## MEMORANDUM

Date: January 7, 2021

Project #: 23641.0

To: Virginia Elandt, Oregon Department of Transportation  
Karl Macnair, City of Medford

From: Matt Hughart, AICP, Matt Bell, and Miranda Barrus, Kittelson & Associates, Inc.

Project: I-5 Exit 30 Interchange Area Management Plan (IAMP)

Subject: Final Tech Memo #5: Future Full-Build Conditions

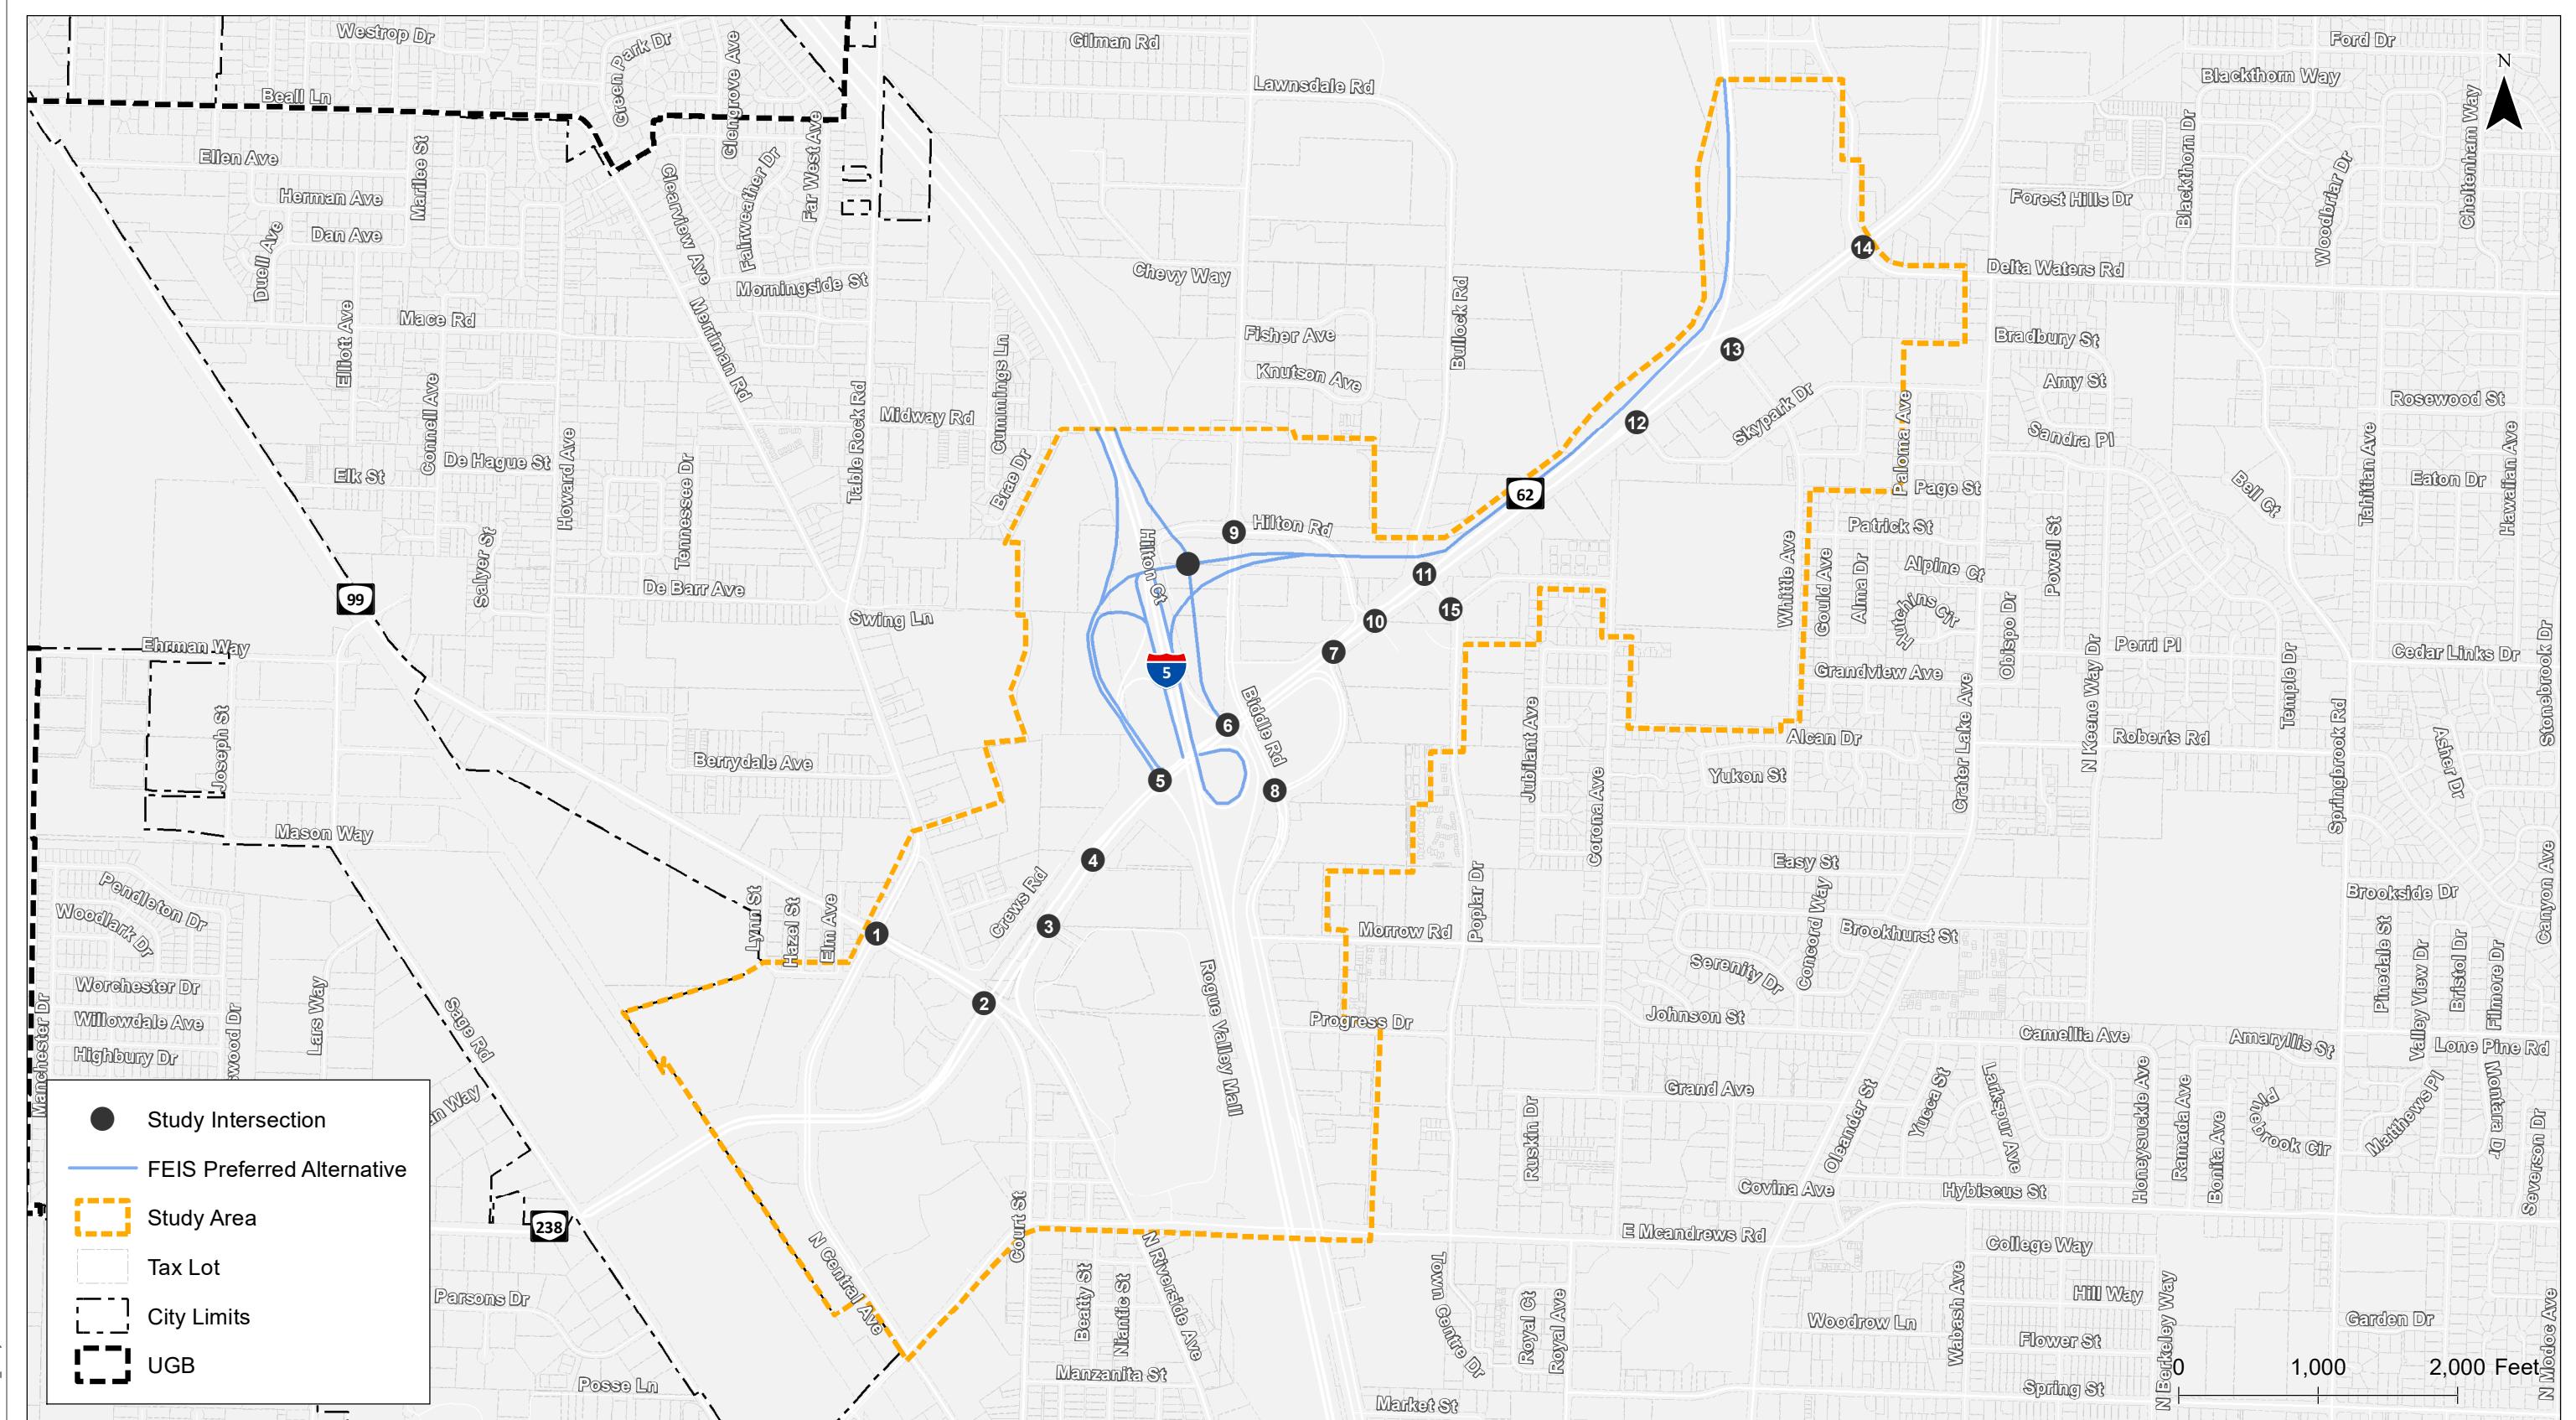

This memorandum summarizes future year 2042 full-build traffic conditions in the Interchange Management Study Area (IMSA) for the I-5 Exit 30 Interchange Area Management Plan (IAMP). Figure 1 illustrates the IMSA. This memorandum includes the results of the future full-build traffic operations analysis, future multimodal analysis, and future freight analysis. This memorandum also includes potential solutions to address transportation system deficiencies. For the purpose of this memorandum, full-build refers to full build-out of the Final Environmental Impact Statement (FEIS) Split Diamond Interchange form without any additional intersection modifications other than those necessary to accommodate new turning movements.

