Oregon's Weekly Surveillance Summary  
Novel Coronavirus (COVID-19)

Oregon Public Health Division

Published June 24, 2020

## Background

COVID-19 Weekly Report data will be finalized every Sunday at 11 p.m. PDT, and the report will be published on Wednesday. **Please note that the data reported here are continually being updated. For daily up-to-date information visit the [OHA COVID-19 web page](#).**

As of 11 p.m. on Sunday, June 21, there have been 7,083 cases of COVID-19 reported to the Oregon Health Authority. Of these cases, 247 (3.5%) are presumptive cases. Presumptive cases are people without a positive PCR test who have COVID-19-like symptoms and had close contact with a confirmed case. Though not confirmed by a positive diagnostic test, presumptive cases have a high likelihood of having COVID-19 because of the specific nature of the symptoms and known exposure. Presumptive cases are encouraged to seek testing to confirm that they do have COVID-19. Presumptive cases who test positive are recategorized as confirmed cases.

These data represent a snapshot of COVID-19 risk factors, clinical and demographic characteristics and include data on cases with pending investigations. Not all cases have been interviewed at the time of this report. The data shown in this report come from Orpheus, which is an electronic disease surveillance system for reportable diseases for the state of Oregon.

During the week of June 15–21, 30,773 persons were tested for COVID-19 in Oregon and 3.7% of those people had a positive result. Not all positive tests represent new cases, some positive tests come from specimens collected from people who had already been counted as presumptive cases. These represent tests done at all locations, including commercial non-hospital-based laboratories, hospital laboratories and Oregon State Public Health Laboratory. Based on the current received inventory volumes and what has been distributed, the state's weekly testing capacity is estimated at 34,000.

## Weekly Report Summary

For the fourth week in a row, newly reported COVID-19 cases increased over the previous week. During the week from Monday, June 15, through Sunday, June 21, OHA recorded 1,263 new cases of COVID-19 infection, a 40% increase from the previous week (898 new cases). In addition, 12 Oregonians were reported to have died, compared with 16 deaths in the preceding week. Statewide, cumulative reported COVID-19 cases have reached 7,083 (16.5 cumulative cases per 10,000 Oregonians) and 192 Oregonians (0.4 cumulative deaths per 10,000 Oregonians) are known to have died with COVID-19 since the beginning of the outbreak.

The number of COVID-19 tests\* reported (30,773) increased substantially (25%) compared to the preceding week, while the percentage of tests positive increased slightly (3.7% vs. 3.1% during the preceding week). The daily number of new infections again achieved new highs in Oregon since the emergence of COVID-19. However, available evidence suggests average severity of illness among reported cases is lower than it was early in the outbreak: hospitalizations and deaths remain well below their peaks, even after reported cases have been surging for 4 weeks, and the percentage of emergency department visits attributable to COVID-19-like symptoms remains below 1%.\*\* ICU bed usage remains well under capacity statewide.\*\*\* In addition, median age of people with newly diagnosed COVID-19 infection is declining as more cases are being diagnosed in people younger than 50 years of age (Figure 5).

Taken together, these data suggest that while underlying COVID-19 incidence has likely increased somewhat since Phase 1 re-opening in Oregon, increased availability and application of testing has increased the

# COVID-19 Weekly Report

Novel Coronavirus (COVID-19)

Oregon Public Health Division

Published June 24, 2020

proportion of COVID-19 infections that are diagnosed. Earlier and more complete recognition of cases makes contact tracing, quarantine and isolation more effective tools for reducing transmission.

Large workplace outbreaks (Table 7) continue to account for much of the recent case burden, however their relative contribution has declined this week as sporadic cases increased (Figure 1). Once again, despite ever increasing caseloads, local public health staff have successfully contacted close to 95% of new cases within 24 hours to begin investigating and initiate contact tracing, a key indicator of public health control efforts as contact tracing infrastructure continues to expand.

Figure 5 shows that cases have substantially increased for all age groups of people younger than 50 years of age, including young children and teens, although hospitalizations remain rare in children, and, thankfully, no deaths have been reported in any person younger than 30 years of age. The reasons for the shift are not known, but some likely factors include increased testing overall, increased testing of asymptomatic and mildly symptomatic household members of people with diagnosed cases, returns to workplaces and some public gatherings by working-age people, and routine testing in some workplaces such as health care and food production facilities.

