

Chronic hepatitis C

Chronic hepatitis C became reportable in Oregon as of July 1, 2005. In 2016, 5,949 chronic hepatitis C cases were reported. These numbers are likely an underestimate of the true incidence because most infections are asymptomatic and therefore not diagnosed or reported to public health. Infection in males (185/100,000) is more common than in females (108/100,000). The highest prevalence of HCV infection is among persons born between 1945 and 1965. The CDC estimates this age group comprises 75% of chronic hepatitis C cases in the United States; among 2016 Oregon cases, 3,253 belong to this age group (54%).

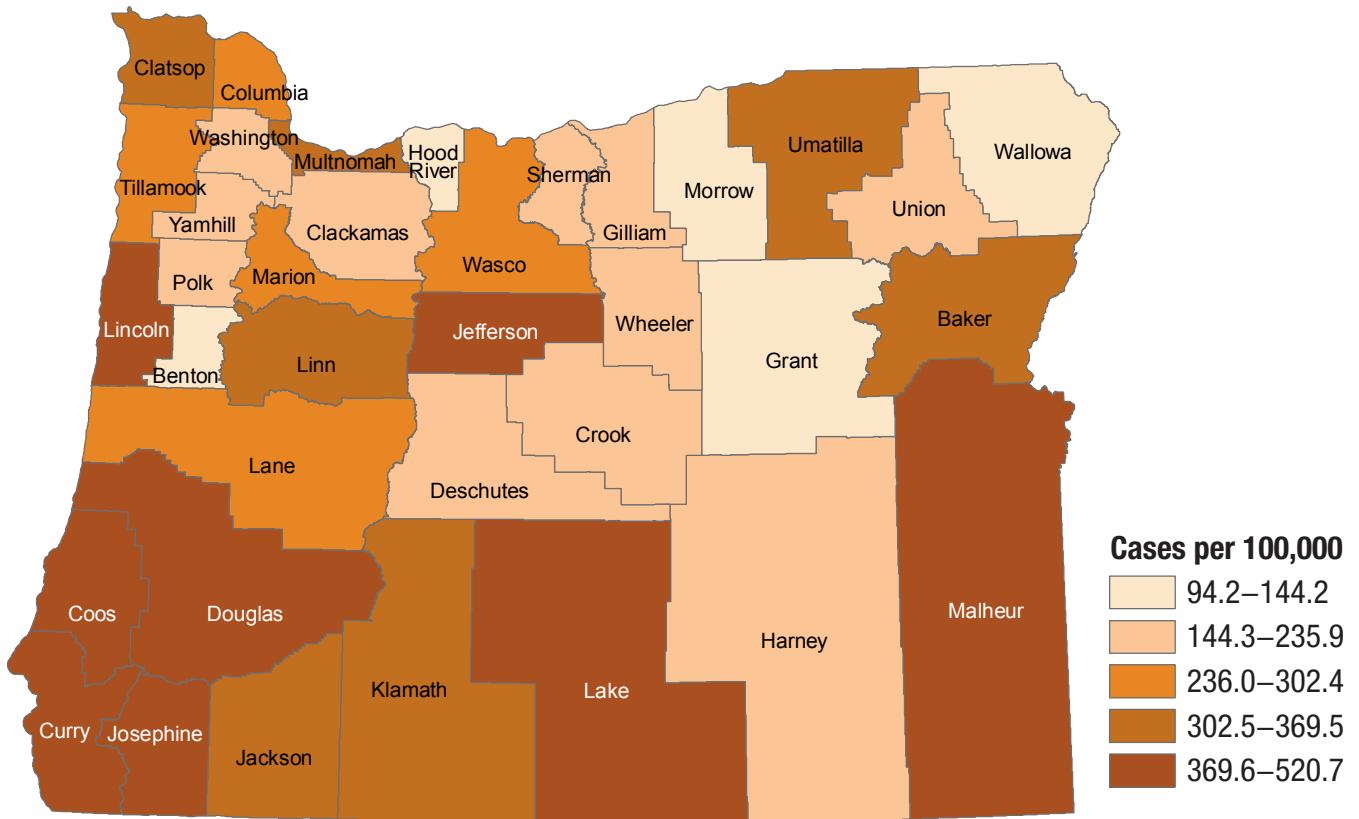

Chronic hepatitis C by year: Oregon, 2006–2016

Incidence of chronic hepatitis C by age and sex: Oregon, 2016

Incidence of chronic hepatitis C by county of residence: Oregon, 2007–2016

Prevention

- Health care workers: Use universal precautions and best practices to prevent needlestick injuries.
- Persons who inject drugs can:
 - › Avoid sharing needles or works with others.
 - › Use only clean needles and works.
 - › Purchase new sterile needles from pharmacies.