### FUTURE FULL BUILD TRAFFIC OPERATIONS ANALYSIS

#### FEIS – Split Diamond Interchange Description

In 2013, an FEIS was adopted by ODOT and area agencies that determined a new alignment for an OR 62 bypass. The bypass was constructed and opened to traffic in early 2020 as documented in previous technical memorandums. Also included in the FEIS were a number of improvement concepts that were identified to address forecast longer-term regional circulation and capacity constraints. One such improvement is a new split diamond interchange that would directly connect the southern extent of the bypass to I-5 Exit 30. Graphical illustrations are included in Exhibit 1 that show how the recently constructed bypass and existing interchange are envisioned to be modified with inclusion of the FEIS Split Diamond Interchange concept. Major circulation changes associated with the FEIS include:

- Closure of the cut-and-cover: The bypass will no longer have a direct connection to OR 62. Instead, all bypass traffic will connect to the new interchange ramps and frontage roads. As a result, most intersections within the interchange vicinity would see significant traffic pattern and volume changes.
- Changes at the I-5 ramp terminals: The I-5 southbound off-ramp and I-5 northbound on-ramp will be significantly modified to accommodate the split diamond interchange form and to accommodate traffic to/from the new bypass.

# **Study Intersections**

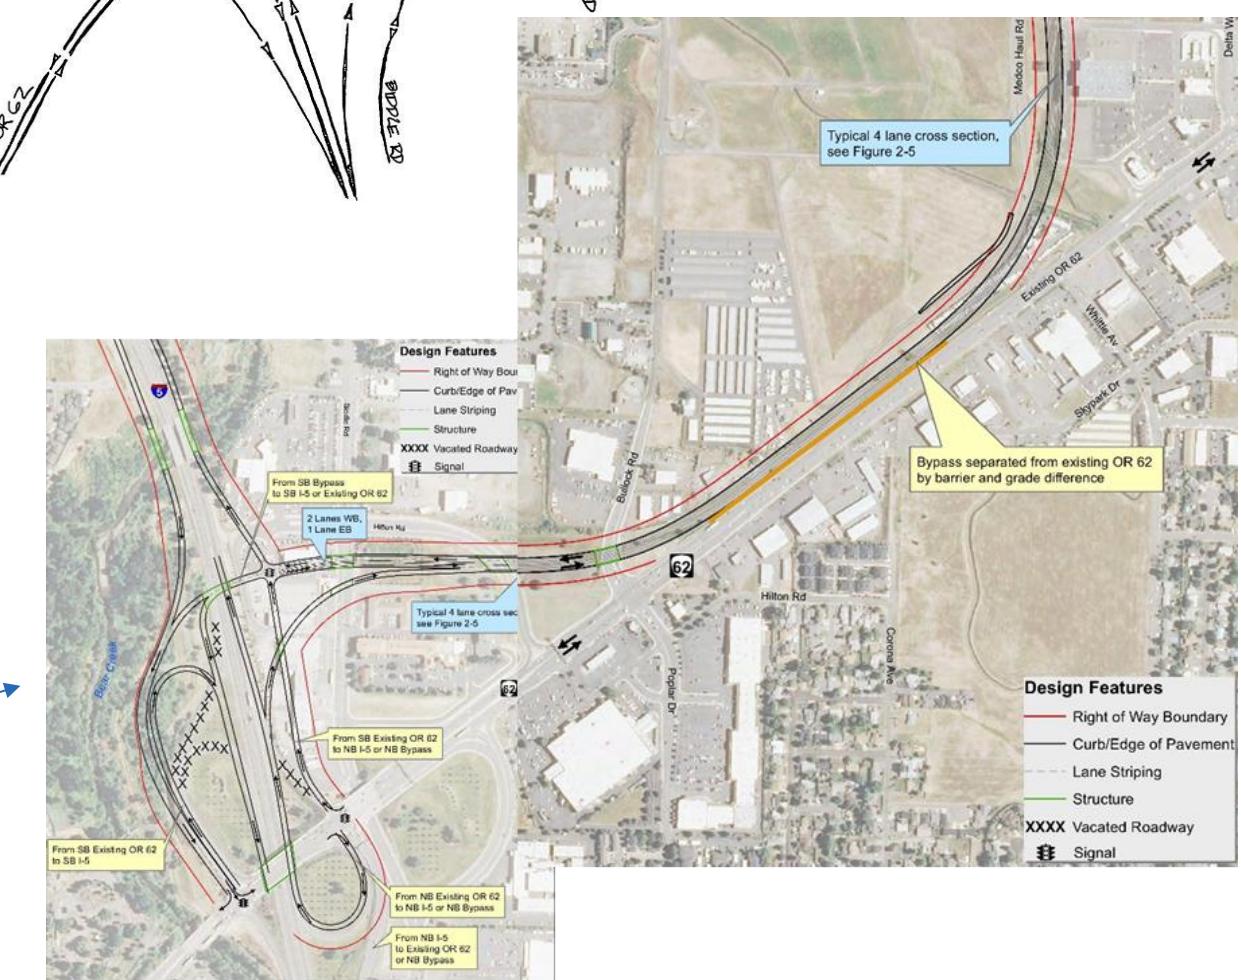

## **Medford, Oregon**

# Figure 1

**Exhibit 1:**

- Single line drawing of the existing Exit 30 interchange, OR 62 corridor, and bypass
- Single line drawing of how the Exit 30 interchange, OR 62 corridor, and bypass would be conceptually modified with the inclusion of the FEIS Split Diamond Interchange (dashed lines represent new roadway connections)
- Conceptual double line drawing of the modified Exit 30 interchange, OR 62 corridor, and bypass with the FEIS Split Diamond Interchange

### **Traffic Volume Redistribution with FEIS Split Diamond Interchange**

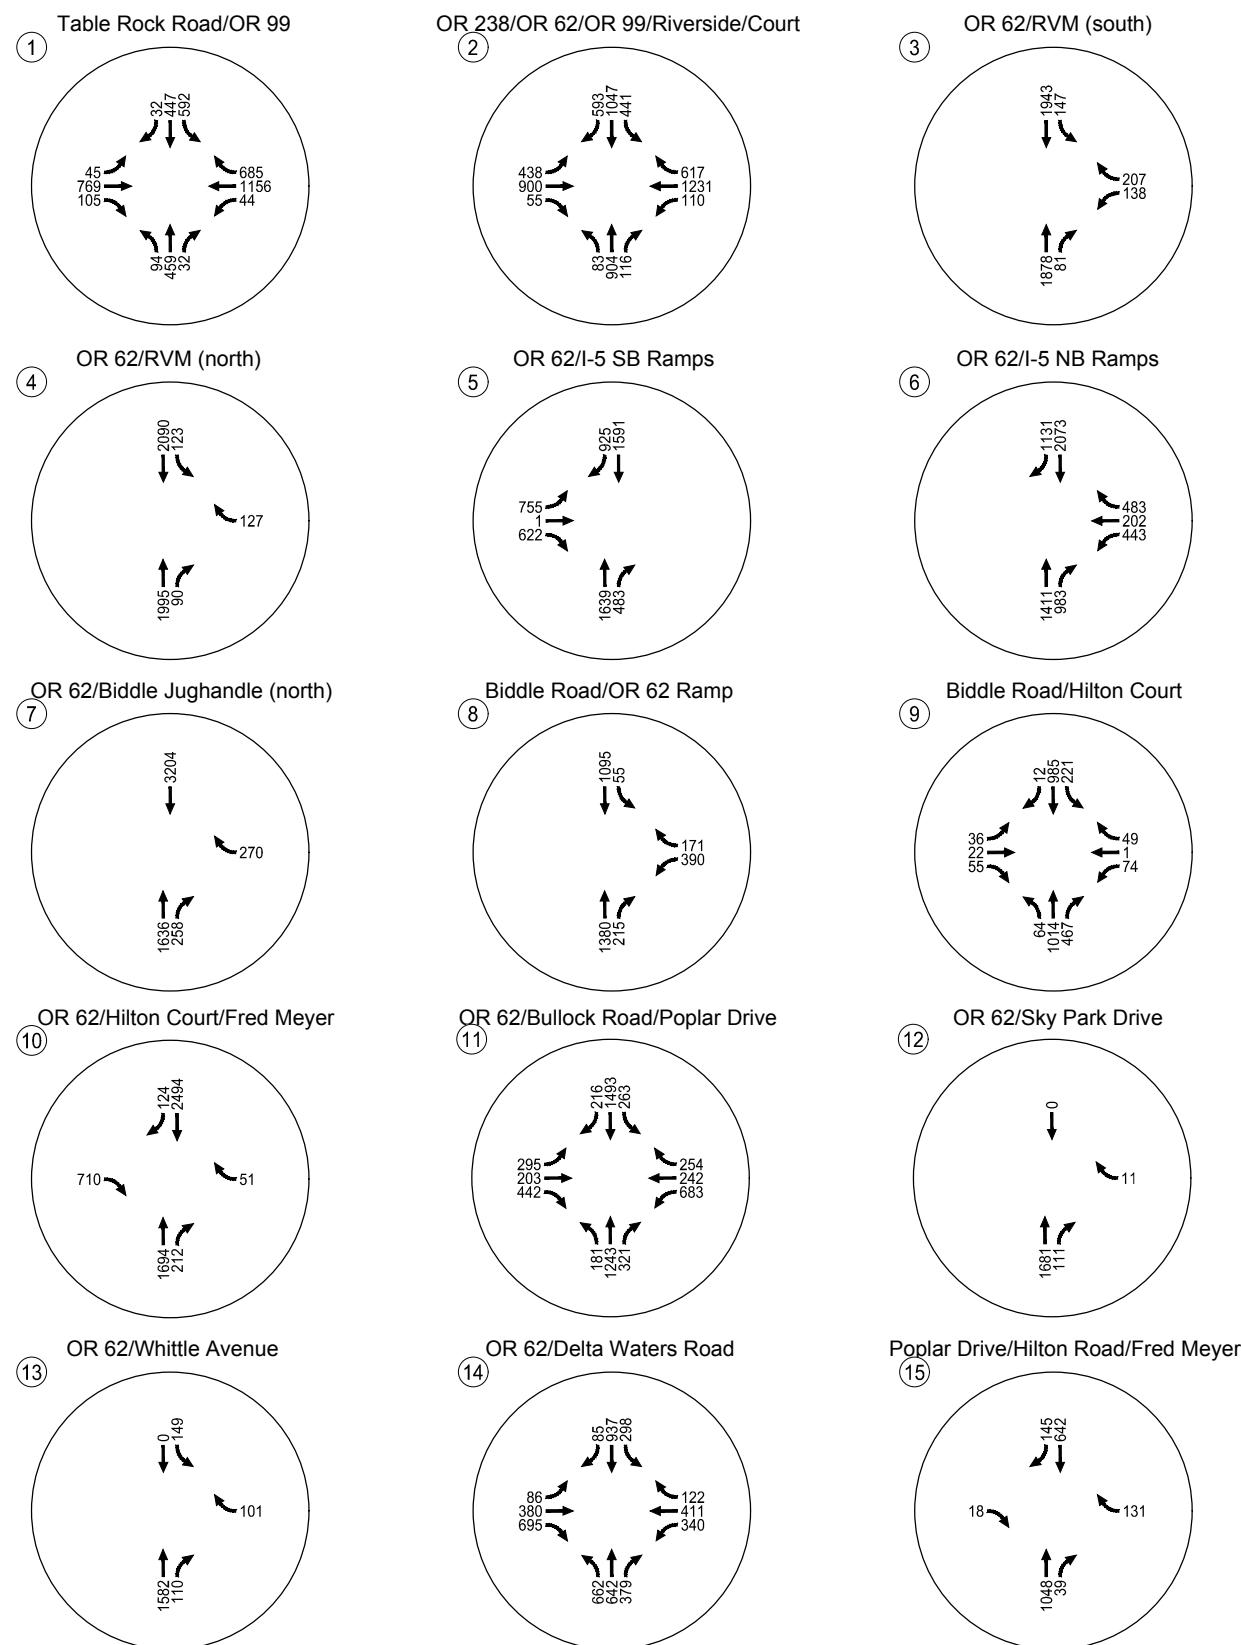

As noted in Technical Memorandum #4, forecast 2042 traffic volumes were developed for the study area intersections based on anticipated growth in the local and regional study area. With the inclusion of the FEIS Split Diamond Interchange shown in Exhibit 1, it is recognized that some of the forecast traffic movements will redistribute within the study area and at individual intersections. This redistribution is anticipated to result in the following significant changes:

- Through traffic volumes on OR 62 west of the Bullock Road-Poplar Drive intersection will reduce as the highway will no longer have a direct connection to the bypass.
- Bypass related traffic volumes to/from Bullock Road-Poplar Drive will experience a directional shift at OR 62 due to new travel patterns.
- The I-5 southbound ramp terminal at OR 62 will experience a significant increase in traffic volumes as it will be the new portal for southbound bypass-related travel demand.
- The I-5 northbound ramp terminal at OR 62 will experience a significant increase in traffic volumes as it will be the new portal for northbound bypass-related travel demand.

