Lab update

Lab capacity
Whole genome sequencing and cefiderocol resistance (as time allows)

Funding update

Introductions

- Name, organization and title
- *In the chat:*
 - the greatest challenge facing your organization/community as related to CPOs and *C. auris* right now?

OREGON
HEALTH
AUTHORITY

STAR

History, Goals, and Objectives

Statewide Taskforce for Antimicrobial Resistance (STAR)

History

Public health academic partnership
Initiated September 2012

Goals

Detect and contain high-priority
antimicrobial resistant pathogens

STAR

Objectives

Monitor Oregon antimicrobial resistant (AR) organism epidemiology and assess needs for prevention and response

Coordinate statewide education about carbapenem-resistant and other AR organisms

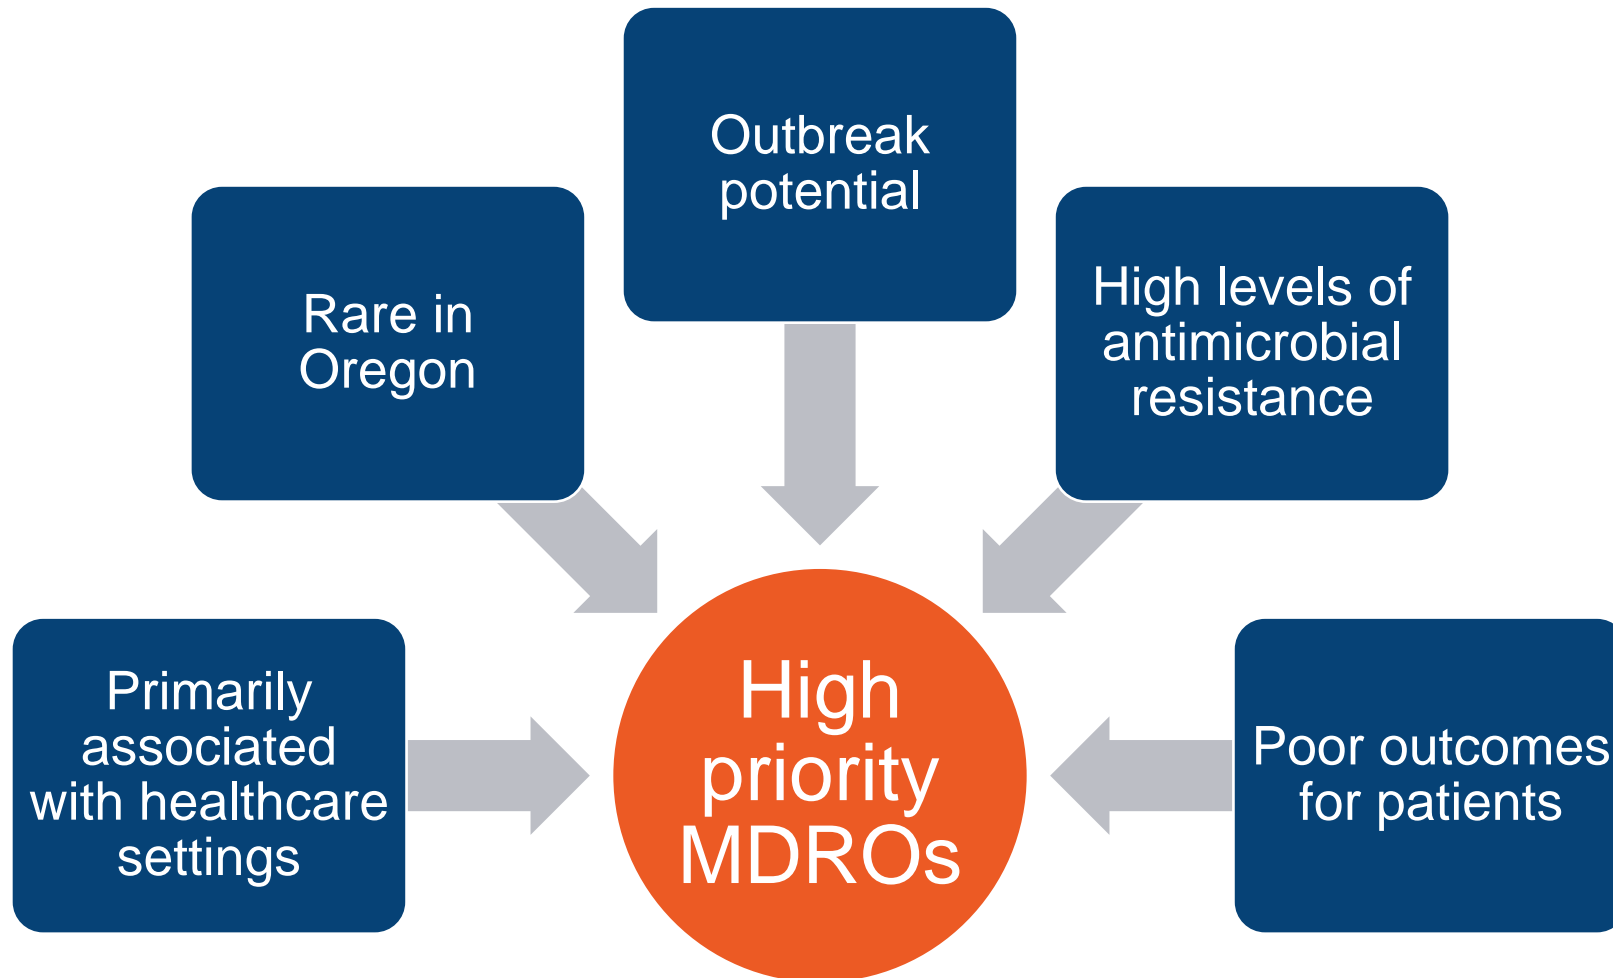

Develop laboratory capacity and promote consistent laboratory practices for the rapid detection of carbapenemase-producing and other AR organisms

