Background

COVID-19 Weekly Report data will be finalized every Sunday at 11 p.m. PST, and the report will be published on Wednesday. Please note that the data reported here are continually being updated. For daily up-to-date information, visit the OHA COVID-19 web page: https://govstatus.egov.com/OR-OHA-COVID-19.

As of 11 p.m. Sunday, March 20, there have been 701,729 cases of COVID-19 reported to the Oregon Health Authority. Of these, 23,627 (3.4%) are “presumptive” cases. This includes people with COVID-19-like symptoms and close contact with a confirmed case, but who did not have a confirmatory laboratory test, and people that self-report at-home tests to public health. Though not confirmed, presumptive cases are highly likely to have COVID-19, given their specific symptoms and known exposure or at-home positive test. If a case later tests positive at a lab, that case will be recategorized as confirmed. If a case tests positive at home, the case will remain presumptive.

These data represent a snapshot of COVID-19 risk factors and clinical and demographic characteristics of cases, and they include data on cases with pending investigations. Not all cases have been interviewed at the time of this report. It is important to note that as of 1/11/2022, case investigation and contact tracing operations...
have been modified to prioritize outbreaks in high-consequence settings, such as healthcare, congregate care (e.g., nursing homes), corrections and settings related to our food chain. Public health is no longer calling all cases to attempt interview to assess symptoms and risks. The data shown in this report come from Oregon’s electronic disease surveillance system for reportable diseases.

During the week of March 13–March 19¹ 89,917 tests for COVID-19 were performed on Oregonians; of these, 2.5% had a positive result.² This figure represents a “test-based” method, whereby all electronic lab reports received by OHA are used to calculate percent positivity.³ Detailed tables of the number of tests and percent positivity can be found online at https://public.tableau.com/profile/oregon.health.authority.covid.19#!/vizhome/OregonHealthAuthorityCOVID-19DataDashboard/OregonsCOVID-19ELRsbyCounty.

**Weekly Report Summary**

During Monday, March 14, through Sunday, March 20, 2022, OHA logged 1,769 new cases of COVID-19 infection—crossing the 700,000 mark for the pandemic but down another 19% from last week. The decline in cases came as reported tests declined 5.7% and with the proportion positive falling from 3.3% to 2.5%. Since the peak Omicron week of January 17–23, weekly reported tests have fallen 69%, the proportion positive has fallen from 24.5% to 2.5%, and weekly reported cases have fallen 97%.

Newly identified COVID-19-associated hospitalizations declined another 31% this week—from 225 to 156—the lowest figure since the week of July 19–25, 2021. Ninety COVID-19-associated deaths were reported, down from 142 last week. Of the 701,729 COVID-19 cases reported in Oregon to date, 28,228 (4.0%) have been hospitalized, and 6,975 (1.0%) have died. The median age at death has been 76 years. COVID-19-associated deaths remain rare among the young: 6 (0.09%) of the COVID-19-associated deaths have been in Oregonians <20 years old, and 41 (0.6%) in persons

¹ This date range aligns with CDC’s “MMWR week.”

² Does not include antibody (serology) tests.

COVID-19 Weekly Report

Oregon’s Weekly Surveillance Summary

younger than 30. Over the past 6 months, of the 3,381 Oregonians who died in association with COVID-19, none have been <10, and 1 has been <20 years of age. Data on mortality in Oregon, including deaths associated with COVID-19, are available at https://public.tableau.com/profile/oha.center.for.health.statistics.

Clinical Characteristics and risk factors

This section of the report describes the epidemiology of Oregon’s COVID-19 cases, including common symptoms experienced by COVID-19 cases, and demographic breakdowns for sex, age, race, and ethnicity. Indicators of disease severity, specifically hospitalizations and deaths, are included in the tables.

Clinical symptoms and reported risk factors

Figure 1 provides information on signs and symptoms from all COVID-19 cases. Of 701,729 cases, 238,432 (34%) reported having signs and symptoms of COVID-19. The most commonly reported symptoms are cough (n=127,792, 18.2%) and headache (n=100,327, 14.3%). Figure 2 provides information on the percentage of COVID-19 cases that report symptoms over time. Figure 3 provides information on risk factors from all COVID-19 cases. The most common risk factors are having contact with a known COVID-19 case prior to symptom onset (n=179,705, 25.6%) and having underlying medical conditions (n=531,167, 75.7%). Note that a person may report more than one sign/symptom or risk factor. Where displayed by week in this report, case data are categorized by week of reported symptom onset, not by date of case report. This results in reduced numbers in the most recent week or more due to reporting lags.

