In this review of OWEB's Operating Capacity investments, we learned that these grants have positively impacted communities' local economies, supported local conservation efforts in completing restoration and conservation projects, and helped build local capacity among conservation partners. Furthermore, the reliability of this grants program has served as an essential strategy for supporting council and district operations, as many grantees expressed the lack of sufficient external capacity-building funding in the face of rising costs and inflation. The Operating Capacity grant programs have supported OWEB and ODA as state agencies in meeting state-wide restoration and conservation goals. Without this funding, many councils and districts would not be able to maintain their operations because restoration and conservation activities can require months or years of networking, planning, and leveraging projects—which cannot be charged to restoration or conservation project grants. This would have negative repercussions on conservation efforts at the local level and limit the capacity of other state and federal agency natural resource partners to achieve state and federal restoration and conservation goals. Councils and districts have primarily used Operating Capacity grants for project development and partnership building, as initial funds for project cash match, and as operational support for administrative staff time and staff training. Other assessments also note that capacity investments have had positive ripple effects on watershed enhancement work more broadly. "Time, effort, and organizational capacity is needed to apply for OWEB grants. Partners that Tribes collaborate with on OWEB-funded projects often have more time and infrastructure devoted to grant writing than they do. Interviewees believed tribal contribution comes in the form of technical expertise, setting overall strategic goals, writing letters of support, and reviewing and improving existing grant applications." *- Granting Practices Impacts to Tribes: An Assessment of OWEB (2021)*

Capacity is the largest challenge that organizations face as the complexity of the issues they address are increasing from a growing understanding of the impacts of climate change, which have caused drier summers, droughts, and more frequent wildfires in geographic regions that have not typically seen this. Furthermore, the retirement of staff across multiple agencies, combined with the difficulty of offering competitive wages and benefits for staff retention, and the effects of elevated housing values and other costs of living, even prior to the COVID-19 pandemic, have further challenged councils and districts. They often serve as small, front-line organizations for large-scale issues, working across multiple agencies, non-profits, local governments, and private landowners, at the intersection of natural resource management and community outreach and education.

Additionally, during times of an influx in federal and state dollars that emphasize implementing restoration and conservation projects, agencies often rely on councils and districts as necessary community-based partners. Some communities have also seen a shift in restoration and conservation needs that are driven by changes in land use from agriculture and ranching to an increase in recreation, while needing to address the needs of existing working lands and ongoing habitat conservation for salmon, sage-grouse, and other important species. Lastly, the increasingly technical aspects of project permitting and grant reporting requirements, while improving accountability, monitoring, and performance, have increased administrative burden. All of these factors point to the essential purposes these organizations serve and the capacity challenges they face. Councils and districts rely on committed individuals who are relationship-oriented, and driven by conservation and community.

The case study approach helped us define common experiences and challenges of councils and districts. However, we recognize that councils and districts have a diversity of experiences and contexts within which they function. To improve the application of findings, we selected case study organizations across Oregon with different staffing levels across typologies, in rural and urban contexts, and with varying tiers of resources obtained and leveraged. We followed an approach that could be conducted within the timeframe of the project since it would not be possible to interview all organizations. Furthermore, during the interview process, we noted that we had identified enough common insights and themes, within and across organizations and capacity dimensions, through thematic coding and memo writing.

From this evaluation, we learned that governance is fluid because relationships are fluid. Councils and districts have often heavily depended on a single individual (i.e., the district manager or council executive director) to build relationships and develop a strategic vision for the organization and the watershed with partners and funders, while simultaneously pursuing grants and managing projects. Specific to councils, the lead staff position title itself has evolved over time to recognize the full spectrum of work that this role fulfills – from secretary to coordinator to executive director. Because these organizations have limited staffing capacity, the ways that each organization governed itself was based on an iterative process that those individuals worked through together. Some organizations needed more structure than others, depending on the communication, needs, and level of trust among the individuals involved, while some needed less. Some organizations started with more structure, but as trust was built through relationships, the need for structure decreased. This was particularly true for organizations that had multiple opportunities for communication through built structural support and proximity, within and across organizations. Peer learning networks and other partnership models eased lead staff transitions through mentorship, shared resources, and project coordination. These groups also offered overlapping points of connection and communication to create a community network of local conservation partners.

At the individual organizational level, common issues that reduced organizational capacity included: a disengaged board or board micromanagement of lead staff, lead staff turnover and capacity, and challenges with finding qualified staff.

- **A disengaged board was less involved with providing organizational direction through strategic plans and offered less accountability of lead staff's work plans.** This sometimes led to reduced lead staff capacity or burn-out. These boards were also less engaged in effective fiscal oversight and less aware of how to maintain consistent funding revenue. In these contexts, the board was more focused on project implementation than organizational management.

- **When a board micromanaged lead staff, some grantees' experienced organizational gridlock.** In these circumstances, there was a lack of joint organizational priority setting for strategic plans and/or annual work plans. This sometimes resulted in burn-out or reduced capacity of lead staff.
- **Regardless of whether a board was disengaged or micromanaging, roles and responsibilities of the board and lead staff were unclear. Additionally, board members were unsure of how to manage lead staff personnel issues or engage in organizational management.** Reduced capacity or burn-out of lead staff sometimes led to turnover of lead staff or a need for someone with a different set of skills to improve the organization.
- **Board members were concerned that they would not be able to find replacement staff** given the challenges of offering competitive wages and benefits for lead staff, given the grant-funded nature of these positions. Challenges with lead staff transitions or navigating the need for lead staff with a different set of skills sometimes caused an organizational downward cycle. This made partners less likely to work with them, which led to missed opportunities for projects and funding.

At the individual organizational level, key opportunities for building organizational capacity included: joint priority setting between lead staff and board through strategic plan development, targeted board recruitment and diversification of funding, development of an effectively engaged board, and follow-through on projects.

- **Lead staff and boards co-established organizational and watershed priorities through strategic planning processes.** This streamlined pursuit of key partnerships and funding sources for projects, improved organizational fiscal efficiency, helped organizations design stronger grant proposals, and more effectively use funders' resources. Joint-priority setting supported board and lead staff in creating a shared understanding of what a manageable project workload was while keeping everyone aligned on organizational priorities. Together these supported an effective level of board engagement. Furthermore, strategic planning sessions sometimes focused on how to diversify funders for short- and long-term organizational funding needs.
- **Lead staff engaged in targeted board recruitment by forming a network** within the community through participation and hosting of community events. These served as opportunities to identify potential board members who could help organizations meet goals in their strategic plans and strengthen information sharing across agencies.
- **Being networked in the community also allowed them to learn about diverse funding opportunities.** Examples included: federal and state agencies, private foundations, and local community institutions that sponsored non-profits (e.g., banks, grocery stores, or breweries), as well as annual fundraising events with local partners and fostering of city/county government relations for inclusion of their programs in local government budgets. Additionally, some organizations developed an annual federally negotiated indirect cost rate agreement to support critical operation costs to build administrative capacity.
- **Lead staff developed board relationships by incorporating education and training into board meetings** so they were able to mutually support each other in their respective roles to guide the organization's trajectory.

At the community level, common issues that reduced organizational capacity included: staff turnover at partner organizations, a history of troubled partnerships, and access to funding resources.

- **Capacity does not occur in a vacuum.** Lead staff turnover in adjacent councils and districts who were key partners and experts in a particular restoration or conservation activity affected other councils' and districts' capacity. This reduced their ability to leverage grants and implement project work.

- **Areas with a history of troubled partnerships were sometimes challenging to overcome** which hampered relationships with other partners and funders, who had difficulties with completing project work they were interested in and wanted to fund.
- **Access to funding resources.** As third-party researchers, it is challenging to give the full context of each region's available opportunities given the differing land uses, endangered species, and other items tied to funding sources because there are a wide variety of factors and those factors evolve over time. Additionally, funders have become interested in more innovative and collaborative projects and increased leveraging of funds, which can create a perception that councils and districts have to "keep up." Lead staff have always needed to manage this consistent ebb and flow in funders' priorities, even before the COVID-19 pandemic. Regardless, the variability of funding sources is an inherent challenge that affects community capacity.

At the community level, key opportunities for building organizational capacity included: proactively maintaining partnerships during times of staff turnover, resolving a history of troubled partnerships, and participating in various partnership models to share resources.

- **Regional network formation, shared planning, and the development of resource-sharing arrangements were the most typical ways that organizations built community capacity.** Some areas established regional partnerships using OWEB FIP or P-TA grants to develop governance documents and define commitments to build cross-organizational support for landscape-level restoration and conservation. Some participated in regional information-sharing groups, which supported streamlining of projects through the identification of partners for cost-match and coordination of efforts to work towards landscape-scale restoration and conservation. Others shared equipment costs and staffing.
- **Onboarding new personnel following staff turnover at partner organizations on their joint projects and priorities**. Lead staff that engaged in these practices were able to maintain their partnerships during these transition periods.
- **Acquisition of joint funding for a project or sharing information learned from a monitoring program helped organizations rebuild trust after a history of troubled partnerships.** This often included a change in staff leadership, as well, who were not invested in this history.

Range Monitoring Tour. *credit: South Fork John Day WC.*

VII. Considerations and Proposed Recommendations

Considerations and potential recommendations were developed for points of impact that agencies and supporting organizations can provide, as well as best practices for council and district grantees.

VII.A. Points of Impact: Agencies and Service Providers

Coordinate Across Agencies and Improve Cross-agency Understanding of Grantees' Needs

Based on the case study interviews, there is a demonstrated need to improve awareness of what NOWC, OrCP, OCEAN, and the SWCD Operations Specialist provide, particularly since the COVID-19 pandemic has altered what was offered over the last few years. Furthermore, according to the NOWC Membership Outreach Consultancy Report (2021), "less than 15% of members are aware of any of the items [NOWC provides] including document templates, which is one of the primary benefits that NOWC provides to its members."[16] Reconnecting with councils and districts to share what these organizations offer is important, especially as more in-person events are happening, which offer additional opportunities for peer networking and information sharing. Lastly, it is important to recognize that not all lead staff step into these roles with a background in project management or organizational management, which are essential functions for this position, and must learn as they go.

Topical Needs Identified by Grantees:

- OWEB-specific and general grant writing and reporting requirement courses.
- Fiscal management and terminology.
- Best practices or examples of organizational policies, procedures, and bylaws.
- Board management and education.
- Personnel management and handling lead staff transitions.
- Direction on how to develop a balanced project workload for lead staff, while also navigating the management of multiple projects.
- Guidance on developing unrestricted funding sources to help maintain critical operations (e.g., development of an annual federally negotiated indirect cost rate agreement, budgeting for more project time in grant applications to build in additional capacity for projects).

[16] NOWC Membership Outreach Consultancy Report (2021)

Potential Strategies to Address Identified Needs

Some grantees were interested in engaging in a regional forum to learn from other councils or districts. Suggestions included: a show and tell with an OWEB Regional Representative to help organize groups by region. Interestingly, this mimics what some places with a higher concentration of councils and districts are doing, (e.g., the UWSN and JDBP). This could potentially be useful if organizations are facing challenges in working with local partners and developing joint priorities.

NOWC could play a key role in supporting peer regional forums for councils, because their board includes regional representatives and they support regional peer networking groups. Additionally, they have created a NOWC Insider Webinar series addressing a variety of topics with content experts to discuss nonprofit board governance, legal issues, financial best practices, and other relevant needs. It is important to note, however, that these services would be limited to paying NOWC members, because they are dependent upon membership fees to support their operations and part time coordinator.

Another strategy could be for OWEB to engage the ODA's SWCD Operations Specialist's skills to develop regional round-table trainings for lead staff focusing on management topics. Trainings could be joint for councils and districts or separate. Additionally, interviewees were interested in being able to connect directly with OWEB and ODA staff, so it would be important to consider their involvement. Hosting regional in-person forums could be particularly beneficial for organizations in more rural areas, who typically have to travel further and face greater travel costs for professional networking opportunities. Lastly, new lead staff may have different needs than those who have been in this position longer. This emphasizes the importance of mentorship and peer learning networks to create information exchanges and learn from each other's experiences.

Strategic Planning

As part of the Council Capacity grant application and review process, requiring greater specificity in strategic plans or annual work plans, depending on the function of these plans for an organization, could allow for objectives and measures on how councils are identifying and implementing watershed restoration and conservation activities, while engaging with partners. Council Capacity grant Merit Criterion 2: Progress in Planning, currently states, "The council uses its planning documents, such as the action plan, strategic plan, and other relevant documents, to identify and implement on-the-ground watershed restoration and stakeholder engagement projects. The council regularly evaluates its action plan and work plans and makes adjustments to respond to changes and challenges."[17] Strategic plan and annual work plan guidance could account for the differences in how organizations use these plans in different ways depending on their local context, while also emphasizing how planning processes for these can help establish expectations between board and staff of what amount and type of project work is manageable based on staffing capacity, as well as create a shared understanding of priorities to promote an effective level of engagement between board and lead staff.

Technical and Financial Support

Councils and districts can benefit from technical and financial support to assist them in strategic planning processes to incorporate diverse perspectives and needs and engage in relevant technical expertise for identifying geographic priorities. Interviewees have expressed interest in live webinars and being able to address questions in real-time for learning best practices and how to improve organizational efficiencies. NOWC and OrCP currently offer ongoing webinar training opportunities. Additionally, some councils and districts engage in peer

[17] FY 21-23 OWEB Operating Capacity Grant Guidance

learning networks to learn from each other's experiences and share examples of lessons they have learned in NOWC and OrCP webinars, as well as CONNECT and OACD conferences. NOWC has self-funded a "watershed camp" for council staff that provides management peer training, mentoring for new staff, and technical training in collaboration with state and federal agency staff. Strategic planning processes could help organizations develop clearly measurable objectives; determine short, medium, and long-term project priorities; and identify potential partnerships and funding sources. This may help grantees, particularly lead staff, to gain valuable insight into project development, management, and implementation, while making the best use of OWEB's various grants in project design (e.g., technical assistance, stakeholder engagement, monitoring, and restoration).

Board Management

We heard from interviewees as well as from the survey findings that councils and districts noted challenges around board member training. We also heard webinars would allow for increased opportunities to meet the scheduling needs of retired or working board members. Key training areas included: strategic plans, organizational policies and procedures, fiscal responsibilities, and personnel management of lead staff (See Section V, **Table 14**). Additionally, lead staff that developed an engaged board often incorporated brief, 15-30 minute training modules into board meetings. Grantees may benefit from board training guidance and resources available from ODA, NOWC, and OrCP. Considering that lead staff capacity and turnover are common organizational challenges, this emphasizes the importance of continually promoting relevant and available resources for lead staff.

Staff Benefits and Retirement

We often heard from interviewees that a piece of lead staff succession planning and staff retention revolves around pay, health benefits, and retirement, which are further challenged by the rising costs of living and housing in Oregon, even before the COVID-19 pandemic. This is particularly applicable to councils, which are 501(c)(3) non-profit organizations. It can be challenging to maintain organizational longevity when lead staff leaves to seek out positions with increased pay and benefits. Additionally, based on the survey results, less than half of councils and districts indicated that they had succession planning or mentorship for lead staff, or succession planning for board members. Furthermore, only 47% of councils and 63% of districts indicated that they had competitive salaries and benefits compared to similar types of organizations. Most interviews with board members and partnering organizations recognized that lead staff often move onto conservation jobs elsewhere, while simultaneously relying on them as essential partners for watershed restoration and conservation, given their relationships with the local community.

Coordinating Across Agencies

It is challenging for councils and districts, as smaller organizations, to be able to afford the purchase of group health insurance for their staff, as they are working within a grant-funded framework. Some interviewees mentioned interest in a toolkit or an online resource page for how to incorporate health and retirement benefits into their organization. An online resource page could include relevant, available resources from the NOWC Insider Webinar Series or OrCP webinar archive. Additionally, some councils and districts have participated in peer learning networks to learn from each other's experiences and share examples of lessons they have learned in NOWC and OrCP webinars, as well as CONNECT and OACD conferences. Lastly, councils and districts may benefit from legal experts sharing their advice and tips, while answering questions in real-time.

Coordinating with and Educating External Funders on the Significance of Longer-Term Funding

As part of the external capacity-building program review, we learned that other funders (e.g., the Ford Family Foundation and the Wilburforce Foundation), recognize the need to develop longer-term funding strategies that can support longer-term partnerships. They also acknowledge the need to collaborate with other funders to ensure that collective investments and capacity resources are coordinated and effective. OWEB and ODA have provided ongoing, programmatic support for 20 years to councils and districts' efforts in improving local watershed quality and health. OWEB has developed longer-term funding strategies to help support grantees in partnership capacity and larger landscape-scale restoration (P-TA and FIP grants), while NRCS has developed RCPP grants to support collaboration with other councils and districts for landscape-scale conservation projects with private landowners. External funders often see OWEB and ODA as essential funding partners for restoration and conservation activities through these locally based councils and districts. As such, OWEB can play a role in educating funders on the significance of longer-term grants to work toward landscape-scale restoration and conservation.

VII.B. Best Practices: Council and District Grantees

Strategic Plans

Strategic plans support organizational efficiencies, can reduce lead staff burn-out through joint priority setting between staff and board, and provide a framework for developing annual work plans. The planning processes for these are shaped by their regional contexts, are varied based on the organization's structure, and serve different functions depending on how the organization is managed. Strategic plans, may have more detail or less, depending on these factors. Overall, strategic plans guide organizations by creating a vision to guide restoration and conservation priorities in the basin. Some organizations may find a more detailed strategic plan to be more useful in defining priorities between the lead staff and the board, while others may need a strategic plan with a wider scope to be able to capture funding opportunities that arise, and instead use their annual work plans to inform the more nuanced details. Regardless of which planning model that is used, identifying key partnerships and funding sources for project and/or program development, along with joint priority setting to define short, medium, and long-term priorities helps organizations to establish a shared understanding between the board and staff of what amount and type of restoration and conservation activities are achievable based on staffing capacity, and can inform which grants to pursue and when to do so. Together, these strategies can help reduce the chances of lead staff burnout and turnover.

Board Recruitment and Management

Boards affect organizational trajectory through the composition of their members, the functions they serve, their level of engagement in establishing organizational direction and priorities for the watershed, and most importantly, the relationships they develop with lead staff. Well-functioning organizations have proactively shaped the organization through targeted recruitment. Some organizations have accounted for staff time in their operational budget to participate in local boards and committees and attend community events to develop a network with the intention to identify potential board members and encourage their involvement in projects to cultivate a pool of potential candidates for current or future board vacancies. By using targeted recruitment with the intention of relationship building, some organizations have found that they were able to develop an effectively engaged board. When board positions were only posted or spread by word of mouth, organizations typically had a less diverse board. *(*It is important to note that organizations built up their operational budget over time to pay for staff time to participate in local boards and committees.)* Part of targeted recruitment included identifying potential candidates who could help them meet goals in their strategic plans or could

improve communication and information sharing across agencies and industries. Furthermore, developing board diversity allowed lead staff to engage with multiple board members for guidance and brainstorming. When there were too many people with the same knowledge and skills, there was less feedback for decision-making, which could lead to gridlock, since individuals tended to view and problem-solve similarly. In more rural and remote areas, board members noted they have a diverse skill set in terms of holding multiple roles in a given community (e.g., rancher and business owner).

Districts have faced additional challenges in board recruitment, given the legal requirements of owning or managing 10 acres of land to be eligible for zone directorship. To work around these, some districts have recruited individuals who do not meet these legal requirements to attend board meetings and become associate or at-large directors instead. This strategy can support a greater diversity of skills, knowledges, perspectives, and experiences in board composition. After one year, these positions become eligible for zone director elections as long as they are a registered voter who lives within the zone they represent, and have a conservation plan approved by the district.

To develop an effectively engaged board, lead staff included 15-30-minute skills training and educational talks (e.g., personnel and fiscal management) into board meetings. This assisted boards in understanding their roles and responsibilities and how to provide organizational direction setting. They also invited agency staff or other relevant experts to provide project updates and upcoming funding opportunities to help boards understand regional priorities. This enabled boards to make informed decisions on project and funding priorities. This helped establish a healthy relationship and better define expectations between the board and lead staff.

Education and Outreach

We often heard from councils and districts about the lack of OWEB funding for community outreach and education activities due to statute.[18] A key piece of conservation is educating the public about local resources, forming connections to the place they live, and demonstrating how they can engage the local community in voluntary watershed restoration and conservation. Furthermore, education and outreach are important ways for organizations to broaden their networks, develop partnerships, and secure funding. Funding for education and outreach supports their work with agency partners to engage the local community and host community events, which allows them to tap into other communities. To address the lack of funding, some organizations have looked to private foundations, while some districts with tax bases have developed their own grant program for education and outreach funding. Lastly, organizations can partner with OSU Extension.

Fiscal Management

Well-functioning organizations budget more project management time into grant applications to build additional capacity for projects and consider future costs and expenses (e.g., staff wages and materials). Some organizations have also developed an annual federally negotiated indirect cost rate agreement to support critical operation

[18] Refer to Measure 76 and ORS 541.956, which authorize OWEB to make grants available for outreach activities that are necessary for carrying out eligible restoration and acquisition projects that protect or restore native fish or wildlife habitat, or that protect or restore natural watershed or ecosystem functions to improve water quality or stream flows. To qualify as necessary for restoration or acquisition, the project must be tied to a specific geography, address clearly articulated habitat or watershed or ecosystem function goals for that geography, and identify a clear path toward achieving the restoration or acquisition measurable outcomes within a reasonable and specific timeframe. Projects whose primary purpose are education are not eligible.

costs. Furthermore, some organizations build their operational budget over time so they can pay lead staff and other project managers to participate in local committees, boards, and foundations, or attend local events. Through these avenues, staff can build relationships, discover joint priorities with potential partners, develop projects, and acquire funds.

Partnerships

Effective organizations assess the complexity of current projects and staffing capacity prior to pursuing additional grant funding to create a feasible project workload. Maintaining this awareness supports them in pursuing grants strategically, while being consistent in obtaining and managing grants to implement project work in a timely manner. Consistency builds trust with partners and helps them to establish themselves as reliable and capable partners, which attracts more funding from partners. By building this trust, partners may seek them out or be willing to take on riskier, more complex projects over time.

Well-functioning organizations manage staff turnover at partner organizations by orienting new personnel to the program of work, joint project grants, and priorities. This includes inviting agency partners to attend board meetings or meeting with them individually. Additionally, these organizations participate in regional group networks to share information and stay connected to regional priorities, as well as project and grant opportunities. This relationship-building can help organizations to be aware of and adapt to upcoming changes.

To work towards improving relationships with partners who have troubled histories, lead staff or partners have obtained funding to work together on a joint project or use a monitoring grant to collect and share information that both organizations need to develop projects. Through sharing knowledge and joint project funding, organizations have worked towards repairing organizational relationships. This helped support the capacity of the entities involved since each had access to valuable skills, knowledge, and community connections necessary to complete the restoration and conservation activities.

Personnel Management

Organizations with an effectively engaged board have been better positioned to make challenging HR decisions regarding the organization's budgetary and project needs and re-evaluate necessary skills for staff positions, to accommodate shifts in an organization's trajectory. Additionally, they recognize when and how to support, lay off, or fire staff as needed.

VII.C. Proposed Metrics Scorecard

This project focused on five dimensions of organizational and partnership capacities related to the watershed restoration and conservation contexts in which councils and districts work. After completing our analysis and discussions with the Core Project Committee and Advisory Group, we developed a proposed metrics scorecard that OWEB could use to strengthen tracking for the Operating Capacity grant program. These were developed from strategies used by case study organizations to improve organizational efficacy and handle common capacity issues, as well as lessons learned from analyzing the case study interviews and input from the Core Project Committee (**Table 5**). **Note: The proposed qualitative indicators are not an exhaustive list, nor are they "check boxes;" rather, they are meant to provide a more nuanced understanding of how well an organization is functioning to provide more guidance for OWEB and ODA staff engaged in supporting councils and districts.*

Table 5. *Revised Capacity Dimensions, Indicators, and Metrics.*

Organizational Capacity

Capacity Dimension:	**Evidence of Ability to:**
Internal Governance & Operational Practices	Manage people and resources Accountability
Proposed Qualitative Indicators: Well-Functioning	
Development of a strategic planning process that is adapted to the organizational structure and management, as well as available funding opportunities within organizations' regional contexts. (1) For ex: Regions with more funding opportunities may benefit from more detailed strategic plans that incorporate diverse perspectives and needs, and engage relevant technical expertise to identify geographic project and/or programmatic priorities, potential partnerships, and funding sources. These priorities could be laid out as short, medium, and long-term goals that describe how they will result in tangible benefits or improvements, along with clearly measurable objectives. (2) For ex: Regions with more limited funding opportunities may develop strategic plans that are wider in scope, while covering organizational history, land uses, and limiting factors. The strategic plan then serves as a litmus test to see if emergent opportunities fit into the strategic plan goals and needs, while accounting for constraints described in the plan. From this strategic plan, lead staff develop a more detailed annual work plan to establish geographic project and/or programmatic priorities, potential partnerships, and funding sources. These priorities could be laid out as short, medium, and long-term goals that describe how they will result in tangible benefits or improvements, along with clearly measurable objectives.	Consistent implementation of governing policies and procedures, bylaws. Revising these in regular intervals (e.g., every 5 years). Lead staff engaging in active board management through integrating educational talks by agency experts into board meetings to help boards make informed decisions on funding and project priorities. Ability to make necessary HR decisions regarding the organization's budgetary and project needs, and re-evaluating necessary skills for staff positions, to accommodate shifts in an organization's trajectory. Additionally, recognizing when and how to support, lay off, or fire staff as needed.

Capacity Dimension:
Resources Obtained & Leveraged

Evidence of Ability to:
Attract investment and support (crosswalk with partnership capacities)

Proposed Qualitative Indicators: Well-Functioning

Having a general knowledge of available funding (e.g., periodically updated spreadsheet), ensuring consistent revenue streams, and developing a long-term plan to diversify funding sources.

Assessing complexity of current projects and staffing capacity to better define a feasible project workload and avoid overcommitting. Then with this knowledge, consistently obtaining restoration and conservation grants and implementing project work in a timely fashion to build trust with partners, which can lead to more complex, riskier projects with more funding.

Budgeting for more project management time in grant applications to build additional operational capacity for projects, as well as, considering future costs and expenses (e.g., staff wages and materials).

Capacity Dimension:
Adaptive & Resilient Governance

Evidence of Ability to:
Respond to challenges, changing needs and opportunities

Proposed Qualitative Indicators: Well-Functioning

Being networked in the community through participation in local boards and committees to create a pool of potential board members for future vacancies, as well as future staff positions.

Developing a lead staff succession plan (e.g., identifying potential staff who can be trained in lead staff roles and responsibilities).

Developing an engaged board through targeted recruitment and board education training to shift from a stakeholder board to governing board.

Creating an online shared drive of important organizational and project documents to smooth lead staff transitions.

Partnership Capacity

Capacity Dimension:
Types of Partners Engaged

Evidence of Ability to:
Work with all necessary types of partners relevant to watershed restoration / conservation in a given geography

Proposed Qualitative Indicators: Well-Functioning

Building and maintaining strong relationships with funders, decision-makers, and project partners.

Increasing communication, cooperation, and collaboration with funders, decision-makers, and project partners.

Participating in local committees and boards, attending events to build an organizational reputation, and meeting with landowners to discover joint priorities to acquire funds and develop projects.