Provide outbreak assistance

STAR focuses on emerging pathogen threats

STAR focuses on emerging pathogen threats

Candida (Candidozyma) auris

OREGON
HEALTH
AUTHORITY

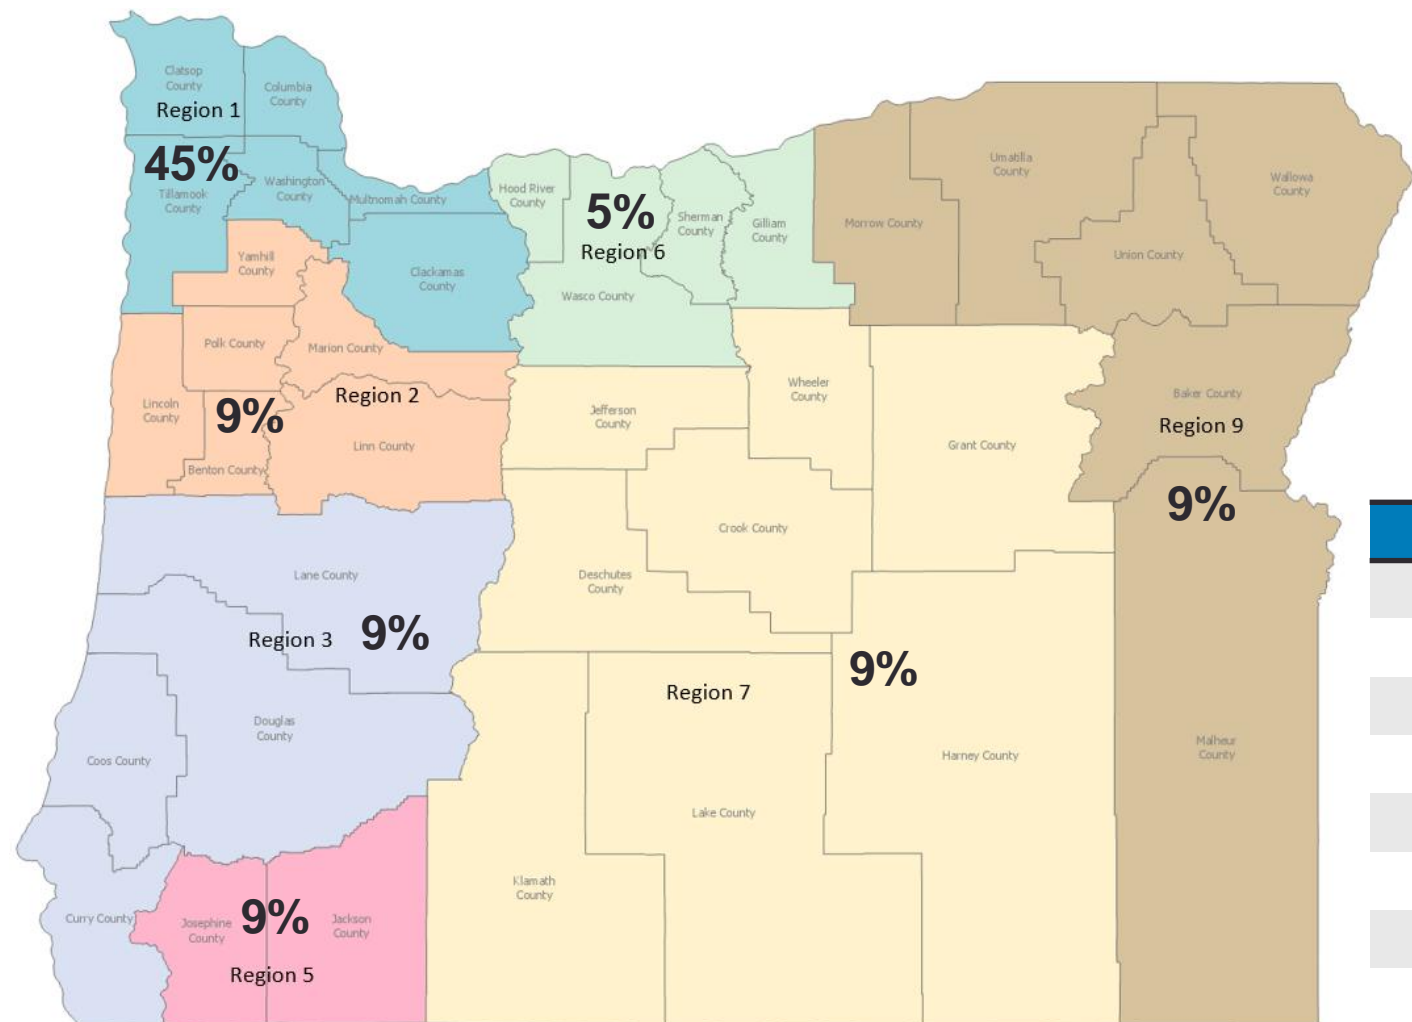

STAR
Housekeeping & Membership

STAR Advisory Committee Membership

- Minimum advisory committee commitment:
 - 1-2 annual meetings (virtual)
 - 2 years of participation
 - Contributions to resources, guidance documents, etc. as needed and available
 - Smaller group of OHA staff and consultants meets monthly to carry out this work
- 2027 = renewal year

Current STAR Advisory Committee Members

OR Region	% Members
Region 1	45%
Region 2	9%
Region 3	9%
Region 5	9%
Region 6	5%
Region 7	9%
Region 9	9%

Ongoing transmission of *Candida auris*
identified in Washington

Public Health
Prevent. Promote. Protect.
Region 4 Public Health
Clark, Cowitz, Skarmanis, Wabkial