While these roadway segments and intersections are projected to see significant changes, it should be noted that most of the other major study area intersections such as the OR 62-OR 238 / OR 99-Court Street-N Riverside Avenue (Big X) and OR 62 / Delta Waters intersections will remain unchanged. Figure 1 shows the study intersections and Figure 2 shows the resulting volume redistribution assumptions.

### **Intersection Operations Analysis with FEIS Split Diamond Interchange**

While the 2013 FEIS identified the Split Diamond Interchange in conceptual form, it did not provide a detailed assessment of operational impacts at the study intersections when accounting for the anticipated redistribution of traffic volumes shown in Figure 2. To test these operational impacts, no traffic control or geometric enhancements were assumed with the inclusion of volumes shown in Figure 2 other than those necessary to accommodate routing changes. Table 1 summarizes the resulting intersection operations analysis results and compares them to applicable mobility standards and targets. As shown, several study intersections are forecast to exceed their applicable mobility standards and targets. *Attachment A contains the future full-build traffic conditions HCM 6<sup>th</sup> Edition and HCM 2000 worksheets.*

14	OR 62 / Delta Waters Road	Signal	0.90/LOS D <sup>4</sup>	N/A	<b>&gt;1.0</b>	>80.0	F
15	Poplar Drive / Hilton Road	Unsignalized	LOS D	WBR	0.35	19.0	C

<sup>1</sup>Lane configurations not supported by HCM 2010 or 6<sup>th</sup> Edition methodologies, therefore, HCM 2000 results are reported.

<sup>2</sup>The HCM 2010 and HCM 6<sup>th</sup> Edition analysis results do not reflect field observations. Therefore, the HCM 2000 analysis results are reported.

<sup>3</sup>This mobility target may be increased to as much as 0.90 through the IAMP adoption process.

<sup>4</sup>City and State mobility standards and targets are shown given recent jurisdictional transfer of infrastructure within the study corridor.

The following intersections are forecast to exceed their respective mobility standards and targets under these conditions:

- OR 62-OR 238 / OR 99-Court Street-N Riverside Avenue – intersection operations are consistent with the previously documented 2042 no-build analysis.
- OR 62 / Rogue Valley Mall entrance (east, at Target) – intersection operations are consistent with the previously documented 2042 no-build analysis.
- OR 62 / I-5 Southbound Ramp Terminal – intersection operations diminish from the previously documented 2042 no-build analysis and capacity is exceeded due to the increase in bypass-related travel demand on the modified I-5 SB off-ramp.
- OR 62 / I-5 Northbound Ramp Terminal – intersection operations diminish from the previously documented 2042 no-build analysis and capacity is exceeded due to the increase in travel demand generated by OR 62 traffic destined to the new bypass connection.
- OR 62 / Hilton Court-Fred Meyer Parking Lot Entrance – intersection operations improve from the previously documented 2042 no-build analysis due to the decrease in travel demand on OR 62.
- OR 62 / Bullock Road-Poplar Drive – intersection operations improve from the previously documented 2042 no-build analysis due to the decrease in travel demand on OR 62.
- OR 62 / Delta Waters Road – intersection operations are consistent with the previously documented 2042 no-build analysis.

Potential solutions are investigated later in this memorandum for the signalized intersections listed above not meeting their mobility standard and target.

## Queueing Analysis

Provided that select study intersections within the IMSA are forecast to be impacted by full build-out of the FEIS Split Diamond Interchange project, it is expected that unaffected study intersections will experience similar traffic queues. Therefore, a queuing analysis was conducted using SimTraffic microsimulation software within Synchro 10 for the study intersections forecasted to experience changes in traffic volume. Table 2 summarizes the 95<sup>th</sup> percentile queues during the weekday PM peak hour under future year 2042 full-build traffic conditions and indicates if existing storage can accommodate future queues. The vehicle queue and storage lengths were rounded to the nearest 25-feet. The turning movement storage lengths reflect the striped storage for each turn-lane pocket at the intersections and the through movement storage lengths reflect the distance to the nearest adjacent intersection and/or driveway. *Attachment B contains the SimTraffic reports.*

**Table 2: Future Full-Build Queueing Analysis**

Map ID	Location	Movement <sup>1</sup>	Storage Length (Feet)	95 <sup>th</sup> Percentile Queue (Feet)	Adequate?

Map ID	Location	Movement <sup>1</sup>	Storage Length (Feet)	95 <sup>th</sup> Percentile Queue (Feet)	Adequate?
11	OR 62 / Bullock Road-Poplar Drive	WBR	200	50	Yes
		NBL	450	375	Yes
		NBT (x2)	360	425	Yes <sup>2</sup>
		NBTR	360	350	Yes
		SBL (x2)	410	275-425	Yes <sup>3</sup>
		SBT (x3)	2200	375-450	Yes
		SBR	425	450	Yes <sup>4</sup>
		EBL (x2)	350	175-600	No
		EBT	165	1,250	Yes <sup>2</sup>
		EBR	150	200	No
		WBL (x2)	250	275	Yes <sup>5</sup>
		WBT	930	300	Yes
		WBR	450	350	Yes

<sup>1</sup>WB= Westbound, SB = Southbound, EB = Eastbound, NB = Northbound, L = Left, T = Through, R = Right

<sup>2</sup>Sufficient storage is available, but queue blocks nearest driveway or minor street intersection.

<sup>3</sup>Additional storage is available on the southbound ramp, outside of the deceleration lane.

<sup>4</sup>Additional storage is available in the center two-way left-turn lane on Biddle Road.

<sup>5</sup>Additional storage is available in the through lane(s).

<sup>7</sup>Queue extends onto private property.

<sup>8</sup>Sufficient storage is available for this queue beyond the striped storage.

As shown in Table 2, 95<sup>th</sup> percentile queues for one or more movements at the following study intersections are forecast to exceed their current striped storage in 2042:<sup>1</sup>

- 5: OR 62 / I-5 Southbound Ramp Terminal – the northbound right-turn queue exceeds its striped storage and the eastbound right-turn queue exceeds its striped storage, blocking the outside (right) southbound lane of I-5.
- 6: OR 62 / I-5 Northbound Ramp Terminal – the northbound through queues block the upstream signalized intersection.
- 8: OR 62 / Biddle Road (south end of jug handle) – the northbound through-through/right queues block the upstream signalized intersection.
- 9: Biddle Road / Hilton Court – the northbound through queues block the upstream signalized intersection and the northbound right-turn queue exceeds its striped storage.
- 11: OR 62 / Bullock Road-Poplar Drive – the eastbound left- and right-turn queues exceed their striped storage.

<sup>1</sup> While it is important to be mindful of vehicle queues potentially impacting upstream signalized intersections, it is equally important to consider the trade-offs associated with capacity improvements intended to solve long queues. These improvements (e.g. adding lanes, providing free movements, etc.) have the potential to negatively impact other transportation modes, particularly walking and biking. Further, traffic modeling software such as Synchro is more effective for analyzing improvements for an existing deficiency, rather a long-range, forecasted deficiency. It is likely that as queues lengthen over time, drivers will choose alternate routes on the system, but this cannot be emulated in the modeling software.