OHA continues to monitor trends in case counts, hospital and healthcare capacity and changing age distribution of cases. Though counts have increased, other indicators suggest that health care and resources remain sufficient and that local public health authorities continue to build capacity for investigating outbreaks, tracing contacts and supporting people who need to isolate or quarantine. State and local officials will continue to emphasize the critical importance of maintaining physical distance, practicing hand hygiene, limiting in-person gatherings and wearing face coverings where physical distancing is difficult or impossible.

Recent data on mortality in Oregon, including deaths related to COVID-19, are available at <https://public.tableau.com/profile/oha.center.for.health.statistics#!/>

## Clinical Characteristics, Risk Factors and Demographic Characteristics

Figure 1 shows the number of cases reported weekly by their epidemiological link. Figure 2 provides information on signs and symptoms from all COVID-19 cases. Of all 7,083 cases, 75.4% (n=5,338) reported having signs and symptoms of COVID-19. The two most commonly reported symptoms are cough (n=3,893, 55.0%) and headache (n=3,158, 44.6%). Figure 3 provides information on risk factors from all COVID-19 cases. The two most common risk factors are having contact with a known COVID-19 case prior to symptom onset (n=4,601, 65.0%) and having underlying medical conditions (n=3,528, 49.8%). Note that a person may report more than one sign/symptom or risk factor.

Figure 1. Epidemiologic link of COVID-19 cases by week

\*MMWR Week: The MMWR week is the week of the epidemiologic year assigned to notifiable infectious diseases for the purposes of incidence reporting and publishing. MMWR week supports reporting of notifiable infectious disease incidence data at the national level. [https://www.cdc.gov/nndss/document/MMWR\\_Week\\_overview.pdf](https://www.cdc.gov/nndss/document/MMWR_Week_overview.pdf)

Sporadic: Cases with a sporadic epidemiologic link do not have known exposure to another case or outbreak.

Outbreak: Cases with an outbreak epidemiologic link have a shared, defined exposure with at least one other case. For example, a defined exposure could be an event, a workplace, a congregate facility, etc.

Cluster: Cases with a cluster epidemiologic link had contact with another case, but the exposure is not well defined. For example, cases from two households may have interacted many times prior to illness onset.

Household: Cases with a household epidemiologic link were exposed to another case in their household.

## Recovery

OHA staff periodically call people with reported cases of COVID-19 who experienced fever, cough, shortness of breath or diarrhea and were initially interviewed before May 1, when OHA changed its definition of recovery, to inquire about resolution of symptoms. This group includes 1,885\* people who were all diagnosed before mid-April and have not succumbed to their illness. Among these, 1,639 (86.5%) of cases are considered recovered, and a recovery date is available for 1,380 people. It is this group of 1,380 for which recovery times are depicted in Figure 8. Of these 1,885 people, 50 (2.6%), have yet to recover, and current recovery status is not yet available for 196 (10.3%) of these cases. People are assumed to have recovered three days after resolution of all symptoms. The median time to recovery among non-hospitalized symptomatic cases is presently 20 days (interquartile range: 15–29 days); among symptomatic cases who were hospitalized it is 25 days (interquartile range: 18–37 days).

\*Case counts have decreased from 1894 to 1885. This is because this case count excludes people who have died. Onsets may also have been updated when OHA staff call and ask them about their illness

## Weekly Care Facility, Senior Living Communities and Congregate Living Settings Report

OHA is publishing data on cases and deaths in care facilities, senior living communities, and congregate living settings that have three or more confirmed COVID-19 cases or one or more deaths (Table 5). Facilities with outbreaks that are considered resolved are moved to the closed outbreak list (Table 6). An outbreak is considered resolved if there are no new cases identified for 28 days after the last case onset. This list does not include correctional facilities.

In addition to the facilities listed, OHA is aware of six congregate settings of five or fewer beds that have three or more confirmed COVID-19 cases or one or more deaths. Because foster homes typically have relatively few residents, OHA follows the Oregon Department of Human Services practice in not naming these locations to protect privacy.

To date, there has been one COVID-19 death of a staff person who worked in a congregate care setting. To protect patient privacy, OHA does not report employee deaths by workplace or other potentially identifying

information. Similar information will only be released in the future in weekly reports if OHA determines that such information, in addition to other information it releases, and information released by other agencies, like the Centers for Medicaid and Medicare, cannot be used to identify an individual.

