Background

COVID-19 Weekly Report data will be finalized every Sunday at 11 p.m. PDT, and the report will be published on Wednesday. Please note that the data reported here are continually being updated. For daily up-to-date information, visit the OHA COVID-19 web page: https://govstatus.egov.com/OR-OHA-COVID-19.

As of 11 p.m. Sunday, June 20, there have been 206,851 cases of COVID-19 reported to the Oregon Health Authority. Of these, 7,595 (3.7%) are “presumptive” cases—i.e., people with COVID-19-like symptoms and close contact with a confirmed case, but who did not have a confirmatory laboratory test. Though not confirmed, presumptive cases are highly likely to have COVID-19, given their specific symptoms and known exposure. Presumptive cases are encouraged to seek testing to confirm that they do have COVID-19. Presumptive cases who test positive are recategorized as confirmed cases.

These data represent a snapshot of COVID-19 risk factors and clinical and demographic characteristics of cases, and they include data on cases with pending investigations. Not all cases have been interviewed at the time of this report. The data shown in this report come from Oregon’s electronic disease surveillance system for reportable diseases.

During the week of June 13–June 191 68,601 tests for COVID-19 were performed on Oregonians; of these, 3.3% had a positive result.2 This figure represents a “test-based” method, whereby all electronic lab reports received by OHA are used to calculate percent positivity.3 Detailed tables of the number of tests and percent positivity can be found online at https://public.tableau.com/profile/oregon.health.authority.covid.19#!/vizhome/OregonHealthAuthorityCOVID-19DataDashboard/OregonsCOVID-19ELRsbyCounty

1 This date range aligns with CDC’s “MMWR week.”

2 Does not include antibody (serology) tests.

Data are provisional and subject to change.
Weekly Report Summary

During Monday, June 14, through Sunday, June 20, 2021, OHA recorded 1,697 new cases of COVID-19 infection, down 4.7% from the previous week’s figure and the lowest weekly case count in nine months. Testing decreased by another 3.1%, and test positivity fell from 4.0% to 3.3%.

One hundred sixty-one Oregonians with COVID-19 were hospitalized this week, up from 152 last week. Twenty-six Oregonians died in association with COVID-19, down from 36 last week. Of the 206,851 cases reported in Oregon to date, 11,597 (5.6%) have been hospitalized, and 2,756 (1.3%) have died. Data on mortality in Oregon, including deaths associated with COVID-19, are available at https://public.tableau.com/profile/oha.center.for.health.statistics.

Hospitalization and death rates have been highest among the elderly (Table 2). Although only 4.2% of Oregonians are 80 years of age or older, they have accounted for 2,077 (18%) of the COVID-19-associated hospitalizations and 1,389 (50%) of the COVID-19-associated deaths. Persons 70 years of age and older make up 12.4% of Oregon’s population, but they have accounted for 4,391 (38%) of the COVID-19 hospitalizations and 2,050 (74%) of the COVID-19-associated deaths. The proportion of deaths occurring in these age groups has declined in recent weeks; since April 5, 37% of COVID-19-associated deaths have been in those ≥80, and 60% in those ≥70. Additional data are available at https://public.tableau.com/profile/oregon.health.authority.covid.19#!/vizhome/OregonCOVID-19CaseDemographicsandDiseaseSeverityStatewide/DemographicData.

Persons of Hispanic ethnicity have been disproportionately affected by COVID-19 (Table 4): they account for 13% of Oregon’s population but 31% of cases of known ethnicity reported to date. This proportion has fallen in recent months, however: before March 2021, 34% of reported cases of known ethnicity were Hispanic; since then, 19% have been Hispanic.

Table 3 shows that, by race, the highest crude COVID-19 case-fatality rate (CFR)—1.7%—is among whites, with lower CFRs in other races. Similarly, Table 4 shows a lower CFR among Hispanics (0.5%) than among non-Hispanics (1.6%). However, non-white and Hispanic populations in Oregon are younger overall, which lowers the crude CFRs in these racial and ethnic groups. Age adjustment displays how rates would compare if the age distribution of each racial and ethnic group resembled that of the population of the United States in the year 2000. Table 5 shows that COVID-19 hospitalization rates in non-white populations have been 1.2 to 8.7 times those of whites and death rates 1.1 to 7.9 times those of whites. Table 6 shows that
the age-adjusted hospitalization rate among Hispanics in Oregon has been 3.5 times that of non-Hispanics and the death rate 2.7 times as high.