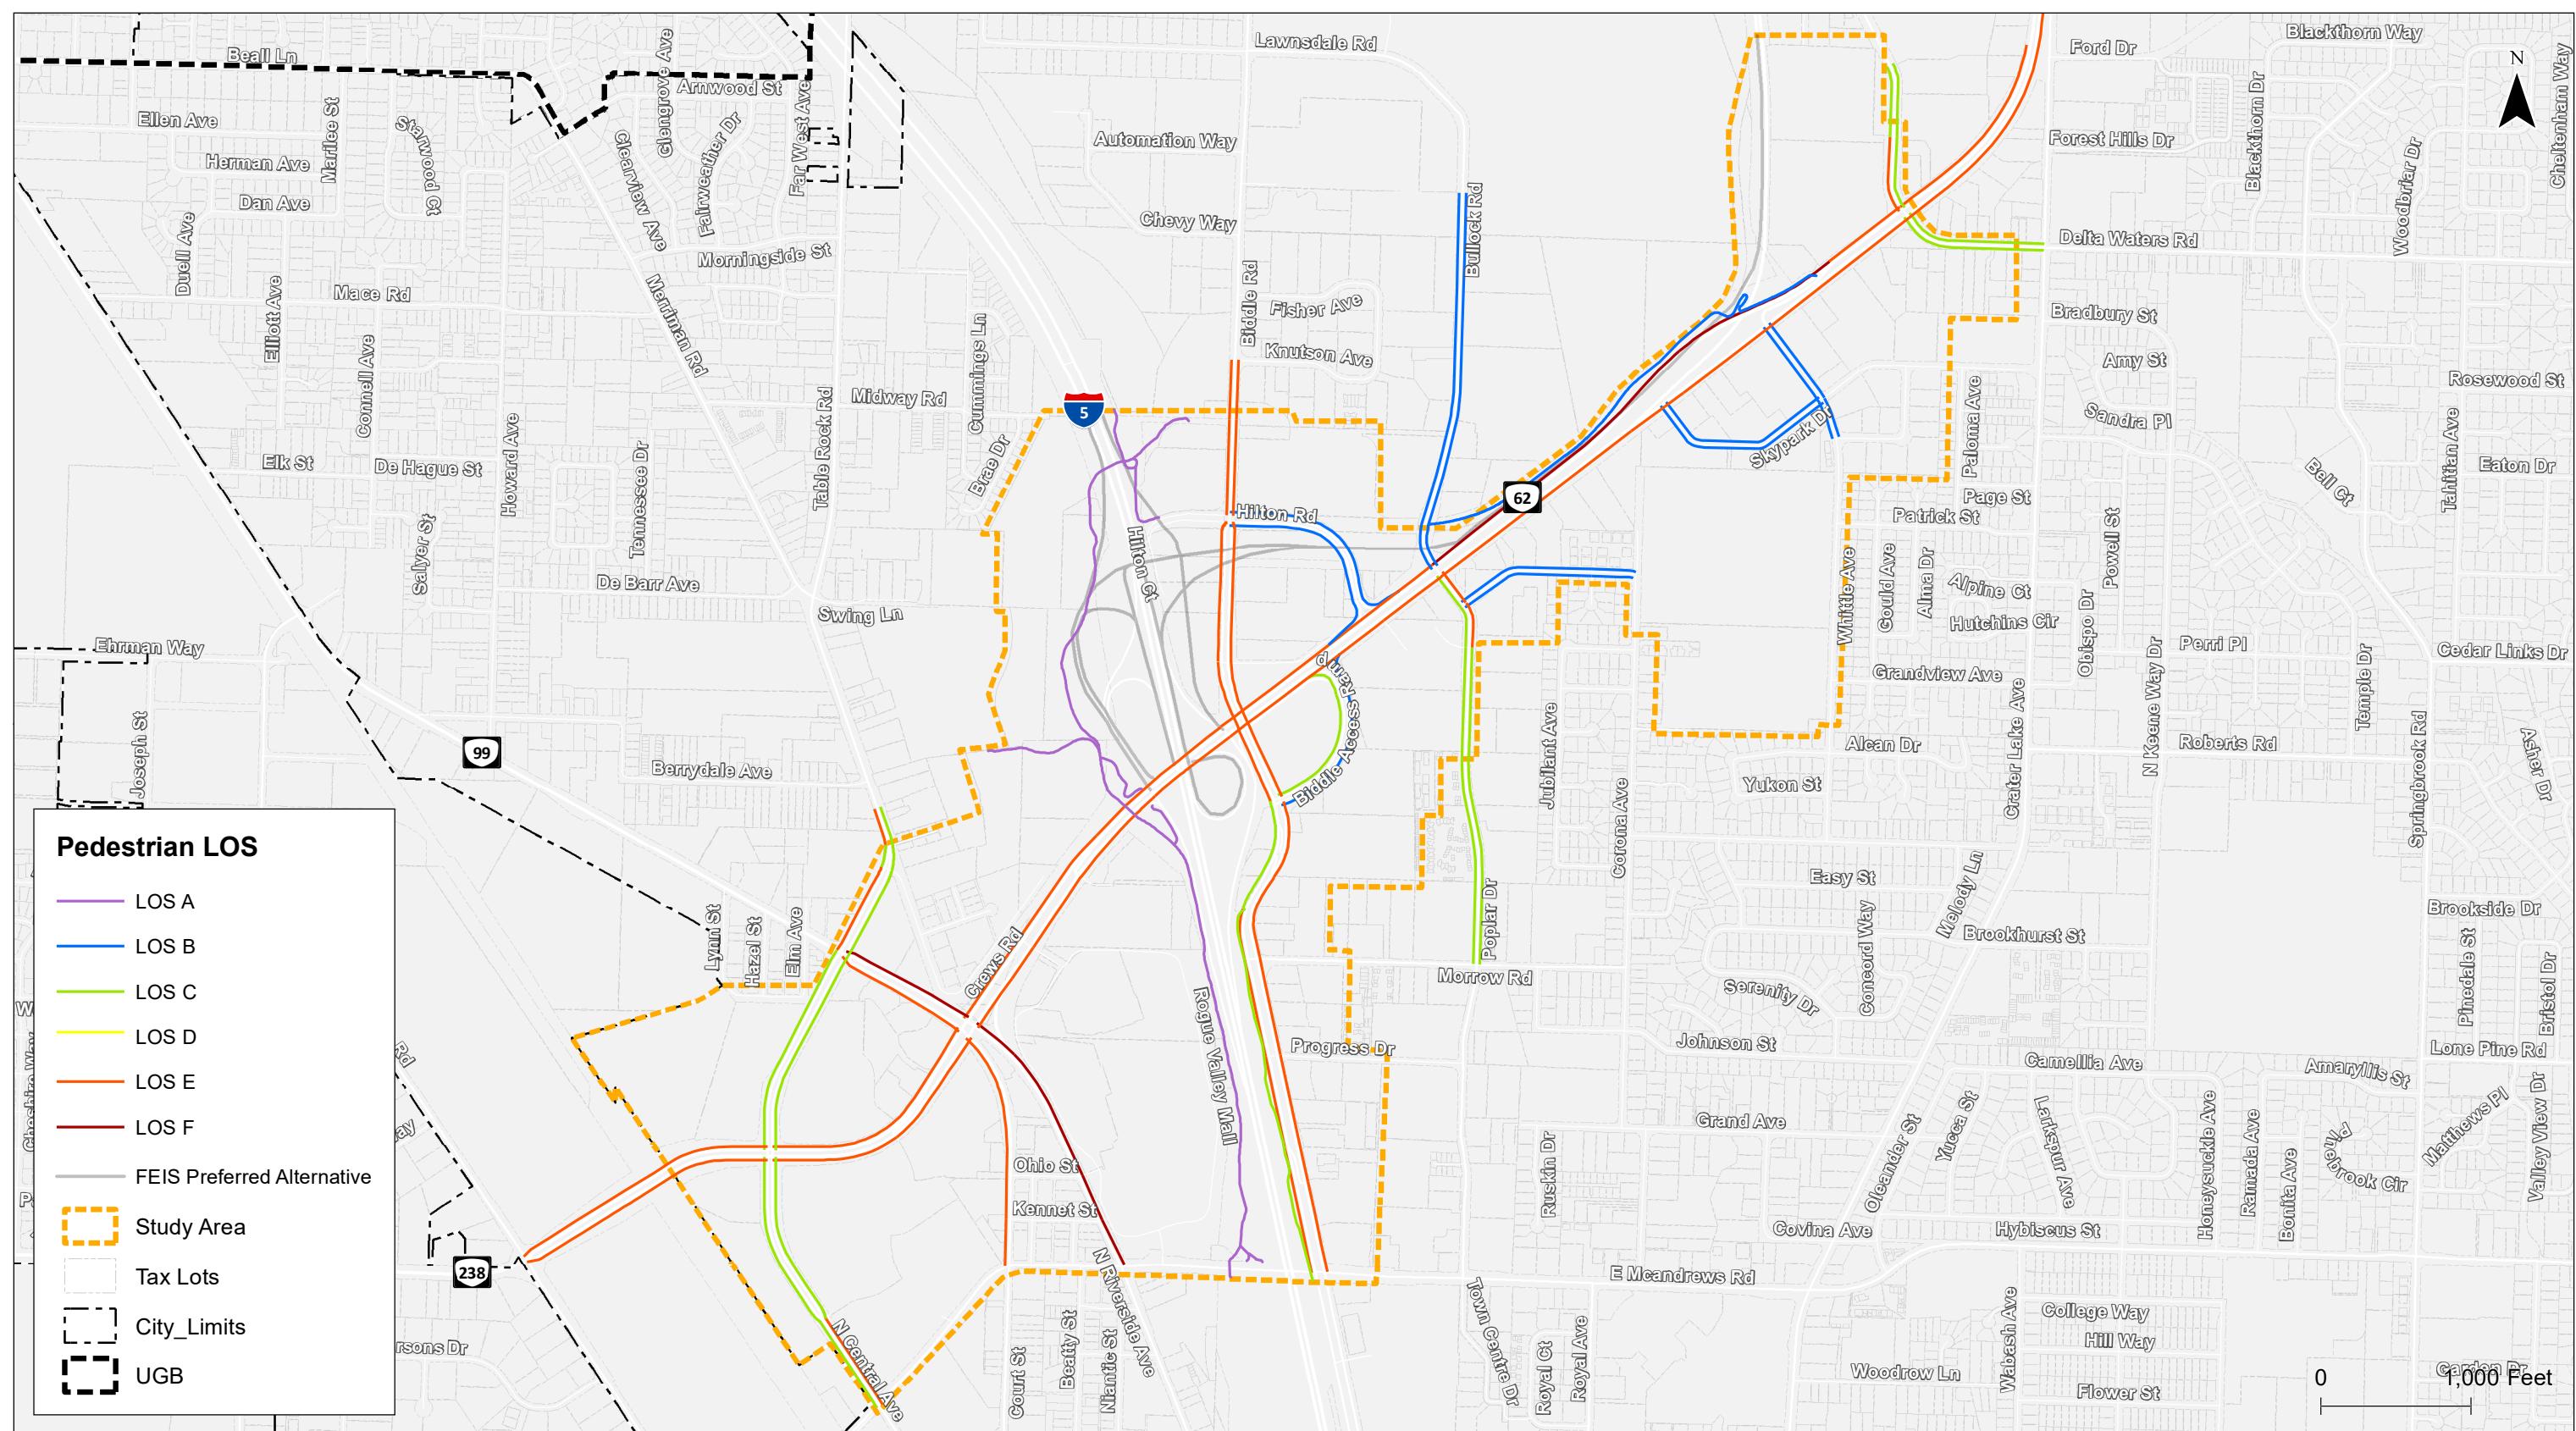

## FUTURE MULTIMODAL ANALYSIS

The pedestrian, bicycle, and transit facilities and services within the IMSA were evaluated under year 2042 full-build traffic conditions in accordance with the simplified Multimodal Level-of-Service (LOS) analysis methodologies identified in Chapter 14 of the ODOT Analysis Procedures Manual (APM). Per the APM, these methodologies are intended for use when a detailed analysis is desired or when a no-build alternative is compared to one or more build alternatives. These methodologies are not meant for defining overall needs or making prioritization decisions, rather they are meant for evaluating alternatives. Multimodal LOS scores are based on user perceptions (traveler satisfaction) and are graded from best (LOS A) to worst (LOS F). A more detailed description of how the scores were developed is provided in *Tech Memo 2 Appendix C: Traffic Operations Analysis*. The results of the future multimodal analysis are summarized below.

### Pedestrian Level of Service

As described in *Tech Memo 2C: Traffic Operations Analysis*, the simplified multimodal LOS analysis methodology uses four variables to estimate Pedestrian LOS. The only variable that is expected to change under year 2042 full-build conditions is directional traffic volume. Directional traffic volumes along OR 62 are expected to decrease between the I-5 SB Ramp Terminal and Skypark Drive as all traffic to/from the bypass will travel through the interchange; the only exception is the segment between the I-5 SB and NB Ramp Terminals where northbound traffic volumes are expected to increase. Turning movement volumes at the study intersection are also expected to increase and decrease along the corridor as traffic redistributes; however, the net difference is an overall decrease, except as noted above.

Figure 3 illustrates the future Pedestrian LOS analysis results for major roadways (collector and above) in the IMSA. As shown, most facilities are expected to continue to operate at LOS E with the exception of the segments with relatively low traffic volumes and/or travel speeds, such as Biddle Road, Bullock Road, and Poplar Drive. The segment of OR 62 from Bullock Road to the right-in/right-out commercial driveway is shown as LOS F; however, the shared-use path that runs parallel to OR 62 is LOS A. The segments that changed relative to existing conditions include Biddle Road from Morrow Road to the Jug Handle (the northbound segment changed from LOS C to LOS E) and the Jug Handle from OR 62 to Biddle Road (the southbound segment changed from LOS B to LOS C). A tabulated summary of the Pedestrian LOS analysis results is provided in Attachment C.

**Pedestrian Level of Service (LOS)  
Future Full-build Traffic Conditions  
Medford, Oregon**

Figure  
**3**

## Bicycle Level of Service

As described in *Tech Memo 2C: Traffic Operations Analysis*, the simplified multimodal LOS analysis methodology uses four variables to estimate Bicycle LOS. However, none of the variables are expected to change under year 2042 full-build conditions.

Figure 4 illustrates the future Bicycle LOS analysis results for major roadways (collector and above) in the IMSA. As shown, most facilities are expected to continue to operate at LOS D with the exception of the segments with relatively low traffic volumes and/or travel speeds, such as Bullock Road. The segment of OR 62 from Poplar Road to Delta Waters Road is show as LOS F, despite buffered bike lanes, due to the number of unsignalized conflicts along the roadway. A *tabulated summary of the Bicycle LOS analysis results is provided in Attachment C*.

