Injection Safety, Hand Hygiene, and Healthcare Worker Influenza Vaccination

Oregon Public Health Division
Healthcare-Associated Infections HAI Program
HAI Program at OHA

- Surveillance and reporting
- Outbreak response
- Prevention
Objectives

• Injection Safety
  – Syringe and medication vial safety
  – Drug diversion
  – Oregon-specific risks and resources

• Hand Hygiene
  – Review current recommendations
  – Promotional resources for safe surgery

• Healthcare worker influenza vaccination
  – Oregon ASC progress towards HP2020 benchmarks
  – Strategies for promotion: What works?
INJECTION SAFETY

ONLY ONCE.
Safe injection practices are a set of measures to perform injections in an optimally safe manner for patients, healthcare providers and others. Learn about Safe Injection Practices >
Drug diversion can lead to infection

Hepatitis C concerns prompt response from McKay-Dee Hospital

4,800 patients have been notified about possible exposure to the virus

By Aldo Vazquez | avazquez@good4utah.com
Published 11/01/2015 05:46PM Updated 11/01/2015 06:05PM

- Hepatitis C virus (HCV) positive (genotype 2b) healthcare worker (HCW) fired November 2014 for diverting medication
- Former emergency room patient subsequently diagnosed with genotype 2b HCV infection
- HCV strain match, plus lack of other risk factors, led authorities to link cases
- Utah Department of Health notifies 4,800 patients of potential exposure, offering testing and counseling

Syringe Reuse: Unthinkable? Think again

Infection Control Assessment of Ambulatory Surgical Centers

Context
More than 5000 ambulatory surgical centers participate in the Medicare program. Little is known about infection control practices in ASCs. The Centers for Medicare & Medicaid Services (CMS) required all ASCs to complete a self-assessment and submit a risk assessment report. The results are made public, and centers are required to submit an action plan for improvement.

Objective
To describe infection control practices in a sample of ASCs in 3 states.

Design, Setting, and Participants
Seven state surveys were conducted in North Carolina, South Carolina, and Oklahoma. Surveys were conducted at 666 ASCs in 3 states.

Measurements and Main Outcomes
Proportion of facilities with control practices and incorporation of infection control policies in the electronic medical record.

Results
Overall, 68 ASCs (67.6%; 95% confidence interval [CI], 55.9%-77.9%) had at least 1 lapse in infection control; of 68 ASCs (76.8%; 95% CI, 60.6%-92.9%) had lapses identified in 3 or more of the 5 infection control categories. Common lapses included using single-dose medication vials for more than one patient (18/64; 28.1%; 95% CI, 18.2%-40.0%), failing to adhere to recommended practices regarding reprocessing of equipment (19/67; 28.4%; 95% CI, 18.4%-40.0%), and lapses in handling of blood glucose monitoring equipment (25/64; 40.6%; 95% CI, 33.4%-59.6%).

Conclusion
Among a sample of US ASCs in 3 states, lapses in infection control were common.

JAMA. 2010;303(22):2273-2279

FIGURE 2. Unsafe injection practices and circumstances that likely resulted in transmission of hepatitis C virus (HCV) at clinic A—Nevada, 2007.
Unsafe Injections: A National Issue

- Over 50 US outbreaks (1998-2014) due to unsafe injections
- >700 patients infected
- >150,000 patients notified of potential exposure
- Syringe reuse
- Improper use of single-use/multi-dose vials
- Improper arterial blood gas measurement
- Drug diversion

http://www.oneandonlycampaign.org/
Why what we know is just the tip of the iceberg

• Underestimated infections
  – Infections (especially HCV) may go undetected for years
  – Difficult to identify infected patients and link them to HCWs diverting drugs

• Underreported drug diversion
  – Healthcare facilities are reticent to publicize these events, especially if risk to patients appears low
  – Misaligned incentives on the part of agencies who place HCWs
  – “Culture of silence” among HCWs who witness substance abuse among co-workers
Why what we know is just the tip of the iceberg

- Underestimated infections
  - Infections (especially HCV) may go undetected for years
  - Difficult to identify infected patients and link them to HCWs diverting drugs

- Underreported drug diversion
  - Healthcare facilities are reticent to publicize these events, especially if risk to patients appears low
  - Misaligned incentives on the part of agencies who place HCWs
  - “Culture of silence” among HCWs who witness substance abuse among coworkers
Core principles of injection safety

- Foundational principles that guide prevention efforts across settings
- Underpin the CDC’s One and Only Campaign
- Incorporated into Infection Control Assessment and Response (ICAR) tools

