Healthcare Acquired Infection Reporting Program

Healthcare Acquired Infection Reporting 2009—2010

This research brief provides updates on three HAI targets in the state:

- Central Line Associated Bloodstream Infections (CLABSIs) are primary bloodstream infections that are associated with the presence of a central line or a tube that is placed into a patient’s large vein, usually in the neck, chest, arm or groin.

- Surgical Site Infections (SSIs) are infections that are directly related to an operative procedure. The procedures reported in this update are coronary artery bypass graft and knee prosthesis (replacement).
  - Coronary artery bypass graft (CABG) surgery is a treatment for heart disease in which a vein or artery from another part of the body is used to create an alternate path for blood to flow to the heart, bypassing a blocked artery.
  - Knee prosthesis (KPRO) procedures include replacement procedures, replacement of all or part of the knee joint with an artificial device, and revisions of existing prostheses.

Background
A healthcare acquired infection (HAI) is an infection that occurs during or after treatment for a separate medical condition. Nearly one in every 20 hospitalized patients in the United States each year acquires an HAI. In the United States, an estimated 1.7 to 2 million people per year develop an HAI, and nearly 100,000 die. The economic burden of HAIs is substantial, estimated at $33 billion per year in US hospitals.

In response to the importance of HAIs, the Oregon state legislature passed House Bill 2524 in 2007 to create a mandatory HAI Reporting Program in an effort to raise awareness, to promote transparency for healthcare consumers, and to motivate hospitals to prioritize prevention. HB 2524 assigned responsibility for the HAI Reporting Program to the Office for Oregon Health Policy and Research (OHPR), part of the Oregon Health Authority (OHA), and also created a 16 member committee to advise OHPR on the HAI reporting program.

Photo: Hand washing is one of the most effective ways to prevent the spread of infection. (Centers for Disease Control and Prevention)

Methods
CLABSI and SSI data were collected using the National Healthcare Safety Network (NHSN), a free, secure, internet-based HAI surveillance system developed, administered, and maintained by the Centers for Disease Control and Prevention (CDC). The system integrates patient and healthcare personnel safety surveillance information from facilities across the nation. The Surgical Care Improvement Project (SCIP) process of care measures were collected according to protocols established by the Centers for Medicare and Medicaid Services (CMS). The majority of hospitals (48) reported their data to CMS and OHPR obtained these data from the Hospital Compare web site.

Hospital Review
Copies of data extracted from NHSN and CMS Hospital Compare were sent to the chief executive officer and to the infection control professional at each hospital. Hospitals were given 15 days to preview and correct their HAI data before publication. This process was vital to assure that the reported data were as accurate as possible. As noted in previous reports, hospitals continued to use the review period to report more infections.

During the hospital review period, over half of Oregon hospitals provided 60 corrections to OHPR regarding their HAI data. OHPR confirmed all corrections with hospitals via email. In addition, one hospital reported it performed a specialty surgery that involved replacement of the knee joint as part of a highly specialized oncologic limb salvage procedure. The hospital flagged these procedures in NHSN and OHPR excluded them from the final reporting data set.

To assure a fair and representative set of data, OHPR applied NHSN minimum reporting thresholds for reporting hospital-level data. The reporting threshold for CLABSI is a minimum of 50 central line days per reporting period. The reporting threshold for surgical site procedures is a minimum of 20 patients undergoing a surgical procedure per reporting period.

Results
Oregon’s statewide CLABSI rate in 2009 was one-third lower than the corresponding national rate (Figure 1). The CLABSI rate for 2010 is approximately 60% lower than the national rate and about 40% lower than 2009.

Figure 1: Central Line Associated Bloodstream Infections (CLABSI)

Results (continued)

Oregon’s statewide KPRO SSI rate in 2009 was essentially the same as the corresponding national rate (Figure 2). The KPRO SSI rate for 2010 is about 13% lower than the 2009 rate.

Oregon’s statewide CABG SSI rate in 2009 was about 25% lower than the corresponding national rate (Figure 3). The CABG SSI rate for 2010 is about 8% higher than the 2009 rate, but is still 20% lower than the national rate.