## Weekly Workplace Outbreak Report

OHA is publishing data on cases in workplace outbreaks. Given a cluster of cases in space and time, within plausible incubation periods for the pathogen, OHA epidemiologists will consider cases to be related—i.e., part of a workplace outbreak—unless a more likely alternative source for acquisition is identified. Any suspected workplace outbreak is required to be reported to the local public health authority (see OAR 333-018-015). Local health department and Tribal partners conduct ongoing public health investigations to identify workplace outbreaks. This list of outbreaks will be updated as investigations continue, and we learn about epidemiologic links between cases. This list may not reflect all the workplace outbreaks in Oregon.

In order to protect privacy, OHA is only reporting workplace outbreaks with five or more cases and only for workplaces where there are at least 30 employees. If more than 50% of the employees are COVID-19 cases, then we will not report specific case numbers. Case counts include all persons linked to the outbreak, which may include household members and other close contacts. The list below includes active workplace outbreaks (Table Data are provisional and subject to change.

# COVID-19 Weekly Report

Oregon's Weekly Surveillance Summary  
Novel Coronavirus (COVID-19)

Oregon Public Health Division

Published June 24, 2020

7), meaning that there has been a case within the past 28 days. Outbreaks that are resolved will be moved to a separate table of resolved outbreaks (Table 8).

The presence of correctional facilities and food packing and agricultural worksites on this list highlights the challenges of controlling COVID-19 in settings where people must work or live in close proximity. In addition, people of color are overrepresented in agricultural and correctional settings, perhaps contributing to higher rates of COVID-19 observed in these groups. OHA publishes these data in response to public request, but with some concern that workers or staff members at these workplaces might be subject to discrimination.

State and local public health officials work intensively with staff at workplaces where outbreaks are identified to isolate sick workers, test and quarantine those who have been exposed and implement workplace changes to reduce risk of transmission. Unless otherwise noted, public health officials have determined that these workplaces, their employees and their products do not pose significant risk to the public. Employees of a business with a workplace outbreak should never be subjected to discrimination or excluded from patronizing other businesses. In fact, discriminating against employees or avoiding products might jeopardize the economic viability of essential local businesses.

Employers can support their employees with policies that make sure that ill workers are not in the workplace and are not penalized for taking sick leave. Employers should ensure that workers are aware of and understand these policies.

There have been eight COVID-19 deaths associated with the workplace outbreaks below. To protect patient privacy, OHA does not report employee deaths by workplace.

Novel Coronavirus (COVID-19)

Oregon Public Health Division

Published June 24, 2020

## Weekly COVID-19 Hospitalizations

OHA is publishing data on the number of COVID-19 hospitalizations by hospital in the prior week; data are from HOSCAP, Oregon's hospital capacity web system. Table 9 lists all hospitals which, at some time during the week reported, had 10 or more suspected/confirmed COVID-19 patients. The left column shows the highest number of suspected and confirmed COVID-19 hospitalized patients for each hospital between 6/15/2020 and 6/21/2020. The right column shows the highest number of confirmed COVID-19 patients hospitalized during the same time period.

**Table 9. Hospitals reporting 10 or more COVID-19 patients.**

Hospital	Max Patients (Both suspected and confirmed)	Max Patients (Confirmed only)
Salem Health Hospital	27	22
Providence Portland Medical Center	22	14
OHSU Hospital	15	<10
Legacy Emanuel Medical Center	11	10
Good Samaritan Regional Medical Center	11	<10
Adventist Health Portland	11	<10
Mercy Medical Center	10	0

The hospitals listed in Table 10 reported at least 1 and at most 9 suspected or confirmed COVID-19 patients between 6/21/2020 through 6/15/2020. Hospitals not listed in either table did not report any suspected or confirmed patients during the week.

**Table 10. Hospitals reporting 1–9 COVID-19 patients.**

## Cases by ZIP Code

OHA is publishing data on cases at the ZIP code level (Table 11). In order to protect patient privacy, ZIP codes with small populations or small numbers of cases will be aggregated. Cases from ZIP codes with less than 1,000 people will be reported as one number. ZIP codes that have fewer than 10 cases will be reported as "1-9". ZIP codes that do not have any cases will have a "0". ZIP code population was retrieved from the 2010 US Census Bureau ZIP Code Tabulation Area.

**Table 11. COVID-19 cases by ZIP code**

ZIP code	Case count	Cases per 10,000