Identifying key partners who have access to the information the organization needs and developing a network of relationships to obtain multiple perspectives on how to develop and implement projects.

Diversifying and expanding types of restoration and conservation activities based on landscape needs (e.g., stream restoration, uplands, etc.) over time to engage additional partners.

Engaging key decision-makers in strategic planning processes to develop watershed priorities.

Continuing partnerships during times of turnover at partnering agencies and other local partners, e.g., introducing them to project work and grants.

Facilitating and coordinating public messaging with partners (e.g., strengthening the feedback loop between resource managers and community members).

Capacity Dimension:

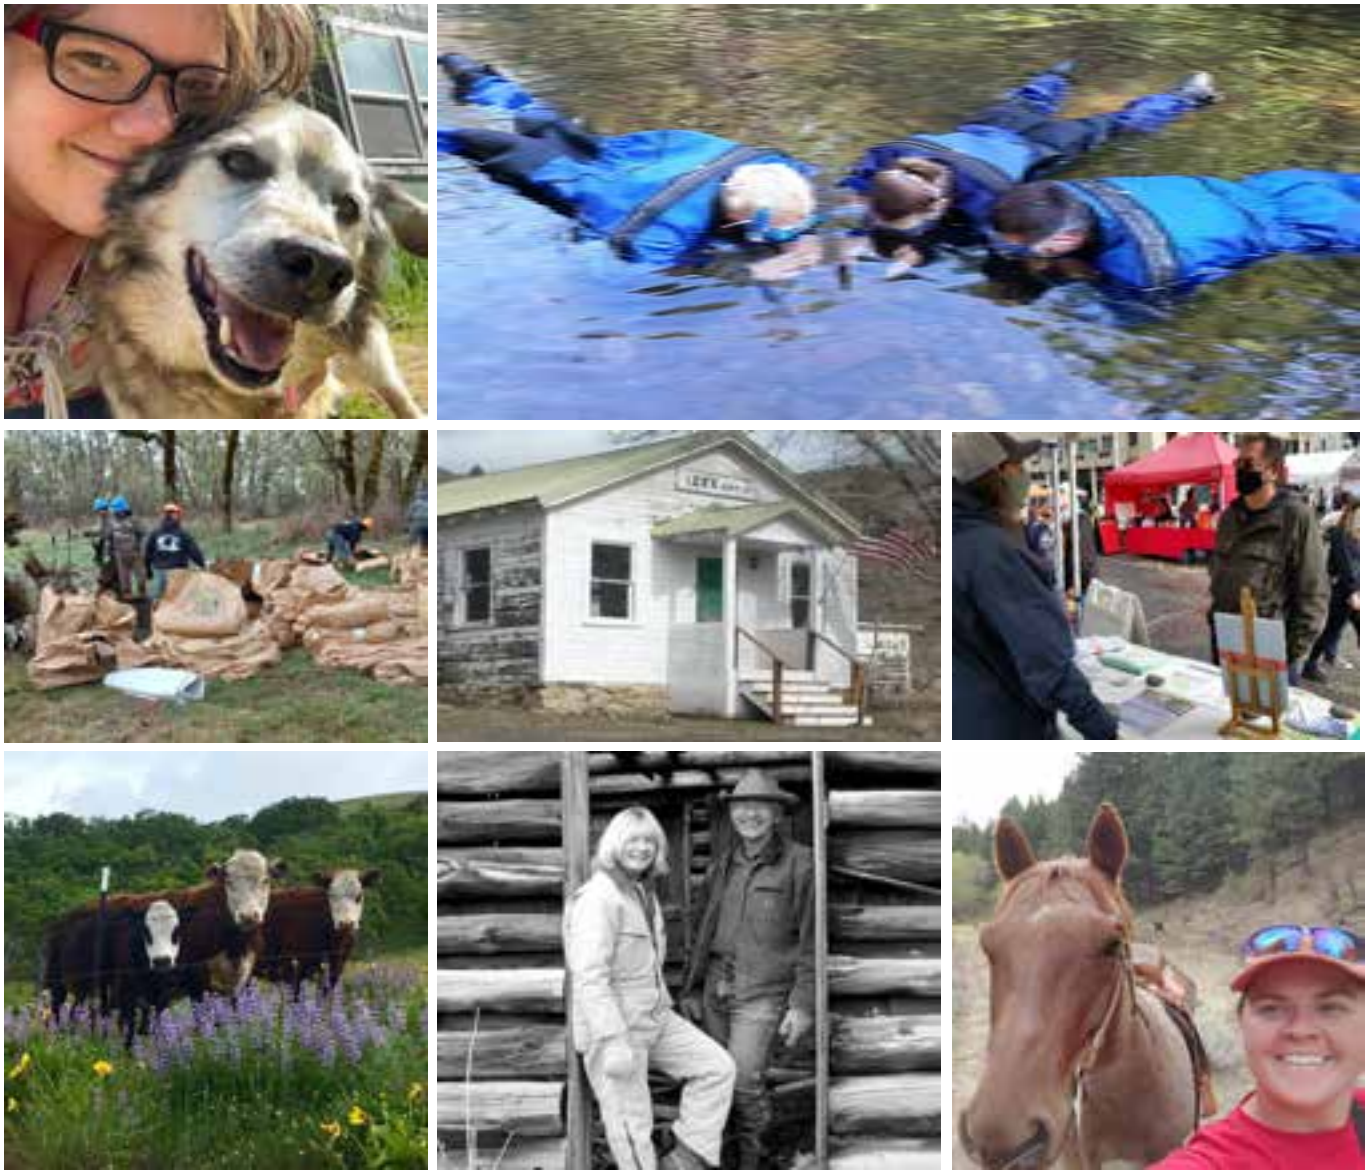
Partnership Types Engaged In

Evidence of Ability to:

Use partnership types suited to issues and needs at hand

Proposed Qualitative Indicators: Well-Functioning

Diversifying and expanding types of restoration and conservation activities to increase project complexity through group partnership networks, e.g., tying smaller projects into larger, landscape-scale restoration and conservation projects. Increasing communication, cooperation, and collaboration with funders, decision-makers, and project partners.



Participating in regional coordination and information-sharing groups to be connected to regional priorities, funding, and partnership opportunities, and to learn from each other's skills and experiences. Identifying key partners who have access to the information the organization needs and developing a network of relationships to obtain multiple perspectives on how to develop and implement projects.

Building on existing relationships to work towards developing collaborative governing strategies for OWEB FIPs, P-TA, NRCS RCPP, or other cross-jurisdictional partnerships to engage in landscape-scale restoration. Engaging key decision-makers in strategic planning processes to develop watershed priorities.

Serving as an information conduit, building professional capacity among partners, and fostering strong working relationships (e.g., supporting workshops and trainings to deliver technical information on topics).

Conclusion

This report reviewed the 20 years of investment that the Oregon Watershed Enhancement Board has made in the operating capacity of watershed councils and soil and water conservation districts. Our evaluation of these grants found that they have been crucial to sustaining operations, building partnerships, and developing the capacity to strategically accomplish watershed restoration and conservation on the ground. We also found that (1) lead staff capacity and retention, (2) board composition and recruitment, and (3) strategic planning were all key influences on the health and effectiveness of these organizations. We hope that our analysis and insights help grantees, agencies, community partners, and others continue to support the important work of councils and districts.

Funding Strategy	Biennium	Description
Blanket Funding	1997 - 2003	**Evaluation Criteria** Evaluated based on the scope of work and description of accomplishments. There was no consideration of biological or geographic values or priorities. **Funding Distribution** Equally distributed across OWEB regions. **For the 2001 - 2003 grant cycle, two regions had an increase in the number and amount of requests. New applicants in these regions were awarded half-time support.*
Categorical Funding	2003 - 2005	**Funding Distribution** Distributed grants based on funding categories. Each category had a pre-designated range of funds.
Decision Matrix with Ranked Scoring	2005 - 2007	**Eligibility Criteria** Council serves a unique geographic area (i.e., not within the bounds of another council OWEB grantee), the council reflects the balance of interests or actively seeking this, and the council has been designated by a local government. **Merit Evaluation Criteria** Elements included: (1) Council Organization, (2) Past Performance - Capital Projects, (3) Past Performance - Non-Capital Projects, and (4) Proposed Work Plan/Watershed Complexity. Reviewers looked for a balance between the two Past Performance elements. **Review Process & Ranking System** Review teams consisted of local and state perspectives. The review process consisted of reviewer evaluations, applicant interviews, and staff/reviewer discussions, followed by a review team assigning scores using a decision matrix to rank applicants. Applicants were ranked from significantly ineffective with limited accomplishments to highly effective with strong accomplishments. **Funding Distribution** OWEB provided funding based on a graduated point scale, using a standard formula, rather than a standard amount by category or a percentage of the funding requested by the applicant. Through this formula, the highest-scoring council received the highest base funding. **Start of Umbrella Councils** Some councils, i.e., "umbrella councils" received additional funding on top of the base award from 2005 - 2017.

[1] Sources include: OWEB Board Meeting Notes from 2005 - present and OWEB 2021 - 2023 Operating Capacity Grant Guidance.

		Umbrella councils were based on (1) "support and coordination of at least 3 groups, having a coordinating council, sharing staff and a single Council Support grant", (2) "providing services to a watershed area containing three or more 4th-field hydrologic units" or (3) both.
Modified Decision Matrix with Ranked Scoring	2007 - 2015	**Eligibility Criteria** Remains the same. **Merit Evaluation Criteria** Two categories (1) Council Organizational Structure and (2) Council Effectiveness. ● *Council Organizational Structure criteria included:* Organization Make-up and Citizen Involvement, Organization Improvement Efforts, Management of the Organization, and Fiscal Management. ● *Council Effectiveness criteria included:* Leadership Role in Watershed Activities, Planning Strategically, Working Collaboratively, and Accomplishments. Applications also included a "special circumstances" section to provide context for reviewers to keep in mind while looking at the accomplishments of each council. Councils could describe staffing situations and demographic and social issues that affected their work. **Review Process & Ranking System** Reviewers consisted of two teams with a representative from each OWEB region and two statewide representatives. After reviewers pre-scored the applications, they met for a facilitated "consensus scoring session". Following this, OWEB staff applied weighted factors that resulted in one merit score for each application. Council effectiveness and accomplishment criteria were weighted more heavily than council organizational structure criteria. Applications ranked by: Excellent, Very Good, Good, Satisfactory, and Needs Improvement. **Funding Distribution** Funding distribution remained the same, i.e., the highest-scoring council received the highest base funding. **For the 2013 - 2015 biennium, councils received the same level of funding as the 2011-2013 biennium based on that biennium's review and merit category placement. The purpose of this was to support OWEB staff who were in the process of developing new Council Capacity grant rules for the 2015-2017 biennium.* **Umbrella Council Awards Continue** Umbrella Council awards continue until 2017.
Eligibility Criteria Focused	2015 - Present	Due to resource-intensive staff time and council time of the previous method, OWEB adopted new Council Capacity grant rules. **Eligibility Criteria**[2] Includes: (1) designated as a watershed council by a local government, (2) previously received a Council Capacity grant, and serves an area that covers the same or larger area served by a council or group of councils as of 2013 with only one

[2] https://secure.sos.state.or.us/oard/viewSingleRule.action%3BJSESSIONID_OARD=_VLon9LnJiAMJjJkYNJha26rZ1ggeHDYseAQO-PWCFwak9LE4AU_!-2132861245?ruleVrsnRsn=180686

		applicant per geographic area and includes a minimum population size of 500 within its designated boundaries, (3) has an adopted action plan by a council-governing body that meets OWEB requirements, (4) is a 501(c)(3) registered with Oregon, or written fiscal sponsorship agreement with a 501(c)(3), SWCD, city, county, or tribal government, (5) Council's governing body has adopted bylaws or a charter that includes: (a) a declaration that the council's mission aligns with OWEB's purpose as described in the Oregon Constitution and statutes. At a minimum, the bylaws or charter shall indicate that a primary purpose of the council is to work collaboratively with communities and landowners to develop and carry out voluntary watershed protection, restoration, enhancement, and community engagement activities; (b) the eligibility, selection process, length of service, and powers for governing body and officers; officer titles, governing body's decision-making process, minimum number or frequency of governing body meetings; (c) a statement that the council intends its governing body to include a diverse range of geographic areas and community interests in the watershed in order to engage a balance of interested and affected persons within the watershed as required by ORS 541.910(2); and (d) a process for amending bylaws or charter. If the council is a membership organization, its bylaws or charter must also include: membership eligibility, when membership meetings will occur, the decision-making role of the membership, a process to remove members or terminate members' voting rights; and (6) the Council's governing body has adopted policies/procedures that include: (a) list of geographic areas and community interests the council intends to include on its governing body in order to engage a balance of interested and affected persons within the watershed pursuant to ORS 541.910(2); (b) policy that the council operates as an open and inclusive organization, including inviting the public to council meetings, and, upon request, providing the public with records of its meetings and decisions; (c) policy that the council, or its fiscal sponsor, uses Generally Accepted Accounting Principles; and (d) policy that the council does not rely on litigation to compel regulatory enforcement as a means to implement its mission. **Merit Evaluation Criteria** Criteria include: (1) Effective Governance and Management, (2) Progress in Planning, (3) Progress in On-the-Ground Watershed Restoration, and (4) Progress in Stakeholder Engagement for Watershed Restoration Purposes. **Review Process** OWEB staff evaluate Council Capacity grant applications based on the merit criteria described above as well as their institutional knowledge of the council, including the council's project performance history. Councils are not ranked, but rather each application is considered on its own basis to determine funding amount. **Funding Distribution** Funding levels include: (1) full funding if the council meets all criteria, (2) reduced funding if the council meets some criteria, and (3) do not fund if the council's performance is inadequate. **Additionally, if two or more councils have merged, they are eligible for additional funding on top of the base capacity grant award. These grant funds are used to help organizations merge together to address board and staff development, strategic planning, and other costs to support the transition from multiple organizations to a single entity. This amount varies depending on whether 2, 3, or 4 or more organizations are merging.* **Umbrella Council Awards Continue** Umbrella Council awards continue until 2017.

Appendix 2. Service Providers and Supportive Organizations.

Organization	Description
OWEB Regional Program Representatives	● Represents OWEB's programs with councils and other local conservation partners. ● Reviews, administers, and oversees the implementation of grants. ● Promotes cooperation, participation, and funding from federal, state, and local public agencies; citizens; and interest groups to assess watershed conditions, develop priority actions, and implement projects to enhance watershed conditions (e.g., attend council board meetings to support councils experiencing management challenges and sharing grant opportunities). ● Coordinates technical assistance with local partners, including councils, districts, landowners, and other stakeholders.
OWEB Capacity Coordinator[3]	● Works with the Director to improve coordination and joint investment opportunities with external funders, including other state agencies, federal agencies, private foundations, and other funders of similar conservation work. Identifies opportunities for leveraged investment; develops materials to help other funders understand OWEB's role and the types of investments the agency makes. ● Holds regular planning and coordination meetings with statewide organizations representing local organizations including, but not limited to the OACD, NOWC, OCEAN, and Coalition of Oregon Land Trusts. Works collaboratively to identify local partner problems and solutions. ● Works collaboratively with OWEB Regional Program Representatives and Grant Payment Specialist to manage, coordinate, and troubleshoot funding request process of Council Capacity grants. ● Leads coordination for Oregon Department of Agriculture to implement District Capacity program. ● Coordinates program development, assessment, and implementation with program managers, regional field staff and other agency staff. ● Develops and leads effective review teams to evaluate and makes funding recommendations for Operating Capacity grants. ● Regularly communicates with applicants and trains on the application process and materials as needed. ● Makes recommendations for other grant types that may be effective to improve local capacity.
ODA Regional Water Quality Specialists	● Provide districts with technical assistance in implementing the agricultural water quality management program. This is achieved through districts' scope of work (SOW) by "ensuring that farmers and ranchers help achieve water quality

[3] Note: OWEB no longer has this position. This work has been incorporated into OWEB's Monitoring and Reporting Program Manager role.

	standards and meet the agricultural pollutant load allocations assigned by the Department of Environmental Quality (DEQ) in its Total Maximum Daily Loads (TMDLs)."[4] ● Reviews and approves districts' SOW reporting and operational funds prior to districts' receipt of payments. ● Attends district board meetings and works with funding partners to support districts in working with local partners and share grant opportunities. ● Meets monthly with the SWCD Operations Specialist to share concerns about lower-functioning districts and will sometimes ask peers of higher-functioning organizations to work with lower-functioning ones. Time spent on this can be included in a district's capacity grant.
SWCD Operations Specialist	● Provides biennial regional board member trainings focused on newly elected or appointed board members on legal obligations of elected officials. ● Provides biennial regional district manager round-table trainings on a variety of topics (e.g., personnel management, ethics, public meeting laws). ● Offers individual onboarding training for new employees and board directors. ● Provides on-demand operational technical support (personnel management, legal obligations, ethics, public meeting law, etc.). ● Writes and updates a "District Guidebook" outlining legal and best management practices for operating a conservation district.
Network of Oregon Watershed Councils (NOWC)	● Nonprofit organization funded primarily by OWEB and membership fees, that engages in advocacy work at the state level, while also offering professional development and networking opportunities. ● NOWC Insider Webinar Series regularly features content experts who offer technical training and resources on a range of topics, including best practices for nonprofit management. ● Template Library of funding resources, sample templates, handbooks, and guides. ● Watershed Council FAQs covering meetings, contracts and bids, financials, hiring and onboarding, and community action. ● 2022 Funding Opportunities spreadsheet summarizing emerging (or enhanced) state and federal funding programs.
Oregon Conservation Education and Assistance Network (OCEAN) Connect + Conference	● Hosts the annual CONNECT conference for councils and districts with opportunities for peer learning and networking. ● Offers training and certification for districts on education and outreach training through universities, professional networks, and NOAA; as well as technical training, e.g., NRCS, GIS, and river restoration; and DEI trainings and toolkits.
Oregon Association of Conservation Districts (OACD)	● Nonprofit association of districts that partners and converses with state agencies, legislators, and statewide conservation organizations. ● Hosts the annual OACD conference which covers topics, e.g., funding opportunities, updates from partners, water quality programs, and conservation practices.

[4] https://www.oregon.gov/oda/programs/naturalresources/agwq/pages/agwqplans.aspx

Oregon Conservation Partnership (OrCP)	● Hosts affinity groups to increase collaboration to improve conservation across councils, districts, and land trusts. Groups focus on: estuaries and tide gates, journal club for aquatic habitat restoration, pollinators, and protection of working lands and easements. ● Offers monthly webinars covering fiscal management, restoration and conservation topics, outreach, partnerships, contracting, OWEB grants, and more.

Appendix 3. Survey

A. Methods

Development and Review

A survey was sent out online using Oregon State University's Qualtrics survey platform to all 58 councils and all 42 districts in Oregon that receive or have received Operating Capacity grants. The first set of questions focused on employees and shared staffing arrangements. The purpose of this was to frame the sampling of councils and districts using Dr. Margerum's "Reliance Model of Collaborative Capacity", which was developed through prior surveys of councils. This conceptual model provided a way to identify staffing models, arranging organizations into similar types. We used this to develop representative sampling for case study selection. After a discussion with key ODA staff, it was determined that this was an appropriate way to understand districts as well. Types include: (1) Board-Reliant, (2) Staff-Reliant, and (3) Partner-Reliant (Table 1).

Table 1. *Typology Classifications.*

Board-Reliant	Staff-Reliant	Partner-Reliant
Lower staff levels (< 3.0 FTE).	Higher staff levels (>= 3.0 FTE).	Varied staffing that is shared with another organization (e.g., staff, coordinator).
Staff delivers primary capacity with greater reliance on a working board.	Staff fulfills most management capacity roles.	

The second set of questions focused on the level of agreement or disagreement with statements identifying factors that build or reduce organizational capacity to obtain a consistent source of quantifiable information across council and district grantees since much of the existing data sources were inconsistent. Survey questions were informed by recurring themes from key informant interviews and discussion with the Core Project Committee.

Recruitment Process

We collected emails and phone numbers for the executive director, coordinator, or district manager, for all councils and districts using the organization's websites for councils and the annually updated Oregon SWCD Directory for districts. The survey took place between April - May 2022. The research team contacted potential respondents three times, either via email or phone call, while the Core Project Committee promoted the survey through their networks. To ensure that only qualified individuals completed the survey, we included a screening question to verify respondents were employed by a council or district and able to answer questions about their organization's staffing and capacity.

Data Analysis

Data was downloaded, cleaned, and organized in Microsoft Excel. We did not include responses that were incomplete for applying the capacity typology or for identifying factors that built or reduced organizational capacity. To categorize grantees by the capacity typology, we asked about staffing levels over the past 12 months for the executive director, district manager, or coordinator; permanent staff; contracted staff; and temporary (e.g., seasonal) staff. We then totaled these to determine whether an organization was staff- or board-reliant. There were 3 councils and 6 districts that fell on the dividing line of board-reliant vs. staff-reliant. For those, we looked at the organization's self-description and discussed with the research team what seemed the most

appropriate designation. For partner-reliant, we used the organization's self-description of its relationship with other organizations, and to what extent they shared staff and/or physical location with another organization. Additionally, we asked whether board members served on another related local organization's board and if board members or other community members (e.g., volunteers) took on essential administrative tasks. For the statements focused on organizational capacity factors, we used descriptive statistics to examine the percentage of respondents in each response category by: (1) councils and districts, (2) board, staff, and partner-reliant councils as well as districts, and (3) taxing and non-taxing districts. Additionally, the categories of "strongly agree" and "somewhat agree" were simplified into a single category "agree". This was done for the "strongly disagree" and "somewhat disagree" categories as well. Furthermore, for the capacity typologies, we calculated the average (mean) response for each of these questions to determine if there was a statistical difference between types. For the open-ended questions, we coded them qualitatively for repeated themes to find connections with the statements on organizational capacity factors.

B. Survey Questionnaire

The following questions focus on FTE and staffing arrangements.

1. What has been your organization's staff FTE at its highest level over the past 12 months for the following categories? (FTE = Full Time Equivalent. For example, two half-time positions = 1 FTE).
    a. Total permanent staff FTE (NOT including contract or temporary staff)?
    b. Total contract staff FTE?
    c. Total temporary staff FTE (e.g., seasonal)?
    d. Executive director, district manager, or coordinator FTE (as either employee or contractor)?

2. If your organization shares any staff with another organization(s), what is the shared staff FTE for each of the following categories?
    a. Total permanent staff FTE (NOT including contract or temporary staff)?
    b. Total contract staff FTE?
    c. Total temporary staff FTE (e.g., seasonal)?
    d. Executive director, district manager, or coordinator FTE (as either employee or contractor)?
    e. What is the name of this organization(s)?
    f. Is there anything else you would like to explain about how you share staff and work with this organization(s)?

3. If any of your board members serve on another related local organization's board, which of the following do they serve on?
    a. [x] Soil & Water Conservation District.
    b. [x] Watershed Council.
    c. [x] Another organization that is fiscally, or otherwise important to supporting your operational capacity.
    d. What is the name of this organization(s)?

4. Do any of your board members or other community members (e.g. volunteers) take on these tasks?
    a. [x] Staff administrative tasks.
    b. [x] Grant writing.
    c. [x] Strategic planning.
    d. [x] Other _____(please explain).

The following questions focus on finding out what factors help keep your organization functional and healthy.

1. We're interested in learning about how your organization operates. Please indicate how much you agree with the following statements for your organization. (Strongly Agree = 1, Somewhat Agree = 2, Neither Agree nor Disagree = 3, Somewhat Disagree = 4, Strong Disagree = 5, Unsure = unranked).

Our board members have clear position descriptions describing their roles and responsibilities.
Our board receives training on financial management, facilitation, and personnel management.
Our board takes initiative and actively engages in helping manage our organization.
We have written personnel and operational policies.
We implement our personnel and operational policies.
Our board members have term limits. **Since district board members are elected, we did not ask districts to respond to this.*
We have succession planning for board members in our strategic plans and/or other documents.
We have succession planning for lead staff (district manager, coordinator, and/or executive director) in our strategic plans and/or other documents.
We have mentorship structures in place to introduce new coordinators/directors to the community, agency contacts, and board members to support relationship building.
Our staff has clear position descriptions describing their roles and responsibilities.
We have competitive staff salaries and benefits compared to councils, districts, or similar types of organizations.
Our organization has high retention rates for our lead staff (district manager, coordinator, and/or executive director).
Our staff receive training on key operational capacities (e.g., project management, contracting, and administrative tasks).
Our staff receive training on technical skill-building (e.g., GIS).
We have adequate equipment/ technology for virtual meetings.

2. We're interested in learning about how your organization operates with other councils, districts, or other local partners. Please rate how often your organization works with other organizations based on the following statements. (Most of the time = 1, Some of the time = 2, Seldom = 3, Never = 4, Unsure = unranked).

We are working with councils, districts, and/or other local partners.
We share office space and other administrative costs with councils, districts, or other local partners.
We share staff expertise between councils, districts, or other local partners (e.g., technical, GIS, outreach to landowners, farmers, etc.).

We actively seek out opportunities to leverage OWEB Operating Capacity grants to acquire stakeholder engagement, monitoring, technical assistance, and restoration grants to implement projects on the ground.
We actively seek out opportunities to leverage OWEB Operating Capacity grants to build cooperative partnerships with councils, districts, or other local organizations.
We actively seek out opportunities to leverage OWEB Operating Capacity grants to obtain additional funding for capacity building (e.g., hiring additional staff, providing staff skills training, and improving administrative management).

3. (Optional): Please explain anything important that has helped keep your organization healthy and functional.

4. (Optional): What has been your most significant challenge for sustaining the work of your council/district?

C. Statistical Analysis

Appendix 4. Case Studies

A. Methods

Case Study Selection

For the organizations that responded to the survey, we crosswalked the capacity typology with Oregon Watershed Restoration Inventory (OWRI)[5] and OWEB Grant Management System (OGMS)[6] data, from 1997 to 2019, to identify grantees with lower, low to medium, medium to high, and higher levels of obtaining and leveraging resources. To define these, we added up the total cash spent and in-kind contributions for each organization and then used quartile statistical breakpoints. We compared councils to councils and districts to districts, since each differed in their organizational structure, and as such, were distinct units of measure. We also accounted for organizations' name changes to ensure we included their entire history of funding obtained. We also noted which districts received local taxes. The only districts with a tax base fell under the staff-reliant typology, which validated the data based on the working assumption that once a district obtained a tax base, they were able to operate at a higher level because of increased staffing.

Initial Document Analysis

We sampled 20 organizations, (i.e., 10 councils and 10 districts; see Table 14), using selection criteria in the following order: representative across typologies, a representative proportion of resources obtained and leveraged, and representative across urban and rural. Lastly, we consulted with the Core Project Committee to identify which of these organizations would be more likely and able to participate. For each of the selected 20 organizations, we reviewed available data from OGMS grant documents[7] and OWRI data from 1997 to 2019, as well as SOW and FAAP from 2015 to 2019, OWEB FIPs and P-TA, and other organizational documents accessible on council and district websites to create in-depth organizational profiles. These profiles summarized the history and trajectory of each organization relative to the following capacity dimensions:

- Internal governance and operational practices (e.g., organizational documents, changes in staffing and board over time, changes in organizational structure and processes)
- Adaptive governance (e.g., mention of succession planning in organizational documents)
- Resources obtained and leveraged (e.g., funding sources used most frequently, acquisition of regionally competitive funds)
- Types of partners engaged (e.g., landowners, public agencies, private, nonprofit, and research entities worked with most frequently)
- Partnership types engaged in (e.g., involvement in OWEB FIPs and P-TA, NRCS RCPP, and cross-boundary partnerships)

[5] OWRI included projects voluntarily reported that may or may not have received OWEB restoration grants. However, the purpose of this data source was to determine how many resources grantees obtained overall. Furthermore, despite the voluntary nature of reporting, this data source contained a fairly comprehensive listing of councils and districts self-reporting from 1997 to 2019.