The Surgical Care Improvement Project (SCIP) process of care measures reported here are:

- SCIP-INF-1: Percent of surgery patients who were given an antibiotic at the right time (within one hour) before surgery to prevent infection.
- SCIP-INF-2: Percent of surgery patients who were given the right kind of antibiotic to help prevent infection.
- SCIP-INF-3: Percent of surgery patients whose preventative antibiotics were stopped at the right time (within 24 hours after surgery; 48 hours for cardiac patients).

The statewide averages for SCIP measures have improved when comparing the rates for the annual periods ending March 2009 and March 2010. When comparing the most recent annual period ending March 2010 with national averages for the same time, the rates were essentially the same (Figure 4).

**Figure 4: Surgical Care Improvement Project (SCIP) Process of Care Measures**

The statewide CLABSI rate for 2010 is 60% lower than the most recent national rate and 40% lower than the 2009 statewide CLABSI rate. This trend can be attributed to two events. First, OHSU has reduced CLABSIs in both of its adult medical and surgical intensive care units. In 2009, OHSU reported a total of 27 CLABSIs, which represented 31% of the total CLABSIs reported to the state. In 2010, OHSU reported a total of 11 CLABSIs, representing 24% of the total CLABSIs reported to the state. In addition, the number of hospitals reporting zero CLABSIs in medical/surgical ICUs has increased from 23 (52% of reporting hospitals) in 2009 to 28 (61% of reporting hospitals).

**Discussion**

In comparing 2009 and 2010 data, it appears Oregon hospitals have shown improvement in two targets, CLABSIs and SCIP measures. The statewide CLABSI rate for 2010 is 60% lower than the most recent national rate and 40% lower than the 2009 statewide CLABSI rate. This trend can be attributed to two events. First, OHSU has reduced CLABSIs in both of its adult medical and surgical intensive care units. In 2009, OHSU reported a total of 27 CLABSIs, which represented 31% of the total CLABSIs reported to the state. In 2010, OHSU reported a total of 11 CLABSIs, representing 24% of the total CLABSIs reported to the state. In addition, the number of hospitals reporting zero CLABSIs in medical/surgical ICUs has increased from 23 (52% of reporting hospitals) in 2009 to 28 (61% of reporting hospitals).
The three SCIP measures have shown improvement when comparing the annual periods ending in March 2009 and March 2010. All three measures have shown increases ranging from 3% to 11% and all are similar to national averages.

The KPRO SSI rate for 2010 is 13% lower than the 2009 rate and is about 11% lower than the most recent national rate. However, as we have observed that the KPRO SSI rate for 2009 has slightly increased in subsequent reports, we expect the KPRO SSI rate for 2010 will also rise slightly since SSIs can be identified up to one year after the procedure is performed. The number of hospitals reporting zero KPRO SSI decreased from 27 in 2009 (54% of reporting hospitals) to 22 in 2010 (46% of reporting hospitals).

While the statewide CABG SSI rate for 2010 is substantially lower than the most recent national rate, it is about 8% higher than the statewide CABG SSI rate for 2009. The number of hospitals reporting zero CABG SSIs increased from 1 in 2009 to 3 in 2010.

Results for this report may differ slightly from the results originally published in the Oregon Healthcare Acquired Infections report in December 2010. Additional CLABSI and SSI cases have been identified since that report was published. The OHA is validating the CLABSI data, and this work has led to identifying a small number of previously unreported CLABSI cases. Additional SSI cases have been identified by hospitals through their routine surveillance. This was an expected outcome as some SSI cases were identified up to nine months after the patient was discharged from the hospital.

Limitations
The data reported here are subject to two important limitations:

1. Data are self-reported by the hospital.

2. Surveillance methods and infection control resources vary across hospitals, which may affect a hospital’s ability to detect HAI cases. Higher HAI rates may be due to improved case-finding rather than more true HAI cases.
Implications for the Future

OHPR is currently collecting additional HAI data for public reporting. In January 2011, hospitals began reporting four additional surgical site infections, including abdominal hysterectomy, colon surgeries, hip replacements, and laminectomies. Hospitals also began reporting two additional process of care measurements for cardiac surgery with controlled postoperative glucose and surgery patients with peri-operative temperature management. OHPR will evaluate HAI reporting in other health care facilities.

