COVID-19 Weekly Report

Oregon's Weekly Surveillance Summary

Background

COVID-19 Weekly Report data will be finalized every Sunday at 11 p.m. PDT, and the report will be published on Wednesday. Please note that the data reported here are continually being updated. For daily up-to-date information, visit the OHA COVID-19 web page:

<https://govstatus.egov.com/OR-OHA-COVID-19>.

As of 11 p.m. Sunday, September 19, there have been 313,159 cases of COVID-19 reported to the Oregon Health Authority. Of these, 10,318 (3.3%) are “presumptive” cases—i.e., people with COVID-19-like symptoms and close contact with a confirmed case, but who did not have a confirmatory laboratory test. Though not confirmed, presumptive cases are highly likely to have COVID-19, given their specific symptoms and known exposure. Presumptive cases are encouraged to seek testing to confirm that they do have COVID-19. Presumptive cases who test positive are recategorized as confirmed cases.

These data represent a snapshot of COVID-19 risk factors and clinical and demographic characteristics of cases, and they include data on cases with pending investigations. Not all cases have been interviewed at the time of this report. The data shown in this report come from Oregon’s electronic disease surveillance system for reportable diseases.

During the week of September 12–September 18¹ 140,538 tests for COVID-19 were performed on Oregonians; of these, 10.5% had a positive result.² This figure represents a “test-based” method, whereby all electronic lab reports received by OHA are used to calculate percent positivity.³ Detailed tables of the number of tests and percent positivity can be found online at <https://public.tableau.com/profile/oregon.health.authority.covid.19#!/vizhome/OregonHealthAuthorityCOVID-19DataDashboard/OregonsCOVID-19ELRsbyCounty>.

¹ This date range aligns with CDC’s “MMWR week.”

² Does not include antibody (serology) tests.

COVID-19 Weekly Report

Oregon's Weekly Surveillance Summary

Weekly Report Summary

During Monday, September 13, through Sunday, September 19, 2021, OHA recorded 11,655 new cases of COVID-19 infection—a 10% decrease from the previous week and the lowest figure in 6 weeks. This was in the context of a 5.8% drop in testing, with test positivity falling from 12.0% to 10.5%—also the lowest in 6 weeks. Since September 4, the proportion of cases among children <10 years of age has risen to 10.7%; before that date, 6.2% of cases were among children of this age. Case counts continue to be higher in Oregon counties with lower vaccination rates; of 15 counties with <50% of the population vaccinated, 13 had rates of COVID-19 above the statewide average of 257.1 per 100,000 last week (Figure 10).

New COVID-19 hospitalizations fell only slightly this week—from 592 to 579. COVID-19-associated deaths rose from 120 to 148. Of the 313,159 cases reported in Oregon to date, 17,070 (5.5%) have been hospitalized, and 3,594 (1.1%) have died. Data on mortality in Oregon, including deaths associated with COVID-19, are available at <https://public.tableau.com/profile/oha.center.for.health.statistics>.

Additional data are available at

<https://public.tableau.com/profile/oregon.health.authority.covid.19#!/vizhome/OregonCOVID-19CaseDemographicsandDiseaseSeverityStatewide/DemographicData>.

COVID-19 Weekly Report

Oregon's Weekly Surveillance Summary

Clinical Characteristics and risk factors

This section of the report describes the epidemiology of Oregon's COVID-19 cases, including indicators of COVID-19 transmission, common symptoms experienced by COVID-19 cases, and demographic breakdowns for sex, age, race, and ethnicity. Indicators of disease severity, specifically hospitalizations and deaths, are included in the tables.

Epidemiologic links

The figures below show the epidemiologic link of COVID-19 cases. Public health classifies all cases as part of a household, part of an outbreak, part of a cluster, a close contact of another case, or sporadic. Sporadic indicates that a case was not linked to a known source of COVID-19. Lower numbers of sporadic cases suggest lower community spread of COVID-19. Figure 1 focuses on recent cases of COVID-19, and allows for the easy comparison of different types of epidemiologic link. Figure 2 includes all COVID-19 cases, showing the pattern of epidemiologic links since the first cases were identified in Oregon. Figures 3 and 4 show sporadic cases by race, and figures 5 and 6 show sporadic cases by ethnicity. Looking at the data by race and ethnicity helps public health to identify disparities.

Epidemiologic link designations:

- Sporadic:⁴ Cases who do not have known exposure to another case or outbreak.
- Outbreak: Cases who have a shared, defined exposure with at least one other case. For example, a defined exposure could be an event, a workplace, a congregate facility, etc.
- Cluster: Cases who had contact with another case, but the exposure is not well defined. For example, cases from two households who interacted many times prior to illness onset.
- Household: Cases who were exposed to another case in their household.
- Close contact: Cases who were exposed to another case, not in their household. This designation was added on 7/15/2020.