[6] OGMS data included OWEB grants for technical assistance, monitoring, education, outreach, and stakeholder engagement from 1997 to 2019. Since the initiation of OWEB's restoration grants, grantees have been required to report receipt of these to OWRI. Therefore, we did not include restoration grants to avoid duplication.

[7] OGMS grant documents included council support, restoration, technical assistance, monitoring, education, outreach, and stakeholder engagement from 1997 to 2019. For districts that served as fiscal sponsors to a council, we also looked at council support grant documents for councils to better understand how they work together.

In-depth Interviews

To select case study organizations for in-depth interviews, we developed a spreadsheet of the sampled 20 organizations, noting highlights from each capacity dimension to identify organizations that seemed likely to offer insights into these topics based on their specific experiences. Additionally, we ensured that the organizations we selected were roughly representative of a diversity of types and locations as per our selection criteria for the initial document analysis. Lastly, we considered which councils and districts were involved in the FIP Partnership Learning Project to not over-burden potential participants in a simultaneous research study. We selected 7 organizations for case study interviews in consultation with the Core Project Committee (Table 15). Interview questions were informed by the in-depth organizational profiles and discussion with the Core Project Committee. Prior to conducting interviews, we shared the organizational profile we developed with lead staff (e.g., coordinator, executive director, or district manager) for validation. Interviews were semi-structured and questions were slightly adjusted in the course of the interview based on what organization they worked for, as well as based on the expertise and role of the interviewee. Interviewees included: current and past lead staff (i.e., executive directors, coordinators, district managers), 1 to 2 other staff (e.g. project managers, administrative assistants), 1 to 2 board members (e.g., board chair/president or vice chair/vice president), and 2 to 3 top partnering organizations.[8]

[8] It was difficult to contact previous staff or board members for interviews since they were less available to participate, while some organizations were not sure of who past staff were. Interestingly, some organizations have relied on past staff during times of staffing transitions, which increased the likelihood of their participation. Additionally, when it was not possible to obtain partner contacts of a council or districts' top partnering organization because they were going through their own lead staff transition, we interviewed the organizations who were available to participate.

Interview Analysis

Interviews were recorded on Zoom or by hand-held recorder for phone interviews, and transcribed using Rev transcription service. For individuals that preferred to not be recorded, we took detailed notes. Data collected during the interviews was linked only to participant names by password-protected key sheets kept on the researchers' institutional computers and password-protected cloud file sharing. Using NVivo qualitative analysis software, we analyzed the interviews by using themes related to the capacity dimensions, as well as by how grantees' used the Operating Capacity grants to identify what built or reduced organizational capacity (Table 16). Additionally, we triangulated this data with the key informant interviews that took place in 2020 with OWEB Regional Program Representatives and ODA Regional Water Quality Specialists, as well as the organizational profiles we developed in the initial document analysis, to validate findings from the case study interviews. Lastly, we discussed the findings with the Core Project Committee to verify what we found with their institutional knowledge and long history of working with councils and districts.

Table 16. *Primary NVivo Codes.*

Primary Codes	Description
Operating Capacity Grant Program	How organizations used the Operating Capacity grants, comments on the role of OWEB/ODA staff in supporting organizations, and comments about grant application or reporting requirements.
Governance	Organizational management and challenges (e.g., roles and relationships between board and lead staff, fiscal management, succession planning), strategic plans, board recruitment, staff and board transitions, and on-boarding and training for staff and board.
Partnerships	How organizations build relationships to develop partnerships with agencies, tribes, councils, districts, or other local partners to work on joint projects; sharing staff or technical skills or knowledge with these entities; involvement in OWEB FIPs, P-TA grants or NRCS' RCPP grants; and participation in regional coordination and other information-sharing groups.
Resources	Discussion of how OWEB grants have helped organizations acquire non-OWEB funding sources; how they learned about these funding sources; participation in group networks to learn about and coordinate funding; access to stable funding; geographic and other differences in funding opportunities.
Interviewee Role	Position's title and length of employment; daily tasks and level of oversight with board and staff; and past work or volunteer experiences with councils, districts, or other jobs that led them to this position.

B. Case Study Interview Guide

Introductory Question

1. What's your role in your organization? How long have you been in this position?

Operating Capacity Grant Program

For this section, we want to hear your thoughts on how to improve OWEB's Operating Capacity grant program.

2. Is there anything about the Operating Capacity grant program that you think needs to change to be more supportive of your organization?
3. Are there aspects of the Operating Capacity grant program that help or hinder your ability to build more capacity?

Internal Governance & Operational Practices

For this section, we're hoping to learn more about how your organization functions, how it has evolved over time, and what factors have contributed to your organization's resilience.

4. We have some questions about the role and culture of your board.
    a. Is your board more of a working board or a strategic board?
    b. How engaged is your board in the management of the council?
    c. Have you used onboarding or continuing education processes for your board?
        i. *PROMPT*: e.g., orientation, position descriptions, division of duties?
    d. What challenges have you had in board recruitment? What strategies have you used to overcome these?
5. *Plan to reference organizational profile:* Do you have a strategic action plan? How are you using it to build your organizational capacity? To sustain and build partnerships?
6. Can you tell me about a time when your organization faced challenges and you were able to respond to these challenges effectively?
    a. *PROMPT:* What helped make that response effective? Leadership, partners, staff?
7. Can you tell me about a time when you faced difficulties that your organization had difficulty responding to or recovering from?
    a. PROMPT: What made the response challenging? Capacity, board, partners, staff?
8. Has your council/district faced any challenging staffing or board changes?
    a. *Follow-Up:* Were these expected or unexpected changes?
    b. *Follow-Up:* Were these individuals key players in running the organization and/or had they been a part of the organization for a long time?
    c. *Follow-Up:* How did your organization navigate staffing/board transitions?
9. What kinds of strategies, resources, or guidance do you have for succession planning?
    a. *PROMPT - IF PARTNER-RELIANT:* I've heard of some organizations that work with a district or other entity as a fiscal sponsor will sometimes share staff. Does your organization do this? If so, do you have this written up in your organizational documents, or is this more informal, based on when the need arises?

Partnerships

For this section, we're hoping to learn more about how your organization partners with other organizations to build capacity in terms of skills, knowledge, and leveraging financial resources. We're also interested in learning about the types of partners you engage with on projects.

10. How do you partner with neighboring councils and/or districts to share services to meet skill and/or knowledge gaps to build capacity?
    a. *PROMPT*: For example, working with a district that has an engineer on staff and can share technical assistance, while council staff focuses on outreach or education?
11. Who are the top 3 organizations that are your most important partners? How familiar are they with how your organization functions? *(We're planning to reach out to interview these organizations to help us learn more about how your organization operates. This will give us additional insight into what builds or reduces capacity.)*
    a. *Follow-Up:* How did those partnerships develop?
12. Have you lost any partnerships recently?
    a. *Follow-Up:* Do you know why it ended?
13. *If they received an OWEB FIP or P-TA grant:* How has the use of Partnership TA or FIP grants assisted your organization in building partnerships?
    a. *PROMPT*: Based on looking through the OGMS grant applications, it seems like you had already built relationships with partners through past work together. Did anything change through the act of developing organizational documents and/or strategic action plans for P-TA grants? Did these working relationships become more intentional or was it just writing down what you were already practicing?

Resources Obtained & Leveraged

For this section, we're hoping to learn more about how your organization has leveraged funding from other sources and what challenges you've faced in acquiring those resources. We are also interested in understanding how your relationships with other organizations affect your ability to obtain funding.

14. Can you discuss how your non-OWEB funding sources have been developed and maintained?
    a. *PROMPT:* Was it personal relationships with others, networking, or informal information sharing?
    b. *PROMPT:* Has this been through staff outreach? Board connections?

15. How have OWEB Operating Capacity grants helped to leverage these other resources?
16. What kinds of ecological or regionally specific funds has your council/district received (e.g., BEF, BPA, NOAA, Meyer Memorial Trust, stewardship contracting from national forests)?
    a. *Follow-Up:* What do you think has led to your success in capturing those grants?

Closing

17. Is there anything I didn't ask you about that you think is important to this discussion?

C. Key Informant Interview Guide

1. I'd like to start by knowing about the major or most common trends in the top priorities that councils/districts deal with in your area and how this has changed over time. Can you tell me about some of the key characteristics/what is unique in your region?
2. Can you identify two or three "types" of councils/districts in your region in terms of staff size, stability, etc.?
3. What are the different needs and challenges that each "type" is confronting? How do you think they would best be supported?
    a. How do the necessary types and combinations of capacity for a council seem to vary depending on the organizational development stage, staff size, local partnership ecology, and their primary focus?

    b. If needed as another way to get them to talk about this: Walk through a story of a "high functioning" anonymous council/district in your area. How and why is it high functioning?
    c. If needed: Walk through a story of a "low functioning" anonymous council/district in your area. How and why is it low functioning?
4. What are the differences, if any, in the challenges and opportunities faced by municipal corporations (districts), nonprofits, other non-government structures (councils), or hybrid council/district organizations in your region?
5. Are there any specific ways you have seen capacity funding used in your region that have improved organizational and partnership capacity?
6. Are there any specific ways you wish you saw capacity funding being used in your region?
7. Can you think of any possible ways that OWEB could track and share quantitative and qualitative capacity measures to better support councils and districts in your area in overcoming capacity challenges?
8. What intangible or difficult-to-quantify impacts do you think that OWEB Operating Capacity grants have had on organizations that have received them?
9. Have you seen that receiving OWEB funding has led to any unintended negative consequences for recipient groups? If so, what are they?
10. Knowing that your answers will be confidential, do you have any positive or negative feedback for OWEB/ODA about their work to support councils and districts? What changes would you recommend that they make to their programs?

D. Database of Case Study Organizations

The following table is a summary of the organizational background information we collected for each of the organizations selected for in-depth interviews. The purpose of this is to highlight the context of the organizations we studied (Table 17).

Table 17. *Case Study Organizations Database.*

COUNCILS

Organization	Background	Geography	Land Ownership
Coast Fork Willamette WC	**Founding Year:** 1999 **501(c)(3) incorporation:** 2010	**Lane County, Oregon** **Service Area:** 435,000 acres **Streams:** 3,058 miles **303(d) Streams:** 111.7 miles	**Federal:** 36.2% **Private:** 33.8% **Private Industrial**: 29.49% **State & Local Government:** < 1%
North Coast WA	**501(c)(3) incorporation:** 2001	**Clatsop County, Oregon** **Service Area:** 222,720 acres **Streams:** 417 miles **303(d) Streams:** 164 miles	**Private:** 60.8% **State Government:** 39.2%
Powder Basin WC	**Founding Year:** 1996 **501(c)(3) incorporation:** 2008	**Baker County, Oregon** **Service Area**: 2,150,400 acres **Streams:** 4,833 miles **303(d) Streams:** 1,223 miles	**Private:** 49.8% **Federal:** 49.7% **State Government:** < 1%
South Fork John Day WC	**Founding Year:** 1996 **501(c)(3) incorporation:** 2018	**Grant County, Oregon** **Service Area:** 546,850 acres **Streams:** 362 miles **303(d) Streams:** 155 miles	**Federal:** 84% **Private:** 7% **State Government:** 9%

DISTRICTS

Organization	Background	Geography	Land Ownership
Curry SWCD	**Incorporation:** 1953 **Curry Watersheds Partnership Formed:** 2017	**Curry County, Oregon** **Service Area:** 1,047,707 acres **Perennial Streams:** 4,043 miles **303(d) Streams:** 336 miles **# of HUC-8 sub-basins:** 7	**Federal:** 65.4% **Private:** 33.3% **State Government:** < 1%
Marion SWCD	**Incorporation:** 1949 **Taxing District:** 2000	**Marion County, Oregon** **Service Area:** 751,594 acres **Perennial Streams:** 1,789 miles **303(d) Streams:** 291 miles **# of HUC-8 sub-basins:** 6	**Private:** 56.6% **Federal:** 30.2% **Private Industrial:** 8.2% **State Government:** 4.1% **Tribal & Local Government:** < 1%
Wheeler SWCD	**Incorporation:** 1963	**Wheeler County, Oregon** **Service Area:** 1,098,145 acres **Perennial Streams:** 937 miles **303(d) Streams:** 148 miles **# of HUC-8 sub-basins**: 6	**Private:** 71.1% **Federal:** 28.7% **State Government:** < 1%

Appendix 5. External Capacity-Building Programs Review

As part of this project, we reviewed organizational capacity-building programs that invest in local organizational capacity in natural resources and conservation management to develop recommendations for OWEB's Operating Capacity grant program (see Appx 5.C. Summary of External Capacity-Building Programs Review). We started by looking at Washington, California, and Idaho, but since there were a limited number of capacity-building programs, we expanded our search to look across the U.S. For this review, we defined organizational capacity in terms of administrative management, financial, and technical capacities (Table 18). Following this, we shared our list of inclusion and exclusion criteria.

Table 18. *Defining Organizational Capacity.*

Administrative Management	Management skill training, networking with other local partners, peer learning, and building partnerships with other organizations to share staff expertise (e.g., technical skills, outreach, and fundraising).
Financial	Pooling financial resources and financial management strategies, practices, and/or training.
Technical	Technical skills training, e.g., learning GIS.

Inclusion Criteria:

- Improves capacity for a council, district, or non-profit organization that works at local or regional scales (e.g., community, county, watershed, subregion of a state).
- Targets work that focuses on building organizational capacity. We primarily included programs focused on capacity building for natural resources and conservation management, but we also included some that worked in other areas. For example: Ford Family Foundation offers a Community Building grant that focuses on organizational capacity building in rural communities, which can include organizations that work on natural resource issues.

Exclusion Criteria:

- Programs that only provide funding for on-the-ground restoration work.
- Programs that target and invest in organizations that work at a national scale. The funder providing organizational capacity-building grants could be at the national scale, but to be included, must support regional or local organizations.

A. Program Highlights

In this section, we highlight key features and opportunities for improving OWEB and ODA capacity grant programs from the capacity-building program review. Following this, we provide potential recommendations.

Integrate Mentorship and Peer-Learning Opportunities into Program Design

The Ford Family Foundation's Community Building Grants Program supports organizations through coaching, mentoring, and connecting grantees to related ongoing efforts and relevant resources, including the foundation's own programs. During a 2019 program evaluation to identify the program's impacts and ongoing challenges to community-building work, they developed the following recommendations to improve peer support: (1) mobilize communities to reach communities (e.g., invest in an anchor person in each community, develop mentorship

groups, convene learning exchanges, etc.) and (2) clarify the confusing aspects of the community-building approach (e.g., simplify materials, develop a clear introductory path to people who are new, etc.). The Wilburforce Foundation's Capacity Building Program design focuses on providing long-term capacity-building and views organizational leadership as a key to an organization's efficiency and effectiveness. They partner with service providers that offer specialized consulting, coaching, and training on leadership development, board capacity, strategic planning, fundraising, financial management, human resource management, communications, technology, and more. Through this, they also convene organizations and partners to share knowledge to work towards advancing outcomes that benefit a regional ecosystem. Additionally, Lake Champlain Basin Program's Organizational Support Grant offers supplemental funding for professional development. Local watershed organizations can apply for an annual $500 mini-grant for professional development. This can be used for conference attendance, registration, and associated travel costs.

Offer Funding Support to Develop Strategic Plans

The Pennsylvania Department of Conservation & Natural Resources' Peer Grant offers funding to hire a professional consultant to study specialized small-scale issues to work with community leaders to develop an action plan addressing conservation needs. The maximum grant award is $10,000.

Coordinate with External Funders

The Ford Family Foundation's Community Building Grants program emphasizes the importance of working with external funders. As part of a recent self-directed evaluation, they identified the program's need to develop strategies for long-term partnerships (e.g., working with other foundations to develop tools for grant applications, demonstrating that long-term grants make a difference, etc.). Additionally, the Wilburforce Foundation's Capacity Building Program's design acknowledges the need to build and maintain strong relationships with organizations, agency leaders, decision-makers, funders, scientists, etc. to improve grantees' effectiveness. They also recognize the need to collaborate with funders to ensure that collective investments and capacity resources are coordinated and effective.

Identify Potentially Useful Indicators for Improving Capacity Program Monitoring

Types of Partners Engaged

- Builds and maintains strong relationships with grantees, funders, scientists, decision-makers, and other allies - *Wilburforce Foundation's Capacity Building Program.*
- Increases communication, cooperation, and collaboration among grantees, funders, scientists, and government decision-makers - *Wilburforce Foundation's Capacity Building Program).*
- Facilitates and coordinates public messaging with management partners (e.g., strengthening the feedback loop between resource managers and community members) - *Lake Champlain Basin Program's Organizational Support Grant.*

Partnership Types Engaged In

- Serves as an information conduit, builds professional capacity among partners, and fosters strong working relationships (e.g., supporting seminars, workshops, and conferences to deliver technical information on topics) - *Lake Champlain Basin Program's Organizational Support Grant.*
- Organizations are successful in agreeing on the design and implementation of watershed and/or landscape scale enhancement projects - *National Forest Foundation's Community Capacity & Land Stewardship Program.*

Internal Governance and Operational Practices (*Focusing on strategic planning)

- Extent to which the proposal will strengthen the capacity of eligible organizations to achieve their mission and to implement priorities detailed in the Opportunities for Action Plan- *Lake Champlain Basin Program's Organizational Support Grant.*
- Merit of the proposal and the extent to which the proposal will result in tangible benefits or improvements that can be clearly measured - *Lake Champlain Basin Program's Organizational Support Grant.*
- Appropriateness and clarity of the proposed budget, relative to project objectives - *Lake Champlain Basin Program's Organizational Support Grant.*

B. Potential Recommendations

Coordinate with Service Providers on Mentorship and Peer-Learning

OWEB and ODA can continue to support and coordinate with their service providers (e.g., NOWC, OACD, OCEAN, OrCP, and the SWCD Operations Specialist) to provide tailored services to grantees. Many of the topics mentioned in the Wilburforce Foundation's program design were also of interest to interviewees. These included: specialized consulting, coaching, and training on leadership development, board capacity, strategic planning, financial management, and HR management. Additionally, new lead staff may have different needs than those who have been in this position longer. This emphasizes the importance of mentorship and peer-learning networks to create information exchanges and learn from each other's experiences.

Mini-Grants for Professional Development

Councils and districts may benefit from mini-grants for professional development, which would particularly be useful for lead staff since they are typically funded by project grants. Providing a small grant for professional development could help support lead staff in developing new skills or improving existing ones.

Technical and Financial Support for Strategic Plan Development

Strategic planning processes are shaped by their regional contexts, are varied based on the organization's structure, and serve different functions depending on how the organization is managed. Strategic plans, may have more detail or less, depending on these factors. Councils and districts can benefit from technical and financial support from OWEB and ODA and other supportive organizations to assist their strategic planning and annual work plan processes to incorporate diverse perspectives and needs and engage in relevant technical expertise for identifying restoration and conservation priorities.

Coordinating with and Educating External Funders on the Significance of Longer-Term Funding

OWEB and ODA have provided ongoing, programmatic support for 20 years to councils and districts' efforts in improving local watershed quality and health. OWEB has also developed longer-term funding strategies to help support grantees in partnership capacity and larger landscape scale restoration through their Partnership Technical Assistance, Focused Investment Partnership grants. External funders often see OWEB and ODA as essential funding partners in getting restoration work done on the ground through these locally-based councils and districts. As such, OWEB can play a role in educating funders on the significance of longer-term grants to work toward landscape-scale restoration and conservation.

C. Summary of External Capacity-Building Programs Review.

Sponsoring Organization and Program Name	Program Design, Activities and/or Objectives	Eligibility Requirements	Match Requirement	Evaluation Criteria and Selection Process	Allowed Costs and Uses	Program Implementation and Monitoring Measures
OWEB's Council Capacity Grant Program	(1) Support organizational growth with access to diverse skill sets. (2) Develop broad and deep support from local and regional communities. (3) Engage a balance of interested and affected people, businesses, and communities in their watershed to participate in voluntary, cooperative conservation. (4) Secure diversified funding and/or build strategic collaborations with other councils and/or natural resource groups to increase collective local capacity.	(1) Designated as a watershed council by a local government. (2) Has previously received a Council Capacity grant, and which serves an area that is the same or larger than the geographic area served by a council or group of councils as of 2013 with only 1 applicant per geographic area & includes a minimum population of 500 within its designated boundaries. (3) Adopted action plan by a council-governing body that meets OWEB requirements. (4) 501(c)(3) registered with Oregon, or written fiscal sponsorship agreement with a 501(c)(3), SWCD, city, county, or tribal government. (5) Adopted bylaws/charter & policies/ procedures that include standard best-practice governance provisions. *(See Appx. 1 for full description of eligibility criteria in rule.)*	$1 match	(1) Effective Governance and Management. (2) Progress in Planning. (3) Progress in On-the-Ground Watershed Restoration. (4) Progress in Stakeholder Engagement for Watershed Restoration Purposes.	(1) Staff and contractors. (2) Audit and tax preparation costs. (3) General IT Support. (4) Contracted grant administration. (5) General office material & supplies. (6) General training. (7) Software or software subscription, free, or lease (e.g., GIS access). (8) General office rent, utilities, janitorial, yard maintenance, copier lease, P.O. box rent. (9) Insurance. (10) Banking fees, payroll service fees, business license fees, dues *Any expense eligible in other OWEB grants is also an eligible expense for Council Capacity grants.	Continued progress in meeting evaluation criteria. If the organization continues to meet eligibility criteria and makes progress in meeting evaluation criteria, the organization continues to receive funding. Funding levels include: (1) full funding if the council meets all criteria, (2) reduced funding if the council meets some criteria, and (3) do not fund if the council's performance is inadequate.
ODA's District Capacity Grant Program	Capacity funds are divided into two categories: (1) Scope of Work (SOW): Support working with partners and landowners for the conservation and protection of natural	Must be an SWCD and in compliance with legal requirements of ORS 568: (1) Current annual and long-range business plans (2) Annual audit (3) Annual report of activities	$1 match.	None.	(1) Contracted services (e.g., labor, supplies, materials, travel for project implementation). (2) Travel. (3) Materials and supplies. (4) Equipment/Software.	None.

	resources of native fish and wildlife, watersheds, and water quality through implementation of Agricultural Water Quality Management Area Plans. (2) District Operations: Help SWCDs comply with ORS, conduct business, and provide assistance to landowners and partners.	(4) Annual meeting of the landowners of the district.			(5) Other (e.g., project-specific printing, renting meeting rooms, software subscriptions, website domain, etc.).	
National Forest Foundation's Community Capacity & Land Stewardship Program	(1) Remove barriers to watershed and/or landscape scale restoration projects. (2) Facilitate job creation, retention, and business development. *Length of grant funding:* 8 months. *Can grantee apply again:* Yes. Encouraged to apply for continuing work or for new projects, contingent on demonstrated success. *Grants awarded per year:* ~10. *Award range:* Up to $20k.	501(c)(3) nonprofit; federally-recognized Native American tribes; and colleges and universities.	No cash or in-kind match is required, but applicants are encouraged to leverage additional funds to demonstrate broad project support.	(1) Tangible benefits to National Forests & Grasslands. (2) Job creation, business development, or workforce development benefits. (3) Facilitate restoration actions and treatments. (4) Support or help advance the transition to young growth-based forest management.	(1) Outreach and plan development. (2) Workshops and training for capacity building (e.g., facilitation, contracting, etc.). (3) Dissemination of best practices and tools to assist community-based nonprofits & collaborative groups in project development, implementation, and monitoring. (4) Organizational and staff support for facilitation, technical assistance, networking, & peer-to-peer evaluations for shared learning. (5) Travel for collaborative group activities. (6) Development of action plans, project strategic documents, or other collaborative process documents.	(1) Organizations are successful in agreeing on the design and implementation of watershed and/or landscape scale enhancement projects. (2) Organizations accomplish activities that directly support or help advance the transition to young growth-based forest management. (3) Organizations have developed plans for facilitating job creation and retention that will lead to improved watershed health.
Ford Family Foundation's Community	Organizations are invited to submit a grant by Rural Community Building staff.	(1) Be invited by Rural Community Building staff. (2) 501(c)(3) non-profit,	Must have >/= 50% of funding for the total	(1) Community participation is a primary	(1) Training, communications, and gatherings.	The foundation conducted a self-directed evaluation

Building Grants	The program supports organizations through coaching, mentoring, and connecting grantees to related ongoing efforts and relevant resources, including the foundation's own programs. *Program Objectives:* (1) Deepening Community Connections. (2) Strengthening Community Capacity. (3) Taking Community-led Action. (4) Fostering a Community Builder Culture. *Length of grant funding:* Typically 1 year, but offers multi-year grants on a limited basis. *Can grantee apply again:* Yes, if the organization does not have a currently active grant with the Foundation. *Grants awarded per year:* 75. *Award range:* - $2k to $350k. - Average: $50k. - Large: $100k.	governmental entity, or a federally recognized tribe. (3) Serve communities in rural Oregon or Siskiyou County, California. (4) Requests are for no more than ⅓ of the total project cost.	project budget committed before applying.	consideration, demonstrated through >/= 50% of project fundraising raised through the organization's traditional supporters, local businesses, key donors, and other foundations. (2) Involvement of the organization's board with cash or in-kind contributions. (3) Well-defined benefits or outcomes with a description of who and why the community is behind the proposal.	(2) Planning, coordination, capacity building, and regional networking. *They will not fund sponsorship of fundraising events.	in 2019, evaluating the program's impacts and ongoing challenges to community-building work. They developed the following responses to address these: (1) Mobilize communities to reach communities (e.g., invest in an anchor person in each community, develop mentorship groups, convene learning exchanges, etc.). (2) Build capacities to reach the hard-to-reach (e.g., listening sessions, relationship building, etc.). (3) Develop strategies for long-term partnerships (e.g., work with other foundations to develop tools for grant applications, show that long term grants make a difference, etc.). (4) Clarify the confusing aspects of the community-building approach (e.g., simplify materials, develop a

						clear introductory path to people who are new, etc.).
Oregon Community Foundation's Community Grants Program: Capacity-Building	To help strengthen and stabilize an organization's governance, operations, internal culture and/or community relationships. *Length of grant funding:* 1 year. *Can grantee apply again:* No, unless considered a small, rural or culturally-specific organization. *Grants awarded per year:* 370. *Award range:* - Average: $20k. - Large: $40k.	501(c)(3) organization, or fiscal sponsorship with a 501(c)(3), Tribal entity, or government entity.	No cash or in-kind match is required, but applicants are encouraged to leverage additional funds to be more competitive.	(1) Prioritizes organizations that support disproportionately impacted communities (e.g., BIPOC, immigrants, people experiencing disabilities, etc.). (2) Supports organizations that demonstrate strong community support (e.g., intentional engagement and representative support of communities being served). (3) Propose work that advances DEI.	N/A	N/A
Wilburforce Foundation's Capacity Building Program	(1) Supports organizations committed to science-driven conservation efforts and sustainable policies for critical wildlife habitat. (2) Use conservation science to identify priority regions with a focus on wildlands and habitat connections. (3) Build and maintain strong relationships with organizations, agency leaders, decision-makers, funders, scientists, etc. to improve organizations' effectiveness.	Supports current 501(c)(3) grantees.	None.	No longer accepting grant applications. They provide long-term capacity-building support to increase organizational knowledge and skills. They invest in Training Resources for the Environmental Community (TREC) to provide grantees with support for fundraising, board capacity, strategic	Programs are tailored to current grantees to meet their capacity needs. They invest in leaders, organizations, and campaigns, partnering with service providers that offer specialized consulting, coaching and training on leadership development, fundraising, financial management, human resource management, communications, strategic planning, technology, and more.	(1) Builds and maintains strong relationships with grantees, funders, scientists, decision-makers, and other allies. (2) Improves the effectiveness of grantee organizations, their leaders, conservation scientists, and other allies. (3) Increases access to and use of

