SUMMARY:
This report includes total daily counts of ED and urgent care visits in Oregon and counts for heat-related illness, asthma-like complaints, submersion events, and harmful algal bloom exposures through August 15, 2021.

WHAT ARE YOU SEEING?
- Visits for heat-related illness have returned to expected levels.
- No increases for total visits or asthma-like visits, submersion events, and visits related to cyanobacteria blooms.

Summer hazard-related visits can be associated with outdoor conditions, extreme weather events, or recreational activities. The charts below show visit counts matching each query. See the left sidebar for more information on how to read the charts.

TOTAL VISITS QUERY

FINDINGS
In this chart, we see that total visits are currently at expected levels.
HEAT-RELATED ILLNESS (HRI) QUERY looks for the codes for HRI (including ICD-9 code 992 and ICD-10 code T67) or words like “heat,” “sun stroke,” and “hyperthermia.”

FINDINGS
In this chart, we see that HRI visits have returned to expected levels after a recent peak. This is probably due to warmer weather experienced in some parts of the state during those time periods. To reduce the risk of HRI, drink plenty of fluids, wear light colored clothing and sunscreen, and schedule outdoor activities during cooler times of the day.

ASTHMA-LIKE QUERY looks for the code for asthma (ICD-10 code J45) or words like “asthma” and “reactive airway disease.”

FINDINGS
In this chart, we see that visits for asthma-like complaints are currently at expected levels. Summer hazards such as poor air quality, smoke, extreme heat, and even thunderstorms can trigger asthma attacks. Avoid outdoor activities when air quality is unhealthy.
SUBMERSION AND NON-FATAL DROWNING QUERY looks for the codes for “non-fatal drowning” (ICD-9 code 994.1 and ICD-10 code T751) or words like “drown” or “under water” as long as the patient doesn’t say it “feels like drowning.”

FINDINGS
In this chart, we see that visits for submersion events are currently at expected levels. Most drowning deaths and injuries are preventable. Many visits were for children. Always supervise children when they are in or near water, including bathtubs. Wear personal flotation devices when out on boats, near open bodies of water or participating in water sports. Learn how to swim and how to perform CPR. Never swim alone, and always wear a personal flotation device when boating.

CYANOBACTERIA BLOOMS (HARMFUL ALGAL BLOOMS)

CYANOBACTERIA BLOOMS looks for the GI syndrome along with words like “lake” or “swim” or “river”. This query does not look for diagnosis codes.

FINDINGS
In this chart, we see that visits related to cyanobacteria exposure are currently at expected levels. This query looks at visits that include a subset of symptoms that may be related to recreational exposure to cyanobacteria exposure. Be on the watch for cyanobacteria blooms when recreating in Oregon lakes, rivers and reservoirs.
**VISIT INFORMATION** is collected from EDs and urgent care centers across the state. Currently, all 60 eligible hospitals are sending ED data every day for syndromic surveillance. Some urgent care centers are currently reporting, and we are in the process of onboarding more.

**SEASONAL HAZARDS** for summer include elevated temperatures and dry conditions, which can lead to wildland fires and unhealthy air quality in the Pacific Northwest. Water-related activities include the risk of submersion, drowning, or exposure to harmful algal blooms.

**MONITORING** Oregon ESSENCE provides key information on population health during seasonal hazard events. ESSENCE users can now reproduce these queries themselves and look at regional health effects not captured in the statewide view by following instructions posted at www.healthoregon.org/essence

**SYNDROMIC SURVEILLANCE** is the near real-time monitoring of key health indicators in emergency department (ED) and urgent care visits. Oregon’s syndromic surveillance project (Oregon ESSENCE) tracks the number of visits for specific patient symptoms using chief complaints (what the patient says is the reason for their visit) and discharge diagnosis codes. We look at symptoms associated with known health effects of seasonal hazards.

**SIMILAR SYMPTOMS** are grouped together into “syndrome” categories. For example, “wheezing” and “difficulty breathing” are grouped into the asthma-like query. By comparing the counts we see against those we would expect to see, we can identify trends in visits.

**HEALTH EFFECTS OF SUMMER HAZARDS**
- Extreme heat makes many groups, including people with chronic disease, young children, older adults, and outdoor workers, vulnerable to heat-related illness (HRI). HRI refers to a variety of conditions resulting from elevated body temperatures such as heat stroke, heat syncope (fainting), heat exhaustion, and heat cramps.
- Wildfire smoke, air pollution, and pollen can exacerbate respiratory conditions such as asthma.
- Recreational activities in pools and natural waterways can lead to an increase in submersion and near-fatal drownings.
- As temperatures heat up during spring and summer, algae blooms may form in lakes, rivers, and reservoirs. Exposure to cyanobacteria can result in symptoms including skin rash, diarrhea, cramps, vomiting, numbness, and fainting.

**SYNDROMIC COVERAGE** by county is detailed in the map below.