Key elements of injection safety

1. Use aseptic technique when preparing medications

2. Cleanse the access diaphragms of medication vials with 70% alcohol before inserting a device into the vial

3. Never administer medications from the same syringe to multiple patients, even if the needle is changed or injection administered through intravenous tubing

4. Do not reuse a syringe to enter a medication vial or solution

Key elements of injection safety

5. Do not administer medications from single-use vials, ampoules, or bags or bottles of intravenous solution to more than one patient

6. Do not use fluid infusion or administration sets (e.g., intravenous tubing) for more than one patient

7. Dedicate multidose vials to a single patient whenever possible
   - If multidose vials will be used for more than one patient, they should be restricted to a centralized medication area
   - Should not enter the immediate patient treatment area

Key elements of injection safety

8. Dispose of used syringes and needles at the point of use in a sharps container that is closable, puncture-resistant, and

9. Adhere to federal and state requirements for protection of HCP from exposure to bloodborne pathogens.

Know your vials

**THE PROVIDER**

**DO YOU MULTI-DOSE?**

**A SINGLE-DOSE VIAL (SDV)**
- is approved for use on a SINGLE patient for a SINGLE procedure or injection.
- SDVs typically lack an antimicrobial preservative. Do not save leftover medication from these vials. Harmful bacteria can grow and infect a patient.
- **DISCARD** after every use!

**A MULTIPLE-DOSE VIAL (MDV)**
- is recognized by its FDA-approved label.
- Although MDVs can be used for more than one patient when aseptic technique is followed, *ideally even MDVs are used for only one patient.*
- MDVs typically contain an antimicrobial preservative to help limit the growth of bacteria. Preservatives have no effect on bloodborne viruses (i.e. hepatitis B, hepatitis C, HIV).
- **Discard MDVs** when the beyond-use date has been reached, when doses are drawn in a patient treatment area, or any time the sterility of the vial is in question.

**SIZE DOES NOT MATTER!**

SDVs and MDVs can come in any shape and size. **Do not assume** that a vial is an SDV or MDV based on size or volume of medication.

**ALWAYS check the label!**

ONEANDONLYCAMPAIGN.ORG

Oregon Health Authority
“Will the real multi-dose vial please stand up?”
Drug diversion spreads infection from healthcare providers to patients.

**Healthcare Provider**
with Hepatitis C or other bloodborne infection tampers with injectable drug.

**Contaminated Injection Equipment and Supplies**
Present in the patient care environment.

**Exposure of Patient**
Results from use of contaminated drug or equipment for patient injection or infusion.

Drug diversion occurs when prescription medicines are obtained or used illegally by healthcare providers. For more information, visit [CDC.gov/Injectionsafety/Drugdiversion](http://CDC.gov/Injectionsafety/Drugdiversion).
Mechanisms of diversion

- **False documentation** (e.g., medication not administered to the patient or “wasted” and instead used by the HCW)

- **Scavenging** of wasted medication (e.g., removal of residual medication from trash or used syringes)

- **Theft by tampering** (e.g., removal of medication from a container or syringe and replaced with similarly appearing solution that may be administered to patients)
Patient safety is compromised whenever drug diversion by HCWs occur.

Harms can include:

- Failure to receive prescribed medication (including pain management)
- Exposure to substandard care from an impaired HCW
- Exposure to potentially life-threatening infections
• Article discusses six outbreaks over the 10 year period beginning in 2004
• Implicated HCW: three technicians and three nurses
• Two outbreaks: tampering with opioids administered via patient-controlled pumps, associated with bacterial infections in 34 patients
• Four outbreaks: tampering with fentanyl syringes or vials
  ➢ HCV infection was transmitted from infected HCW to 84 patients
  ➢ Nearly 30,000 patients were potentially exposed and contacted regarding bloodborne pathogen testing
Outbreaks of Infections Associated With Drug Diversion by US Health Care Personnel

</tbody>
</table>
Hepatitis C outbreak, Colorado 2009

- Colorado Department of Public Health & Environment received reports of two acute HCV infections in patients who had undergone surgery at the same hospital.
- HCV-infected surgical technician stole fentanyl syringes that had been pre-drawn by anesthesia staff and left unlocked in the operating room (OR).
- HCW refilled contaminated syringes with saline to swap with fentanyl syringes.

At least 18 patients infected; over 8,000 patients notified:
- Notification included an ambulatory surgery center (ASC) that employed the HCW after being fired from CO hospital, and NY hospital of previous employment.
- HCW sentenced to 30-year prison term.