	(4) Invest in the capacity of our grantees and their leaders to help them become more efficient and effective. (5) Convene organizations and partners to exchange knowledge and advance shared outcomes. (6) Collaborate with funders to ensure that collective investments and capacity resources are coordinated and effective. *Length of grant funding:* Typically, 1 year. May fund multi-year grants if they discuss with a representative why the program would benefit from this. *Can grantee apply again:* Yes, if an organization does not have a currently active grant with the Foundation. *Grants awarded per year:* 153. *Award range:* $10k - $250k.			planning, etc..		scientific, legal, political, and economic resources to advance conservation plans, policies, and practices. (4) Increases communication, cooperation, and collaboration among grantees, funders, scientists, and government decision-makers. (5) Increases conservation's social and political relevance in the communities and priority regions in which we work. (6) Decreases or mitigates threats to lands, waters, and wildlife, while improving the ecological resilience, and improving the protected status of these areas.
Lake Champlain Basin Program's Organizational Support Grant	(1) Strengthen watershed organizations during development. (2) Assist established watershed organizations in strengthening their organizational capacity.	501(c)(3) organizations or voluntary watershed associations working with an established 501(c)(3) organization.	No in-kind or cash match is required, though match will be considered favorably	(1) Impact (40 points): Extent to which the proposal will strengthen the capacity of eligible organizations to achieve their	(1) Staffing & fringe benefits. (2) Supplies (e.g., photocopying, mailing, purchasing equipment, technology, software subscriptions).	Support priorities in *Opportunities for Action Plan*. Examples include: (1) Supports local watershed groups (e.g.,

	(3) Facilitate work and communication within and among local communities to further watershed protection and restoration efforts. (4) Local watershed organizations can also apply for an additional annual $500 mini-grant for professional development. *Length of grant funding:* 1.5 years. *Can grantee apply again:* Yes, if the grant is for a new project, contingent on demonstrated success. *Grants awarded per year:* ~ 11. *Award range:* Up to $4k.		during budget review and may make proposals more competitive.	mission and to implement priorities detailed in *Opportunities for Action Plan*. (2) Merit (30 points): Merit of the proposal and the extent to which the proposal will result in tangible benefits or improvements that can be clearly measured. (3) Budget (30 points): Appropriateness and clarity of the proposed budget, relative to project objectives.	(3) Professional services (e.g., hiring a consultant to integrate DEI into organizational documents, participating in training to learn how to create online videos to improve outreach). (4) Travel costs associated with building partnerships. (5) Indirect (e.g., paying auditor, liability insurance, auto insurance). *Specific to professional development mini-grants:* (1) Meetings, conferences, and other venues' activities must be related to improving water quality and/or improving organizational capacity (e.g., fundraising, computer training). (2) Travel, meals, registration, and lodging to attend training.	providing technical assistance through meetings, workshops, presentations, and training; working with partners in priority watersheds to provide technical support and capacity building). (2) Facilitates and coordinates public messaging with management partners (e.g., strengthening the feedback loop between resource managers and community members). (3) Serves as an information conduit, builds professional capacity among stakeholders, and fosters strong working relationships (e.g., supporting seminars, workshops, and conferences to deliver technical information on topics).

Pennsylvania Department of Conservation & Natural Resources' Peer and Circuit Rider Grant Programs	*Specific to Peer Grant:* Funding to hire a professional consultant to study specialized small-scale issues to work with community leaders to develop an action plan addressing conservation needs. *Maximum grant award:* $10k. *Specific to Circuit Rider:* Annual funding gradually decreases over a 4-year period. The purpose is to hire a professional, full-time staff person (i.e., Circuit Rider) to initiate new regional programs and services that position sponsoring entities to more efficiently and effectively meet their natural resource and conservation needs. Includes training expenses (up to $2k) and mentoring expenses (up to $1.5k) for an approved mentor to assist new staff.	County or municipal government. *Specific to Circuit Rider:* Two or more municipalities must cooperate in a new intergovernmental or regional effort by adopting an intergovernmental agreement.	*Specific to Peer Grant:* 10% local cash or in-kind match. *Specific to Circuit Rider:* Must provide local funds to cover the Circuit Rider's employee benefits for all 4 years, the balance of the salary in years 2, 3, and 4, and normal support services (e.g., office space, training and travel expenses, clerical support, equipment, etc.).	Grantees must submit an evaluation of the organization's guiding documents (strategic plan, annual work plan, management action plan, interpretive plan, etc.) to determine the specific project(s), work tasks, outputs, and outcomes they would like to accomplish with grant funding.	*Specific to Peer Grant:* Hire a professional consultant. *Specific to Circuit Rider:* Hire a professional full-time staff person.	None listed for Peer Grant. *Specific to Circuit Rider:* <u>Annual Report</u> (1) Goals and objectives met or unachieved. (2) Accomplishments & challenges. (4) Programs created. (5) Marketing. (6) Budget. (7) Training programs attended. (8) Training programs requested for next year. (9) Evaluating grant program's assistance. <u>Final Report</u> How has the cooperative become a valued service? Which groups gained the most? What would happen if the agency folded? How did the cooperative effort encourage other areas of intergovernmental cooperation?
Minnesota Board of Water	Supports increased capacity by funding	Must be an SWCD.	None.	N/A	(1) Staffing (2) Office rent, utilities,	Report expenditures,

and Soil Resources' Clean Water Fund Capacity Grant	expenses in the following categories: Staffing, Cost Share/Incentives, Technology/Capital Equipment, and Operations. *Length of grant funding:* 1 year. *Can grantee apply again:* Yes, provides ongoing support. *Grants awarded per year:* 90 (Supports all SWCDs in the state). *Award range:* $108k.				and other costs associated with facility maintenance (3) Supplies and equipment. May withhold grant payments if the grantee is not in compliance with all reporting requirements.

OREGON
WATERSHED
ENHANCEMENT BOARD

Hybrid Board Meeting
Klamath Falls, Oregon
October 23-25, 2023

Oregon Watershed Enhancement Board Meeting Agenda Oct 23-25, 2023

Monday, Oct 23, 2023

Running Y Resort
5500 Running Y Rd
Klamath Falls, OR 97601

Business Meeting – 2:00 pm

A. Strategic Planning (2:00 pm)
Executive Director Lisa Charpilloz Hanson will join Principal Consultant Steve Patty with Dialogues in Action to seek board input on OWEB's new strategic plan. *Information item.*

Tuesday, Oct 24, 2023

Business Meeting – 8:00 am

The public is welcome to listen to the virtual meeting through the following methods:

- **YouTube Streaming**: https://www.youtube.com/channel/UC0dl-TOwLt4Sp--i1KEa_OA. Please note that there may be a slight delay when streaming the meeting content.
- **Phone**:
  - **Oct 23:** Dial 1 669 900 6833, when prompted, enter ID number: 851 7302 0607and passcode: 162756
  - **Oct 24:** Dial 1 669 900 6833, when prompted, enter ID number: 881 9760 7442 and passcode: 673912
  - **Oct 25:** Dial 1 669 900 6833, when prompted, enter ID number: 871 5457 5188 and passcode: 725146

The board materials are available at: https://www.oregon.gov/oweb/about-us/Pages/board/2023-Oct.aspx

For each agenda item, the time listed is approximate. Anyone interested in a particular agenda item is encouraged to give ample time and listen in to the meeting at least 30 minutes before the approximate agenda item time.

Public comment
OWEB encourages written or verbal public comment on any agenda item that is not marked with an asterisk. Agenda items with an asterisk (*) are not open for public comment because they were the subject of a formal public hearing that included a comment period.

All written comments and requests to make verbal comments to the board can be submitted on our website at Oregon Watershed Enhancement Board : Public Comment or can be emailed to

Nicole Bettinardi at Nicole.BETTINARDI@OWEB.oregon.gov. The deadline for submitting written comments and requests to make verbal comments is **4:00 p.m. Thursday, October 19, 2023**.

Written comments will be provided to the board before the meeting.

Verbal comments:

- Are limited to three minutes
- Will be heard in the public comment periods (**Agenda Items D, H, and I**).
- Please provide the following information:
  - Your first and last name
  - The topic/item letter of your comment
  - Whether you plan on coming to the meeting in person or virtually
  - If calling in, the phone number you will use when calling the meeting. Also, note if the phone is a landline and you prefer to be scheduled for public comment early to avoid long distance phone call charges.

B. Board Member Comments (8:05 am)
Board representatives from state and federal agencies will provide updates on issues related to the natural resource agency they represent. This is also an opportunity for public and tribal board members to report on their recent activities and share information and comments on a variety of watershed enhancement and community conservation-related topics. *Information item*.

C. Review and Approval of Minutes (9:35 am)
The minutes of the July 2023 meeting will be presented for board approval. *Action item*.

D. General Public Comment (9:40 am)
This time is reserved for the board to hear general public comments and review the written public comment submitted for the meeting. *Information item*.

E. Directors Updates (10:20 am)
Executive Director Lisa Charpilloz Hanson and staff will update the board on agency business. *Information item.*

F. Committee Updates (10:40 am)
Representatives from board committees will provide written updates on committee topics to the full board. *Information item*.

G. ODFW and PCSRF Uses (11:15 am)
Monitoring and Reporting Manager Courtney Shaff will be joined by Conservation and Recovery Program Manager (acting) Alexis Harrison with the Oregon Department of Fish and Wildlife (ODFW) to update the board about ODFW programs that will be supported by Pacific Coastal Salmon Recovery Funds during the 2023-25 biennium. *Information item.*

Board On Site Inspection – 1:00 pm

The Board will conduct an on-site inspection of the JC Boyle Dam Removal Project. This is an active construction site and not open to the public. *Information only.*

Informal Reception – 5:30-7:00 pm

The public is invited to join the OWEB Board and staff at a reception.

Running Y Resort
5500 Running Y Rd
Klamath Falls, OR 97601

Wednesday, October 25, 2023

Business Meeting – 8:00 am

H. General Public Comment (8:05 am)
This time is reserved for the board to hear general public comments and review the written public comment submitted for the meeting. *Information item*.

I. Spring 2023 Open Solicitation Grant Offering Board Awards (8:25 am)
NOTE: Verbal public comment specific to this agenda item will be heard at approximately 9:35 am

Staff Presentation
Grant Program Manager Eric Williams and Regional Program Representatives will review the Spring 2023 Open Solicitation Grant Offering and funding recommendations.

Public Comment
This time is reserved for public comment on the Spring 2023 Open Solicitation Grant Offering and funding recommendations. Only comments about this specific item will be accepted during this portion of the meeting. Any written comments about this agenda item must be received by OWEB staff by **Oct 19, 2023,** to be provided to the board in advance of the meeting. **Verbal comments should be limited to three minutes.**

Spring Open Solicitation Grant Offering Board Deliberation and Awards
The board will consider grant applications submitted through the Spring 2023 Open Solicitation Grant Offering. Applications, supporting materials, and funding recommendations will be discussed and acted on by the board. *Action Item.*

J. Focused Investment Partnership (FIP) Learning Project III (10:50 am)
Senior Policy Coordinator Eric Hartstein, Partnerships Coordinator Denise Hoffert, and Jennifer Arnold of Reciprocity Consulting will update the board on the FIP Partnership Learning Project. *Information Item.*

K. PacifiCorp Interim Measure 11 Funding (12:50 pm)
Acquisitions and Special Programs Manager Renee Davis, Drought Program Specialist Heidi Hartman, and Regional Program Representative Greg Ciannella will provide an overview of OWEB's role as fiscal agent for PacifiCorp Interim Measure 11 funding and request the board approve receipt of this funding in accordance with OWEB's 2023-2025 Legislatively Approved Budget. *Action item.*

L. Co-Chair Election (1:20 pm)
The current term of OWEB Board Co-Chair Barbara Boyer ends in 2023. Board members will consider adopting a co-chair election process and will vote to elect a Co-Chair for a two-year term. *Action item.*

M. Other Business (1:40 pm)
This item is reserved for other matters that may come before the board. *Information item.*

Meeting Rules and Procedures

Meeting Procedures
Generally, agenda items will be taken in the order shown. However, in certain circumstances, the board may elect to take an item out of order. To accommodate the scheduling needs of interested parties and the public, the board may also designate a specific time at which an item will be heard. Any such times are indicated on the agenda.

Please be aware that topics not listed on the agenda may be introduced during the Board Comment period, the Executive Director's Update, the Public Comment period, under Other Business, or at other times during the meeting.

Oregon's Public Meetings Law requires disclosure that board members may meet for meals when OWEB meetings convene.

Voting Rules
The OWEB Board has 18 members. Of these, 11 are voting members and 7 are ex-officio. For purposes of conducting business, OWEB's voting requirements are divided into 2 categories – general business and action on grant awards.

General Business
A general business quorum is **6 voting members**. General business requires a majority of **all** voting members to pass a resolution (not just those present), so general business resolutions require affirmative votes of **at least 6 voting members**. Typical resolutions include adopting, amending, or appealing a rule, providing staff direction, etc. These resolutions cannot include a funding decision.

Action on Grant Awards
Per ORS 541.360(4), special requirements apply when OWEB considers action on grant awards. This includes a special **quorum of at least 8 voting members** present to act on grant awards, and affirmative votes of at least six voting members. In addition, regardless of the number of

members present, **if 3 or more voting members** object to an award of funds, the proposal will be rejected.

Executive Session
The board may also convene in a confidential executive session where, by law, only press members and OWEB staff may attend. Others will be asked to leave the room during these discussions, which usually deal with current or potential litigation. Before convening such a session, the presiding board member will make a public announcement and explain necessary procedures.

More Information
If you have any questions about this agenda or the Board's procedures, please call Nicole Bettinardi, OWEB Board Assistant, at 503-428-1804 or send an e-mail Nicole.BETTINARDI@OWEB.oregon.gov. If special physical, language, or other accommodations are needed for this meeting, please advise Nicole Bettinardi as soon as possible, and at least 48 hours in advance of the meeting.

Oregon Watershed Enhancement Board Membership

Voting Members
Barbara Boyer, *Board Co-Chair, Board of Agriculture*

The Approach We Take

We believe that every endeavor is guided by a set of commitments not just about the "why" and the "what," but also the "how." These are the ways we are committed to engaging in our work. This is our approach. These principles modify everything we do.

Our work is characterized by…

Involving stakeholders broadly and in partnership

- Involving the community members at all levels
- Promoting community ownership of watershed health
- Collaborating and authentically communicating
- Bringing together diverse interests
- Building and mobilizing partnerships

Using best available science supported by local knowledge

- Basing approaches on the best available science
- Advancing efficient, science driven operations
- Addressing root sources and causes
- Incorporating local knowledge, experience, and culture
- Catalyzing local energy and investment

Investing collaboratively with long-term outcomes in mind

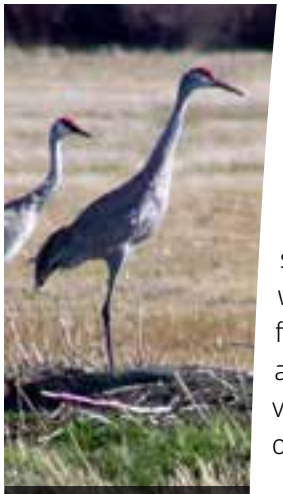
- Aligning investments with current and potential funding partners
- Maintaining progress into the future
- Stewarding for the long term
- Taking the long view on projects and interventions

Demonstrating impact through meaningful monitoring and evaluation

- Providing evidence of watershed change
- Measuring and communicating community impact
- Increasing appropriate accountability
- Incorporating flexibility, adaptive management – when we see something that's not working, we do something about it

Reaching and involving underrepresented populations

- Seeking to include the voice and perspectives that are not typically at the table
- Specific, targeted engagement
- Ensuring information is available and accessible to diverse audiences



OWEB Staff Culture Statement

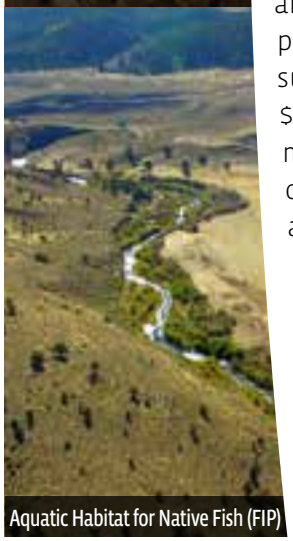
We are dedicated to OWEB's mission and take great pride that our programs support watershed health and empower local communities. Our work is deeply rewarding and we are passionate about what we do. Our team is nimble, adaptable, and forward-thinking, while remaining grounded in the grassroots history of watershed work in Oregon. With a strong understanding of our past, we are strategic about our future. We believe in working hard while keeping our work environment innovative, productive, and fun. We are collaborative, both with each other and with outside partners and organizations, and place great value in continually improving what we do and how we do it.

The Oregon Watershed Enhancement Board (OWEB) provides grants to help protect and restore healthy watersheds and natural habitats that support thriving communities and strong economies.

Eligible applicants include not-for-profit organizations, Soil and Water Conservation Districts, Tribes, Watershed Councils, political subdivisions of the state that are not state agencies, schools, community colleges, Oregon State institutions of higher education, and independent not-for-profit institutions of higher education. State and federal agencies are not eligible grantees but are often partners on OWEB-funded projects. In addition to those listed below, OWEB may offer grant types based on legislative priorities.

Land Acquisition

Water Acquisition



Projects that acquire interests in water from willing sellers. Acquisitions result in legally or contractually protected instream flow to maintain or restore streamflows for the benefit of watersheds and habitats for native fish or wildlife. Eligible applicants are entities qualified to develop valid water rights transactions and oversee the desired outcomes.

Coho Habitat Restoration

Focused Investment Partnerships (FIPs)

Landscape-scale restoration investments that address board-identified Focused Investment Priorities of significance to the state. Successful FIPs achieve clear and measurable ecological outcomes; use integrated, results-oriented approaches as identified through a strategic action plan; and are implemented by a high-performing partnership. Funding supports partnerships with up to $12 million over 6 years. Initiatives must support limiting factors outlined in a federal recovery and/or state conservation plan(s). Funds are awarded through project-level grants in restoration, technical assistance, stakeholder engagement, monitoring, and land and water acquisitions.

Aquatic Habitat for Native Fish (FIP)

Land Acquisition

Projects involving the purchase of interests in land from willing sellers. Projects must maintain or restore watersheds and habitat for native fish or wildlife. Interests in land include fee simple title and conservation easements.

Monitoring

Projects that monitor, gather, analyze, and share watershed data with the public. May describe current watershed conditions, establish trends about watershed conditions, or evaluate specific before-and-after effects of a restoration or acquisition project.

Restoration

Projects that protect or restore watershed functions for instream, riparian, upland, and wetland or estuarine habitat.

Stakeholder Engagement

Projects that communicate and engage with landowners, organizations, and the community about the need for, feasibility, and benefits of a specific eligible restoration, acquisition, or resource assessment/planning project(s) within an identified geography. Education projects are not eligible.

Technical Assistance

Projects that develop a technical design or implementation plan for restoration, including consideration for compliance with the National Historic Preservation Act.

Seine Net Monitoring

Sage Grouse Conservation Stakeholder Engagement

Fish Passage Technical Assistance

Small Grants

Easy-to-engage-in, competitive grant program. Awards up to $15,000 for restoration practices principally carried out on private lands.

Who may apply*: Watershed Councils, Soil & Water Conservation Districts, or Tribes may apply for a small grant on behalf of any of the following entities: Landowner, not-for-profit institution, private, state, or independent institution of education, or local, state, or federal agency.

Forest Collaboratives

Projects that increase restoration efforts on federal forests statewide by enhancing and strengthening the effectiveness of local collaboratives. This grant program was developed by OWEB and the Oregon Department of Forestry.

Who may apply*: local collaborative groups engaged in forest restoration and/or stewardship on federal forests in Oregon (forests managed by the US Forest Service or Bureau of Land Management). Eligible grantees must have 501(c)3 status or a signed agreement with an eligible fiscal sponsor. This can be a non-profit community-based organization, unit of local government or Tribal government.

Weed Board Grants

(Oregon Department of Agriculture)

On-the-ground projects to control weeds and state-listed noxious weeds. Projects may include survey, outreach, monitoring, or research if required to complete the control portion of the project.

Coastal Wetlands

These federal grant funds are awarded to OWEB to use in local grant investments for restoration partners to acquire, restore, and enhance coastal wetlands. All projects must have long-term protection in place to ensure conservation (such as a termed easement).

Small Grant Restoration

Forest Collaborative

District & Council Outreach

Council Capacity

Grants that help support the operations of effective watershed councils that engage people and communities in their watershed to participate in collaborative, voluntary restoration and protection of native fish or wildlife habitat and natural watershed functions to improve water quality or stream flows.

Who may apply*: Watershed councils that meet OWEB's eligibility criteria (OAR 695-040-0030)

District Capacity

Grants that support Oregon's 45 soil and water conservation districts to work with landowners in their communities to conserve natural resources and lend support to the Oregon Department of Agriculture's Agricultural Water Quality Management Program.

Who may apply*: Oregon's 45 soil and water conservation districts.

Partnership Technical Assistance

Grant investments that help support existing partnerships to create or enhance and existing strategic action plans, to elevate the partnership's current level of performance, and to support partnership capacity.

Conservation Reserve Enhancement Program Technical Assistance (CREP TA)

Grants that help local partners deliver the Conservation Reserve Enhancement Program, a federal-state partnership that restores streamside areas on agricultural lands. CREP TA grants support grantee costs for staffing, travel, outreach, technical planning, and project implementation.

***Note:** some grant offerings have different eligibility requirements described here.

Agenda Item A

Strategic Planning

Board Meeting October 23-25, 2023

Oregon
Tina Kotek, Governor

OREGON WATERSHED ENHANCEMENT BOARD

775 Summer Street NE, Suite 360
Salem OR 97301-1290
www.oregon.gov/oweb
(503) 986-0178

Agenda Item A supports all of OWEB's Strategic Plan priorities

MEMORANDUM

TO: Oregon Watershed Enhancement Board

FROM: Eric Williams, Restoration Grants Manager

SUBJECT: Agenda Item A – Strategic Plan
October 23-25, 2023, Board Meeting

I. Introduction

OWEB's strategic plan was adopted in 2018. Consistent with Governor Kotek's directive to state agencies to update strategic plans by June 2024 and recognizing that significant work has been accomplished since the plan was adopted, OWEB has engaged a consultant, Dialogues in Action, to refresh the plan rather than create an entirely new plan. This agenda item is a board work session to provide input for the strategic plan refresh.

II. Background

The 2018 strategic plan includes foundational elements that remain both meaningful and viable. These include the first four sections of the plan: "Who We Are," "What We Believe In," "The Impact We Want to Achieve," and "The Approach We Take." This plan refresh will focus on updating the plan's priorities, strategies, and actions.

III. Status

Our consultant and staff are working through a three-part process to refresh the plan:

- "Get Clear" – calibrate and tune in to the perspectives of those who are close to the work, impacted by the work, or partner in the work, and can provide helpful insight into the work of OWEB.
- "Get Focused" – use the insights from the first phase to identify and clarify the strategic priorities.
- "Get Moving" – develop the strategies, including the intent, steps, scale, scope, outcomes, and resources for each of the key strategies. This will provide sufficient detail to transition into the development of an operational plan.

To prepare for the board work session, Steve Patty from Dialogues in Action interviewed board members, staff interviewed about 30 partners, staff provided input through internal focus groups, and strategic plan questions were added to our broadly distributed customer service survey.

This input is reflected in Attachment A, *Priorities Refresh*, which provides definition to proposed priorities for the updated strategic plan. Note that the content of the document is not intended to provide tactical specifics; instead, it is a starting point to guide development of specific actions.

IV. Work Session

Steve Patty will engage the board in a series of exercises designed to "Get Focused" by identifying and clarifying strategic priorities. In addition to the strategic plan, the priorities will also be used to inform the "Board Recommendations" element of the Oregon Plan for Salmon and Watersheds biennial report that will be submitted to the legislature in January 2024.

V. Recommendation

This is an informational item only.

Attachments

A. Priorities Refresh

How to read the proposed Priority Shifts for the Strategic Plan

In preparation for the board meeting, please review the summary of proposed shifts on the next page. Before you do, please orient yourself to the document by familiarizing yourself with the following description:

What this is about
Our aim in this document is to identify the areas of strategic priority for OWEB over the next 5 years. The ideas of this document are

- informed by extensive engagement with partners (survey, interviews), the board (interviews), and staff (focus groups);
- meant to refresh the 2018 strategic plan, to build on the fundamentals and update the areas of emphasis in the plan instead of start over;
- intended to be high-level areas of strategic focus and attention for the next five years (i.e., the bullet points are meant to define what we mean generally by the priority and not prescriptive as strategies or tactics);
- a product of a staff committee analyzing the engagement data and considering the significance of the data for the future; and
- a signal for the big-picture shifts of emphasis in our priorities going forward.

What this is not
Please bear in mind, this document does not yet represent the strategies, personnel, resources, benchmarks, timelines, outputs, outcomes, and measures of the plan. Our desire is to seek direction from the board on these priorities before building them out into an operational plan. Staff teams will develop the specifics of the plan after the priorities have been established.

What you will read
In this document, you will see

A. **Two ideas as the critical lenses**. We have placed climate change and equity as the through-lines for all that has been identified as the strategic priorities.
B. **Revised priorities.** We have reduced the 7 priorities of the 2018 plan to 5 priorities for the 2023 plan.
C. **Shifts of emphasis**. We have articulated the primary, big-picture shift in the priority from the 2018 plan.
D. **What we mean.** We have provided a list of characteristics of the priority as bullet points, not to be comprehensive but to illustrative

An invitation for the board
Please review this document with an eye toward the following:

- Do these priorities resonate with you as the most productive for our strategic direction going forward?
- Are there areas of emphasis within any of these priorities that you would like to call out for staff consideration?
- What guidance would you like to offer the staff as they begin to develop these priorities into strategies and operations?

Thank you for reviewing this document. We will have time at the October board meeting to dialogue together about the proposed priorities of the strategic plan.

OWEB Priorities Refresh (DRAFT 10-10-2023)

Woven through the plan is an emphasis on equity and climate.

