

# COVID-19 Weekly Report

Oregon's Weekly Surveillance Summary  
Novel Coronavirus (COVID-19)

Oregon Public Health Division

Published June 17, 2020

## Background

COVID-19 Weekly Report data will be finalized every Sunday at 11 p.m. PDT, and the report will be published on Wednesday. **Please note that the data reported here are continually being updated. For daily up-to-date information visit the [OHA COVID-19 web page](#).**

As of 11 p.m. on Sunday, June 14, there have been 5,820 cases of COVID-19 reported to the Oregon Health Authority. Of these cases, 195 (3.3%) are presumptive cases. Presumptive cases are people without a positive PCR test who have COVID-19-like symptoms and had close contact with a confirmed case. Though not confirmed by a positive diagnostic test, presumptive cases have a high likelihood of having COVID-19 because of the specific nature of the symptoms and known exposure. Presumptive cases are encouraged to seek testing to confirm that they do have COVID-19. Presumptive cases who test positive are recategorized as confirmed cases.

Not all cases have been interviewed at the time of this report. These data represent a snapshot of COVID-19 risk factors, clinical and demographic characteristics and include data on cases with pending investigations. The data shown in this report come from Orpheus, which is an electronic disease surveillance system for reportable diseases for the state of Oregon.

During the week of June 8–14, 24,708 persons were tested for COVID-19 in Oregon and 3.1% of those people had a positive result. Not all positive tests represent new cases, some positive tests come from specimens collected from people who had already been counted as presumptive cases. These represent tests done at all locations, including commercial non-hospital-based laboratories, hospital laboratories and Oregon State Public Health Laboratory. Based on the current received inventory volumes and what has been distributed, the state's weekly testing capacity remains at 37,702.

*Please note the original version of this document posted on June 17, 2020 had a LTCF outbreak as both active and resolved and a duplicate resolved LTCF outbreak. This version corrects those error. OHA apologizes and thanks readers who brought the errors to attention.*

## Weekly Report Summary

During the week from Monday, June 8, through Sunday, June 14, OHA recorded 898 new cases of COVID-19 infection, a 44% increase from the previous week (620 new cases). In addition, 16 Oregonians were reported to have died, compared with 10 deaths in the preceding week. Statewide, cumulative reported COVID-19 cases have reached 5,820 (13.5 cumulative cases per 10,000 Oregonians) and 180 people (0.4 cumulative deaths per 10,000 Oregonians) are known to have died with COVID-19 since the beginning of the outbreak.

For the third week in a row, newly reported COVID-19 cases increased over the previous week. During the week ending June 14, the number of COVID-19 tests\* reported (24,708) increased substantially (35%) compared to the preceding week while the percentage of tests positive remained approximately the same (3.1% vs. 3.0% during preceding week). The number of new infections reported daily are now at the highest levels seen in Oregon since the emergence of COVID-19. Fortunately, hospitalizations and deaths remain well below their peaks. However, hospitalizations and deaths from COVID-19 typically occur two or more weeks after onset of illness, so peak hospitalizations and deaths from current cases will likely occur in two to three weeks. The percentage of emergency department (ED) visits for COVID-19-like illness remain below 1%, suggesting that many of the cases now being reported are lower in severity or otherwise not coming through EDs.\*\* Large workplace outbreaks (Table 6) continue to account for much of the recent case burden, although some counties

Data are provisional and subject to change.

without large outbreaks have also experienced increases. Despite increasing case loads, since early May, local public health staff have successfully contacted at least 95% of new cases to begin investigating and initiate contact tracing, a key indicator for public health control efforts.

Figures 1 and 4–7 are new for this week's report. These depict weekly trends in reported COVID-19 cases by epidemiologic link to other known cases, age, sex, race, and ethnicity. Figure 1 indicates that outbreak-associated cases comprise approximately a third of cases each week, with periodic blips associated with large outbreaks. Figure 4 indicates that female cases slightly exceeded male cases early in the outbreak, but this trend has often reversed itself during the immediate past five weeks. Figure 5 shows that new cases among people aged 50 years and older have declined from approximately 50% of all cases early in the outbreak to approximately 25% during recent weeks, perhaps due to large workplace outbreaks and increased testing in work settings. Figures 6 and 7 reveals that relative numbers of new cases by race and ethnicity have remained fairly similar over time.

OHA continues to monitor trends closely. Recent increases in new cases led Governor Kate Brown to pause reopening statewide as OHA and local public health authorities continue to investigate ongoing outbreaks and build the workforce and infrastructure necessary to ensure increased case investigation, contact tracing and support for people who need to isolate or quarantine. State and local officials will continue to emphasize the critical importance of maintaining physical distance, practicing hand hygiene, limiting in-person gatherings and wearing face coverings where physical distancing is difficult or impossible.