Clinical Characteristics and risk factors

This section of the report describes the epidemiology of Oregon’s COVID-19 cases, including indicators of COVID-19 transmission, common symptoms experienced by COVID-19 cases, and demographic breakdowns for sex, age, race, and ethnicity. Indicators of disease severity, specifically hospitalizations and deaths, are included in the tables.

Epidemiologic links

The figures below show the epidemiologic link of COVID-19 cases. Public health classifies all cases as part of a household, part of an outbreak, part of a cluster, a close contact of another case, or sporadic. Sporadic indicates that a case was not linked to a known source of COVID-19. Lower numbers of sporadic cases suggest lower community spread of COVID-19. Figure 1 focuses on recent cases of COVID-19, and allows for the easy comparison of different types of epidemiologic link. Figure 2 includes all COVID-19 cases, showing the pattern of epidemiologic links since the first cases were identified in Oregon. Figures 3 and 4 show sporadic cases by race, and figures 5 and 6 show sporadic cases by ethnicity. Looking at the data by race and ethnicity helps public health to identify disparities.

Epidemiologic link designations:

- Sporadic: Cases who do not have known exposure to another case or outbreak.
- Outbreak: Cases who have a shared, defined exposure with at least one other case. For example, a defined exposure could be an event, a workplace, a congregate facility, etc.

---

Due to the lag between case reporting and case investigation, the proportion of cases categorized as sporadic is high in the most recent week or more; some of these cases will be recategorized after investigation is completed.

Data are provisional and subject to change.
• Cluster: Cases who had contact with another case, but the exposure is not well defined. For example, cases from two households who interacted many times prior to illness onset.
• Household: Cases who were exposed to another case in their household.
• Close contact: Cases who were exposed to another case, not in their household. This designation was added on 7/15.

Data are provisional and subject to change.
Clinical symptoms and reported risk factors

Figure 7 provides information on signs and symptoms from all COVID-19 cases. Of 206,851 cases, 127,966 (61.9%) reported having signs and symptoms of COVID-19. The most commonly reported symptoms are cough (n=75,453, 36.5%) and headache (n=63,057, 30.5%). Figure 8 provides information on the percentage of COVID-19 cases that report symptoms over time. Figure 9 provides information on risk factors from all COVID-19 cases. The most common risk factors are having contact with a known COVID-19 case prior to symptom onset (n=107,981, 52.2%) and having underlying medical conditions (n=110,834, 53.6%). Note that a person may report more than one sign/symptom or risk factor. Where displayed by week in this report, case data are categorized by week of reported symptom onset, not by date of case report. This results in reduced numbers in the most recent week or more due to reporting lags.
Figure 7. Reported signs and symptoms for all COVID-19 cases

- Any symptoms: 61.9% Yes, 28.9% Unknown, 9.2% No
- Cough: 36.5% Yes, 44.5% Unknown, 19% No
- Headache: 30.5% Yes, 52.3% Unknown, 17.2% No
- Aches: 28.6% Yes, 52% Unknown, 19.5% No
- Loss of smell: 25.2% Yes, 47.6% Unknown, 27.3% No
- Runny nose: 22.1% Yes, 53.2% Unknown, 24.6% No
- Chills: 20.5% Yes, 54.7% Unknown, 24.8% No
- Sore throat: 20% Yes, 53.1% Unknown, 26.9% No
- Fever: 19.7% Yes, 48.2% Unknown, 32.1% No
- Shortness of Breath: 15.3% Yes, 47.4% Unknown, 37.3% No
- Nausea: 11.4% Yes, 55.3% Unknown, 33.3% No
- Diarrhea: 11.3% Yes, 54.6% Unknown, 34.1% No
- Abdominal Pain: 5.8% Yes, 56.3% Unknown, 37.9% No
- Vomiting: 3.8% Yes, 55.6% Unknown, 40.6% No
- Pneumonia: 1.2% Yes, 53.7% Unknown, 44.1% No
- Abnormal X-Ray: 1.9% Yes, 62.4% Unknown, 35.7% No
- ARDS: 6% Yes, 61.6% Unknown, 37.8% No
- Ventilator: 4% Yes, 61.4% Unknown, 38.2% No
Figure 8. Reported symptoms among all COVID-19 cases by week of onset

Data are provisional and subject to change.
Figure 9. Reported risk factors among all COVID-19 cases

Risk factor definitions:

- Congregate living situations include, but are not limited to, long-term care facilities, group homes, prisons, and shelters. Data include people with confirmed cases who live or work in congregate living situations.
- Direct patient care is only asked if a case is a healthcare worker or volunteer. The denominator is the number of healthcare workers or volunteers.
- Underlying medical conditions include cardiovascular disease, chronic liver disease, chronic lung disease, chronic renal disease, current or former smoker, diabetes mellitus, immunocompromised condition, neurologic and neurodevelopmental conditions, obesity, or other chronic diseases.