Priority 1: Build broad awareness of the relationship between people and their watersheds

Shift this priority toward elevating success of watershed restoration. What we mean:

- Tell the restoration story clearly and compellingly
- Elevate the success of watershed restoration and the benefits to the people of Oregon
- Increase awareness for the long-term horizon of watershed outcomes
- Highlight the commitment of partners to watershed work

Priority 2: Reflect the diversity of Oregonians in watershed work

Shift this priority toward engagement of all communities. What we mean:

- Pursue diverse representation in watershed work through engagement grant offerings
- Thoughtfully pursue board and staff diversity
- Increase engagement with non-traditional partners on working lands and rural communities
- Engage communities disproportionally influenced by climate change

Priority 3: Strengthen community capacity to achieve healthy watersheds

Shift this priority toward strengthening community organizations to enhance the health of watersheds in their region. What we mean:

- Elevate expectations for the quality of watershed work in communities
- Provide training and technical support to increase internal capacity of organizations
- Support strategic partnerships among people, organizations, and agencies
- Promote stable funding for sustained watershed work

Priority 4: Advance learning about watershed restoration effectiveness through coordinated monitoring

Shift this priority toward communication of data, emerging insights, and promising practices. What we mean:

- Facilitate the use and development of science-based planning tools
- Facilitate the exchange of information and insight from monitoring
- Promote tools and best practices to connect the science to the practitioners
- Connect people and partners to science to enhance their effectiveness
- Monitor the effectiveness of actions in pursuit of climate objectives
- Invest in long-term monitoring efforts

Priority 5: Take bold and innovative action

Shift this priority toward important interventions to respond to climate change and emerging issues. What we mean:

- Pursue and support experimental programs
- Make room to try new techniques in restoration
- Design action to respond and mitigate the effects of climate change on watershed health
- Identify and develop new and innovative ways of pursuing watershed health and communicating climate benefits.

Tuesday, July 25, 2023

The meeting was called to order at 8:00 a.m. by Barbara Boyer: Recording

A. Board Member Comments (Timestamp = 0:4:40)

Board representatives from state and federal agencies provided updates on issues related to the natural resource agency they represent. Public and tribal board members also reported on their recent activities, shared information, and commented on various watershed enhancement and community conservation-related topics. *Information item*.

B. Review and Approval of Minutes (Timestamp = 1:34:55)

The minutes of the April 24 & 25, 2023 meeting was presented for board approval. *Action item*.

Meg Reeves moved the board approve the minutes from the April 24 & 25, 2023 meeting. Kelly Coates seconded. Motion passed unanimously.

C. Co-Chair Election (Timestamp = 1:35:50)

Executive Director Lisa Charpilloz Hanson suggested moving this item to a future meeting and board members indicated their support for this approach. *Action item*.

D. Directors Updates (Timestamp = 1:42:50)

Executive Director Lisa Charpilloz Hanson and staff updated the board on agency business. *Information item.*

E. Committee Updates (Timestamp = 2:46:00)

Representatives from board committees provided updates on committee topics to the full board. *Information item*.

F. General Public Comment (Timestamp = 2:56:59)

This time was reserved for the board to hear general public comments and review the written public comment submitted for the meeting. *Information item*. Written public comments available on the OWEB public comments page.

- Haley Lutz, Coos Watershed Association
- Kelley Beamer, Coalition of Oregon Land Trusts
- Andrea Kreiner, Oregon Association of Conservation Districts
- Vanessa Green, Network of Oregon Watershed Councils

G. Adopt 2023-2025 Spending Plan (Timestamp = 3:22:00)

Executive Director Lisa Charpilloz Hanson and Grant Program Manager Eric Williams provided the 2023-2025 Spending Plan for board review and approval. *Action item.*

Motion #1: Mark Labhart moved the board approve receipt of funds in the "Other Designated Funds/Programs" section of the spending plan. Jamie McLeod-Skinner seconded. Motion passed unanimously.

Motion #2: Mark Labhart moved the board delegate authority to the Executive Director to execute grant agreements and approve the spending plan items in the "Proposed 2023-2025" column of Attachment B to the staff report. Kelly Coates seconded. Motion passed unanimously.

Motion #3: Mark Labhart moved the board approve tables one and two of Attachment D of the staff report regarding spending plan policy decisions, carryforward, and delegation authorities for the spending plan. Kelly Coates seconded. Motion passed unanimously.

H. Council Capacity Grant Awards (Timestamp = 5:27:50)

Monitoring and Reporting Manager Courtney Shaff and Water Acquisitions & Capacity Coordinator Brian Wolcott provided an overview of the 2023-2025 Council Capacity grant offering and outlined staff recommendations for grant awards. *Action Item.*

Item H Public Comment (timestamp = 5:53:43)
Written public comments available on the OWEB public comments page.

- Greta Holmstrom, Greater Yamhill Watershed Council
- Jordan Anderson, Greater Yamhill Watershed Council
- Andy Bleckinger, Yamhill Soil and Water Conservation District
- Margaret Magruder, Columbia County Commissioner

Jamie McLeod-Skinner moved that the board award council capacity grants as described in Attachment D with an award date of July 1, 2023, with the exception of providing one year of full funding for the Great Yamhill WC and one year of reduced funding to the Lower Columbia River WC, to be revisited in July 2024, contingent on their performance in the coming year. The motion was not seconded; motion failed.

Mark Labhart moved the board award council capacity grants as described in Attachment D with an award date of July 1, 2023. Gary Marshall seconded. The motion failed with a vote of 7-3, with Meg Reeves, Jamie McLeod-Skinner, and Barbara Boyer opposed.

Kelly Coates moved the board award council capacity grants as described in Attachment D with an award date of July 1, 2023, with the exception of increasing the Greater Yamhill WC to 1 year of full funding, to be revisited July 2024, based on achievements and benchmarks. Jamie McLeod-Skinner seconded. Motion passed unanimously.

I. Climate-Related Evaluation Criteria Rulemaking (Recording)

Senior Policy Coordinator, Eric Hartstein and Water and Climate Programs Coordinator Jessi Kershner presented the proposed climate-related evaluation criteria for the OWEB Grant Program administrative rules for board review and approval. *Action Item.*

Jamie McLeod-Skinner moved the board approve the Climate-Related Evaluation Criteria administrative rules found in Attachment D to the staff report, as revised by the board. Bruce Buckmaster seconded. The board approved unanimously.

The meeting was adjourned at 4:00pm by co-chair Liza Jane McAlister.

Wednesday, July 26, 2023

The meeting was called to order at 8:00 by Liza Jane McAlister: Recording

J. General Public Comment (Timestamp = 0:03:50)
This time was reserved for the board to hear general public comments. *Information item*.
Written public comments available on the OWEB public comments page.

- Monica Tomosy, East Cascades Audubon Society
- Jim Greer, East Cascades Audubon Society
- Josh Collins, East Cascades Audubon Society
- Jared Weybright, McKenzie Watershed Council

K. Water Acquisition Grant Award (Timestamp = 0:16:40)
Grant Program Manager Eric Williams and Water Acquisitions & Capacity Coordinator Brian Wolcott provided an overview of the November 2022 Water Acquisitions Grant Offering process and outlined staff recommendations for grant awards. *Action item*.

Item K Public Comment (timestamp = 0:45:12)
Written public comments available on the OWEB public comments page

- Karl Wenner
- Mark Hennelly, California Waterfowl Association
- Gene Souza, Klamath Irrigation District

Mark Labhart moved the board award funding for water acquisition grants as specified in Table 1 of the staff report with an award date of July 26, 2023, including the conditions identified in the staff report and verbally provided by staff, "Funding shall be informed by the USFWS/USBOR consumptive use study of the Thomas Ranch water claim to ensure the purchase of only wet water." Jamie McLeod-Skinner seconded. The motion passed; with Gary Marshall voting no.

L. OWEB 101 Small Grants (Timestamp = 2:13:28)
Grant Program Manager Eric Williams and Small Grants Coordinator Kathy Leopold provided an 'OWEB 101' presentation highlighting the Small Grants program. *Information Item.*

M. Drought and Fire Grant Program Presentation (Timestamp = 2:45:30)
Fire, Klamath, and Drought Program Manager Renee Davis, OWEB drought and fire staff, and representatives from local organizations that are grantees in the post-wildfire recovery and drought relief grant programs joined the board for a panel discussion on the work they are implementing, and how this work addresses post-wildfire recovery and drought relief efforts. *Information Item.*

N. Council Capacity Retrospective Analysis (Timestamp = 4:21:00)
Monitoring and Reporting Manager Courtney Shaff and guest presenter Oregon State University Extension Service Interim Fire Program Director Emily Jane Davis presented to the board the results of a retrospective evaluation of OWEB's operating capacity grants. *Information item*.

O. Initiate Rulemaking – Division 35 (Timestamp = 4:28:25)
Senior Policy Coordinator Eric Hartstein requested board authorization to initiate rulemaking for the OWEB Small Grant Program and a legislatively directed new grant program related to protecting source drinking water. *Action Item*

Bruce Buckmaster moved the board authorize rulemaking for the Small Grant Program in Division 35, and to authorize rulemaking for the Source Drinking Water Protection Grant Program contingent upon the Governor signing House Bill 2010 and related funding bills. Jamie McLeod-Skinner seconded. The motion passed unanimously.

P. Other Business (Timestamp = 5:06:00)
Board members used this time to discuss ideas for future meetings. *Information Item.*

The meeting was adjourned at 1:45pm by co-chair Barbara Boyer.

I want to provide comment at (select one):	OWEB Board Grants committee
Agenda Topic / Item Letter	Pipe Fork Land Purchase Assistance
Type Comment Here (comments may also be uploaded below):	A Yellowbook Appraisal is required by the purchasers to help evaluate the monetary value of the Pipe Fork Land Sale. These appraisals help determine the price at sale and guide purchase of the real property. It is a comprehensive analysis of the land, timber, and real estate value by a qualified third party who has experience in land sale appraises. The Conservation Fund and the Bureau of Land Management required this appraisal for the land purchase. We are not involved in the real estate sale, that is done by the real estate managers at the Josephine County, the Conservation Fund, and the Bureau of Land Management real estate office. The Williams Community Forest Project is a non-profit community group that negotiated with the County and set up the land purchase and brought together the partners that are willing to complete the land purchase. The real estate land managers are skilled in this process and we are following their requirements. Our efforts are to find some funding that will help complete the land sale when it is ready. Closing costs for property managers are needed to complete the sale and are being matched by generous donations.. These costs include negotiations by the real estate managers of The Conservation Fund, a land purchasing group that provides bridge loans for these type of land purchases. The Williams Creek Watershed Council has donated many hours writing letters and articles to local newspapers and negotiating with the County to establish the land sale and will continue with this public outreach. It has measured water levels, checked the water

	quality, and conducted outreach with property owners downstream of the Pipe Fork where quality salmon habitat exists. This funding is crucial in completing the sale by providing matching funding for the bridge loans through The Conservation Fund. Please consider funding the purchase of Pipe Fork and supporting this Technical Assistance.

October 19, 2023

To: Oregon Watershed Enhancement Board

From: Brenda Smith, High Desert Partnership

Subject: Feedback on Attachment A OWEB DRAFT Equity Statement & DEIEJ Resolution 9.6.23

I appreciate the attention that OWEB is giving to drafting a thoughtful statement for Equity as it may be applied to fulfill the mission of OWEB to "protect and restore healthy watersheds and natural habitats that support thriving communities and strong economies'.

Today, I would like to offer a couple of “food for thought” comments as OWEB continues to refine the draft document.

In my experience in DEI work in our organization at High Desert Partnership, drafting a statement and putting it to use is an iterative process. We spent a good deal of time developing our DEI statement and reviewing our statement yearly to make sure it continues to be relevant and that we remain dedicated to the work.

A process that worked well for us as we embarked on a DEI effort and documentation for our organization was to first have our board and staff agree upon foundational definitions, in our case it was diversity, equity and inclusivity. What we found initially is there is a lot of interpretation around these words. We often think we know what the words mean but everyone has experiences and perceptions that put a different lens on the meaning of these words. Having agreement on the definition of the words allowed us to move forward on what we were hoping to achieve with a DEI statement and how we integrate it into our ongoing activities.

I would also like to bring up our publicly managed lands and how they are intrinsically linked to other land ownership and management. In Harney County, for example, over 70% of our lands are publicly managed and as you may know these are lands for all to experience. In this frontier, rural county of 10,000 square miles and less than 7,500 residents, distributing resources to better coordinate projects across jurisdictional boundaries would help to meet important DEI goals and restore and protect ecosystems. What happens on privately managed lands must be coordinated with publicly managed lands for watershed health. Often these are also lands that provide more urban areas with clean, safe water supply. Underserved and under resourced communities and individuals in frontier rural communities in fact protect urban communities - from catastrophic fire, flooding, etc.

Thank you for continuing to examine what it means to have resolutions such as this in organizations that provided resources for watershed level work and management. Given the mission of OWEB, is seems that working directly with groups that manage watersheds and natural habitats there are ways to provide underserved communities identified a larger voice in what types of watershed and habitat projects are occurring without of using resources that are not directly linked to watersheds and habitats.

Sincerely,

Brenda Smith

Director, High Desert Partnership

Salem, OR 97301-1290

RE: Collaborative Expansion of the Columbia County Water Quality Monitoring Program 2023-2026
Spring 2023 Open Solicitation Grant Proposal

Dear OWEB Board Members,

The Columbia Soil and Water Conservation District (CSWCD) is writing you in support of the Lower Columbia Estuary Partnership's (the SWCDs project partner) Spring 2023 Open Solicitation grant proposal, the Collaborative Expansion of the Columbia County Water Quality Monitoring Program 2023-2026. We kindly ask that the OWEB Board consider funding this important project. We would like to highlight that the project was recommended for funding by the OWEB Review team based on the proven track record of the monitoring team's technical expertise, good quality data reported to the Oregon Department of Environmental Quality (DEQ), and the large amount of partner support. However, the project fell below the OWEB staff recommend funding line. Without OWEB funding the project as it's currently configured will cease to exist after 2023.

As impacts to water quality have detrimental effects to critical salmon and steelhead habitat, and to other important species and resources, the CSWCD is committed to monitoring water quality and has expended an extensive amount out-of-pocket funds to support the project. Since 2017 the SWCD's technical lead, in collaboration with our project partner, the Lower Columbia Estuary Partnership, has collected continuous water quality data for temperature, *E.coli*., dissolved oxygen (DO) and turbidity across six key Columbia County, Oregon, subbasins. All collected data is reported to DEQ and is used to inform Total Daily Maximum Loads (TDMLs) and beneficial use statuses. If the project is discontinued, paused for a year or more, due to a lack of crucial funding this will result in significant data loss which will have implications for strategic planning and habitat restoration, and particularly for expanded restoration funding.

From 2019 to 2022 the CSWCD received a total of $3,000,000 in federally appropriated funding, administered through NRCS, to implement a Regional Conservation Partnership Program (RCPP) for the Clatskanie River Watershed and the areas of the Lower Columbia River that occur within Columbia County. The purpose of this RCPP was to address the primary two Natural Resource Conservation Service (NRCS) identified Resource Concerns impacting the recovery ESA salmonids in the county: 1) water quality degradation, and 2) inadequate habitat. It's essential to underscore that the water quality monitoring project was instrumental in securing this $3,000,000 funding. This project not only highlighted the urgent need for action but also provided a clear roadmap for targeted, effective habitat restoration. The CSWCDs water quality monitoring project supported NRCSs determination that water quality degradation was affecting the recovery of ESA salmonids in Columbia County, which resulted in the RCPP funding the design and construction of four logistically complex habitat restoration projects and the design of a fifth project.

This project allows the CSWCD to provide solid information to the public and local governments on watershed water quality issues to facilitate strategic planning and water quality improvement actions. If three years of funding under the Spring 2023 Open Solicitation is granted, this project will build on data collected to date, which will provide an opportunity to complete more in-depth analyses of watershed health to identify specific areas of concern. The results of this project, identification of long-term water quality status and trends supported by in-depth analyses with robust data sets, will provide a strategic framework for habitat restoration prioritization, and provide opportunities for expanded habitat restoration funding, and better inform the public and local governments on effective actions to improve water quality.

We deeply value the support that the Board has extended for the project in the past. We are confident that the project aligns with OWEB's mission and strategic plan priorities, and we believe it will make a lasting, positive impact on our watersheds and the species and communities that depend on them. Again, we kindly request that you to consider our plea for continued funding, keeping in view the benefits, the endorsement of the review team, and the adverse consequences of prematurely discontinuing the project to strategic planning and habitat restoration in Columbia County.

Thank you for your consideration, sincerely,

Selene Keeney

Salem, OR 97301

Re: Letter of support for funding the application to extend the Columbia County Water Quality Monitoring Program 2023-2026 (Application number 223-1028-23003)

Dear OWEB Board Members:

Columbia County is divided by the Coastal Range into two major watersheds, the Lower Columbia River Watershed, and the Upper Nehalem River Watershed, which flows west to the Pacific Ocean. There are 62 miles of Columbia River shoreland, and seven watersheds and many fish bearing streams.

Columbia County is writing in support of funding for the Collaborative Expansion of the Columbia County Water Quality Monitoring Program between Lower Columbia Estuary Partners (LCEP), Columbia County Soil and Water Conservation District (SWCD), and other partners for a requested amount of $270,865 to extend the monitoring efforts for an additional three years; covering years 7-9 of the existing program. The extended timeline and growth of the program allow for the continued collection of crucial data and in-depth analyses of watershed health across six key sub-basins in Columbia County.

Continuing with the ongoing status and trend monitoring across Columbia County sub-basins, the above application aims to shift continuous dissolved oxygen (DO) data collection which will provide more insight to meet ODEQ requirements in addition to the implementation of innovative eDNA studies. The goal of the eDNA study is to trace sources of the ongoing E.coli issues, observed across all sub-basins. The testing for eDNA will assist Columbia County to determine if septic systems are failing, leaching into streams, and in need of repair. Through a current DEQ tri-county grant with Columbia, Clatsop, and Tillamook Counties and administered by Community Action Team, the testing will allow collaboration to solve this problem affecting our communities.

This program not only supports Columbia County's water quality efforts through the Stormwater & Erosion Control Ordinance 2001-10, it is a thorough collaborative drive to protect water sheds across multiple agencies while supporting Columbia County Land Development Services as a Designated Management Agency (DMA) and other DMA's for the Lower Willamette River Total Maximum Daily Loads (TMDL's) as required by DEQ for Mercury,

Temperature and future Bacteria: E.coli, to name a few. This funding opportunity encompasses a collaborative effort.

between partners within the County, including the Drainage Districts, for the betterment of the community, environment, water quality, and OWEB's mission, vision, and values.

Your thorough consideration of Columbia County Water Quality Monitoring Program grant application number 223-1028-23003 is greatly appreciated.

Sincerely,

Casey Garrett, Chair

Kellie Jo Smith, Commissioner

RE: Support for Funding the Collaborative Expansion of the Columbia County Water Quality Monitoring Program 2023-2026 project (OWEB Application number 223-1028-23003)

Dear OWEB Board Members,

Columbia County's Onsite Wastewater Program is writing in support of the Collaborative Expansion of the Columbia County Water Quality Monitoring Program 2023-2026 project that was recommended for funding. If funded, this project would extend monitoring efforts for an additional three years. This extended timeline will allow for the continued collection of crucial data on water quality parameters such as temperature, *E. coli*, dissolved oxygen (DO), and turbidity across six key subbasins in Columbia County. In addition to continuing the ongoing status and trends monitoring across all monitored sub-basins, three years of additional data will allow more in-depth analyses of watershed health to better inform the project partners' strategic planning and restoration efforts.

As the application demonstrates, partners have provided an unprecedented amount of support. However, without OWEB funding the project as it's designed will cease to exist after 2023. Discontinuing the project will result in significant data loss, which will have implications for all entities involved.

We would like to highlight that after a rigorous review, the project was recommended for funding by the OWEB Review team. Their recommendation is based on the proven track record of the monitoring team's technical expertise, good quality data reported to the ODEQ, and a large amount of partner support.

I am the primary Environmental Services Specialist serving Columbia County; I am one of the core staff responsible for development processes and standards and often serve as the point person on water quality matters. I also act as the Oregon DEQ county contract agent for implementing the Onsite Wastewater System Rules which is a significant part of overall land development and currently the only staff responsible for protection of public health and waters as related to sanitation. I have been with Columbia County for 15 years and have long advocated for the counties increased role in water quality concerns and capabilities. The data amassed by this Water Quality Program has in the last few years allowed us to create the foundation to start to build out regulatory programs and processes with the direct purpose of creating policy for development's role in protecting our watersheds and communities. To highlight a few key advances made because of the data set established:

- As of FY 2024, a new Site Development program with the intended purpose of better regulating activities of storm water and erosion control
- Plans to update the Columbia County Storm Water and Erosion Control Ordinance
- Hiring an additional Environmental Services Specialist staff person
- Increasing capacity to build collaboration with multiple partner agencies on water quality and restoration; this includes the Watershed Councils, Soil and Water Conservation Districts, and all cities located in Columbia County to name a few.

- Development of a WQ mapping tool by the Columbia County GIS department to help use informatics to draw data related conclusions
- A new pilot program for eDNA testing for E. coli that we will look to support and establish septic repair programs and community outreach
- More robust Oregon DEQ TMDL reduction capabilities

The long term data already established by the Columbia County Water Quality Monitoring Program is a key piece responsible for providing the information needed for the County's leadership and staff to take steps towards a more comprehensive approach. The data to date demonstrates the need to act as the regulatory authority to ensure more effective policy in order to increase impacts. Should the ability to continue monitoring end, this effort could be significantly impacted. Columbia County is a small rural county that often does not have the resources to meet all of the needs of our citizens and we rely on every resource available to provide the most responsible government we can.

We deeply value the support that the Board has extended for the project in the past. We are confident that the project aligns with OWEB's mission and strategic plan priorities, and we believe it will make a lasting, positive impact on our watershed and the communities that depend on it. We kindly request you to consider our plea for continued funding, keeping in view the benefits, the endorsement of the review team, and the adverse consequences of prematurely discontinuing the project to strategic planning and restoration in the County that the project will inform.

Sincerely,

Erin O'Connell, REHS
Environmental Services Specialist

Subject: Support for Funding the Application to Extend the Columbia County Water Quality Monitoring Program

Dear OWEB Board,

Community Action Team Inc. is writing in support of funding the Collaborative Expansion of the Columbia County Water Quality Monitoring Program 2023-2026 (Application number **223-1028-23003**). Community Action Team Inc. (CAT) has been awarded a $1.5 million grant from DEQ to address failed or failing septic systems in Columbia, Clatsop and Tillamook counties. CAT has developed a partnership with the North Coast Watershed Councils and our organization uses some of the eDNA testing and mapping for the DEQ program. This mapping has been utilizing eDNA to identify various E. coli strains (human, deer, cow, etc.) throughout the area. This will allow for targeted outreach to households in the area who might be in need of septic repairs or replacement. With the partnership between CAT and the Watershed Councils, the program could also provide the results of testing from January 2023, as well as the results of future testing to occur in 2025. This would allow us to compare results to show the benefit of septic repairs/replacement and the effect on human E. coli in those particular waterways.

We look forward to working with the Columbia County Water Quality Monitoring Program to help identify watersheds that have been impacted by failed septic systems.

Sincerely,

Casey Mitchell
Program Manager
Community Action Team Inc.

October 16, 2023

Dear OWEB Board,

Subject: Support for Funding the Application to Extend the Columbia County Water Quality Monitoring Program

The Oregon Department of Fish and Wildlife (ODFW) is writing in support of funding the Collaborative Expansion of the Columbia County Water Quality Monitoring Program 2023-2026 (Application number 223-1028-23003). ODFW understands the difficulties of evaluating and prioritizing limited grant funds across all OWEB regions. ODFW also believes in the review team process using evaluation criteria to inform decisions at the review team, OWEB, and board levels. Understanding these complexities and the process, ODFW would like to address some concerns which the review and monitoring teams expressed during the review process.

All monitoring proposed under this application is occurring in the Clatskanie and Scappoose fish populations within the Lower Columbia River (LCR) Evolutionary Significant Unit. Clatskanie fish populations are LCR coho and SW Washington Distinct Population Segment (DPS) steelhead. In the last three years, a Columbia River chum re-introduction project has re-introduced chum salmon into the Clatskanie River basin. The Scappoose population has LCR coho and SW Washington DPS steelhead. LCR Chinook have not been found in the Scappoose population in the last 11 years of monitoring and not found outside of Plympton Creek (approx. 100% hatchery fish from Big Creek) in the Clatskanie

The Scappoose population is and has been for years, thermally stressed during the summer months and approximately 25% of available rearing habitat is no longer available during the summer. This scenario is only expected to worsen as a changing climate continues to warm summer air and stream temperatures. Additionally, LCR fall chinook occupy basins on either side of the Scappoose and Clatskanie populations but have not re-colonized based on annual spawning ground surveys. LCR coho have not responded in the Clatskanie as they have across other locations and Scappoose steelhead are averaging returns of less than 100 fish. With no hatcheries (except Clatskanie chum), almost no in basin harvest and no hydropower facilities, the problem most likely revolves around habitat. Part of the habitat story is water quality and that is acknowledged in the Oregon's recovery plan as secondary limiting factors (excessive fine sediment, elevated water temperature and altered hydrology from upslope land uses).

While there are many parameters around water quality, ODFW's key interest is in water temperature. Water temperatures is already stressed and will only continue to worsen under a changing climate without mitigative measures. Having current water temperatures provides a baseline to model for future change. ODFW developed a downscaled model for future summer stream temperatures within the LCR ESU. Current water temperatures could further inform the model. With this information practitioners can plan and prioritize restoration projects under future stream conditions and maximize restoration efforts for the benefit of salmonids.

There is also the mystery of why fish populations have not recolonized, not bounced back akin to adjacent populations and for some populations, teetering on extinction. During the chum re-introduction project, investigation occurred and showed the presence of *Ceratonova shasta* and the

vulnerability of chum salmon fry. *C. shasta* is also known to affect coho, chinook and steelhead. For the Klamath River, Oregon State University developed a model to simulate the density of water-born *C. shasta* actinospores. Spore density was simulated by a quadratic regression model based on a parabolic thermal response with river water temperature. While additional information would be needed to create this model based on Columbia County streams, water temperatures are focal points.

Data amassed by this proposal for water quality monitoring can inform future restoration project location and type, the potential to inform chum salmon release timing as well as potentially informing *C. shasta* actinospore densities.

ODFW values the support that the Board has extended to the monitoring program in the past.

Jim Brick
CREP Implementation Coordinator
Oregon Department of Fish and Wildlife

RE: Support for Funding the Collaborative Expansion of the Columbia County Water Quality Monitoring Program 2023-2026 project (OWEB Application number 223-1028-23003)

Dear OWEB Board Members,

Scappoose Bay Watershed Council (SBWC) are writing in support of the Collaborative Expansion of the Columbia County Water Quality Monitoring Program 2023-2026 project that was recommended for funding. If funded, this project would extend monitoring efforts for an additional three years This extended timeline will allow for the continued collection of crucial data on water quality parameters such as temperature, E.coli, dissolved oxygen (DO) and turbidity across six key subbasins in Columbia County.