Multistate HCV outbreak, 2012

- 45 cases of HCV in New Hampshire, Kansas & Maryland associated with radiology technician

- HCW also diverted opiates in Michigan, Arizona, New York, and Pennsylvania

- Investigation reveals holes in licensure, certification, placement, hospital detection programs, and peer/supervisor reporting

- HCW sentenced to 39 years in prison
Context: Increasing presence of opioids

Figure 2. Rates of opioid overdose deaths, opioid sales, and opioid substance abuse treatment admissions, United States, 1999-2010
Context: Substance abuse in HCW tracks with population at large

- 10-12% of physicians will develop substance use disorder during careers\(^1,2\)
- 5 year British Medical Journal (BMJ) study found that physicians with substance use disorders are
  - 87% male
  - 36% abused opioids
  - 50% abused alcohol
  - 14% history of IDU
- Less data on non-physician HCW substance abuse, but diversion documented in these HCWs

---

1. Hughes, JAMA, 1992
Rates of acute HCV cases in Oregon were 50% higher than the national rate during 2007–2011.
High prevalence = High risk & burden

Facts at a glance

- 81% of U.S. residents infected with HCV were born between 1945 and 1965.
- At least 50% of persons infected with HCV are unaware of their infection.

Figure A. Future burden of HCV-related morbidity and mortality in the United States

DCC is defined as decompensated cirrhosis and HCC as hepatocellular carcinoma.
Adapted from Ward JW.17
HCV morbidity & mortality in Oregon

- The mortality rate in Oregon from HCV was nearly twice the national average in 2011.

HAND HYGIENE
Hand hygiene: A no brainer?

- >150 years of evidence: hand hygiene (HH) prevents infections
- Alcohol-based handrubs (ABHR) increases HH, remains low (<40%)
- Reasons cited
  - Inconvenient HH products
  - Understaffing or busy
  - Skin irritation
  - Cultural issues
Your 5 Moments for Hand Hygiene

1. Before touching a patient
2. Before clean/aseptic procedure
3. After body fluid exposure risk
4. After touching a patient
5. After touching patient surroundings

2014
Surgical hand antisepsis

• Goal: reduce risk of patient SSI by
  – Removing transient organisms from hands
  – Suppressing growth of resident microorganisms for duration of procedure

• Challenges
  – Minimizing skin irritation
  – Standardizing evidence-based practices
  – New and evolving products
Hand preparation for surgery: SHEA Compendium, 2014

- ABHR formulated for surgical use
  - Rapid action + persistence
  - Superior reductions to traditional scrubs
  - Less damaging to skin
  - Equivalent to scrubs for SSI prevention

- Follow manufacturers instructions
  - Multiple applications required
  - Longer rub time than for routine HH
# Hand preparation for surgery

Implementation guidance

Implementing AORN Recommended Practices for Hand Hygiene

April 2012

MARcia Patrick, MSN, RN, CIC;
Sharon A. Van Wicklin, MSN, RN, CNOR, CRNFA, CPSN, PLNC

Association for periOperative Registered Nurses

Nails: Nothing over 2mm (0.08in)

Figure 1. Nails should not extend beyond the tips of the fingers.
Can healthcare personnel wear gel or shellac nail polish in the perioperative setting?

Can artificial nails be worn by personnel in the operating room?

Does the first surgical hand scrub of the day have to be soap and water before using surgical hand rub products?

A standardized surgical hand scrub with a soap (antimicrobial agent), nonabrasive sponge, and water does not have to be the first surgical hand scrub of the day before an alcohol-based surgical hand rub product is used, unless it is recommended in the manufacturer’s instructions for use. The surgical hand scrub reduces the transient and resident flora of the hands, which also may reduce health care-associated infections. A standardized surgical hand scrub using an alcohol-based hand rub product will decrease transient and resident flora on the hands. Hand washing does however need to be performed before the first surgical hand scrub of the day.

Updated June 12, 2015
Hand Hygiene in Healthcare Settings

Hand hygiene is one way to prevent infections. Hand hygiene can prevent the spread of germs, including those that are resistant to antibiotics and are becoming difficult, if not impossible, to treat. Studies show that healthcare providers perform hand hygiene less than half of the times they should. Practicing hand hygiene is one of the most important ways to stop the spread of infections in hospitals that affect 1 in 25 patients on any given day.

World Hand Hygiene Day is May 5th

**CAUTI** – Catheter-associated urinary tract infection  
**MRSA** – Methicillin-resistant *Staphylococcus aureus*  
**SCIP** – Surgical Care Improvement Project

---

**ADDITIONAL MANDATORY REPORTING**

**Communication of Multidrug-resistant Organisms during Patient Transfer:**

When a referring healthcare facility transfers or discharges a patient who is infected or colonized with a multidrug-resistant organism (MDRO) or pathogen requiring Transmission-based Precautions, transfer documentation must include written notification of the infection or colonization to the receiving facility.

