this classification tree (Figure C-10) indicate that a dominant proportion of failures occurs closest to the pavement (< 15') at all depths (Table C-6).

Table C-6. Summary of outcomes in Deschutes-Columbia Province for Lead

Record counts:

Distance from Pavement:		1 (< 15')			2 (15-30')			3 (> 30')			
EASL ≤ 1?	Sample Depth Interval:	1 (<0.5')	2 (0.5-1')	4 (1-1.5')	1 (<0.5')	2 (0.5-1')	4 (1-1.5')	1 (<0.5')	2 (0.5-1')	4 (1-1.5')	Grand Total

Figure C-11. Classification tree predicting benzo(a)pyrene pass/fail relative to the screening level. Total sample size is 222 (uncertain values with DL > SL were excluded). Data restricted to Basin and Range province only.

The base rate of failure is 5 out of 222 samples (Table C-7). These samples are randomly distributed across levels of the factors considered in the classification tree model, so the tree model produces no splits.

Table C-7. Summary of outcomes in Basin and Range Province for benzo(a)pyrene

EASL ≤ 1?	**Counts**	%
Failed	5	2%
Passed	217	94%
Uncertain	10	4%
Grand Total	232	100%

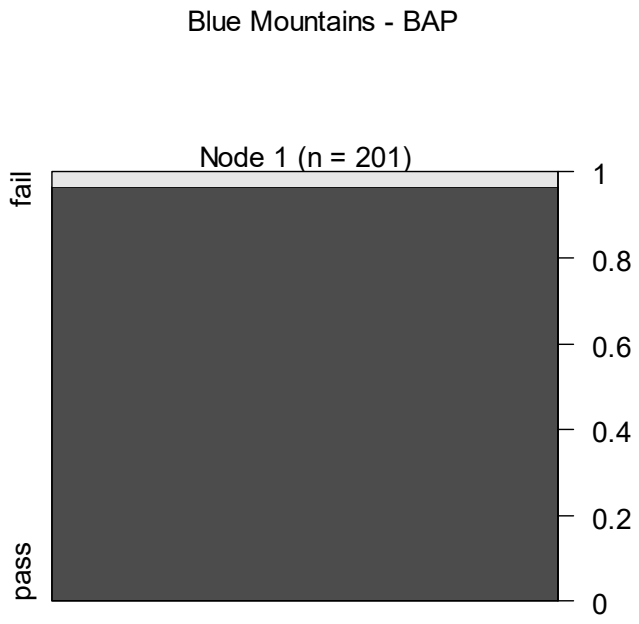

Figure C-12. Classification tree predicting BAP pass/fail relative to the screening level. Total sample size is 232 (uncertain values with DL > SL were excluded). Data restricted to Blue Mountains province only.

The base rate of failure is 7 out of 201 samples (Table C-8). The classification tree model produces no splits because there was no pattern to these failures using the levels of the factors included in the model. Dialing in to where the failures occurred, they may be location specific.

- Three of the failures were from one location (Station K0411- K0411), closest to the pavement, at all three depth intervals.
- Two of the failures were at one location (Station BM-07-15-30'), at 15-30 feet from the pavement, at the top two depth intervals.
- The other two failures were at two different locations (BM-05->30' (0-0.5')_Prepared; and BM-10-15-30' (1-1.5')_Prepared).

Table C-8. Summary of outcomes in Blue Mountains Province for benzo(a)pyrene

EASL ≤ 1?	**Counts**	%
Failed	7	3%
Passed	194	84%
Uncertain	29	13%
Grand Total	230	100%

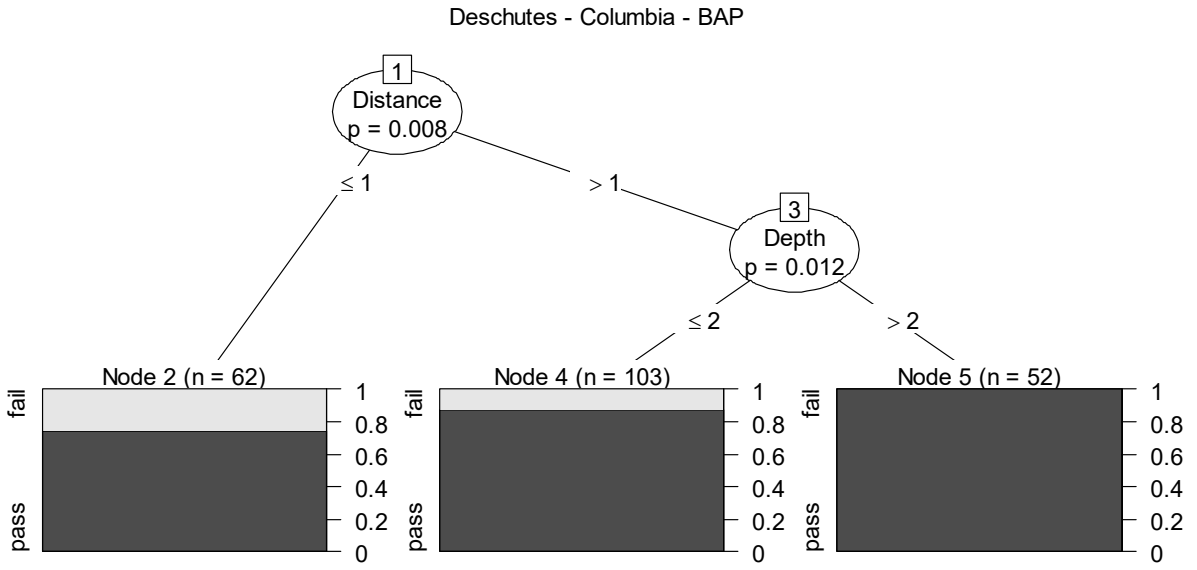

Figure C-13. Classification tree predicting BAP pass/fail relative to the screening level. Total sample size is 222 (uncertain values with DL > SL were dropped). Data restricted to Deschutes-Columbia province only.

A summary of the data that follows the breakdown indicated in this classification tree (Figure C-13) indicate that a dominant proportion of failures occur only at the sampling interval closest to the pavement (< 15') at all depth intervals, and at sampling depths up to 1 foot, at all distance categories (Table C-9). However, within these categories, the failure rate was always less than 25%, so the distance and/or depth categories are not reliable indicators of likely failure, only of a higher proportion of failures.

Table C-9. Summary of outcomes in Deschutes-Columbia Province for benzo(a)pyrene.