Clinical cases of *Candida auris* reported in the
United States, 2016 - 2023

140 cases of *C. auris* reported in Washington state

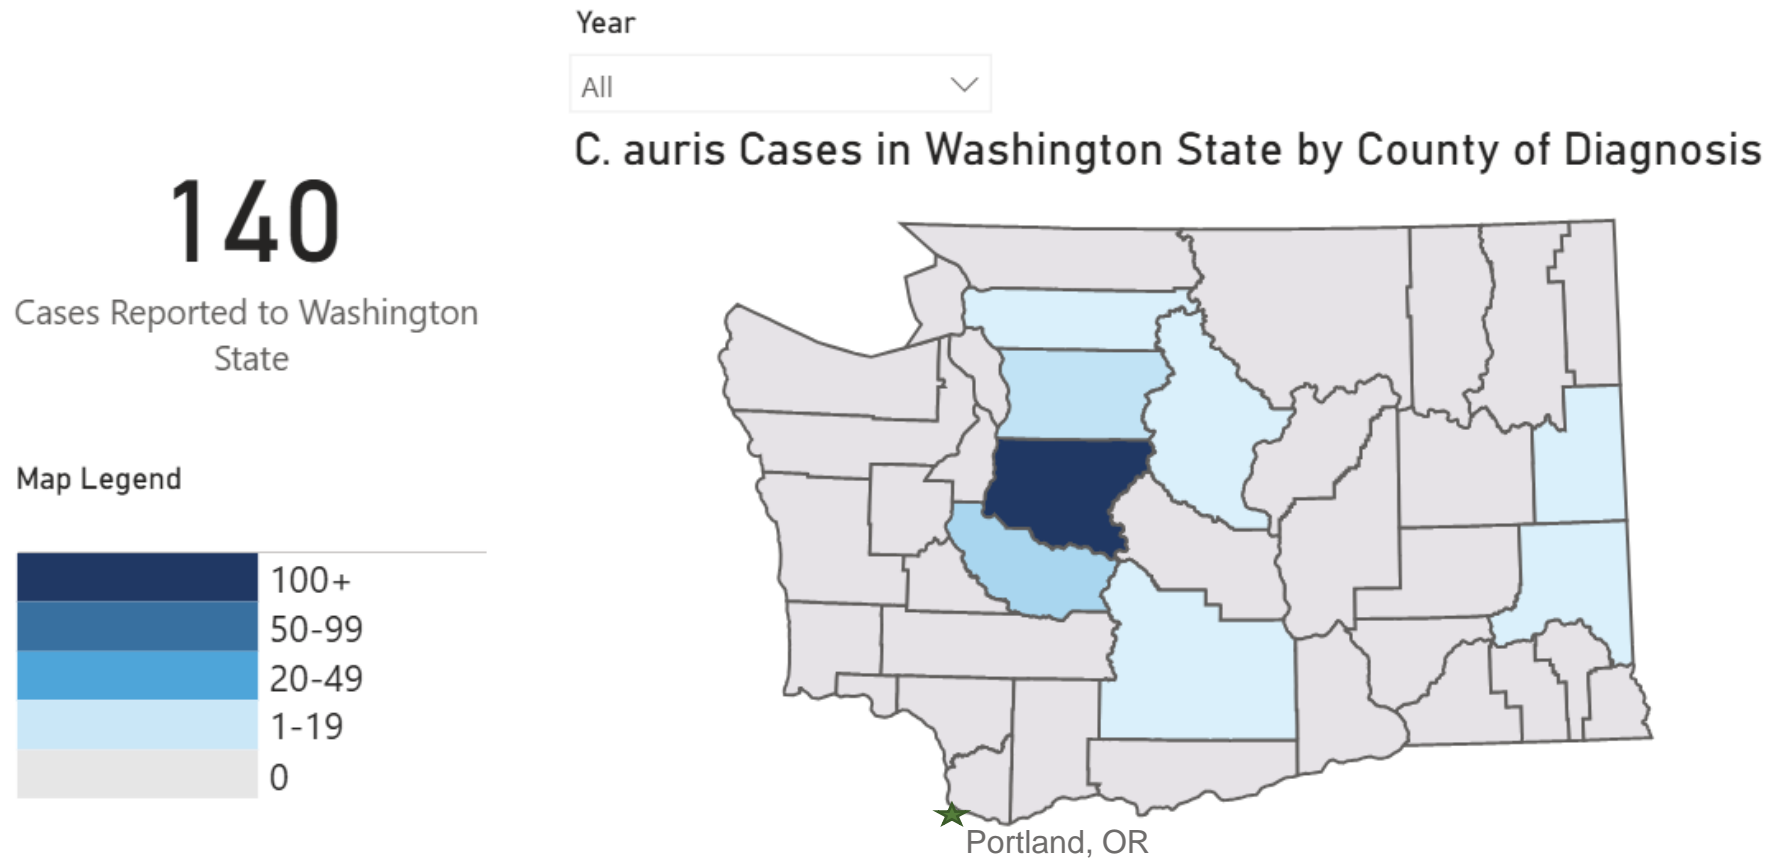

This graph shows the number of positive *C. auris* cases reported to Washington. Surveillance for *C. auris* began in 2017. The first Washington case was detected in 2023. Data only shows one *C. auris* identification per case.

Ongoing local transmission in WA state

This graph shows the total number of positive *C. auris* cases reported to Washington since 2023 and their suspected exposure location.