Additional data that will be reported includes healthcare worker influenza vaccination rates for hospitals and nursing homes, urinary tract infection rates for nursing homes, and evidence-based elements of patient safety practices used by ambulatory surgical centers.

The Patient Protection and Affordable Care Act includes a hospital value-based purchasing program for HAIs, which includes federal reporting of HAIs for hospitals and adjusting Medicare reimbursement rates based on performance. This has required many Oregon hospitals to expand CLABSI reporting in 2011 and may also require expanded SSI reporting in 2012.

Hospital HAI Data Sheets

As part of this report, OHPR has prepared individual HAI data sheets for the 59 acute care hospitals in Oregon. These HAI data sheets present summary data and two columns of graphs, with the 2009 data presented on the left side of the page and the 2010 data presented on the right.

The Office for Oregon Health Policy and Research (OHPR) conducts impartial, non-partisan policy analysis, research and evaluation, and provides technical assistance to support health reform planning and implementation in Oregon. The office serves in an advisory capacity to Oregon Health Policy Board, the Oregon Health Authority, the Governor and the Legislature.

For More Information

During their 15-day review of the hospital-level Healthcare Acquired Infection (HAI) reports, all hospitals were also given the opportunity to provide comments on their reports. Six hospitals provided comments on their HAI data reports, and they are listed in alphabetical order.

- Bay Area Hospital
- Good Samaritan Regional Medical Center
- Oregon Health and Science University (OHSU) Hospital
- Rogue Valley Medical Center
- Sky Lakes Medical Center
- Tuality Healthcare

If a hospital is not listed in this section, the hospital did not provide comments on its HAI report for this period.

**Bay Area Hospital**

Bay Area Hospital is committed to Patient Safety as our first priority by providing evidence based care to achieve positive outcomes. Engaged medical and hospital staff are dedicated to excellence and continue efforts to prevent and reduce the incidence of healthcare acquired infections at Bay Area Hospital.

**Prevention of Central Line Associated Bloodstream Infections (CLABSI)**

A quality improvement healthcare team has implemented evidence-based practices to eliminate central line associated blood stream infections. Bay Area Hospital has sustained 0 infections related to central line associated bloodstream infections for over two years.

**Prevention of Surgical Site Infections (SSI)**

Bay Area Hospital continues to aggressively attack surgical site infections (SSIs). Our SCIP measures have consistently been improving to above 93 percent. The Surgical professionals at Bay Area Hospital have been reviewing specific cases and determining steps to minimize potential infections. The rates reported as infections are not risk adjusted to adequately reflect the patient population served. Focused prevention activities have been implemented in areas of pre-operative and post-operative care, including patient education and revised wound care practices. To date, the knee prosthesis SSI rate has decreased between 2009 and 2010. Our infection prevention program team continues efforts to identify and reduce these infections, utilizing evidence-based, best practices.

**Good Samaritan Regional Medical Center**

Good Samaritan Regional Medical Center (GSRMC) targeted Oregon State Surgical Site Infections have decreased 75% to 80% within the last quarter of 2010 and into 2011. GSRMC is participating in several initiatives to reduce the incidence of preventable hospital acquired infections. Initiatives include continued monitoring and implementation of evidenced best practices in the prevention of Surgical Site Infections and Central Line Associated Blood Stream Infections. The following are a few (not inclusive) initiatives we have continued or
Good Samaritan Regional Medical Center
(continued)
implemented since 09/2010:

- Physician and staff focused Infection Prevention education
- Patient education on the prevention of Surgical Site Infections
- Surgical site dressing care to reflect best practices
- Review and implementation of ASHE environmental controls within the OR suites
- Appropriate pre-operative antibiotic administration ( timing and dosing)
- Appropriate hair removal ( clippers not razors)
- Controlled Postoperative Serum Glucose in Cardiac Surgery
- Active participation in the Oregon Collaborative on the Prevention of Health Care Associated Infections
- Supportive 24/7 hour IV therapy team
- Implementation of the Institute of Healthcare Improvement Central Line Bundle
- Shift towards the model of Comprehensive Unit-based Safety Programs (CUSP)

Our Surgical Site Infection target is to achieve less than the NHSN Standardized Infection Ratio for all surgeries performed at GSRMC. Preventable Surgical Site Infections are challenged by non-modifiable patient risk factors such as smoking, morbid obesity, renal failure and diabetes which may contribute to a greater risk for a surgical site infection.