**Mandatory outbreak reporting:** Healthcare facilities and providers are required to report outbreaks of HAI including MDROs of public health significance and common source outbreaks.

**Multidrug-resistant organism (MDRO):** an organism that causes human disease that has acquired antibiotic resistance, as listed and defined in the *Centers for Disease Control and Prevention’s Antibiotic Resistance Threats in the United States, 2013*. MDROs include but are not limited to:

- a. Methicillin-resistant *Staphylococcus aureus* (MRSA)
- b. Vancomycin-resistant *Enterococcus* (VRE)
- c. Carbapenem-resistant *Enterobacteriaceae* (CRE)
- d. Multidrug-resistant *Acinetobacter baumannii*
- e. Multidrug-resistant *Pseudomonas aeruginosa*
- f. Drug-resistant *Streptococcus pneumoniae*
- g. Other Gram-negative bacteria producing extended-spectrum beta-lactamases (ESBL),
- h. Toxin-producing *Clostridium difficile*
Annual Influenza Summary

Each hospital, ASC, Dialysis facility, LTCF, and IRF must submit an annual survey to the Authority, on a form prescribed by the Authority, no later than May 31, regarding influenza vaccination of staff. Facilities must report at least the following information:

(1) Number of staff with a documented influenza vaccination during the previous influenza season;

(2) Number of staff with a documented medical contraindication to influenza vaccination during the previous influenza season;

(3) Number of staff with a documented refusal of influenza vaccination during the previous influenza season; and

(4) Facility assessment of influenza vaccine coverage of facility staff during the previous influenza season and plans to improve vaccine coverage of facility staff during the upcoming influenza season.

Facility-specific HCW influenza vaccination: Consumer report

What can patients and families do to not get influenza?
- Ask for influenza vaccination from your health care provider for you and your family every October.
- Clean your hands often, especially after blowing your nose or coughing.
- Cover your face when you sneeze and cough, then clean your hands.
- Avoid going to work or school when sick.
- Ask your health care provider if they got the influenza vaccination this year.

Vaccine promotion strategies

Oregon 2016 HAI Hospital Survey

Healthcare Personnel Influenza Vaccination Promotion Strategies

* 59. Which of the following strategies did you use to deliver and promote healthcare personnel influenza vaccination at your facility? Check all that apply.

- [ ] Mobile carts
- [ ] Centralized mass vaccination fairs
- [ ] Peer vaccinators
- [ ] Provided vaccination in congregate areas (e.g., conferences/meetings or cafeteria)
- [ ] Provided vaccination at occupational health clinic
- [ ] Incentives
- [ ] Reminders by mail, email, pager, or text
- [ ] Coordination of vaccination with other annual programs (e.g., tuberculin skin testing)
- [ ] Campaign including posters, flyers, buttons, fact sheets
- [ ] Required mask use during influenza season among personnel declining influenza vaccination
- [ ] Required declination form
- [ ] Other (please specify)
Vaccine promotion strategies

Figure 1. Use of vaccine promotion strategies by facility type: averaged over 2012–13 and 2013–14 influenza seasons
Vaccine promotion strategies with high impact potential: Focus on ASCs

**Employee Vaccination Rates by Rate of Strategy Adoption for ASCs:**

- **2012-2013 & 2013-2014 Influenza Seasons Combined**

**Strategies with high impact potential:**
- Adaptors have higher than average vaccination rates
- Currently low adoption rates

**Overall (aggregate) influenza vaccination rate for ASC employees averaged across two seasons: 70.5%**

Next steps towards HCW influenza vaccination

- Improve interactive map
- Examine rates by county/region
- Support promotion efforts
  - Collaborate with Immunization & Preparedness
  - Develop toolkit
  - Engage counties and HPP regions
Updated interactive map for Oregon: Benchmarking Healthy People goals

Healthcare Worker Influenza Vaccination

- 2014-2015 Health Care Worker Influenza Vaccination Report (pdf)
- Effective Strategies to Promote Staff Influenza Vaccination in Oregon Healthcare Facilities (pdf)
- Impact of Vaccine Promotion Strategies in Oregon Healthcare Facilities-ID Week 2015: Influenza Vaccination Poster (pdf)

Healthcare workers can acquire influenza from patients or transmit influenza to patients and other staff. Annual vaccination of health care workers can prevent influenza transmission.

This report presents healthcare worker influenza vaccination rates for 62 Oregon hospitals and 137 skilled nursing facilities, and 85 ambulatory surgery centers.

Previous reports are listed under Archived Reports.
Thank you for your collaboration to improve care for Oregonians!