In addition to continuing the ongoing status and trends monitoring across all monitored sub-basins, three years of additional data will allow more in-depth analyses of watershed health to better inform the project partners' strategic planning and restoration efforts. Data from this project will assist local governments in focusing efforts to improve water quality in their watersheds and is valuable in informing the public and leading to expanded funding opportunities.

While partners have provided $130,000 in match funding, showing an unprecedented amount of support. However, without the necessary funding from the OWEB, the project as it's designed will cease to exist after 2023. Discontinuing the project will result in significant data loss, which will have implications for strategic planning and subsequent restoration actions in the County. Furthermore, the data collected is reported to ODEQ, and in turn, is used by ODEQ to inform TDMLs and beneficial use status.

We would like to highlight that after a rigorous review, the project was recommended for funding by the OWEB Review team. Their recommendation is based on the proven track record of the monitoring team's technical expertise, good quality data reported to the ODEQ, and a large amount of partner support.

The Scappoose Bay Watershed Council does rely on data amassed by this Program for water quality management. The continued efforts of this program are allowing partners to assess and find mitigation strategies for water quality issues in the watershed. If necessary, scaling the proposed application to fit the available funding will at least provide the support needed for continuing this important project.

We deeply value the support that the Board has extended to the project in the past. We are confident that the project aligns with OWEB's mission and strategic plan priorities, and we believe it will make a lasting, positive impact on our watershed and the communities that depend on it. We kindly request you to consider our plea for continued funding, keeping in view the long-term benefits, the endorsement of the review team, and the adverse consequences of discontinuing the project to strategic planning and restoration in the County that the project will inform.

Sincerely,

Rachell Meyers

Coordinator, Scappoose Bay Watershed Council

Lower Columbia Estuary Partnership

October 19, 2023

Oregon Watershed Enhancement Board -OWEB
Board of Directors
Submitted via email

RE: Support for Funding the Application to Extend the Columbia County Water Quality Monitoring Program

Dear OWEB Board Members,

Lower Columbia Estuary Partnership is writing in support of funding the Collaborative Expansion of the Columbia County Water Quality Monitoring Program 2023-2026 (Application number 223-1028-23003). In the application, LCEP and partners request funds to extend the monitoring efforts for an additional three years. This extended timeline and growth of the project would allow for the continued collection of crucial data and more in-depth analyses of watershed health across six key subbasins in Columbia County. In addition to continuing the ongoing status and trends monitoring across all sub-basins, the new application also aims to shift to continuous dissolved oxygen (DO) data collection across these sites to gain more insight and meet ODEQ requirements, in addition to the implementation of an innovative eDNA study. The goal of the eDNA study is to trace sources of the ongoing *E. coli* issues observed across the sub-basins. These programmatic changes are informed by the results of our ongoing data collection from this program, feedback from our partners, and feedback provided by the OWEB grant committees and staff.

We would like to highlight that after a rigorous review, the project was recommended for funding by the OWEB Review team. Their recommendation is based on the proven track record of technical expertise on the monitoring team, good quality data with a large amount of partner support for this Program.

While partners have shown an unprecedented amount of support, without the necessary funding from the OWEB Board, the long-term program as it's designed will cease to exist beyond 2023. Discontinuing funding for the Program will result in significant data loss and affect any subsequent restoration actions in the County.

The data amassed by the project has been immensely useful to our partners. Over the course of the project's timeline, the CSWCD has been able to secure $3 million over 2019 – 2022 to implement a Regional Conservation Partnership Program (RCPP) for the Clatskanie River Watershed. The ODEQ uses data from this project to inform TMDLs for the County. Columbia County Department of Public Health has been able to take steps to implement updates to the Columbia County Storm Water and Erosion Control Ordinance 2001-10, develop a WQ mapping tool by the Columbia County GIS department, and take steps to establish septic tank repair programs. ODFW also has a key interest in water temperature data from this project which informs their models. If necessary, scaling the proposed application to fit the available funding will at the minimum provide the support needed for continuing the long-term baseline monitoring efforts.

We deeply value the support that the Board has extended for the project in the past. We are confident that the project aligns with OWEB's mission and strategic plan priorities, and we believe it will make a lasting, positive impact on our watershed and the communities that depend on it. We kindly request you to consider our plea for continued funding, keeping in view the long-term benefits, the endorsement of the review team, and the adverse consequences of discontinuing the project.

E. Elaine Placido

E. Elaine Placido, DPA
Executive Director

OREGON WATERSHED ENHANCEMENT BOARD

Agenda Item E

Director's Updates

Board Meeting October 23-25, 2023

This report provides the board with an update on the status of OWEB's investment in Klamath River Post-Dam Removal Watershed Restoration costs associated with work by the Klamath River Renewal Corporation (KRRC).

Background

PacifiCorp previously owned four hydroelectric dams on the Klamath River, three in California and one in Oregon (J.C. Boyle dam). PacifiCorp and the Oregon Public Utilities Commission determined that it is in the best interest of the company and its customers to stop operating the dams rather than spending substantial amounts on improvements needed if they were to continue generating power. The dams are not used for irrigation. KRRC is a private, independent nonprofit organization formed by signatories of the amended Klamath Hydroelectric Settlement Agreement (KHSA). Signatories of the amended KHSA, including the States of Oregon and California, local governments, Tribal nations, PacifiCorp, irrigators, and several conservation and fishing groups, appointed KRRC to take ownership and oversee the removal of the four Klamath River dams. Funding in the amount of $450 million for removal and watershed restoration was committed.

As KRRC implements the dam removal, former reservoir areas will become exposed and require restoration and stabilization of bare sediment deposits for long-term water quality, ecological benefits, and restoration of natural river functions and processes. Restoration work also will be needed at upland sites (where dredged material generated by regrading of slopes will be deposited) and at the mouths of creeks entering the former reservoir pools. KRRC submitted a Reservoir Area Management Plan (RAMP) to the Federal Energy Regulatory Commission (FERC), the responsible entity for principal federal regulatory review of the project. The RAMP describes measures for restoration, monitoring, and adaptive management of the former reservoir areas and high-priority tributaries, including actions specifically planned for the former reservoir area upstream of J.C. Boyle dam, the section of the project located in Oregon.

During the FERC review, a question was raised about whether existing contingencies and risk tools provide a high enough level of certainty that the work will be completed on time and within budget. In response to this concern, the states and PacifiCorp agreed to provide up to $45 million in additional financial support for the project, divided equally among the three entities. On October 26, 2022, the OWEB Board committed $15 million over a period of 3-5 years for Klamath River post-dam removal restoration watershed restoration costs incurred by KRRC. Multiple funding sources administered by OWEB will be utilized for this commitment. The initial grant award made and delegated by the board in October 2022 was $4.053 million. An additional $8 million was committed and delegated by the board in the 2023-2025 spending plan at the July 25, 2023, board meeting. The remaining $2.947 million will be included in the OWEB Board's spending plans in future biennia.

The final License Surrender Order from FERC approving the decommissioning and removal of the dams was issued on November 17, 2022. Ownership of the four dams and associated lands was transferred to KRRC effective December 1, 2022. The removal of the J.C. Boyle facility located in Oregon is expected to occur in 2024.

In late 2022, OWEB and KRRC finalized a partnership agreement that affirms the intent of OWEB's investment in Klamath River post-dam removal watershed restoration and describes the framework, scope, tasks, and timeline for the overarching $15 million in funding. In addition, the States of Oregon and California, PacifiCorp, and KRRC finalized a Memorandum of Agreement regarding the Supplemental Contingency Funding Implementation.

OWEB created a KRRC-specific grant offering that includes a project-level grant application and associated guidance documents for use by KRRC to propose specific activities that would utilize the OWEB's post-dam removal watershed restoration funding. Grant applications submitted by KRRC will mirror the restoration actions for the J.C. Boyle area as outlined in the RAMP and will adhere to minor additional requirements included in FERC's final order.

In March 2023, work officially began on dam removal. Significant work has been completed, including road and bridge improvements, installation of the Yreka water line, and other site preparations. In June 2023, FERC issued final authorization to complete remaining Pre-Drawdown Period work activities and construction, including removal of Copco No. 2 dam. Kiewit began removal of Copco No. 2 dam in June and completed removal in September.

Status Update

Since the July 2023 board meeting, OWEB staff have been in regular communication with KRRC. OWEB and KRRC are coordinating on timing for grant applications to be submitted to OWEB, in addition to considerations for different fund sources (e.g., Pacific Coastal Salmon Recovery Funds (PCSRF), Bipartisan Infrastructure Law funding through PCSRF, and Measure 76 lottery funds) relative to the restoration actions to be included in grant applications. Currently anticipated actions include tributary restoration, floodplain restoration and reconnection, fish-passage barrier removal, instream large-wood placement, revegetation, and treatment of invasive species, among others. KRRC, working with RES, KRRC's restoration contractor, expect to submit a grant application in mid-2024.

In terms of progress related to the broader Klamath dam removal project:

- KRRC's restoration contractor, RES, is coordinating closely with Kiewit, KRRC's construction contractor, to complete biological and water quality monitoring throughout the construction process.
- RES is beginning to coordinate initial restoration activities in anticipation of reservoir drawdown and ongoing construction activities. In addition, they are completing boulder- and tree-related work between the site of the now removed Copco No. 2 dam and Iron Gate dam, to ensure safety for recreators by the end of October.
- Kiewit will continue roadway and infrastructure improvements, including relocation of the Yreka water line, recreation site removals, fire management improvements, and other preparations for dam removal through the end of this calendar year.
- FERC and independent consultants are completing final review of the dam removal design. KRRC anticipates a phased approval approach, with FERC granting approval for reservoir drawdown and initial dam removal activities at J.C. Boyle and Copco No. 1 dams in 2023 and approval for the remaining dam removal activities in the spring of 2024, once the 2024 water year has been analyzed to finalize the Iron Gate dam breach schedule to ensure public safety during dam removal.
- Reservoir drawdown will begin in January 2024 and deconstruction of J.C. Boyle, Copco No. 1, and Iron Gate dams will be complete by October 2024. Restoration activities will commence immediately and continue for the next several years.

Quarterly reports will be provided to the board at each meeting.

Staff Contact

If you have questions or need additional information, contact Renee Davis, Acquisitions and Special Programs Manager, at renee.davis@oweb.oregon.gov or 971-345-7231.

October 23-25, 2023, OWEB Board Meeting

Executive Director Update E-3, Drinking Water Source Protection Grant Program Update

This report provides the board with an update about initial work to begin scoping for development of a Drinking Water Source Protection grant program, as directed by House Bill (HB) 2010 (2023).

Background

Earlier this year, the Oregon Legislature passed HB 2010, which was the 'omnibus' water package. The bill directed OWEB to establish a new drinking water source protection land acquisition grant program. The intent of this program is to provide grants to water suppliers to protect sources of drinking water. The bill also allocated $1 million in General Funds to the program; this funding is combined with an additional $4 million in Lottery Bond funding—through HBs 5030 and 5506—for the drinking water source protection program established in HB 2010. In total, $5 million is available to support the new grant program. Additionally, OWEB received funding (General Fund) and position authority for a 0.88-FTE Natural Resources Specialist 4 position to help support program development and administration.

At the July 2023 meeting, the board approved initiation of rulemaking for two grant programs, including the Drinking Water Source Protection program. This process will convene a rules advisory committees (RAC) composed of potential grant applicants, reviewers, and others most likely to be impacted by the administrative rules that govern the grant program. Staff propose to develop the rules in accordance with the draft schedule below.

Rulemaking Action	**Dates/Deadlines**
Board Authorization for Rulemaking	July 2023
Draft Rules Developed	Fall 2023
RAC Meetings to Vet Draft Rules and Provide Feedback	Fall-Winter, 2023/2024
Draft Rules Revised Based on RAC Feedback	April 1, 2024
Notice Filed with Secretary of State	April 1, 2024
Public Comment Materials posted online	April 1, 2024
Notice to Agency Mailing List and Legislators	April 1, 2024
Secretary of State's Bulletin	April 1, 2024
Public Comment Period	April 1-April 30, 2024
Public Hearing(s)	April 2024
Revisions to Draft Rules Based on Public Comment	May/June 2024
Board Adoption of Rules	July 2024

Status Update

The Drinking Water Source Protection grant program will sit within the newly created Acquisitions and Special Program section of the agency. Staff have taken several early steps for program scoping:

- Drafting a position description for submission through the State of Oregon's recruitment process for state employees;
- Initiating communications with subject-matter experts and grant program managers from the Oregon Department of Environmental Quality, Oregon Health Authority, the U.S. Environmental Protection Agency, and U.S. Forest Service to better understanding both technical information regarding source water protection and how this program may complement existing drinking water protection grant and loan programs;
- Analyzing legal and statutory direction to the agency to inform rulemaking;
- Beginning to engage in existing processes (e.g., Coastal Partnerships for Drinking Water Protection workshops) to learn more about challenges and opportunities faced by local communities and partners; and
- Drafting an outreach and implementation plan for program scoping and development, including RAC formation.

The board and, as appropriate, relevant board committees will receive periodic updates about progress on program development and rulemaking.

Staff Contact

If you have questions or need additional information, contact Renee Davis, Acquisitions and Special Programs Manager, at renee.davis@oweb.oregon.gov or 971-345-7231.

October 23-25, 2023, OWEB Board Meeting
Executive Director Update E-4: Focused Investment Partnership (FIP) Solicitation

This report provides the board an update about the current FIP solicitation and the review process for submitted applications.

Background

In May 2023, OWEB started a solicitation for new FIP initiatives that would begin in the 2023-2025 biennium. Over the summer, OWEB staff conducted virtual pre-application consultations with six partnerships exploring the option of submitting a FIP application in this grant offering. This consultation is required for all FIP applicants. During the meeting, OWEB staff described FIP program expectations and partnerships discussed their potential initiatives. OWEB staff expect to receive up to five applications by the October 16, 2023 due date.

FIP Application Review and OWEB Board Grants Committee Process

In January 2024, OWEB will convene a review team with expertise in partnerships and in each ecological priority represented in the submitted applications. Reviewers will evaluate the applications according to criteria in administrative rules for the program. After the review team discusses each application's strengths and concerns, OWEB staff will ask reviewers to rank the applications in numerical order. This is a new step compared with the previous FIP application reviews.

The rankings and other results of the review team meeting will be provided to the applicants and the OWEB Board Grants Committee. The committee and OWEB staff will meet for a work session in February 2024. This meeting is an opportunity for the committee to receive background information on the applications and evaluations and to begin to formulate interview questions to ask each of the partnerships. There will be no deliberations or recommendations at the work session.

In March 2024, the committee will conduct public interviews of the applicant partnerships. There was consensus at the September 2023 committee meeting to explore options for in-person interviews as conversations tend to be richer in-person than those held virtually. If the interviews are held in-person, OWEB will offer travel stipends for the partnerships to attend. The interviews will be conducted by the committee with individual committee members assigned to lead the interviews with each of the of the applicant partnerships.

Following the interviews, the committee will take into consideration the interview responses and rankings of the review team to develop a funding recommendation that will be provided to the full board at the April 2024 meeting. The full board will award new FIP initiatives at that time.

Staff Contact

If you have questions or need additional information, contact Eric Hartstein, Senior Policy Coordinator at eric.hartstein@oweb.oregon.gov /503-910-6201.

This report provides the board an update about two areas of focus in the SIA program: a pilot Restoration grant offering in Fall 2023 and the preparations for the next offering of SIA Technical Assistance funding in Winter 2024.

Background

The Oregon Department of Agriculture (ODA), Agricultural Water Quality Management Program, is leading the SIA initiative. Under the current program model in place since 2017, select areas around the state receive focused stakeholder engagement, technical assistance , monitoring, and, where necessary, compliance follow-up to address water quality concerns in agriculturally influenced areas. Local partners work with landowners and managers to meet and exceed water quality requirements, and ODA follows up as needed to address compliance concerns.

SIA Pilot Restoration Grant Offering

In September 2023, OWEB opened a Pilot Restoration grant offering for SIA leads to address restoration opportunities that were identified through the SIA process. The total amount available from OWEB for SIA Restoration Grants is $500,000. This program was developed in response to feedback from partners over the last few years. Eligible applicants are SIA lead organizations who received a SIA technical assistance grant between 2017-2022, or a partner organization if authorized by the SIA lead. Two grant cycles will be available this biennium, and applicants can apply to either cycle. The maximum request amount per grant is $15,000.

The offering is based on OWEB Small Grant Administrative Rules and uses the Small Grant Application plus supplemental climate questions. Applications will be reviewed by an interagency team from OWEB, ODA, Oregon Department of Environmental Quality (DEQ), and Oregon Department of Fish and Wildlife (ODFW). Projects must demonstrate a clear watershed benefit to aquatic species, wildlife, or watershed health. Priority will be given to projects intended to restore or protect agricultural water quality, such as: managing nutrient or sediment inputs; managing vegetation; managing erosion; implementing irrigation practices and/or improving surface drainage. Additional eligible project types include improvements to instream habitat, wetlands and/or fish passage, and/or invasive species eradication. For the full list of eligible project types see Attachment A.

Preparation for New SIA Applications for Technical Assistance Grants

Under the current funding model in place since 2017, OWEB Stakeholder Engagement/Technical Assistance and Monitoring funding is offered to each SIA identified by ODA. Technical assistance funding supports the SIA lead and local partners in developing outreach plans and working with landowners to develop restoration projects. Monitoring funds support baseline and long-term monitoring within the SIA geography. Each SIA convenes a local monitoring team to provide guidance and feedback on local monitoring objectives and the development of a monitoring proposal. Prior to implementation, all monitoring plans are reviewed by an inter-agency Monitoring Advisory Group made up of representatives of OWEB, ODA, DEQ, and ODFW.

ODA anticipates that at least four SIAs will apply for the offering in March 2024. Following the existing funding model, up to $125,000 will be made available for each SIA, and at least $25,000 of this must be used for monitoring. The Monitoring Advisory Group has developed updated SIA monitoring proposal guidance and a collaborative review process in response to local partner

concerns, and ODA is offering additional technical assistance to SIA grantees as they develop their monitoring proposals.

Staff Contact

If you have questions or need additional information, contact Courtney Shaff, Monitoring and Reporting Program Manager, at Courtney.Shaff@OWEB.oregon.gov or 971-345-7012.

A. Restoration Grant Offering Announcement

SIA Leads, OWEB and ODA staff are excited to announce the opening of the Pilot Restoration grant offering for SIA leads to address restoration opportunities that were identified through the SIA process. This program was developed in response to feedback from partners over the last few years. The information on this pilot program is below, including application deadlines and eligible project types.

Eligible Applicants

SIA Lead organizations who received an OWEB SIA TA grant between 2017-2022. Other organizations can apply if the SIA Lead organizations emails OWEB and ODA granting permission for the other entity to apply for the SIA restoration funds.

Application Deadlines:

- January 17, 2024
- January 15, 2025

Maximum request amount per grant: $15,000

Total amount available from OWEB for SIA restoration grants: $500,000 (evenly distributed across the 2 grant cycles). Applicants can submit more than one project per cycle, and can re-apply to the 2nd cycle if they are unsuccessful with the first cycle. Match requirement is 25% and can be cash or in-kind.

Timeframe: Projects must be completed within two years of the grant award date. No time extensions will be allowed for these projects.

Application process: Applications will be submitted through OWEB's Online Application System. The grant offering title is: SIA Restoration.
In July 2023 the OWEB Board adopted new climate rules that are applicable to all grant types. As a result of these rules applicants must answer all of the questions in the online application AND must answer the climate questions, attached to this email. The answers to these questions must be uploaded and submitted with the application.

Review Process: Applications will be reviewed by an interagency team consisting of OWEB, ODA, DEQ, and ODFW. Funding decisions will be shared with applicants following the review team meeting.

Eligible Project types: Projects must demonstrate a clear watershed benefit to aquatic species, wildlife, or watershed health and be one of the eligible project types listed below. These are based on OWEB Small Grant Rules OAR 695-035-0050. Priority will be given to projects intended to restore or protect agricultural water quality.

Projects commonly used to restore or protect Agricultural Water Quality:

- Manage Nutrient and Sediment Inputs through managed grazing (e.g., fencing and developing off-channel watering) and plantings.

- Manage Vegetation: plant or seed native riparian species, propagate native riparian plants, or control weeds in conjunction with a restoration project.
- Manage Vegetation: control weeds (in conjunction with a restoration project), or plant native wetland species.
- Manage Erosion on Agricultural Lands: terrace land; employ laser leveling; create windbreaks; install water and sediment control basins (WASCBs); develop filter strips/grassed waterways; manage mud (e.g., gravel high-use areas, develop paddocks); seed bare areas, reduce tillage.
- Manage Nutrient and Sediment Inputs to Streams through the management of grazing, vegetation cover, animal waste, or irrigation runoff.
- Improve Surface Drainage: surface road drainage improvements, gravel surfacing, stream crossings.
- Manage Erosion: bioengineer stream banks, slope stream banks, or develop water gaps, streambank barbs.
- Implement Irrigation Practices.
- Decommission Roads.

Additional eligible project types:

- Improve Instream Habitat: place large wood, boulders, or salmon carcasses.
- Fish Passage: Remove Irrigation or Push-Up Dams, Remove and/or Replace Culverts, Remove or Replace Stream Crossings.
- Restore Wetlands: excavate or remove fill, or eliminate drainage structures.
- Install Stormwater Runoff Treatments.
- Create Off-Channel Flood Storage.
- Employ Integrated Pest Management.
- Eradicate or Control Exotic Aquatic Species.
- Manage Vegetation: prescribed burning, except when conducted as part of a commercial harvest; non-commercial thinning; control/remove juniper (except late-seral/old growth); plant or seed (native upland species or native beneficial mixes preferred); or control weeds (in conjunction with a restoration project). Projects for prescribed burning to reduce fuel loads require ODF technical review and approval, or tribal government review and approval for projects on Tribal Trust Lands, using a standard OWEB form.
- Manage Wildlife: install water guzzlers.

Questions

Questions regarding the application and review process should be directed to: Amanda Robinson, ODA SIA Lead amanda.robinson@oda.oregon.gov, or Courtney Shaff, OWEB Monitoring and Reporting Program Manager, Courtney.shaff@oweb.oregon.gov.

October 23-25, 2023, OWEB Board Meeting

Executive Director Update E-6 Strategic Plan Update

This report provides the board updates on the implementation progress of the 2018-2028 strategic plan. In addition, this report shares OWEB's current thinking on a timeline and process for an update to the strategic plan, in accordance with Governor Kotek's expectations of state agencies.

Background

In June 2018, the board approved a new, ten-year strategic plan. Beginning with the July 2022 board meeting, staff began providing quarterly reports using a new template.

Attached is the latest update of actions related to the strategic plan between July 2023 and October 2023. Some highlights from this quarter's report include:

- OWEB's outreach included meetings with additional new groups to discuss watershed health throughout Oregon including granting foundations Meyer Memorial Trust and Wild Rivers Coast Alliance. Staff continued Diversity, Equity, Inclusion and Environmental Justice training that focused on wealth inequality perceptions and realities regionally. Council Capacity was a focus with a 20-year Programmatic Review conducted collaboratively between OWEB, Oregon State University, and the University of Oregon. Watershed Councils were also awarded over $9 million in Council Capacity Grants.
- Accomplishments in funding diversity include an increase of $2 million in funding from the Bureau of Land Management for grants and the removal of Lovelace Dam with funding from National Oceanic and Atmospheric Administration (NOAA) Fisheries under the federal Bipartisan Infrastructure Law (BIL). This was the first project completed with NOAA BIL funds anywhere in the Northwest.
- With the adoption of new administrative rules, OWEB began incorporating questions related to the Climate-Related Evaluation Criteria into grant applications.

Upon taking office in January 2023, Governor Kotek shared a list of expectations for state agencies related to operational excellence. One of the expectations is that agencies with strategic plans older than 36 months will update those plans by June 1, 2024.

In response, OWEB has engaged with Dialogues in Action, the consulting team that helped the agency develop the current 2018-28 Strategic Plan. Staff, board, and partners were interviewed through a series of meetings to determine the diversity of values, perceptions, and needs, and a discussion session is planned as part of this October's board meeting.

A. OWEB Strategic Plan Report October 2023

OREGON Watershed Enhancement Board

Linda Repplinger

2018-2028 Strategic Plan

Quarterly Report to the Board | October 2023

Mission: To help protect and restore healthy watersheds and natural habitats that support thriving communities and strong economies.

Priority 1

Broad awareness of the relationship between people and watersheds

Proceeds from Bandon Preserve (a 13-hole golf course) support grant funds for Wild Rivers Coast Alliance. Photo from Wild River Coast Alliance of Bandon Preserve No. 7

This past quarter, OWEB leadership continued to **connect with key organizations that can help build awareness about the relationship between people and watersheds.** Leadership met with four organizations active in connecting youth with Oregon's cultural and natural resources:

- OWEB met with Jill Fuglister, Program Director at Meyer Memorial Trust. The Meyer Memorial Trust is one largest private funders in Oregon. They work to accelerate racial, social and economic justice in Oregon.
- OWEB met with Marie Simonds, Executive Director of the Wild Rivers Coast Alliance during Lisa's trip to the South Coast. Wild Rivers Coast Alliance utilizes proceeds from Bandon Dunes Golf Resort to fund grants that promote local economics that preserve natural resources.

Eastern Oregon Economic Summit, 2023. Pnoto from Eastern Oregon Women's Coalition.

- OWEB attended another Say Hey networking event which is an opportunity to connect with diverse professionals in the greater Portland metro area.
- OWEB attended the 2023 Eastern Oregon Economic Summit in Union County. The summit is hosted by the Eastern Oregon Women's Coalition. Topics included economic development, housing, water, and forest management.

In addition to the groups above, OWEB leadership also continued regular meetings with other partner organizations and groups.

Priority 2

Leaders at all levels of watershed work reflect the diversity of Oregonians

OWEB staff engaged in **training focused on Understanding Growing Wealth Inequality.** Through an interactive workshop format with ECONW, staff learned about key structural factors that are causing and upholding economic inequality. Staff discussed how these factors affect individual experiences and how it intersects with OWEB's work.

Priority 3

Community capacity and strategic partnerships achieve healthy watersheds

Slide from Council Capacity presentation.

The OWEB board **awarded $9,204,267 in Council Capacity Grants** at the July Board Meeting. Council Capacity Grants help support the operations of Watershed Councils that engage people and communities in their watershed to participate in collaborative, voluntary restoration and protection of native fish or wildlife habitat and natural watershed functions to improve water quality or stream flows.

Capacity Matters document.

OWEB engaged a team from Oregon State University (OSU) and the University of Oregon (UO) to conduct a **20-year programmatic review of Organizational Capacity grants.** ODA staff and a group of Watershed Council and SWCD representatives advised OWEB and the OSU/UO team throughout the review process.

The review evaluates:

- Impact funding has had on councils and districts
- Describes how the grants lead to additional funding and partnerships.
- Helps inform future capacity-building investments.

Priority 4

Watershed organizations have access to a diverse and stable funding portfolio

Article on Jefferson Public Radio.

The Lovelace Dam Removal project was the first in the nation to cross the finish line among restoration projects receiving funding from NOAA Fisheries under the **federal Bipartisan Infrastructure Law.**

Marys Peak Ridge View Overlook wildlife enhancement project, completed summer 2022 with BLM funds by Midcoast WC, provided approximately 112 trees suitable for instream restoration.

