

Why do we investigate outbreaks?

2

1

Why do we investigate outbreaks?

- Determine cause of disease
- Identify source of infection
- Determine mode of transmission
- Understand who is at risk
- Control/prevention of additional illnesses

3

3

1. Establish Existence of Outbreak

- Surveillance data
- Contact health care providers, neighboring counties, states, or national data

Don't be fooled by:

- New lab test (more sensitive)
- Increase in population size
- Increased reporting or change in how reported
- Increased awareness of disease in public

4

4

Case counts of cryptosporidiosis by year: Oregon, 2003 to 2022.

Cases are grouped by date of record throughout this report. Other reports may use alternative dates like report date, diagnosis date, or specimen collection dates.

5

5

2. Verify the Diagnosis

- Contact labs, providers and case patients
- Collect laboratory specimens
- Don't spread rumors!

6

6

- Case definition: person, place, time and clinical information
- Make a line list

[illegible]

- Characterize the outbreak in terms of person place and time
- Make epidemic curve
- Use maps to visualize in space and time

“Person” Characteristics

- Age
- Sex
- Race
- Ethnicity
- Medical status
- Exposures
- Occupation

9

9

Residences of Cases

10

10

Epidemic Curve

11

11

5. Determine who is at risk

12

12

6. Develop Hypotheses

- Use descriptive epi
- Use historical information
- Source of agent – usual reservoir
- Mode of transmission
- Pertinent exposure
- Talk to patients

13

13

7. Evaluate Hypotheses

- Design a study and questionnaire
- Use analytic epidemiology

Cohort
Case-control
Case-Case

14

14

Cohort Study

- How are subjects selected?
 - Not based on illness
 - Based on other commonality
- When would you use this type of study?
 - Small, well-defined population
- Can calculate risks and relative risks

15

15

Case-Control Study

- How are subjects selected?
 - Based on illness
- When would you use this type of study?
 - No small, well-defined population
- Cannot calculate risks and relative risks
 - Must use odds and odds ratios as surrogates

16

16

8. Reconsider Hypotheses

- Do data make sense?
- If not, may need to do another study or involve further lab or environmental tests

17

17

9. Implement Control Measures

- Control this outbreak
- Prevent future outbreaks

18

18

Control Measures

- Recall product
- Administer prophylaxis/vaccine
- Make environmental changes

CHOLERA.

PREVENTION.

1. Let every person be washed perfectly clean, morning and evening.
2. Let every room be cleaned and swept every day, and well washed at least once a week.
3. Let no rubbish nor dirt lie about the door, nor near the house.
4. Let off all stagnant water.
5. Let the house be whitewashed with hot lime.
6. Beware of Drunkenness—nothing is so likely to bring on Disease.

If any one is seized with sickness, slight vomiting, and purging, a burning heat at the stomach, with cramp in various parts of the body, and a feeling of cold all over, it probably is the Cholera.

19

19

10. Communicate Findings

- Share locally, state, national and international
- Write up findings
- Present findings
- Use media

20

20

Steps of an Outbreak Investigation

1. Establish the existence of an outbreak
2. Verify the diagnosis
3. Define and identify cases
4. Perform descriptive epidemiology
5. Determine who is at risk
6. Develop hypotheses
7. Evaluate hypotheses
8. Perform additional studies
9. Implement control and prevention measures
10. Communicate findings