Table 5 lists active clusters of three or more cases or one or more deaths in care facilities, senior living communities, and other congregate living setting. Eleven facilities (three fewer than last week) have active clusters, involving more than 169 total patients (down from 201) patients, a welcome decline. Table 6 lists active workplace outbreaks.

Recent data on mortality in Oregon, including deaths related to COVID-19, are available at <https://public.tableau.com/profile/oha.center.for.health.statistics#!/>

\*Includes polymerase chain reaction (PCR) for viral RNA. Does not include antibody tests or tests for viral proteins known as antigen tests.

## Clinical Characteristics, Risk Factors and Demographic Characteristics

Figure 1 shows the number of cases reported weekly by their epidemiological link. Figure 2 provides information on signs and symptoms from all COVID-19 cases. Of all 5,820 cases, 77.4% (n=4,503) reported having signs and symptoms of COVID-19. The two most commonly reported symptoms are cough (n=3,355, 57.6%) and headache (n=2,647, 45.5%). Figure 3 provides information on risk factors from all COVID-19 cases. The two most common risk factors are having contact with a known COVID-19 case prior to symptom onset (n=3,709, 63.7%) and having underlying medical conditions (n=2,980, 51.2%). Note that a person may report more than one sign/symptom or risk factor.

Figure 1. Epidemiologic link of COVID-19 cases by week

\*MMWR Week: The MMWR week is the week of the epidemiologic year assigned to notifiable infectious diseases for the purposes of incidence reporting and publishing. MMWR week supports reporting of notifiable infectious disease incidence data at the national level. [https://www.cdc.gov/nndss/document/MMWR\\_Week\\_overview.pdf](https://www.cdc.gov/nndss/document/MMWR_Week_overview.pdf)

Sporadic: Cases with a sporadic epidemiologic link do not have known exposure to another case or outbreak.

Outbreak: Cases with an outbreak epidemiologic link have a shared, defined exposure with at least one other case. For example, a defined exposure could be an event, a workplace, a congregate facility, etc.

Cluster: Cases with a cluster epidemiologic link had contact with another case, but the exposure is not well defined. For example, cases from two households may have interacted many times prior to illness onset.

Household: Cases with a household epidemiologic link were exposed to another case in their household.

## Recovery

OHA staff periodically call people with reported cases of COVID-19 who experienced fever, cough, shortness of breath or diarrhea and were initially interviewed before May 1, when OHA changed its definition of recovery, to inquire about resolution of symptoms. This group includes 1,885\* people who were all diagnosed before mid-April and have not succumbed to their illness. Among these, 1,635 (86.3%) of cases are considered recovered, and a recovery date is available for 1,377 people. It is this group of 1,377 for which recovery times are depicted in Figure 8. Of these 1,885 people, 55 (2.9%), have yet to recover, and current recovery status is not yet available for 195 (10.3%) of these cases. People are assumed to have recovered three days after resolution of all symptoms. The median time to recovery among non-hospitalized symptomatic cases is presently 20 days (interquartile range: 15–29 days); among symptomatic cases who were hospitalized it is 25 days (interquartile range: 18–37 days).

\*Case counts have decreased from 1894 to 1885. This is because this case count excludes people who have died. Onsets may also have been updated when OHA staff call and ask them about their illness

## Weekly Care Facility, Senior Living Communities and Congregate Living Settings Report

OHA is publishing data on cases and deaths in care facilities, senior living communities, and congregate living settings that have three or more confirmed COVID-19 cases or one or more deaths (Table 5). Facilities with outbreaks that are considered resolved are moved to the closed outbreak list (Table 6). An outbreak is considered resolved if there are no new cases identified for 28 days after the last case onset. This list does not include correctional facilities.

In addition to the facilities listed, OHA is aware of six adult foster homes that have three or more confirmed COVID-19 cases or one or more deaths. Because foster homes typically have relatively few residents, OHA follows the Oregon Department of Human Services practice in not naming these locations to protect privacy.

To date, there has been one COVID-19 death of a staff person who worked in a congregate care setting. To protect patient privacy, OHA does not report employee deaths by workplace or other potentially identifying information. Similar information will only be released in the future in weekly reports if OHA determines that such information, in addition to other information it releases, and information released by other agencies, like the Centers for Medicaid and Medicare, cannot be used to identify an individual.