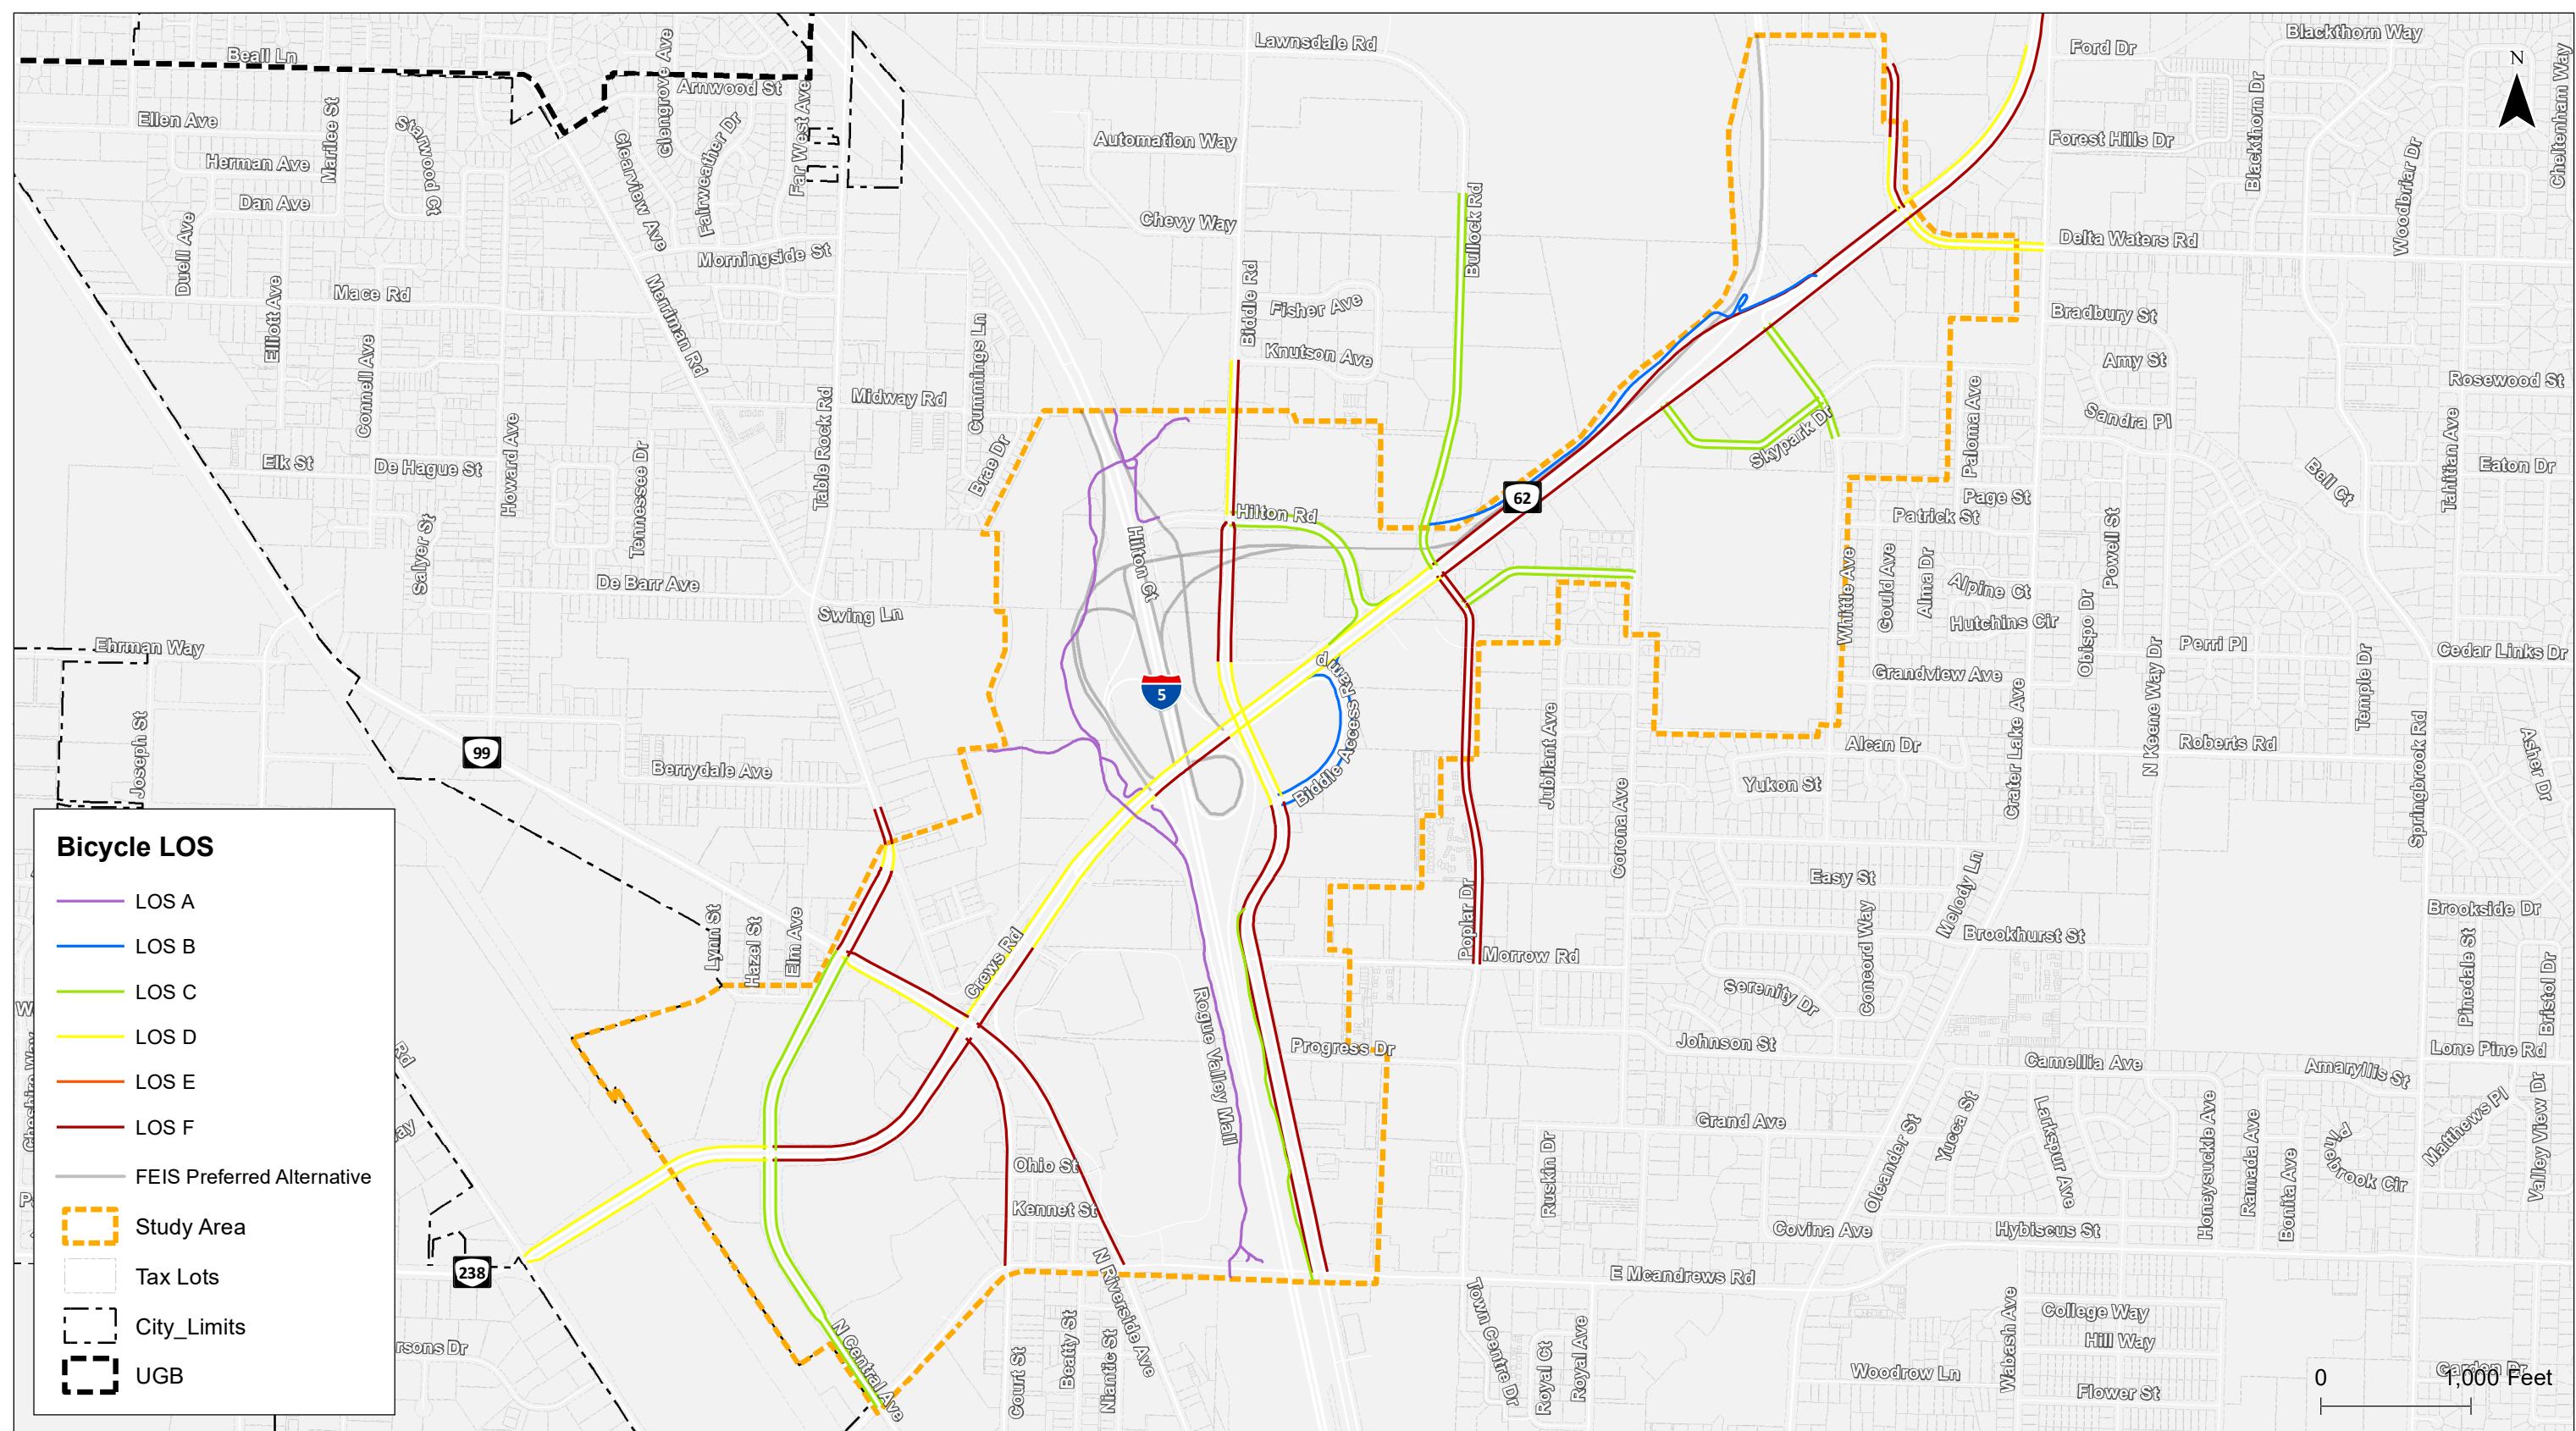

## Transit Level of Service

As described in *Tech Memo 2C: Traffic Operations Analysis*, the simplified multimodal LOS analysis methodology uses four variables to estimate Transit LOS. The only variable that is expected to change under year 2042 full-build conditions is Pedestrian LOS. However, as indicated above, the changes are expected to be minimal.

Figure 5 illustrates the future Transit LOS analysis results for roadways in the IMSA with fixed-route transit service. As shown, the TLOS results continue to vary significantly between the roadways. Roadways that are served by multiple bus lines or by bus lines with shorter headways and/or travel times have better LOS. A *tabulated summary of the Transit LOS analysis results is provided in Attachment C*.