⁴ Due to the lag between case reporting and case investigation, the proportion of cases categorized as sporadic is high in the most recent week or more; some of these cases will be recategorized after investigation is completed.

Clinical symptoms and reported risk factors

Figure 7 provides information on signs and symptoms from all COVID-19 cases. Of 313,159 cases, 166,529 (53.2%) reported having signs and symptoms of COVID-19. The most commonly reported symptoms are cough (n=95,335, 30.4%) and headache (n=77,510, 24.8%). Figure 8 provides information on the percentage of COVID-19 cases that report symptoms over time. Figure 9 provides information on risk factors from all COVID-19 cases. The most common risk factors are having contact with a known COVID-19 case prior to symptom onset (n=134,267, 42.9%) and having underlying medical conditions (n=192,634, 61.5%). Note that a person may report more than one sign/symptom or risk factor. Where displayed by week in this report, case data are categorized by week of reported symptom onset, not by date of case report. This results in reduced numbers in the most recent week or more due to reporting lags.

COVID-19 Weekly Report

Oregon's Weekly Surveillance Summary

Figure 9. Reported risk factors among all COVID-19 cases

Risk factor definitions:

- Congregate living situations include, but are not limited to, long-term care facilities, group homes, prisons, and shelters. Data include people with confirmed cases who live or work in congregate living situations.
- Direct patient care is only asked if a case is a healthcare worker or volunteer. The denominator is the number of healthcare workers or volunteers.
- Underlying medical conditions include cardiovascular disease, chronic liver disease, chronic lung disease, chronic renal disease, current or former smoker, diabetes mellitus, immunocompromised condition, neurologic and neurodevelopmental conditions, obesity, or other chronic diseases.

Demographics

The following tables and figures show the demographic characteristics for all COVID-19 cases. The tables show case counts, case rates, and indicators of severity by sex, age, race and

COVID-19 Weekly Report

ethnicity. The figures show cases over time, by week of onset, for sex, age, race, and ethnicity. Figure 10 displays case rates by county, in comparison to the case rate for all of Oregon.

Geography

The following figure shows case rates by county for the most recently completed MMWR week, which is currently September 12 to September 18, 2021. Cases are displayed using the date that the case became known to public health.

Figure 10. Case rates per 100,000 population, by county

Recovery

OHA staff periodically call people with reported COVID-19 who experienced fever, cough, shortness of breath or diarrhea and were initially interviewed before May 1, 2020, when OHA changed its definition of recovery, to inquire about resolution of symptoms. This group includes 1,884 people who were all diagnosed before mid-April and have not succumbed to their illness. Among these, 1,682 (88.8%) are considered to have recovered, and a recovery date is available for 1,387 people; their time to recovery is depicted in Figure 26. Of these 1,884 people, 16 (0.8%), have not yet recovered; and recovery status is not available for 186 (9.8%). People are assumed to have recovered three days after resolution of all symptoms. The median time to recovery among non-hospitalized symptomatic cases is 20 days (interquartile range: 15–29 days); among symptomatic cases who were hospitalized it is 26 days (interquartile range: 18–37 days).

Figure 26. Time to recovery among symptomatic people with COVID-19

Notes about recovery data:

- Recovery definition: three days after reported resolution of diarrhea, cough, shortness of breath and fever.
- Inclusion criteria: cases who were interviewed about their date of recovery before a change in recovery definition on May 1, 2020.
- Data for 1,387 cases are included.
- This was last updated on September 16, 2020; Data will be updated again as new information is available.

Data are provisional and subject to change.

COVID-19 Weekly Report

Oregon's Weekly Surveillance Summary

People with Intellectual and Developmental Disabilities

As of June 2, 2021 OHA is aware of 945 people with intellectual or developmental disabilities who have had COVID-19 to date. This includes individuals who live in congregate settings and in family or individual homes. To date, there are 27 deaths associated with people with intellectual or developmental disabilities. This number is from conducting a match between the ODHS Office of Developmental Disabilities Services client list and the Oregon COVID-19 case database. OHA will update this number on a quarterly basis.

Additional information about the ODDS program and COVID-19 can be found here:

<https://www.oregon.gov/dhs/SENIORS-DISABILITIES/DD/ODDS%20Resource%20Library/ODDS-Residential-COVID-19-Report.pdf>

ODDS data is based on self-reports from providers and case management entities and therefore may differ from testing data received from the Oregon Health Authority.

Weekly COVID-19 Hospitalizations (HOSCAP)

OHA is publishing data on the number of COVID-19 hospitalizations by hospital in the prior week; data are from HOSCAP. Table 7 lists all hospitals which, at some time during the week reported, had 10 or more COVID-19 patients. The left column shows the highest number of COVID-19 hospitalized patients for each hospital between 09/13/2021 and 09/19/2021. The right column shows the highest number of COVID-19 patients hospitalized during the same time period.