WA cases across 8 counties, no OR border counties

This map shows *C. auris* cases in Washington State since 2023. Data only shows one *C. auris* identification per case. Cases are displayed by county of collection facility at the time of diagnosis. If county of diagnosis is not in Washington, the county of residence is default.

Most new WA *C. auris* cases identified by screening

This graph shows the number of positive *C. auris* cases reported to Washington since 2023. Cases can be classified as either screening or clinical. Screening cases that later tested positive on a clinical culture are shown as "screening to clinical". Data only shows one *C. auris* identification per case.

In Oregon, *C. auris* remains rare for now

Candida auris identified in Oregon residents, Dec 2021 – Sep 2025

★ *C. auris* success so far

- Only outbreak limited to 3 cases in 2021
- Aggressive testing in response to new cases has not yet identified transmission
 - Strong IPC practices
- Some facilities now using List P at baseline, or moving towards this

Challenges based on recent *C. auris* epidemiology

Most newly identified *C. auris* cases have history of domestic healthcare outside Oregon

→ Admission screening of patients with domestic healthcare is more limited

Immunocompromised patients with chronic conditions present to ED frequently

→ Many opportunities for transmission

C. auris likely circulating at low levels in OR already

→ Many facilities do not routinely use list P products

Discussion

How can we maintain low *C. auris* prevalence?

[Close CPOs Text](#)

About CPOs

Carbapenemases are enzymes that break down many antibiotics, including carbapenems, making them ineffective. Carbapenemases are often produced from genes that can be transferred between bacteria, spreading easily from germ to germ. CDC considers carbapenemase-producing organisms (CPO) an urgent threat to public health because they cause high rates of mortality, are difficult to treat, and can spread easily in healthcare settings. Increased mortality is greatest among patients with invasive infections like blood-stream infections and those requiring high-acuity care.

Dashboard: clinical vs screening cases by year

Clinical Case vs. Screening²

Infections caused by CPO can cause high mortality and are difficult to treat. However, some CPO are identified from individuals who do not present with any symptoms of disease. These individuals are screened and considered colonized with CPO. Colonized individuals can spread CPO to others, and are at high risk for developing symptoms.

High-priority MDROs Admission Screening

Oregon has interim admission screening guidance

PUBLIC HEALTH DIVISION
Acute & Communicable Disease Prevention (ACDP)

***Candida auris* and Carbapenemase-Producing Organism (CPO) Interim Admission Screening Recommendations**

The Oregon Health Authority (OHA) has new interim recommendations for admission screening to identify patients colonized with *Candida auris* and carbapenemase-producing organisms (CPOs).

Oregon interim admission screening guidance

OHA *C. auris* and CPO Interim Admission Screening Recommendations

OHA recommends that Oregon hospitals, long-term acute care hospitals (LTACHs), and ventilator-capable skilled nursing facilities (vSNFs) test selected patients for *C. auris* and CPO colonization using one of the following strategies.

Strategy #1	Perform colonization testing on patients with the following exposures in the past 12 months: <ul style="list-style-type: none">• spent the night in a healthcare facility (hospital or long-term care) outside Oregon (including outside the United States), or• outpatient surgery outside the United States and Canada, or• hemodialysis outside the United States and Canada
------------------------	--

*Designed to capture the highest number of cases while balancing simplicity and specificity. Ideal when pairing *C. auris* and CPO admission screening.*

19 Oregon facilities testing on admission

Facility	↕	Year Started	↕	Organisms Screened
Salem Hospital		2023		C. auris, CPO
Asante Rogue Regional Medical Center		2024		C. auris, CPO
Asante Three Rivers Medical Center		2024		C. auris, CPO
Providence Oregon (8 facilities)		2024		C. auris, CPO
Portland VA Medical Center		2024		C. auris, CPO
PeaceHealth - Cottage Grove		2024		C. auris, CPO
PeaceHealth - Peace Harbor		2024		C. auris, CPO
PeaceHealth - Riverbend		2024		C. auris, CPO
McKenzie-Willamette Medical Center		2025		C. auris, CPO
Vibra Speciality Hospital of Oregon		2025		C. auris, CPO

Routine admission screening at 19 of 65 facilities*

Percent of healthcare facilities* with routine admission screening (n=19) or working towards it (n=6)

* Acute care hospitals, longterm acute care hospitals, and ventilator capable skilled nursing facilities