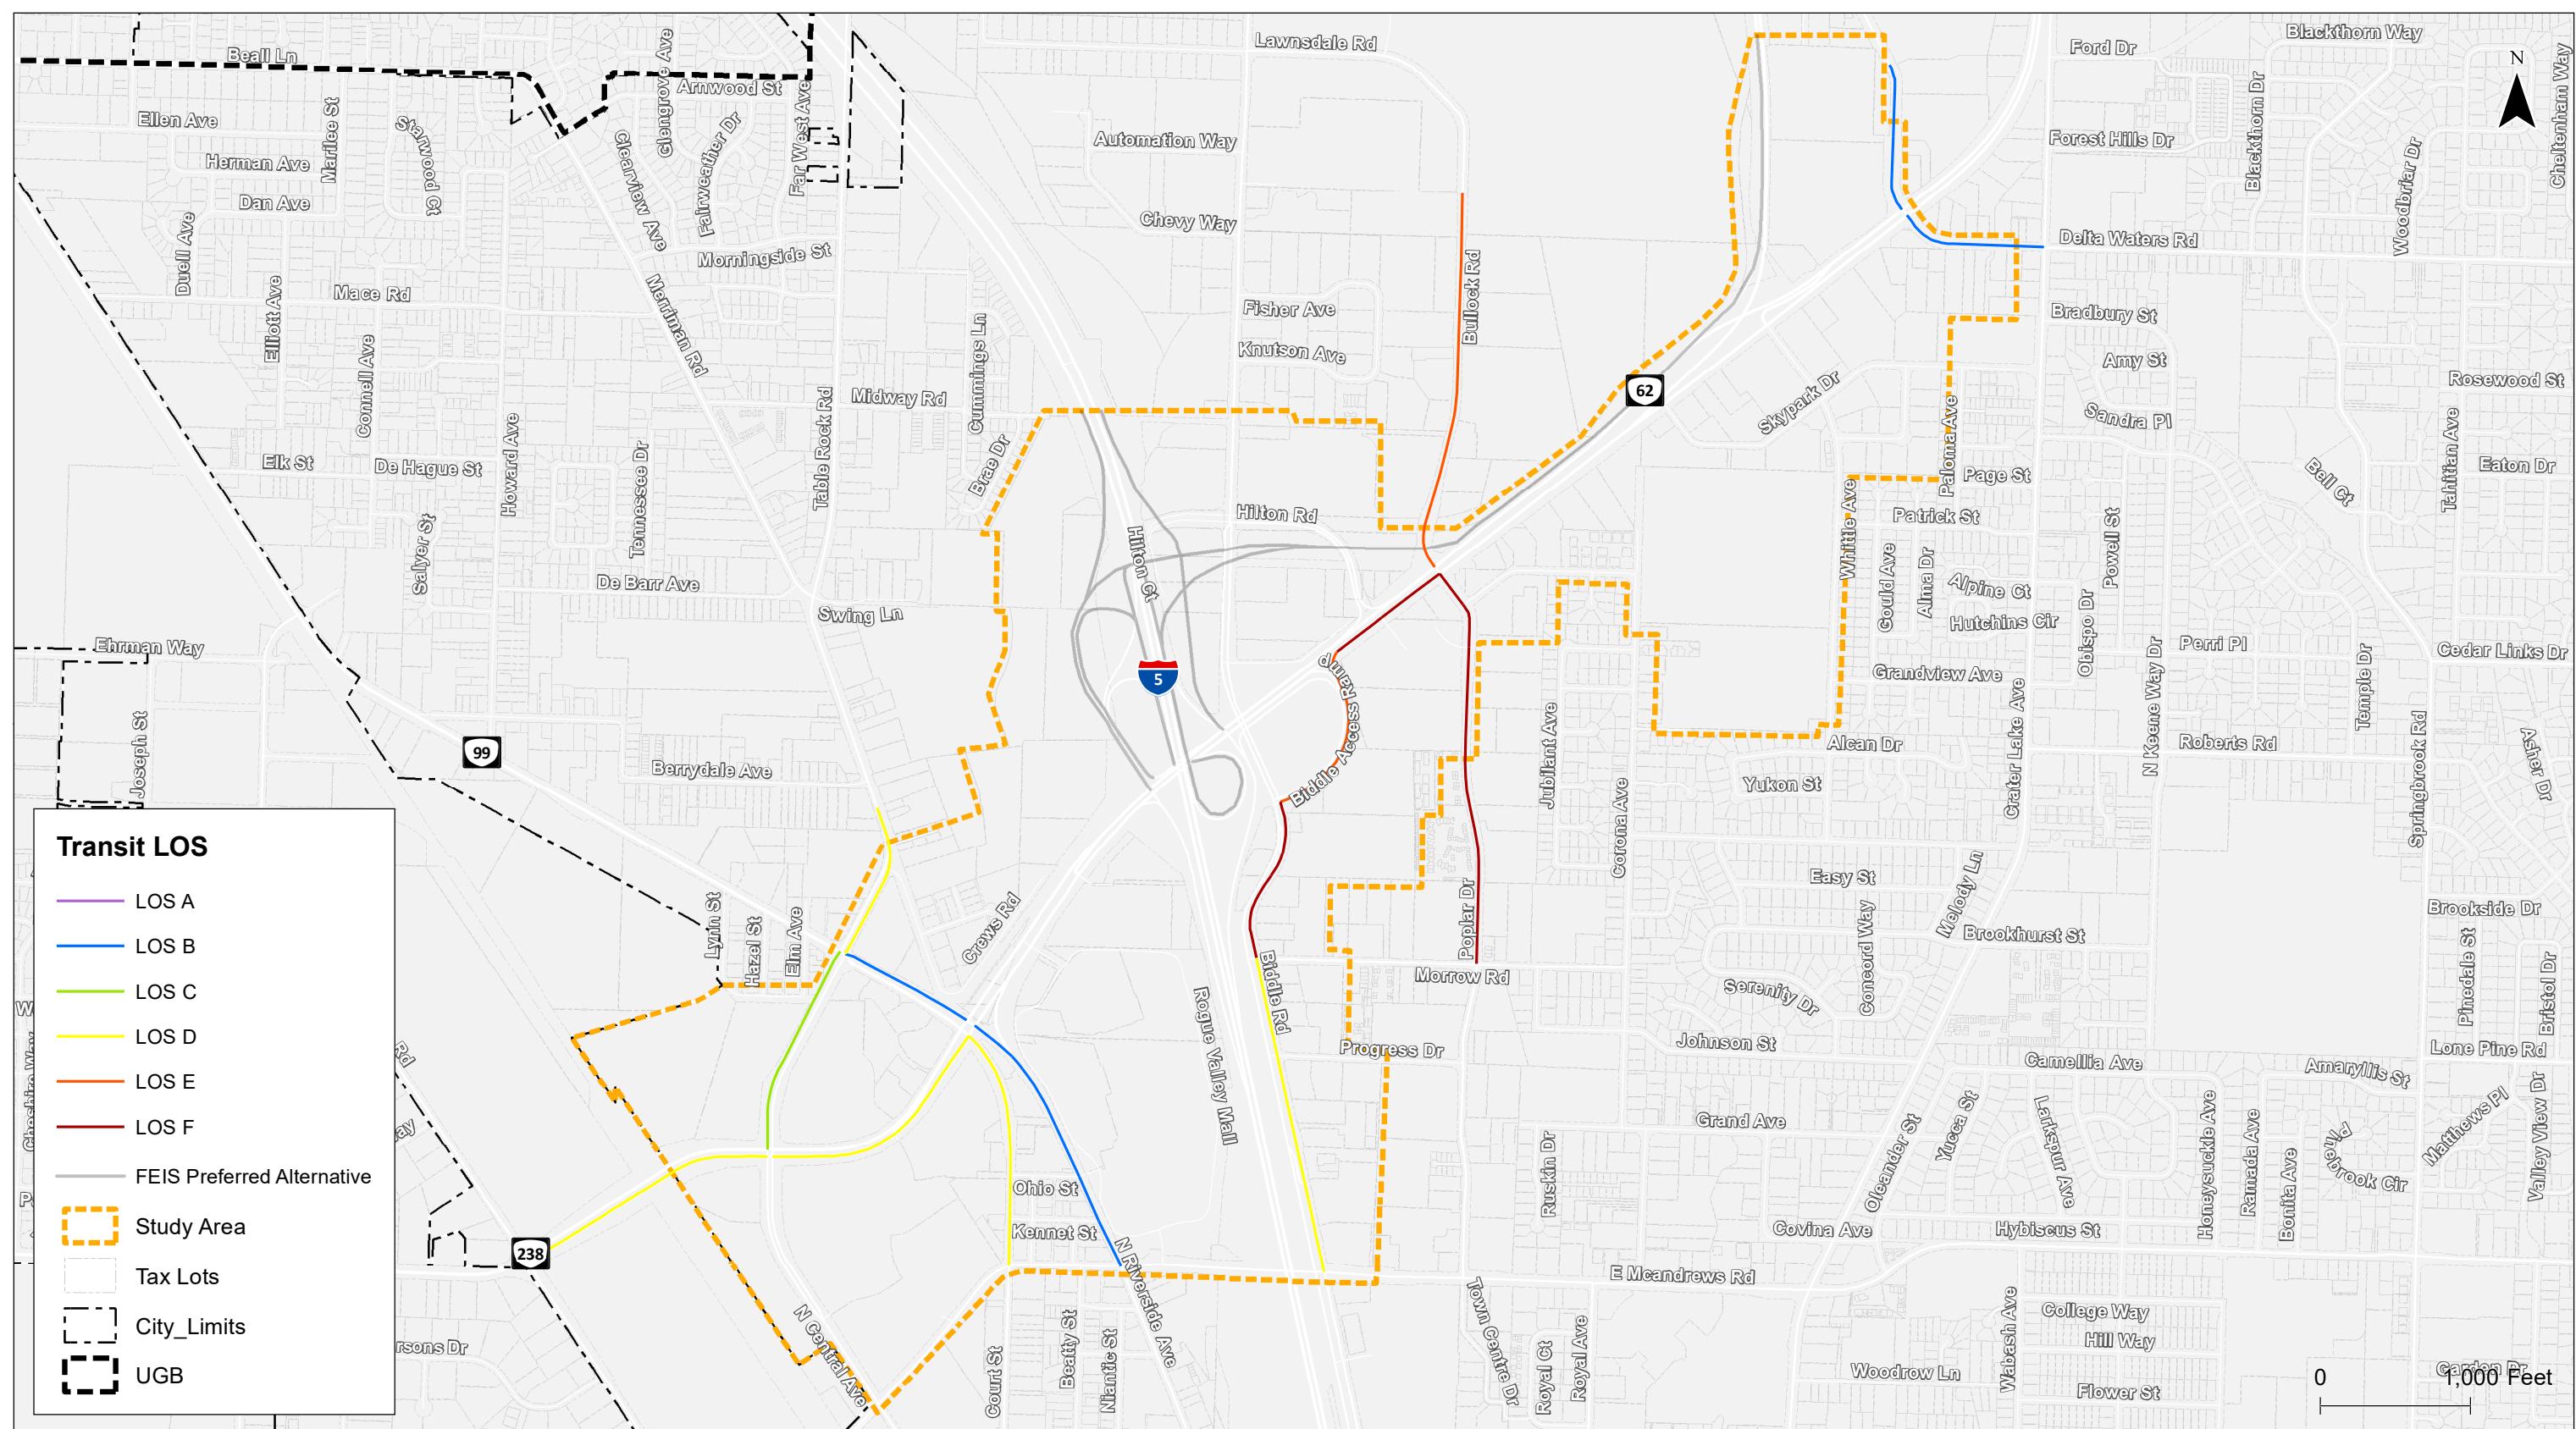

## FUTURE FREIGHT ANALYSIS

The future freight analysis identifies potential issues with freight movements on designated freight routes within the IMSA, including freight route restrictions, bottlenecks, over-dimension load pinch points. As indicated in *Tech Memo 2B: Transportation Inventory*, the majority of state highways within the IMSA are designated freight routes and/or National Highway System (NHS) routes. Therefore, they have been designed to accommodate large trucks and the intersections have been designed to accommodate large truck turning movements. The Motor Carrier Transportation Division (MCTD) Freight Mobility Map also identifies the majority of state highways in the IMSA as *Orange Routes*, or generally unrestricted freight and oversize/overweight routes; OR 238 is identified as a *Magenta Route*, which is a route with some restrictions for both length and width. The inventory also indicates that there are no freight bottlenecks or over dimension load pinch points within the IMSA. Therefore, the only potential issues with future freight movements are the traffic operations and safety issues identified in this memo.