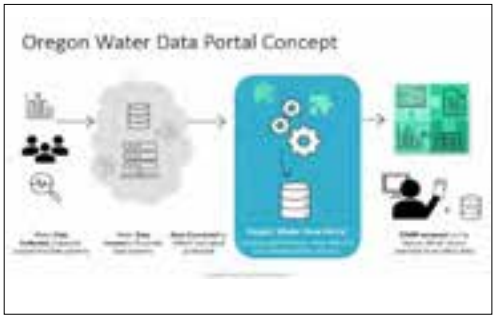
OWEB received its 5th **BLM modification, adding an additional $2,640,904.95 funds,** including $2,221,939 in Bipartisan Infrastructure Law and Inflation Reduction Act funds. These funds will support 17 additional projects to support native fish and instream habitat restoration.

Priority 5

The value of working lands is fully integrated into watershed health

Upper Nehalem River Strategic Implementation Area, 2018.

In response to demand from local partners, OWEB is providing **new Restoration funding opportunities for previously funded Strategic Implementation Areas (SIAs).** The Oregon Department of Agriculture (ODA) and the SIA Leads are working closely with OWEB to pilot this new funding opportunity, with applications accepted in 2024 and 2025.



Priority 6

Coordinated monitoring and shared learning to advance watershed restoration effectiveness

OWEB site visit to a Dam Removal site on the Eklutna River, Alaska.

OWEB staff traveled to Alaska to meet with other PCSRF grantees and NOAA regional and national staff. Staff had a chance to hear about regional and national NOAA priorities, learn about new online systems and build relationships for future collaboration opportunities.

Slide from Report to Legislature Presentation.

OWEB is collaborating with other state agencies to integrate Oregon water data into **a new Water Data Portal.** The 2nd pilot phase of the project now continues through the 2023-25 biennium and is described here: www.oregon.gov/deq/wq/Pages/owdp.aspx

Priority 7

Bold and innovative actions to achieve health in Oregon's watersheds

Notice of changes to Stakeholder Engagement and Technical Assistance grants.

Lowered Match on Technical Assistance and Stakeholder Engagement grants **to just $1 and lifted the cap** on Technical Assistance Grants, making these grants more available to a wider range of potential grantees.

Climate-Related Evaluation Criteria Rule.

Notice of training.

All grant offerings now include Climate Criteria. Multiple training options are offered to OWEB grantees to learn how to respond to new Climate Criteria questions in grant applications.

Strategies Chart Jan. 2022 - Oct. 2023

accomplishments
highlighted in quarterly update

	January	April	July	October
1 Broad awareness of the relationship between people and watersheds				
1.1 Develop and implement broad awareness campaigns and highlight personal stories to tell the economic, restoration, and community successes of watershed investments.	●	●	●	●
1.2 Increase involvement of non-traditional partners in strategic watershed approaches.	●	●	●	●
2 Leaders at all levels of watershed work reflect the diversity of Oregonians				
2.1 Listen, learn and gather information about diverse populations.	●	●	●	●
2.2 Create new opportunities to expand the conservation table.	●		●	●
2.3 Develop funding strategies with a lens toward diversity, equity and inclusion (DEI)	●	●	●	●
3 Community capacity and strategic partnerships achieve healthy watersheds				
3.1 Evaluate and identify lessons learned from OWEB's past capacity funding.	●		●	●
3.2 Champion best approaches to build organizational, community and partnership capacity.	●	●	●	●
3.3 Accelerate state/federal agency participation in partnerships.	●	●	●	●
4 Watershed organizations have access to a diverse and stable funding portfolio				
4.1 Increase coordination of public restoration investments and develop funding vision.	●	●	●	●
4.2 Align common investment areas with private foundations.		●		
4.3 Explore creative funding opportunities and partnerships with the private sector.	●			
4.4 Partner to design strategies for complex conservation issues that can only be solved by seeking new and creative funding sources.	●			
5 The value of working lands is fully integrated into watershed health				
5.1 Implement the Oregon Agricultural Heritage Program.	●		●	●
5.2 Strengthen engagement with a broad base of working landowners.	●	●	●	●
5.3 Enhance the work of partners to increase working lands projects on farm, ranch and forestlands.	●	●	●	●
5.4 Support technical assistance to work with owners/managers of working lands.				●
5.5 Develop engagement strategies for owners and managers of working lands who may not currently work with local organizations.	●	●	●	●
6 Coordinated monitoring and shared learning to advance watershed restoration effectiveness				
6.1 Broadly communicate restoration outcomes and impacts.	●	●		●
6.2 Invest in monitoring over the long term.	●		●	●
6.3 Develop guidance and technical support for monitoring.	●	●	●	●
6.4 Increase communication between and among scientists and practitioners.	●	●		●
6.5 Define monitoring priorities.				●
6.6 Develop and promote a monitoring framework.	●			●
7 Bold and innovative actions to achieve health in Oregon's watersheds				
7.1 Invest in landscape restoration over the long term.	●	●	●	●
7.2 Develop investment approaches in conservation that support healthy communities and strong economics.	●	●	●	●
7.3 Foster experimentation that aligns with OWEB's mission.	●	●	●	●

OREGON WATERSHED ENHANCEMENT BOARD

Agenda Item F

Committee Updates

Board Meeting October 23-25, 2023

October 23-25, 2023, OWEB Board Meeting
Water and Climate Committee Update

Committee Members

Bruce Buckmaster and Jamie McLeod-Skinner (Co-Chairs), Dan Brown, Stephen Brandt, Kelly Coates, Gary Marshall, Lindsay McClary, Eric Murray, Meg Reeves, Dan Shively

Meeting Summary

The Water and Climate Committee met on September 13, 2023.

Alli Miller, Program Analyst for the Clean Water State Revolving Fund (CWSRF) at Oregon DEQ, shared information about the CWSRF, including why and how it was created, eligible borrowers and projects, different loan types, and recent funding from the Bipartisan Infrastructure Law for emerging contaminants projects in Oregon. The committee had an opportunity to ask questions about the nexus of CWSRF with OWEB, including applicants and project types. Committee members were interested in doing a deeper dive into how the work of the agencies can complement each other and benefit Oregon communities and partners.

Brian Wolcott, Water Acquisition and Capacity Coordinator, provided the committee with an overview of the Water Acquisition grant program including its evaluation criteria and review process. This presentation was requested as a follow-up to board member questions that arose during the July 2023 board meeting.

Eric Hartstein, Senior Policy Coordinator, provided a brief overview of OWEB's mitigation policy and its update, particularly as it relates to the committee's past discussions on voluntary carbon markets.

Committee members briefly discussed intersectionality topics from other board committees. Stephanie Page, Deputy Director, and Dan Brown, board member representing the U.S. EPA, shared the recent announcement regarding the trainings for the climate evaluation criteria and the nexus with the Grants Committee.

Committee members also identified several potential topics for upcoming committee meetings, including a climate checklist that could assist in articulation of climate-related work at OWEB, sharing information about the content of the climate trainings and recommended resources, and a more comprehensive look at how OWEB can complement CWSRF activities.

To Be Presented at the October 2023 Board Meeting by:

Bruce Buckmaster and Jamie McLeod-Skinner

Staff Contact

Stephanie Page, Deputy Director
Stephanie.Page@oweb.oregon.gov or 971-345-7004

October 23-25, 2023, OWEB Board Meeting
Grants Committee Update

Committee Members
Barbara Boyer and Dan Brown (co-chairs), Molly Kile, Liz Agpaoa, Chris Allen, Mark Labhart, Liza Jane McAllister, Lindsay McClary

Meeting Summary

The Grants Committee met on September 18, 2023.

Revisiting the Name of the "Stakeholder Engagement" Grant Offering

Committee member Lindsay McClary raised the issue at the previous meeting. Historically, the term "stakeholder" refers to someone staking a claim to land, which can be offensive to tribal communities, reflecting colonial history. The committee agreed that OWEB should consider changing the name of the grant offering to something more appropriate. After discussion, the committee suggested calling the grants simply "Engagement Grants" as this reflects the purpose and intent of the grant type and is inclusive of any type of engagement necessary for implementing eligible restoration or acquisition projects.

While board approval is not needed to name grant offerings, the committee decided to provide this recommendation for discussion at the October board meeting. Staff indicated that if there was consensus from the board on the name change, it could be implemented with the next Engagement Grant offering. The name would be changed in administrative rules as each section of rules referencing this grant type is subject to rulemaking updates.

Preview of October Open Solicitation Grant Awards

Staff previewed the October Open Solicitation Grant awards, noting that the spending plan adopted in July includes significant increases in the restoration ($2.5 million) and technical assistance ($2 million) line items while Stakeholder Engagement and Monitoring line items are similar to last biennium. The board's spending plan approval included significant policy changes affecting open solicitation:

- Match is reduced to $1 for technical assistance and stakeholder engagement grants
- The $75,000 cap on technical assistance grants was lifted.

Since these changes did not apply to the Spring 2023 offering, staff recommendations accounted for the likely increased requests in the three subsequent offerings in the biennium, particularly to account for increased permitting costs and timelines to address cultural resources and no net rise requirements.

Demand in the Spring 2023 offering is similar to the previous cycle that included monitoring, with 110 applications requesting $19 million. Restoration demand increased by about $1.5 million and monitoring demand decreased by about $1 million.

Staff anticipates recommending funding for over 80% of applications recommended by regional review teams for restoration and monitoring applications, 70% of technical assistance applications, and 100% of stakeholder engagement applications.

The committee recommended issuing a separate press release recognizing the important work that salmon license plate revenues will fund in this cycle.

Preview of the Cohort 4 FIP Evaluation Process

Staff described process changes designed to better situate the Grants Committee for recommending implementation FIP applications to the board in April, including:

- The expert review team ranking applications instead of assigning high/medium/low ratings;

- Regional Program Representatives participating on the expert review panel to provide additional regional context;
- A Grants Committee work session in February to identify clarifying questions; no deliberations will occur in this non-public work session;
- An in-person Grants Committee interview of the partnerships in March with travel expenses paid by OWEB for partnership participation.

The Committee agreed that these changes provide a more effective framework to make funding recommendations to the full board. The revised timeline for implementation FIP applications is as follows:

- Applications received: October 16, 2023
- Technical Review: January-February 2024
- Grants Committee Work Session: February 2024
- Grants Committee Interviews, Public Session: March 2024
- Board awards: April 23-24, 2024

To Be Presented at the October 2023 Board Meeting by:

Dan Brown and Barbara Boyer

eric.williams@oweb.oregon.gov or 971-345-7014

October 23-25, 2023, OWEB Board Meeting

Diversity, Equity, and Inclusion (DEI) and Environmental Justice (EJ) Committee Update

Committee Members

Kelly Coates and Dan Shively (co-chairs), Bruce Buckmaster, Liza Jane McAlister, Chris Allen, Aaron Curtis

Meeting Summary

The DEI and EJ committee met on September 5, 2023.

OWEB staff provided an update on the work of the Environmental Justice Council. A major area of focus for the council has been the environmental justice mapping tool created through HB 4077 (2022 regular Oregon legislative session). The council is developing a work plan to develop and roll out the tool and is planning listening sessions in late 2023 and early 2024.

OWEB staff updated the committee on efforts to reach out to non-traditional partners. Staff has committed to engaging with three new non-traditional partners each quarter. Committee members recommended staff continue this outreach, focusing on communities and organizations identified in the board's DEI resolution. Committee members also recommended sending a new request to board members asking for suggestions of groups to meet with.

During the last quarter, OWEB staff have connected with the following organizations:

- Wild Rivers Coast Alliance
- Say Hey (networking event organized by Partners in Diversity)
- Meyer Memorial Trust

OWEB staff also provided an update on government-to-government outreach. Staff met with the Cow Creek Band of Umpqua Tribe of Indians in August and toured restoration projects as well as lands restored to the tribe in 2018. Committee members recommended continuing government-to-government outreach efforts and visiting tribes in their communities to learn about potential barriers to engaging with OWEB.

Staff reviewed information about the co-chair elections process summarized in an email from committee member Liza Jane McAlister. Staff also shared research indicating that votes for co-chair must be done through a public process. The committee discussed recommendations around the elections process going forward, including the number of terms a co-chair may serve and the staggering of terms. The full board will discuss the committee recommendations in October.

Committee members reviewed the latest equity statement and resolution and recommended a few additional edits. The updated statement and resolution are attached and will be presented to the full board for discussion at the October 23-25, 2023 board meeting. Committee members asked that the draft equity statement be shared with the Environmental Justice Council.

Topics for the next meeting

- Engagement with non-traditional partners and government-to-government outreach
- OWEB Equity Statement – continue any discussions needed after Oct. board meeting

- Update on Environmental Justice Council
- Co-chair elections process – continue any discussions needed after Oct. board meeting

To Be Presented at the October 2023 Board Meeting by:

Kelly Coates and Dan Shively

Staff Contact

Stephanie Page, Deputy Director
stephanie.page@oweb.oregon.gov or 971-345-7004

A. DRAFT OWEB Equity Statement and Resolution

DRAFT – FOR DISCUSSION AND FEEDBACK; NO ACTION WILL BE TAKEN AT THE OCTOBER BOARD MEETING

OWEB Equity Statement

As we fulfill our mission of helping to protect and restore healthy watersheds and natural habitats that support thriving communities and strong economies, OWEB and its staff are committed to advancing diversity, equity, inclusion, environmental justice, and sense of belonging in the work we do. In this way we seek to celebrate the rich, cultural, socio-economic, and natural resources of Oregon and work with our local partners to engage all Oregonians.

Diversity, Equity, Inclusion, & Environmental Justice Resolution

Background

WHEREAS OWEB's mission is "to help protect and restore healthy watersheds and natural habitats that support thriving communities and strong economies."

WHEREAS the intersection of impacts from climate change, biodiversity loss, and the movement for social justice has increased our awareness of the need for transformational change. Our conservation and restoration work has shown us the interdependence of all species, and that action or inaction in one area affects the outcome in others. To help protect and restore healthy watersheds and natural habitats that support thriving communities and strong economies, our work must fully integrate and balance environmental, social, and economic sustainability.

WHEREAS protection and restoration of healthy watersheds and natural habitats relies on robust ecosystem biodiversity for stability and resilience.

WHEREAS a multi-dimensional diversity of people, including ethnicities, identities, backgrounds, experiences, perspectives, cultural values and practices, local and indigenous environmental knowledge, and values of nature all contribute to the collective wisdom and stewardship needed for achieving long-term sustainability and resilience in our watershed restoration and conservation work.

WHEREAS while everyone lives in a watershed, not all Oregonians or their communities are starting from the same place due to historic and current embedded biases in society's structure and institutional systems of oppression, including inequities in policies, practices, processes, and the distribution of resources, benefits, and burdens.

WHEREAS systemic biases and inequities have produced advantages for some while disadvantaging others and perpetuated an imbalance of power resulting in the unfair treatment and silencing of too many people and communities; the devaluation of identities, disregard for experiences, and exclusion of perspectives tears through the fabric of our humanity and weakens our collective stability, which has become most apparent in the face of biodiversity loss and climate change.

WHEREAS we recognize that different levels of support are needed for those affected by historic and current inequities so that fairness in access and outcomes can be realized, and that empowerment of those most impacted includes the redistribution of resources, power, and opportunity.

WHEREAS many communities rely on healthy watershed ecosystems for their health and livelihoods and are therefore uniquely vulnerable to changes in their environment caused by climate change, such as food and water insecurity, sea-level rise, ocean health, extreme heat, drought, flooding, wildfire, smoke and other air pollution, and loss of traditional cultural resources or foods.

WHEREAS communities that have traditionally been underrepresented, underinvested, and underserved bear additional environmental burdens such as living in areas vulnerable to extreme weather or have increased health risks due to being overburdened by pollution, declines in ecosystem services, or through their inability to access basic services; where more than one of these apply, the burdens are cumulative and intensify these risks.

WHEREAS the most severe and immediate impacts of climate change such as heat waves, poor air quality, and flooding, compound the risks of vulnerable communities and disproportionately affect those who are the least able to prepare for and recover from these impacts.

WHEREAS these communities are diverse in many ways, including their ethnicities, cultures, nations of origin, race, immigration status, and levels of income; all deserving environmental justice of equal protection, fair treatment, and involvement in decision-making regarding policies affecting their environment without discrimination.

WHEREAS we acknowledge the dispossession of indigenous communities of land ownership, Oregon's history of racism, and systemic injustices that have excluded many Oregonians from the benefits and opportunities afforded others.

WHEREAS while OWEB enjoys strong public support for its contributions to community-based conservation, watershed health, and local economies, our culture of continuous improvement allows us to self-examine and recognize some of our structural biases and institutional policies, practices, and processes that help perpetuate inequities; that while some of these may fall outside of our authority, they do not absolve us of our need for change. Included among these are limitations in diversity for representation at decision-making levels, disparities in distribution of resources and benefits between landowners and non-landowners, lack of project types to accommodate the needs of urban communities, limited diversity in types of partners in project development and stewardship, processes that perpetuate barriers to program access and resources available for traditionally underrepresented and underserved communities, and limited methods of outreach to increase more Oregonians' awareness of OWEB and the support we can provide.

WHEREAS humans shape landscapes as much as they shape us, and degradation of both the natural world and our social systems are intertwined; achieving our mission demands we consider all actions within our authority to restore and protect, and as our name implies improve the health of our watersheds for the well-being and benefit of all.

WHEREAS we acknowledge that diversity, equity, and inclusion are interconnected, that none can thrive without the presence of the other, and that together with environmental justice they must be front and center in all of our board decisions, policy making, processes, and practices, as these considerations are

essential for the restoration, protection, and long-term sustainability of our ecosystems, their wildlife populations and communities.

Resolution

Be it resolved that the Oregon Watershed Enhancement Board will:

- Integrate and prioritize diversity, equity, inclusion, and environmental justice in all of our board decisions, policy making, processes, and other practices by:
    - Eliminating disparities in distribution of resources and benefits between landowners and non-landowners.
    - Increasing project types to accommodate the needs of urban communities.
    - Building a more inclusive grantmaking process to reflect a broader diversity of applicants, grantees, and types of partners in project development and stewardship, including community-based organizations and other private sector groups, businesses, and organizations that have not traditionally been engaged in this work.
    - Increasing & improving methods and diversifying targets of outreach and access to information so that all Oregonians can become aware of OWEB and the support we can provide.
    - Allowing for the tailoring of projects and processes to address locally expressed inequities and priorities while keeping in mind that some community-identified solutions may differ from what we prioritize yet still yield co-benefits beyond that of a singular outcome.
    - Identifying and implementing methods to strengthen public involvement, improve access to information, provide more inclusive decision-making opportunities, and increase community engagement that values the needs, priorities, and solutions expressed by the community, as well as their time and resources making it possible to participate.
    - Recognizing and incorporating the inextricable link between cultural and biological diversity as part of our community-based conservation, including the varying cultural values of and relationships with nature and the holistic approaches of indigenous peoples and local communities.
    - Recognizing the unique role federally recognized tribes in Oregon play in the conservation, stewardship, and restoration of natural resources; and with their permission and counsel, work to incorporate their tribal knowledge, experience, cultural, and spiritual values into our grantmaking processes.
- Motivate grantees to enlist, train, and fairly compensate partners in project development from local labor and businesses to strengthen local economies and skills.
- Continue to challenge our perspectives and positions; recognize and overcome our biases; look for ways we are limiting awareness of OWEB and access to resources from those outside our sphere; and work to counteract and dismantle institutional racism while advancing racial equity. Translate these findings into changes in policy, processes, and practices.

It is further resolved that the above resolutions will be implemented through applicable strategies within OWEB's authorities. Strategies include but are not limited to:

- Participating at least annually in intercultural competency and racial justice workshops, including training for all staff and Board Members.
- Rulemaking to reduce the match requirement for some grant types.
- Amending OWEB's application and grantmaking processes to be easily accessible, time-considerate, inclusive of a broader range of effective land-stewardship practices, and vigilant to the needs of vulnerable and traditionally underserved communities, including providing training and assistance.

- Developing an annual agency Diversity Equity, Inclusion, and Environmental Justice Action Plan, which includes agency-level goals, actions, and measures of success.
- Amending budget and budgeting process to address inequities in the distribution of resources, including the limited types of grants and projects available for traditionally underrepresented, underserved, and climate-vulnerable communities.
- Improving OWEB's communications to meet the needs of Oregon's diverse population and updating the website to be intuitively navigable, user-friendly, and resource-rich, including tools and guidance for translating this resolution into action.

Agenda Item G supports OWEB's Strategic Plan priorities # 4 & 6: Watershed Organizations have access to a diverse and stable funding portfolio and coordinated monitoring and shared learning to advance watershed restoration effectiveness.

MEMORANDUM

TO: Oregon Watershed Enhancement Board

FROM: Courtney Shaff, Monitoring and Reporting Program Manager
Tom Stahl, ODFW Conservation and Recovery Program Manager

SUBJECT: Agenda Item G – ODFW and PCSRF
October 23-25, 2023, Board Meeting

I. Background

A portion of the Pacific Coastal Salmon Recovery Funds (PCSRF) are legislatively directed to be transferred to the Oregon Department of Fish and Wildlife (ODFW). The amount of funding transferred depends on the State of Oregon's successful receipt of PCSRF funding through the National Oceanic and Atmospheric Administration's (NOAA) annual competitive grant process. The purpose of the PCSRF program is to provide benefits to Pacific salmon and steelhead and their habitats. Projects and activities must fall within one of the three program priorities (restoration, technical assistance, or monitoring and capacity) and must be necessary for conservation of salmon and steelhead populations listed as threatened or endangered, or identified by a state as at-risk to be listed or for conservation of Pacific coastal salmon and steelhead habitat.

II. 2023-2025 Biennium ODFW Activities

Oregon's PCSRF grant award for Federal Fiscal Year 2023 was $20.2 million, and ODFW will receive $6.4 million of this award. The following ODFW programs will receive PCSRF funding for the 2023-2025 biennium: Fish Screening and Passage Program, Lower Columbia River Harvest Management Program, Conservation and Recovery Plan Implementation and Technical Support Program, Chum Reintroduction Program, and the Oregon Plan Fish and Habitat Monitoring Program. OWEB will apply again in March 2024 for PCSRF funding for the second part of the biennium.

III. Recommendation

This is an information item only.

OREGON WATERSHED ENHANCEMENT BOARD

Agenda Item I

Spring Open Solicitation Grant Offering Board Awards

Board Meeting October 23-25, 2023

Tina Kotek, Governor

OREGON WATERSHED ENHANCEMENT BOARD

775 Summer Street NE, Suite 360
Salem OR 97301-1290
www.oregon.gov/oweb
(503) 986-0178

Agenda Item I supports OWEB's Strategic Plan priority # 5: The value of working lands is fully integrated into watershed health.

MEMORANDUM

TO: Oregon Watershed Enhancement Board

FROM: Eric Williams, Grant Program Manager

SUBJECT: Agenda Item I. Spring 2023 Open Solicitation Grant Offering
October 23-25, 2023, Board Meeting

I. Introduction

This staff report describes the Spring 2023 Open Solicitation Grant Offering and funding recommendations. Staff request the board approve the funding recommendations outlined in Attachment D to the staff report, including funding for 54 restoration grants, 30 technical assistance grants, 5 engagement grants, and 21 monitoring grants.

II. Spring 2023 Grant Offering Background and Summary

A total of 110 applications were received requesting almost $19 million. Attachment A shows applications submitted by region, project type, and funding request.

III. Review Process

Staff facilitated a review process where all eligible grant applications were evaluated by the agency's six Regional Review Teams (RRTs). Staff scheduled site visits for as many proposed projects as possible, with all RRT members invited to the visits.

OWEB then facilitated RRT meetings in each region for all grant types offered. Reviewers considered the likelihood of success of the proposed project based on evaluation criteria in rule, which are provided in Attachment B. After classifying applications as "Recommended," "Recommended with Conditions," or "Not Recommended," the RRTs then prioritized the projects recommended for funding by application type.

The RRT evaluations and recommendations, along with staff recommendations, were distributed to all applicants. Attachment C includes the number of applications recommended by RRTs and staff for each region by project type, as well as staff-recommended award totals by application type and region. Prior to the board meeting, staff will forward to the board any written comments received from applicants regarding the RRT and staff recommendations.

IV. Salmon License Plate Projects

Staff recommends distributing $500,000 in salmon license plates funds to two recommended restoration projects ($250,000 each):

- 223-2016, “Smith River Basin: High Priority Passage Improvements,” and
- 223-3031, “Upper Sandy River Basin Habitat Restoration Project - Zigzag River.”

V. Sage-grouse Projects

At its April 2015 meeting, the board adopted a policy to make available at least $10 million through its granting programs over the next ten years in support of projects located in Oregon’s sage steppe ecosystem that improve greater sage-grouse habitat. The recommended Spring 2023 Open Solicitation Grant awards include two projects that meet the criteria:

- 223-4029, “Brattain Post Fire Restoration Project Effectiveness,” requesting $252,269, and
- 223-5028, “Dry Creek Phase III WQ Improvement,” requesting $51,183.

If awarded, total funding for sage-grouse projects since 2015 will be $14,254,493.

VI. Funding Recommendation

Staff considered the RRT recommendations and funding availability in developing the staff funding recommendations provided in Attachment D, which includes the number of applications recommended for funding by RRTs and staff by region and grant type. The funding recommendations for the Spring 2023 Open Solicitation Grant Offering are summarized in Table 1. This will be the first Open Solicitation grant award for the 2023-2025 biennium.

Table 1: Spending Plan and Funding Recommendations for Spring 2023 Grant Offering

Grant Type	Spending Plan	Awards to Date	Staff Recommendation	Remaining Spending Plan Balance
Restoration	$36,500,000*	$0	$8,998,845	$27,501,155
Technical Assistance	$6,800,000*	$0	$929,070	$5,870,930
Monitoring	$4,500,000	$0	$2,235,398	$2,264,602
Stakeholder Engagement	$2,000,000	$0	$298,552	$1,701,448
TOTAL	$49,800,000	$0	$12,461,865	$37,338,135

*Spending plan amount includes funds anticipated to be added in July 2024

Staff recommend the board adjust the spending plan and award funds for the staff-recommended projects listed in Attachment D.