Oregon Health Science University

Since 2009, OHSU has made substantial progress toward the goal of eliminating preventable central line associated bloodstream infections (CLABSI). Working in collaboration with the Oregon Health Care Prevention Collaborative and the national CUSP/Stop BSI program, OHSU has so far been able to reduce the rate and number of CLABSI by over 50%. In the coming months, continued progress is anticipated in working toward zero CLABSI.

Substantial improvements have also been made in eliminating infections among patients undergoing prosthetic knee replacement surgery at OHSU. Despite an increase in total number of these procedures done, no infections were recorded in 2010.

Success achieved in preventing infections other areas was not realized among coronary bypass graft (CABG) surgeries in 2010. Although the increase in rate between 2009 and 2010 is not statistically significant, it is still concerning. OHSU faces special challenges in eliminating these infections because of the severity and complexity of the illnesses among its cardiac surgery patients.
Oregon Health Science University
(continued)

The reported data may not adequately account for differences in risk among patients presenting to similar sized hospitals. For example, infections occurred among patients with co-existing conditions that increase risk of infection, such as breast cancer followed by chest radiation, renal transplant on immunosuppression, concurrent aortic valve replacement, and severe cardiomyopathy requiring ventricular assist device. Much work has already been done to implement best practices for the prevention of surgical site infections among cardiac surgery patients, such as standardization of optimized antibiotic prophylaxis, maintenance of body temperature during and after surgery and aggressive control of blood glucose perioperatively. In 2011, OHSU’s work within the HAI prevention collaborative will focus on improving these processes, as well as identifying and implementing additional processes that will help reduce preventable infections among these complex patients.

Rogue Valley Medical Center

Rogue Valley Medical Center (RVMC) is dedicated to excellence by working to reduce our preventable HAIs. As a part of the hospital safety initiatives and movement toward a vision of excellent medical care, RVMC leadership has identified an opportunity to decrease surgical site infections by joining the state-wide Oregon Patient Safety Commission HAI Prevention Collaborative. This provides an opportunity to reach beyond our geographical boundaries to discover and share best practices with others. During 2010, two additional infection prevention nurses have been added to our organization’s Infection Prevention & Control Program. This program is managed by a board certified Infection Control Practitioner (CIC) and the program’s medical director is board-certified in Infectious Diseases as well as having completed the SHEA/CDC Training Course in Healthcare Epidemiology.”

Sky Lakes Medical Center

Sky Lakes Medical Center conducts surveillance for central line-associated blood stream infections in all inpatient units which is above the requirement to conduct surveillance only in critical care units. For this reason, our data is listed as “not reported due to data quality issues”. For calendar year 2010, there were no central line-associated blood stream infections identified in any inpatient unit. This data was validated in an audit conducted by the State in January 2011.

Note from Oregon Health Policy and Research (OHPR): OHPR could not report ICU CLABSI data for Sky Lakes facility as this facility did not collect data in a manner that allowed us to report medical/surgical ICU data, as required by law. The CLABSI validation study, carried out by the State’s Public Health Division, focused on validation of the medical/surgical ICU data for 2009.
Tuality Healthcare

Tuality Healthcare is committed to providing evidenced based care. We have implemented many nationally recognized infection prevention measures in our efforts to constantly improve patient care.

Central Line Associated Bloodstream Infections (CLABSI's):
In 2009 we identified an unusual occurrence of 3 CLABSI's in our ICU. After a thorough review of practices and implementing the use of a new Central Line Checklist, our rate has returned to zero and has remained zero.

CABG SSI's:
In 2009 we had 2 SSIs. In 2010 we had 1 SSI. We will continue to audit pre-op and post-op practices with surgeons and staff.

Knee Prosthesis SSIs:
In 2009 we had zero infections. In 2010 we identified 2 SSIs. We continue to aggressively track outcome data and validate compliance with evidenced based practices among surgeons and staff.

SCIP Measures:
We have implemented several measures to assure compliance with the SCIP core measures pertaining to the prophylactic administration of antibiotics. We demonstrate continuous improvements in our compliance with all three of these SCIP core measures by exceeding 97% so far in 2010.