## POTENTIAL SOLUTIONS

This section presents potential solutions to address transportation system deficiencies identified by the future full-build analysis. This section includes solutions that can be implemented on an incremental basis, prior to full build-out of the FEIS, and solutions that can be implemented along with the FEIS to address traffic operations. Potential solutions are provided for the following study intersections, which are forecast to exceed their applicable mobility standards and targets:

- OR 62-OR 238 / OR 99-Court Street-N Riverside Avenue
- OR 62 / Delta Waters Road
- OR 62 / I-5 SB Terminal
- OR 62 / I-5 NB Terminal
- OR 62 / Bullock Road-Poplar Drive

The intersection operations analysis of these potential solutions was conducted following the same methodology used in the intersection operations analysis described earlier in this memorandum. The following sections describe the approach to developing potential solutions at these intersections for the year 2042 following construction of the FEIS Split Diamond Interchange project.

The potential solutions evaluated through the intersection operations analysis aimed to increase capacity and achieve applicable mobility targets at the study intersections. While capacity improvements may provide benefit to vehicular traffic, such as lane additions or enabling turn movements to be free, they may also impact other modes such as walking, biking, and taking transit. Therefore, multimodal solutions are presented following the intersection capacity solutions. In instances where solutions may increase intersection capacity but do not achieve applicable mobility targets, alternative mobility targets are required as part of the solution where allowed.

### Potential Solutions Uninfluenced by the FEIS Split Diamond Interchange

The signalized intersections within the study area listed below are expected to be uninfluenced by the FEIS Split Diamond Interchange project and have similar flows in traffic volumes after its construction:

- OR 62-OR 238 / OR 99-Court Street-N Riverside Avenue
- OR 62 / Delta Waters Road

The following sections summarize the deficiencies and potential solutions at these study intersections and tabulate the intersection operations analysis results associated with each potential solution.

#### ***OR 62-OR 238 / OR 99-Court Street-N Riverside Avenue***

The OR 62-OR 238 / OR 99-Court Street-N Riverside Avenue intersection is expected to exceed its applicable mobility standard and target and operate near capacity in 2042 with or without full build-out of the FEIS. This is primarily driven by the northbound, southbound, and westbound through movements. Further, the northbound left-, northbound right-, eastbound left-, and westbound right-turn queues

exceed their striped storage and the northbound through and eastbound through-through/right queues block upstream signalized intersections. The following potential solutions were evaluated to increase capacity and storage for these movements.

- **Solution #1:** Convert the northbound (OR 238) right-turn lane into a shared through-right turn; and construct a third, outside receiving lane on the north leg (OR 62). This solution requires modification to the existing signal pole and mast arm for northbound traffic.
- **Solution #2:** Construct a third southbound (OR 62) left-turn lane and a third receiving lane on the east leg (Court Street). This solution potentially requires property acquisition.
- **Solution #3:** Convert the northbound (OR 238) right-turn lane into a shared through-right turn and construct a third, outside receiving lane on the north leg (OR 62); Construct a third southbound (OR 62) left-turn lane and a third receiving lane on the east leg (Court Street). This solution requires modification to the existing signal pole and mast arm for northbound traffic and potential property acquisition.
- **Solution #4:** Restrict the eastbound (OR 99) left-turn movements by removing the turn lanes. This solution does not improve capacity because it assumes that the eastbound (OR 99) left-turn volumes are reassigned to the northbound (OR 238) through lanes.
- **Solution #5:** Solution #1 + Solution #2; convert the eastbound (OR 99) shared through-right turn lane into a right-turn lane; and convert the outside eastbound (OR 99) left-turn lane into a through lane.
- **Solution #6:** Construct a second exclusive southbound (OR 62) right-turn lane. This improvement was identified in the Northgate Center Development Agreement in May of 2012.
- **Solution #7:** Construct a flyover for the eastbound (OR 99) left-turn movements.
- **Solution #8:** Construct flyovers for the eastbound (OR 99) and westbound (N Riverside Avenue) left-turn movements.
- **Solution #9:** Construct a flyover for the southbound (OR 62) left-turn movements.
- **Solution #10:** Construct flyovers for the southbound (OR 62) and northbound (OR 238) left-turn movements.

Table 3 summarizes the intersection operations analysis results for the potential solutions listed above.

**Table 3: Potential Solutions - OR 62-OR 238 / OR 99-Court Street-N Riverside Avenue**

Solution	V/C	Delay (sec)	LOS	Mobility Standard/Target	Meets Standard/Target	
#1	0.92	56.6	E	0.90	No	
#2	0.94	57.8	E		No	
#3	0.86	54.4	D		Yes	
#4	<i>No Improvement</i>				No	
#5	0.95	58.5	E		No	
#6	0.99	61.0	E		No	
#7	0.83	56.4	E		Yes	
#8	0.82	39.9	D		Yes	

#9	0.93	52.3	D		No
#10	0.47	40.6	D		Yes

### **OR 62 / Delta Waters Road**

While the OR 62 / Delta Waters Road intersection was not identified in the City of Medford Transportation System Plan (TSP) to need improvements by the year 2038, the intersection is expected to exceed its applicable mobility standard and operate over capacity in 2042 with or without full build-out of the FEIS. This is primarily driven by the northbound left-turn movements and the southbound approach. The following potential solutions were evaluated to increase capacity for these movements.

- **Solution #1:** Construct a second southbound (OR 62) left-turn lane and a second southbound (OR 62) right-turn lane.
- **Solution #2:** Construct a second southbound (OR 62) left-turn lane and a second westbound (Delta Waters Road) left-turn lane and restripe the westbound approach as two left-turn lanes, a through lane, and a right-turn lane.
- **Solution #3:** Construct a second southbound (OR 62) left-turn lane and a second southbound (OR 62) right-turn lane; and provide flashing yellow for the westbound and eastbound (Delta Waters Road) left-turn movements.
- **Solution #4:** Construct a second southbound (OR 62) left-turn lane and a second westbound (Delta Waters Road) left-turn lane; and construct a southbound (OR 62) right-turn lane.

Table 4 summarizes the intersection operations analysis results for the potential solutions listed above.

**Table 4: Potential Solutions - OR 62 / Delta Waters Road**

Solution	v/c	Delay (sec)	LOS	Mobility Standard/Target	Meets Standard/Target
#1	0.95	56.2	E	0.90	No
#2	0.86	54.4	D		Yes
#3	0.95	47.3	D		No
#4	0.83	47.3	D		Yes

Converting the traffic signal to a roundabout was also evaluated based on Exhibit 3-12 from the National Cooperative Highway Research Program (NCHRP) Report 672, *Roundabouts: An Informational Guide, Second Edition* (Reference 1 – NCHRP Report 672). The exhibit illustrates the vehicular demand at an intersection that is appropriate for a single- or double-lane roundabout by comparing the daily traffic volumes with the percentage of left-turn volumes. According to the exhibit, a roundabout at the OR 62 / Delta Waters Road intersection would require more than two lanes to provide sufficient capacity for the forecast 2042 traffic volumes. While a roundabout has the potential to improve level of stress for people walking and biking, more than two lanes introduces safety obstacles for vehicles by increasing the number of conflict points within the intersection and counteracts one of the primary goals: to improve intersection safety. For these reasons, a roundabout is not considered a feasible option.

## Potential Solutions Influenced by the FEIS Split Diamond Interchange

The signalized intersections within the study area listed below are expected to be influenced by the FEIS Split Diamond Interchange project and have different flows in traffic volumes after its construction:

- OR 62 / I-5 Southbound Ramp Terminal
- OR 62 / I-5 Northbound Ramp Terminal
- OR 62 / Bullock Road-Poplar Drive

The following sections summarize the deficiencies and potential solutions at these study intersections and tabulate the intersection operations analysis results associated with each solution. The solutions that can be implemented on an incremental basis, prior to full build-out of the FEIS, are highlighted below.

### *OR 62 / I-5 Southbound Ramp Terminal*

The OR 62 / I-5 Southbound Ramp Terminal intersection is expected to be significantly impacted by the FEIS Split Diamond Interchange project if the off-ramp location and lane configurations do not change. The intersection is expected to exceed its applicable mobility target but operate below capacity in 2042 with the FEIS. This is primarily driven by the eastbound approach, which includes volumes from the I-5 southbound off-ramp and the OR 62 bypass under full build-out of the FEIS. Further, the northbound right-turn queue is expected to exceed its striped storage and the eastbound right-turn queue is expected to exceed its striped storage, blocking the outside (right) southbound lane of I-5. All of the following solutions reflect a ramp terminal footprint that does not change before or after the FEIS Split Diamond Interchange project and can be implemented on an interim basis. However, the intersection would continue to exceed its applicable mobility target; therefore, an alternative mobility standard would be required for approval.

- **Solution #1:** Channelize the eastbound (I-5 SB Off-Ramp) right-turn lane and make the right-turn a free-flow movement. This would require a receiving lane on the south leg (OR 62) that merges back into traffic north of the downstream signal.
- **Solution #2:** Construct a second eastbound (I-5 Off-Ramp) right-turn lane.
- **Solution #3:** Construct a second eastbound (I-5 Off-Ramp) right-turn lane; and restripe the eastbound (I-5 Off-Ramp) approach as a right-turn lane, shared through-right-turn lane, and dual left-turn lanes.
- **Solution #4:** Construct a second eastbound (I-5 Off-Ramp) right-turn lane; restripe the eastbound (I-5 Off-Ramp) approach as a right-turn lane, shared through-right-turn lane, and dual left-turn lanes; and construct a second southbound (OR 62) right-turn lane.

Table 5Table 5 summarizes the intersection operations analysis results for the potential solutions listed above.

**Table 5: Potential Solutions - OR 62 / I-5 Southbound Ramp Terminal**

Solution	V/C	Delay (sec)	LOS	Mobility Standard/Target	Meets Standard/Target
#1	0.85	21.6	C	0.85	Yes
#2	0.85	63.4	E		Yes
#3	0.85	57.0	E		Yes
#4	0.85	50.5	D		Yes

### *OR 62 / I-5 Northbound Ramp Terminal*

The OR 62 / I-5 Northbound Ramp Terminal intersection is expected to exceed its applicable mobility target and operate over capacity in 2042 with the FEIS. This is primarily driven by the northbound and southbound right-turn movements. Today, the off-ramp experiences queues that cause safety issues with I-5 through traffic. The issue is expected to be exacerbated in the future by traffic growth. Further, the northbound through queues block the upstream signalized intersection. The following potential solutions were evaluated to increase capacity and storage for these movements.