Figure 1. Reported signs and symptoms for all COVID-19 cases

- Any symptoms: 34 (4.5%)
- Cough: 73.9 (7.9%)
- Headache: 78 (7.7%)
- Aches: 78 (8.7%)
- Runny nose: 78.4 (10.2%)
- Loss of smell: 76.6 (12.5%)
- Fever: 76 (13.8%)
- Sore throat: 78.6 (11.6%)
- Chills: 79.8 (11%)
- Shortness of Breath: 76.5 (16.6%)
- Nausea: 80.1 (14.7%)
- Diarrhea: 80 (15%)
- Abdominal Pain: 80.8 (16.6%)
- Vomiting: 80.5 (17.6%)
- Pneumonia: 79.4 (19.5%)
- Abnormal X-Ray: 83.8 (15.3%)
- ARDS: 83.8 (15.9%)
- Ventilator: 83.8 (16%)

Legend: Blue = Yes, Gray = Unknown, Orange = No

Data are provisional and subject to change.
Figure 2. Reported symptoms among all COVID-19 cases by week of onset

Data are provisional and subject to change.
Figure 3. Reported risk factors among all COVID-19 cases

Risk factor definitions:

- Congregate living situations include, but are not limited to, long-term care facilities, group homes, prisons, and shelters. Data include people with confirmed cases who live or work in congregate living situations.

- Direct patient care is only asked if a case is a healthcare worker or volunteer. The denominator is the number of healthcare workers or volunteers.

- Underlying medical conditions include cardiovascular disease, chronic liver disease, chronic lung disease, chronic renal disease, current or former smoker, diabetes mellitus, immunocompromised condition, neurologic and neurodevelopmental conditions, obesity, or other chronic diseases.
Geography

The following figure shows case rates by county for the most recently completed MMWR week, which is currently March 13 to March 19, 2022. Cases are displayed using the date that the case became known to public health.

Figure 4. Case rates per 100,000 population, by county
COVID-19 Weekly Report

Oregon’s Weekly Surveillance Summary

1. Counties that had case rates above the case rate for the state are displayed in orange. Counties that had case rates below the case rate for the state are displayed in blue.

2. Counties that had zero cases in the time period displayed appear on the list, but do not have a bar to display.

Demographics

The following tables and figures show the demographic characteristics for all COVID-19 cases. The tables show case counts, case rates, and indicators of severity by sex, age, race and ethnicity. The figures show cases over time, by week of onset, for sex, age, race, and ethnicity. Figure 4 displays case rates by county, in comparison to the case rate for all of Oregon.

Age-adjustment

Tables 5 and 6 show the ratio of age-adjusted rates of COVID-19 for cases, hospitalizations, and deaths by race and ethnicity. Each table compares the rates of cases, hospitalizations, and deaths between each group and a reference group and accounts for differences in population distributions in each group.

3. Persons for which ethnicity information was not available were not included in these estimates. The number of persons with ethnicity data unavailable can be found in Table 4.

People with Intellectual and Developmental Disabilities

As of January 9, 2022 OHA is aware of 2,397 people with intellectual or developmental disabilities who have had COVID-19 to date. This includes individuals who live in congregate settings and in family or individual homes. To date, there are 49 deaths among people with intellectual or developmental disabilities. This number is from conducting a match between the ODHS Office of Developmental Disabilities Services client list and the Oregon COVID-19 case database. OHA will update this number on a quarterly basis.

Additional information about the ODDS program and COVID-19 can be found here: https://www.oregon.gov/dhs/SENIORS-

OHA 2395 (3/23/22)  Data are provisional and subject to change.
ODDS data is based on self-reports from providers and case management entities and therefore may differ from testing data received from the Oregon Health Authority.

**Weekly COVID-19 Hospitalizations (HOSCAP)**

OHA is publishing data on the number of COVID-19 hospitalizations by hospital in the prior week; data are from HOSCAP. Maps and tables containing the 7-day average of hospitalizations by region and hospital are available online at:

Information on Oregon’s current hospital bed capacity by region is available online at:

**ZIP code**

OHA is publishing data on cases at the ZIP code level, available online at:

Summary table of all zip codes available here:

**Document accessibility:** For individuals with disabilities or individuals who speak a language other than English, OHA can provide information in alternate formats such as translations, large print, or braille.