Novel Coronavirus (COVID-19)

Oregon Public Health Division

Published June 17, 2020

## Weekly Workplace Outbreak Report

OHA is publishing data on cases in workplace outbreaks. Given a cluster of cases in space and time, within plausible incubation periods for the pathogen, OHA epidemiologists will consider cases to be related—i.e., part of a workplace outbreak—unless a more likely alternative source for acquisition is identified. Any suspected workplace outbreak is required to be reported to the local public health authority (see OAR 333-018-015). Local health department and Tribal partners conduct ongoing public health investigations to identify workplace outbreaks. This list of outbreaks will be updated as investigations continue, and we learn about epidemiologic links between cases. This list may not reflect all the workplace outbreaks in Oregon.

In order to protect privacy, OHA is only reporting workplace outbreaks with five or more cases and only for workplaces where there are at least 30 employees. If more than 50% of the employees are COVID-19 cases, then we will not report specific case numbers. Case counts include all persons linked to the outbreak, which may include household members and other close contacts. The list below includes active workplace outbreaks (Table 7), meaning that there has been a case within the past 28 days. Outbreaks that are resolved will be moved to a separate table of resolved outbreaks (Table 8).

The presence of correctional facilities and food packing and agricultural worksites on this list highlights the challenges of controlling COVID-19 in settings where people must work or live in close proximity. In addition, people of color are overrepresented in agricultural and correctional settings, perhaps contributing to higher rates of COVID-19 observed in these groups. OHA publishes these data in response to public request, but with some concern that workers or staff members at these workplaces might be subject to discrimination.

State and local public health officials work intensively with staff at workplaces where outbreaks are identified to isolate sick workers, test and quarantine those who have been exposed and implement workplace changes to reduce risk of transmission. Unless otherwise noted, public health officials have determined that these workplaces, their employees and their products do not pose significant risk to the public. Employees of a business with a workplace outbreak should never be subjected to discrimination or excluded from patronizing other businesses. In fact, discriminating against employees or avoiding products might jeopardize the economic viability of essential local businesses.

Employers can support their employees with policies that make sure that ill workers are not in the workplace and are not penalized for taking sick leave. Employers should ensure that workers are aware of and understand these policies.

There have been eight COVID-19 deaths associated with the workplace outbreaks below. To protect patient privacy, OHA does not report employee deaths by workplace.

## Weekly COVID-19 Hospitalizations

OHA is publishing data on the number of COVID-19 hospitalizations by hospital in the prior week; data are from HOSCAP. Table 9 lists all hospitals which, at some time during the week reported, had 10 or more suspected/confirmed COVID-19 patients. The left column shows the highest number of suspected and confirmed COVID-19 hospitalized patients for each hospital between 6/1/2020 and 6/7/2020. The right column shows the highest number of confirmed COVID-19 patients hospitalized during the same time period.

**Table 9. Hospitals reporting 10 or more COVID-19 patients.**

Hospital Name	Max Patients	Maximum Confirmed Patients
Salem Health Hospital	23	14
OHSU Hospital	17	<10
Providence Portland Medical Center	15	<10
Providence St. Vincent Medical Center	11	<10

The hospitals listed in Table 10 reported at least 1 and at most 9 suspected or confirmed COVID-19 patients between 6/1/2020 through 6/7/2020. Hospitals not listed in either table did not report any suspected or confirmed patients during the week.

**Table 10. Hospitals reporting 1–9 COVID-19 patients.**

Hospital
Adventist Health Portland
Asante Rogue Regional Medical Center
Bay Area Hospital
Good Samaritan Regional Medical Center
Good Shepherd Health Care System
Hillsboro Medical Center
Kaiser Permanente Sunnyside Medical Center
Kaiser Permanente Westside Medical Center
Legacy Emanuel Medical Center
Legacy Good Samaritan Medical Center
Legacy Meridian Park Hospital
Legacy Mount Hood Medical Center
Legacy Silverton Medical Center
McKenzie-Willamette Medical Center
Mercy Medical Center
Mid-Columbia Medical Center
OHSU Doernbecher Children's Hospital
PeaceHealth Sacred Heart Medical Center at Riverbend
Providence Hood River Memorial Hospital
Providence Medford Medical Center

Data are provisional and subject to change.

## Cases by ZIP Code

OHA is publishing data on cases at the ZIP code level (Table 11). In order to protect patient privacy, ZIP codes with small populations or small numbers of cases will be aggregated. Cases from ZIP codes with less than 1,000 people will be reported as one number. ZIP codes that have fewer than 10 cases will be reported as "1-9". ZIP codes that do not have any cases will have a "0". ZIP code population was retrieved from the 2010 US Census Bureau ZIP Code Tabulation Area.

**Table 11. COVID-19 cases by ZIP code**

ZIP code	Number of cases	Cases per 10,000