- **Solution #1:** Convert the southbound (OR 62) right-turn lane into a shared through-right turn lane; and construct an additional receiving lane on the south leg. This solution does not fully mitigate the intersection.
- **Solution #2:** Channelize and yield-control the southbound (OR 62) right-turn lane; and add a lane to the westbound (I-5 Off-Ramp) approach and restripe as a left-turn lane, shared left-through turn lane, and dual right-turn lanes. This solution does not fully mitigate the intersection.
- **Solutions #3-5:** Channelize and yield-control the southbound (OR 62) right-turn lane; and add a lane to the westbound (I-5 Off-Ramp) approach and restripe (#3: dual left-turn lanes, shared through-right turn lane, and right-turn lane; #4: left-turn lane, through lane, and dual right-turn lanes; #5: left-turn lane, shared left-through lane, shared through-right lane, and right-turn lane). These solutions do not fully mitigate the intersection.
- **Solution #6:** Channelize and yield-control the southbound (OR 62) right-turn lane; construct a southbound (OR 62) right-turn lane; and add a lane to the westbound (I-5 Off-Ramp) approach and restripe as a left-turn lane, a shared left-through lane, a shared through-right lane, and a right-turn lane. This solution does not fully mitigate the intersection.
- **Solution #7:** Channelize and yield-control the southbound (OR 62) right-turn lane; construct a southbound (OR 62) right-turn lane; add a lane to the westbound (I-5 Off-Ramp) approach and restripe as a left-turn lane, a shared left-through lane, a shared through-right lane, and a right-turn lane; and restripe the northbound (OR 62) approach as two through lanes, a shared through-right turn lane, and a right-turn lane.
- **Solution #8:** Restripe the southbound (OR 62) approach as two through lanes, a shared through-right turn lane, and a right-turn lane; add a lane to the westbound (I-5 Off-Ramp) approach and restripe as a left-turn lane, a shared left-through lane, a shared through-right lane, and a right-turn lane; and restripe the northbound (OR 62) approach as two through lanes, a shared through-right turn lane, and a right-turn lane.

- **Solution #9:** Construct an additional southbound (OR 62) through lane; channelize and yield-control the southbound (OR 62) right-turn lane; add a lane to the westbound (I-5 Off-Ramp) approach and restripe as a left-turn lane, a shared left-through lane, a shared through-right lane, and a right-turn lane; and restripe the northbound (OR 62) approach as two through lanes, a shared through-right turn lane, and a right-turn lane (this solution could be implemented on an interim basis to address traffic operations prior to full build-out of the FEIS). This solution does not fully mitigate the intersection.
- **Solution #10:** Construct a shared southbound (OR 62) through-right turn lane; add a lane to the westbound (I-5 Off-Ramp) approach and restripe as a left-turn lane, a shared left-through lane, a shared through-right lane, and a right-turn lane; and restripe the northbound (OR 62) approach as two through lanes, a shared through-right turn lane, and a right-turn lane (this solution could be implemented on an interim basis; however, the intersection would continue to exceed its applicable mobility target; therefore, an alternative mobility target would be required for approval).
- **Solution #11:** Make the southbound (OR 62) right-turn lane a free movement and construct a second receiving lane on the west leg (I-5 On-Ramp).
- **Solution #12:** Make the southbound (OR 62) right-turn lane a free movement and construct a second receiving lane on the west leg (I-5 On-Ramp); and remove the Biddle Road jug-handle connection and add a second westbound (I-5 Off-Ramp) right-turn lane (incorporates Biddle Road jug-handle traffic volumes).

Table 6 summarizes the intersection operations analysis results for the potential solutions listed above.

**Table 6: Potential Solutions - OR 62 / I-5 Northbound Ramp Terminal**

Solution	V/C	Delay (sec)	LOS	Mobility Standard/Target	Meets Standard/Target
#1	>1.00	>80.0	F	0.85	No
#2	>1.00	40.2	D		No
#3	>1.00	42.4	D		No
#4	>1.00	52.2	D		No
#5	>1.00	39.2	D		No
#6	0.98	27.8	C		No
#7	0.75	21.6	C		Yes
#8	0.89	25.9	C		Yes <sup>1</sup>
#9	>1.00	30.5	C		No
#10	0.79	21.8	C		Yes
#11	0.89	20.1	C		Yes <sup>1</sup>
#12	0.90	20.5	C		Yes <sup>1</sup>

<sup>1</sup> Policy 1F of the Oregon Highway Plan (OHP) allows a ramp terminal to have a v/c ratio of up to 0.90 if vehicle queues do not extend into the deceleration lane.

### **OR 62 / Bullock Road-Poplar Drive**

The OR 62 / Bullock Road-Poplar Drive intersection is expected to exceed its applicable mobility standard and target but operate below capacity in 2042 with the FEIS. This is primarily driven by the eastbound and northbound right-turn movements and the westbound approach. Further, the eastbound left- and

right-turn queues exceed their striped storage. The following potential solutions were evaluated to increase capacity and storage for these movements.

- **Solution #1:** Allow the eastbound (Bullock Road) right-turn movements to overlap with non-conflicting left-turn movements.
- **Solution #2:** Restripe the eastbound (Bullock Road) approach as a left-turn lane, a through lane, and dual right-turn lanes.
- **Solution #3:** Construct a second eastbound (Bullock Road) right-turn lane.
- **Solution #4:** Construct a second eastbound (Bullock Road) right-turn lane and restripe the eastbound approach as a left-turn lane, a through lane, and dual right-turn lanes; channelize eastbound (Bullock Road) right-turn movements and allow them to overlap with non-conflicting left-turn movements; construct a northbound (OR 62) right-turn lane; and construct a second northbound (OR 62) left-turn lane and add a second receiving lane on the west leg (Bullock Road).
- **Solution #5:** Reconstruct the intersection, with its current mainline lane configurations, as a Restricted Crossing U-Turn (RCUT) intersection form; minor street right-turns include only two lanes.

Table 7 summarizes the intersection operations analysis results for the potential solutions listed above.

**Table 7: Potential Solutions - OR 62 / Bullock Road-Poplar Drive**

Solution	V/C	Delay (sec)	LOS	Mobility Standard/Target	Meets Standard/Target
#1	0.91	70.7	E	0.85	No
#2	0.91	75.7	E		No
#3	0.91	76.2	E		No
#4	0.84	58.0	E		Yes
#5	0.89 (Bullock Road Signal) 0.96 (Poplar Drive Signal)	24.6 (Bullock Road Signal) 38.0 (Poplar Drive Signal)	C (Bullock Road Signal) D (Poplar Drive Signal)		No (Bullock Road Signal) No (Poplar Drive Signal)

It should be noted that none of these solutions could be implemented on an interim basis to address traffic operations prior to full build-out of the FEIS. If the FEIS is not completed, other alternatives will need to be explored.

Converting the traffic signal to a roundabout was evaluated based on Exhibit 3-12 from *NCHRP Report 672*. According to the exhibit, a roundabout at the OR 62 / Bullock Road-Poplar Drive intersection would require more than two lanes to provide sufficient capacity for the forecast 2042 traffic volumes. While a roundabout has the potential to improve level of stress for people walking and biking, more than two lanes introduces safety obstacles for vehicles by increasing the number of conflict points within the intersection and counteracts one of the primary goals: to improve intersection safety. For these reasons, a roundabout is not considered a feasible option.

## Multimodal Solutions

Multimodal solutions are needed along OR 62 as well as many other roadways within the study area to provide a comfortable environment for people to walk, bike, and take transit. As indicated above, most facilities are expected to operate at LOS E or LOS F, including those with existing sidewalks and on-street bike lanes. This is primarily due to relatively high traffic volumes and travel speeds as well as the number of through lanes in each direction and the widths (and type) of existing facilities. The following potential solutions were evaluated to improve multimodal LOS along the corridor.

- **Solution #1:** Fill in the gaps in the sidewalks and on-street bike lanes along study area roadways consistent with adjacent facilities. While this solution would not significantly improve multimodal LOS in all areas, it is sufficient in some areas and would provide continuous facilities along both sides of study area roadways.
- **Solution #2:** Widen the existing sidewalks and on-street bike lanes along study area roadways (and fill in the gaps). This solution would improve multimodal LOS; however, some facilities would continue to operate at LOS E or LOS F. This is due, in part, to the methodology, but also to the physical and operational characteristics of the roadways.
- **Solution #3:** Install shared-use paths along one or two sides of the study area roadways. This solution would significantly improve multimodal LOS but would likely require additional right-of-way and may not be feasible (or needed) in some areas.
- **Solution #4:** Implement a mix of Solutions #1, #2, and #3 based on the individual characteristics of the study areas roadways.

The following summarize the potential solutions along study area roadways. Given the nature of these solutions, all of them can be implemented on an incremental basis, prior to full build-out of the FEIS.

### OR 62

- Install a 12-foot (min) shared-use path on the north/west side of the roadway from Central Avenue to Delta Waters Road consistent with the Rogue Valley Active Transportation Plan (RVATP) – this may require reconfiguring the north/west side of the roadway (e.g., reallocating the space currently used by the westbound bike lane to the path).
- Install enhanced crossing treatments and wayfinding along the shared-use path.
- Install a 7-foot (min) buffered bike lane on the south/east side of the roadway – this may require reconfiguring the south/east side of the roadway (e.g., narrowing the travel lanes).
- Install skip striping through major intersections and across on- and off-ramps.
- Install 1-2 enhanced crossings between the RV Mall Driveway and I-5 NB Ramp Terminal.

### OR 99

- Widen the existing sidewalks on both sides of the roadway to 8-foot curb tight sidewalks or reconstruct the existing sidewalks as 6-foot sidewalks with 4-foot (min) buffers.
- Install 7-foot (min) buffered bike lanes on both sides of the roadway – this may require reconfiguring the roadway (e.g., narrowing the travel lanes).

### Court Street

- Widen the existing sidewalks on both sides of the roadway to 8-foot curb tight sidewalks or reconstruct the existing sidewalks as 6-foot sidewalks with 4-foot (min) buffers.
- Install a 7-foot (min) buffered bike lane/separated bike lane on the west side of the roadway consistent with the RVATP – this may require reconfiguring the roadway (e.g., eliminating a travel lane).

### Riverside Avenue

- Widen the existing sidewalks on both sides of the roadway to 8-foot curb tight sidewalks or reconstruct the existing sidewalks as 6-foot sidewalks with 4-foot (min) buffers.
- Install a 7-foot (min) buffered bike lane/separated bike lane on the east side of the roadway consistent with the RVATP – this may require reconfiguring the roadway (e.g., eliminating a travel lane).

### Biddle Road

- Install 8-foot curb tight sidewalks or 6-foot sidewalks with 4-foot (min) buffers on the west side of the roadway from Knutson Avenue to Hilton Court.
- Widen the existing sidewalks on both sides of the roadway from Knutson Avenue to Hilton Court to 8-foot curb tight sidewalks and/or reconstruct the existing sidewalks as 6-foot sidewalks with 4-foot (min) buffers.
- Fill in the gaps in the sidewalks on the west side of the roadway from North of Morrow Road to McAndrews Road
- Reconstruct the shared-use path on the west side of the roadway to a 12-foot shared-use path from north of Morrow Road to McAndrews Road.
- Install 7-foot (min) buffered bike lanes on both sides of the roadway from Knutson Avenue to Hilton Court – this may require reconfiguring the roadway (e.g., narrowing the travel lanes).
- Install 6-foot bike lanes on both sides of the roadway from Hilton Court to McAndrews Road – this may require reconfiguring the roadway (e.g., narrowing the travel lanes).

### Table Rock Road

- Fill in the gaps in the sidewalks on the west side of the roadway from Berrydale Avenue to Adams Lane consistent with City standards.
- Install 6-foot bike lanes on both sides of the roadway from Berrydale Avenue to OR 99 – this may require reconfiguring the roadway (e.g., narrowing the travel lanes).

### Central Avenue

- Widen the sidewalks on the east side of the roadway from the commercial driveway to McAndrews Road consistent with City standards – maintain buffer if feasible.

### ***Poplar Drive***

- Install 6-foot bike lanes on both sides of the roadway from OR 62 to the south – this may require reconfiguring the roadway (e.g., narrowing the travel lanes).

### ***Sky Park Drive***

- Fill in the gaps in the sidewalks on both sides of the roadway from OR 62 to Whittle Avenue

### ***Whittle Avenue***

- Fill in the gaps in the sidewalks on the east side of the roadway from OR 62 to Skypark Drive

The improvements shown above would significantly improve multimodal level of services along study area roadways. Additional consideration should be given to enhanced crossing treatments at all major intersections to ensure they accommodate bicycle and pedestrian movements.