Demographics

The following tables and figures show the demographic characteristics for all COVID-19 cases. The tables show case counts, case rates, and indicators of severity by sex, age, race and
Data are provisional and subject to change.

Geography

The following figure shows case rates by county for the most recently completed MMWR week, which is currently June 13 to June 19, 2021. Cases are displayed using the date that the case became known to public health.

Figure 10. Case rates per 100,000 population, by county

[Graph showing case rates per county]
COVID-19 Weekly Report

Oregon’s Weekly Surveillance Summary

1. Counties that had case rates above the case rate for the state are displayed in orange. Counties that had case rates below the case rate for the state are displayed in blue.

2. Counties that had zero cases in the time period displayed appear on the list, but do not have a bar to display.

Age-adjustment

Tables 5 and 6 show the ratio of age-adjusted rates of COVID-19 for cases, hospitalizations, and deaths by race and ethnicity. Each table compares the rates of cases, hospitalizations, and deaths between each group and a reference group and accounts for differences in population distributions in each group.

Table 5. Ratio of age-adjusted rates for cases, hospitalizations, and deaths by race

Age-adjusted rate ratios of cases, hospitalizations, and deaths, compared to white persons
1. During the case investigation, people are asked to self-report their race, ethnicity, tribal affiliation, country of origin, or ancestry.
3. Persons for which race information was not available were not included in these estimates. The number of persons with race data unavailable can be found in Table 3.

Recovery

OHA staff periodically call people with reported COVID-19 who experienced fever, cough, shortness of breath or diarrhea and were initially interviewed before May 1, 2020, when OHA changed its definition of recovery, to inquire about resolution of symptoms. This group includes 1,884 people who were all diagnosed before mid-April and have not succumbed to their illness. Among these, 1,682 (88.8%) are considered to have recovered, and a recovery date is available for 1,387 people; their time to recovery is depicted in Figure 26. Of these 1,884 people, 16 (0.8%), have not yet recovered; and recovery status is not available for 186 (9.8%). People are assumed to have recovered three days after resolution of all symptoms. The median time to recovery among non-hospitalized symptomatic cases is 20 days (interquartile range: 15–29 days); among symptomatic cases who were hospitalized it is 26 days (interquartile range: 18–37 days).

Figure 26. Time to recovery among symptomatic people with COVID-19

Notes about recovery data:

- Recovery definition: three days after reported resolution of diarrhea, cough, shortness of breath and fever.
- Inclusion criteria: cases who were interviewed about their date of recovery before a change in recovery definition on May 1
- Data for 1,387 cases are included
- This was last updated on 9/16; Data will be updated again as new information is available.

Data are provisional and subject to change.
People with Intellectual and Developmental Disabilities

As of March 8, 2021 OHA is aware of 744 people with intellectual or developmental disabilities who have had COVID-19 to date. This includes individuals who live in congregate settings and in family or individual homes. To date, there are 21 deaths associated with people with intellectual or developmental disabilities. This number is from conducting a match between the ODHS Office of Developmental Disabilities Services client list and the Oregon COVID-19 case database. OHA will update this number on a quarterly basis.

ODDS data is based on self-reports from providers and case management entities and therefore may differ from testing data received from the Oregon Health Authority.

Weekly COVID-19 Hospitalizations (HOSCAP)

OHA is publishing data on the number of COVID-19 hospitalizations by hospital in the prior week; data are from HOSCAP. Table 7 lists all hospitals which, at some time during the week reported, had 10 or more suspected/confirmed COVID-19 patients. The left column shows the highest number of suspected and confirmed COVID-19 hospitalized patients for each hospital between 06/14/2021 and 06/20/2021. The right column shows the highest number of confirmed COVID-19 patients hospitalized during the same time period.