Open Solicitation – Restoration Grants

PROVIDE PUBLIC BENEFIT FOR WATER QUALITY, NATIVE FISH AND WILDLIFE HABITAT, OR WATERSHED/ECOSYSTEM FUNCTION

Recommend

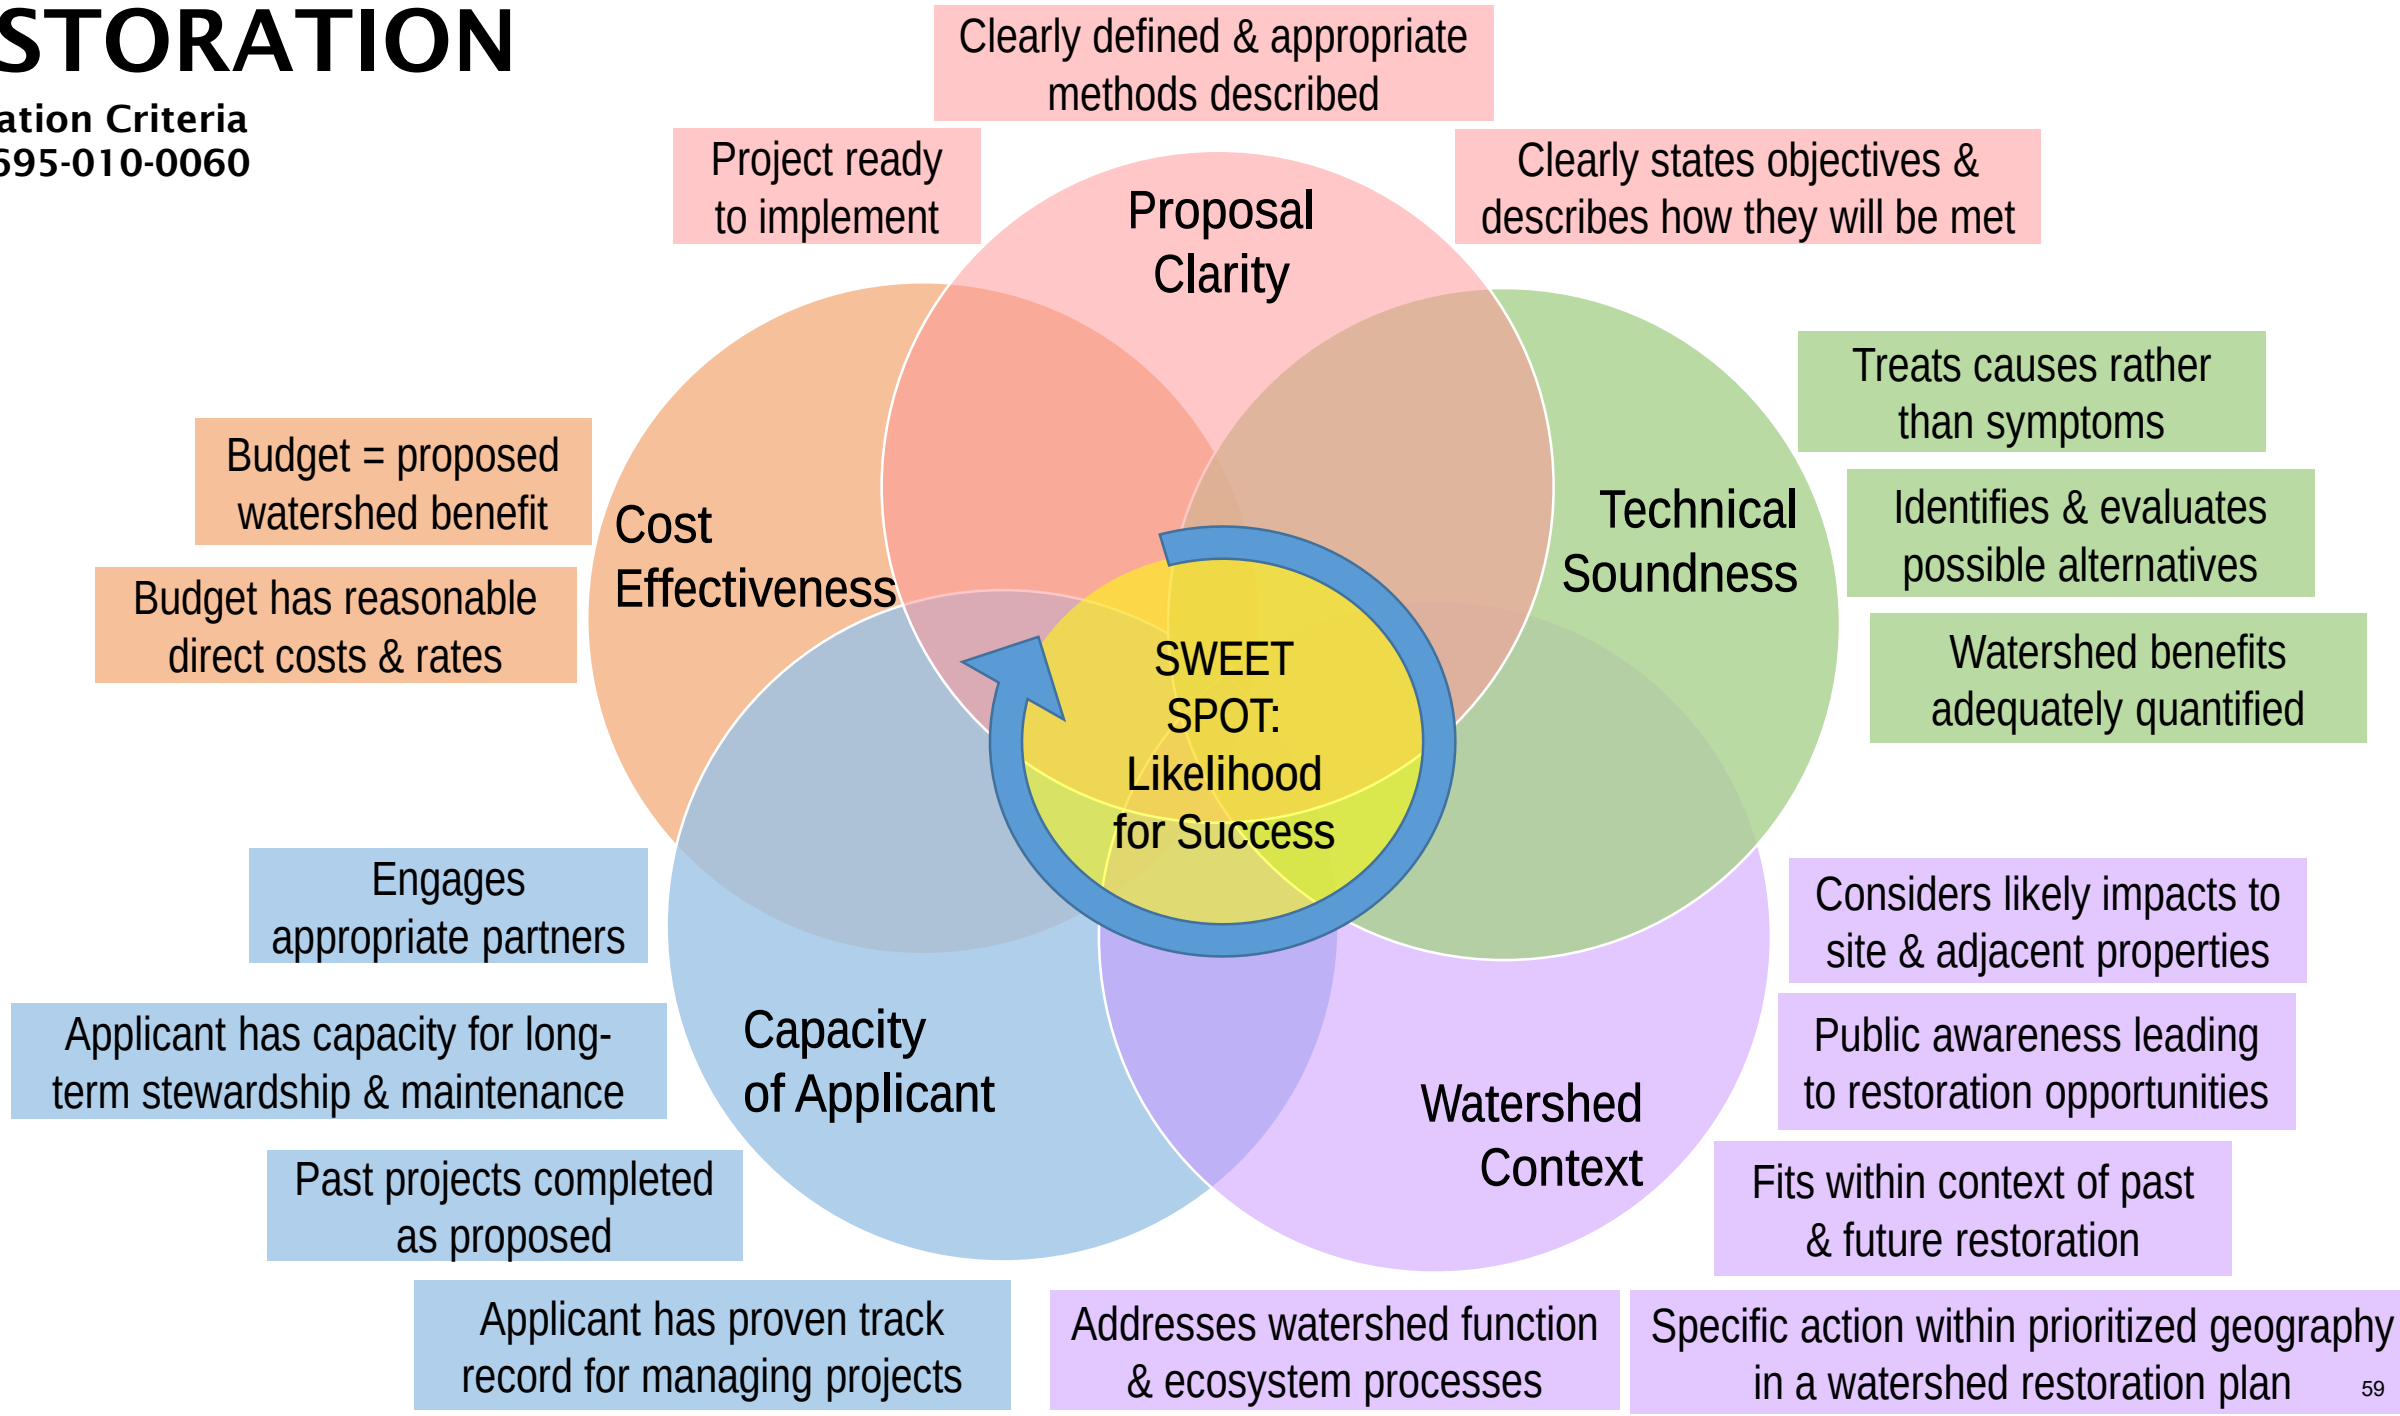
Regional team reviews & evaluates each project individually based on how well project meets criteria

Prioritize

CRITERIA
How well project meets criteria for project evaluation & preferences, including:
- Causes over symptoms of disturbance
- Whole watershed approach over site-specific
- Collaboration over single-party

CERTAINTY OF SUCCESS
Certainty of success, based on the organizational capacity of the applicant & the likelihood the project will meet its ecological objectives

BENEFIT TO OREGON PLAN
Benefit to the Oregon Plan for Salmon & Watersheds, as evidenced by its expected benefits to watershed functions, fish habitat or water quality

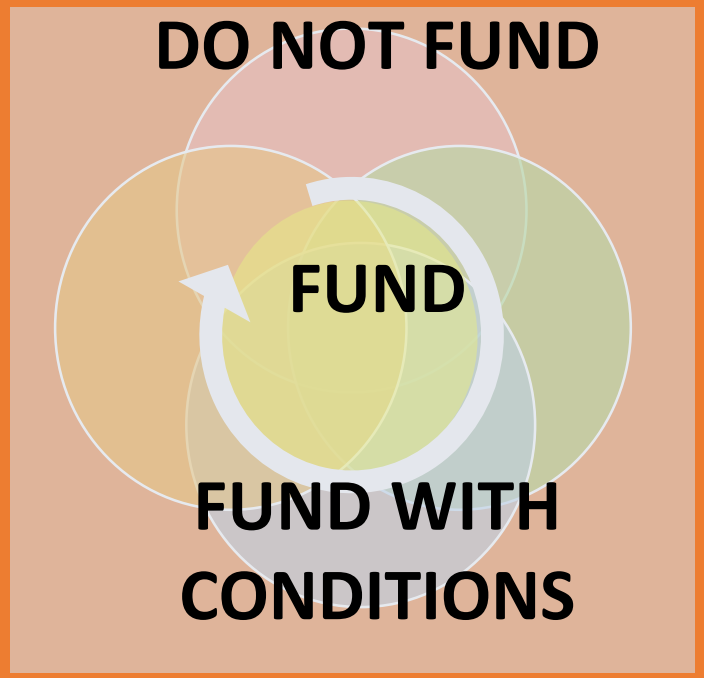


COST BENEFIT
Project costs relative to the anticipated watershed health benefits

Recommendation to Staff

Staff review recommendations from each regional review team & make a statewide funding recommendation to the Board based on available resources for the grant period & type.

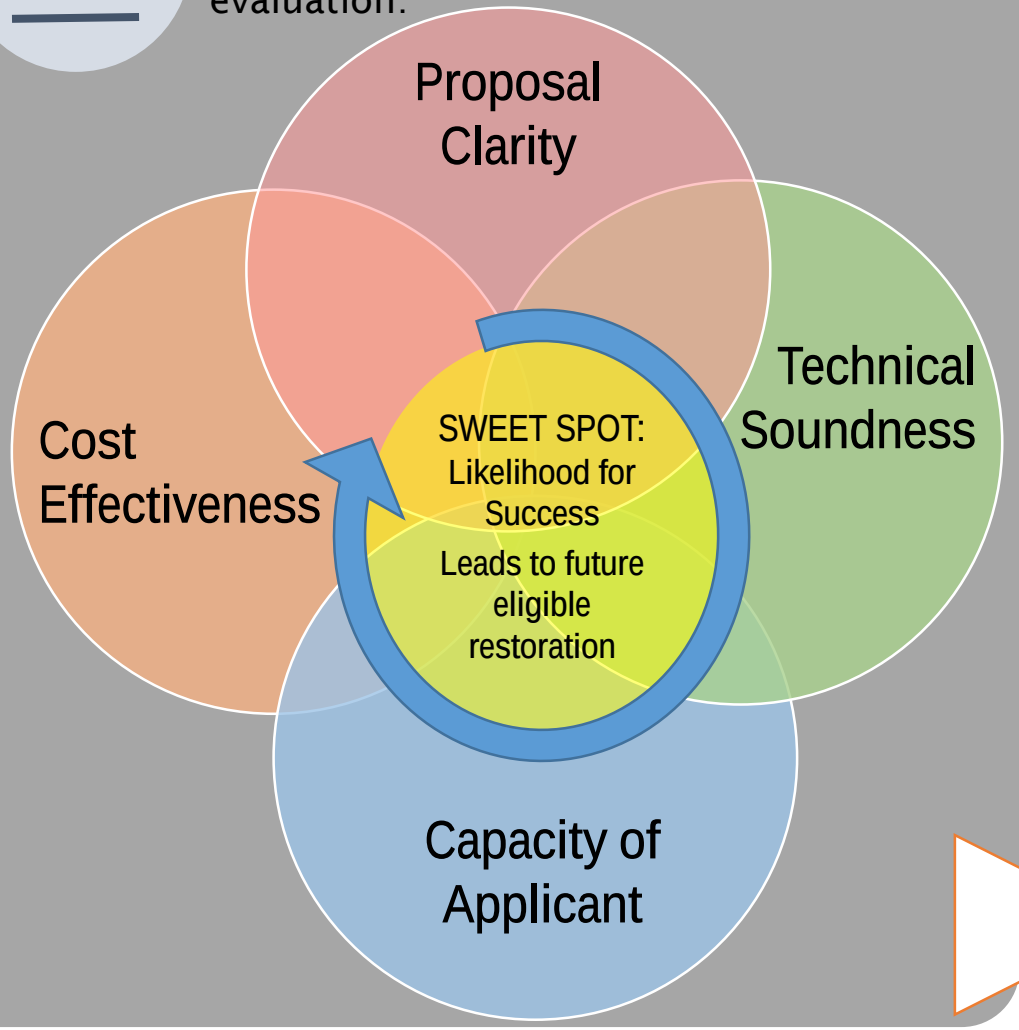
RESTORATION



Evaluation Criteria
OAR 695-010-0060

Open Solicitation – Technical Assistance Grants

PROVIDE PUBLIC BENEFIT FOR WATER QUALITY, NATIVE FISH AND WILDLIFE HABITAT, OR WATERSHED/ECOSYSTEM FUNCTION



Recommend

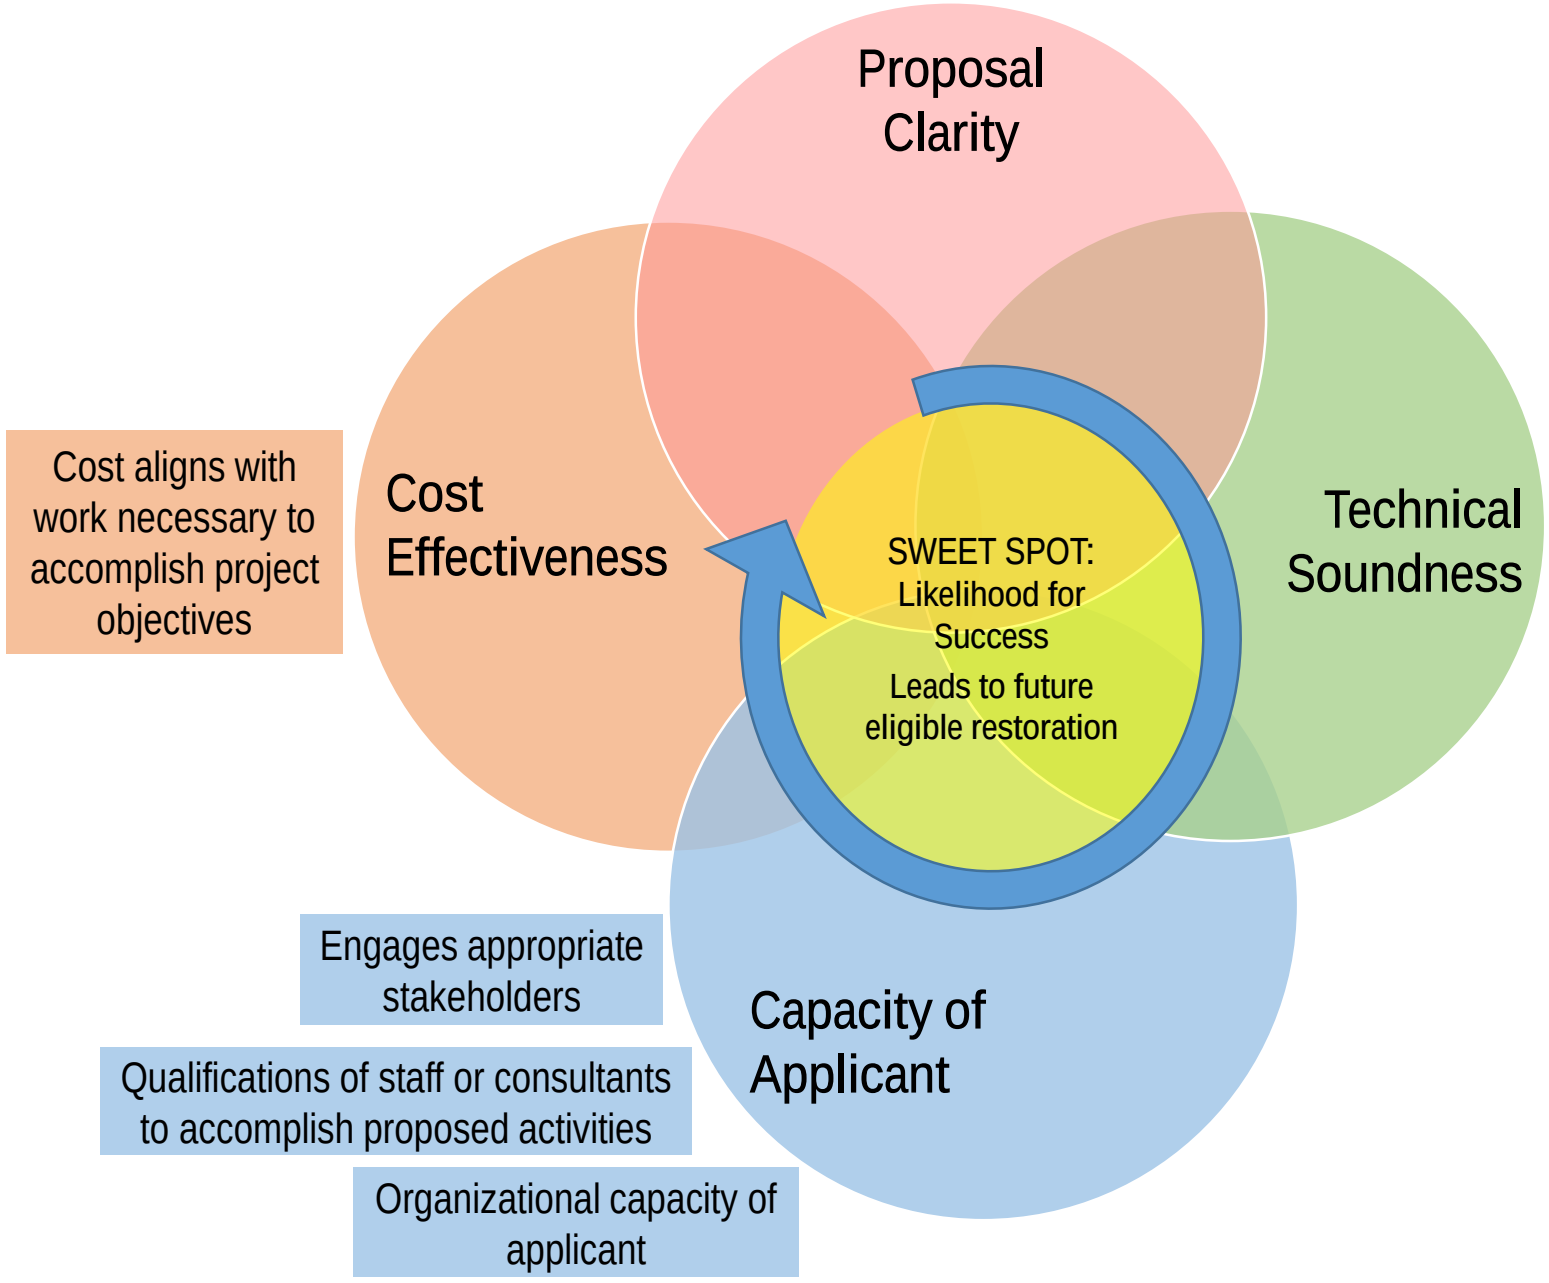
Regional team reviews & evaluates each project individually based on how well project meets criteria

Prioritize

CRITERIA
How well project meets criteria for project evaluation:

Recommendation to Staff

Staff review recommendations from each regional review team & make a statewide funding recommendation to the Board based on available resources for the grant period & type.



TECHNICAL ASSISTANCE

Evaluation Criteria
OAR 695-030-0045

Technical Design & Engineering = project feasibility reports, designs, or engineering materials that directly lead to site-specific restoration or acquisition projects within a specified timeframe

Resource Assessment & Planning = information about existing water quality or habitat conditions and processes at an identified scale, and relates those conditions and processes to actions that will directly lead to desired future conditions within a specified timeframe

Describes a clear need

Cost aligns with work necessary to accomplish project objectives

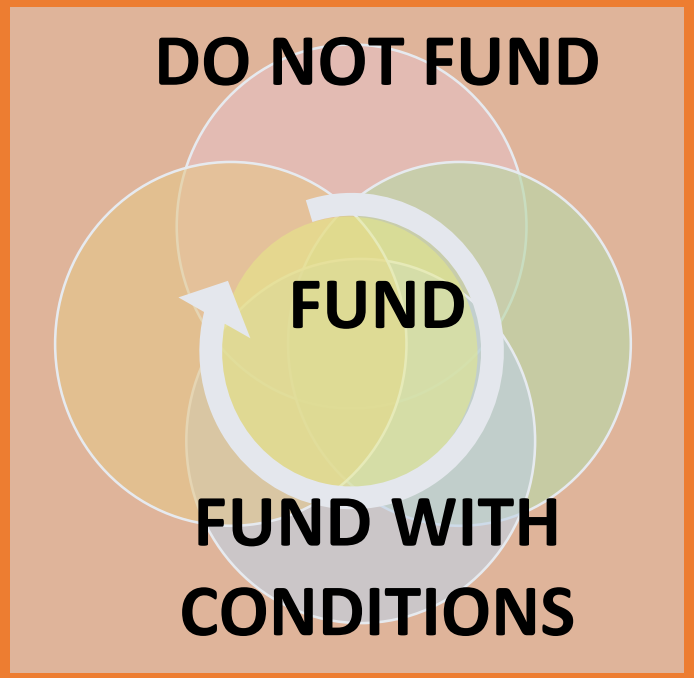
Engages appropriate stakeholders

Qualifications of staff or consultants to accomplish proposed activities

Organizational capacity of applicant

Technical Design & Engineering

- Addresses limiting factors in existing conservation or recovery plan
- Describes alternative analysis that demonstrates a range of options were considered
- Appropriate data will be collected to inform designs
- Professionally accepted technical or engineering approaches will be used

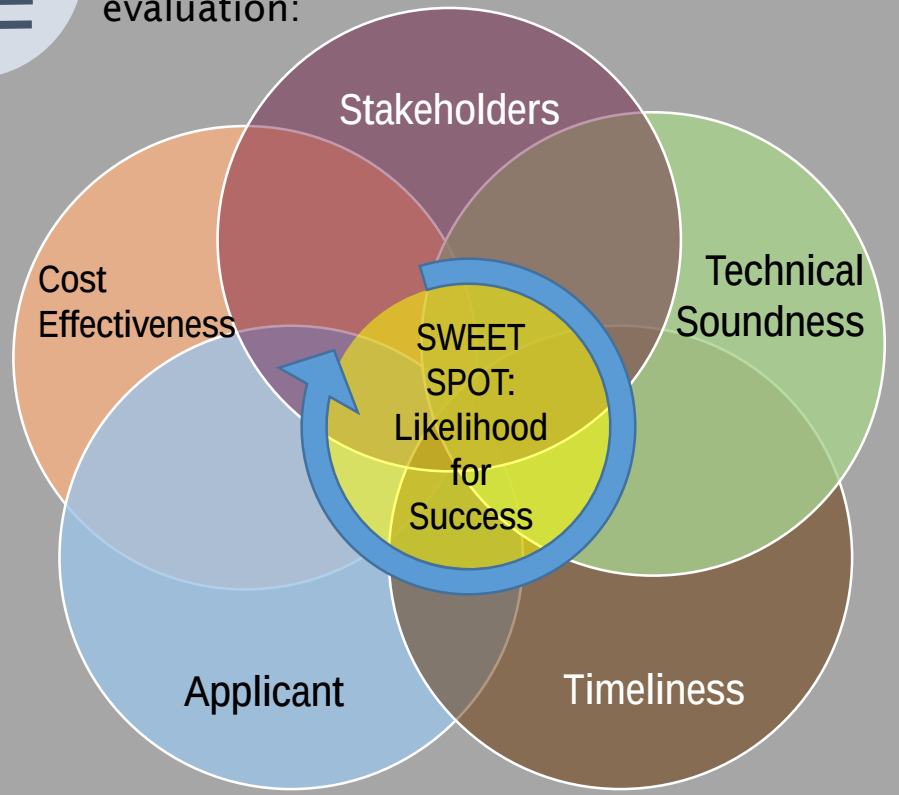


Resource Assessment & Planning

- Scope & scale is feasible, & partners have demonstrated ability in collaborative work at this scale
- Process by which data will be managed & shared with partners
- Professionally accepted methods & parameters will be used

Open Solicitation – Stakeholder Engagement Grants

PROVIDE PUBLIC BENEFIT FOR WATER QUALITY, NATIVE FISH AND WILDLIFE HABITAT, OR WATERSHED/ECOSYSTEM FUNCTION



Recommend

Regional team reviews & evaluates each project individually based on how well project meets criteria

Prioritize

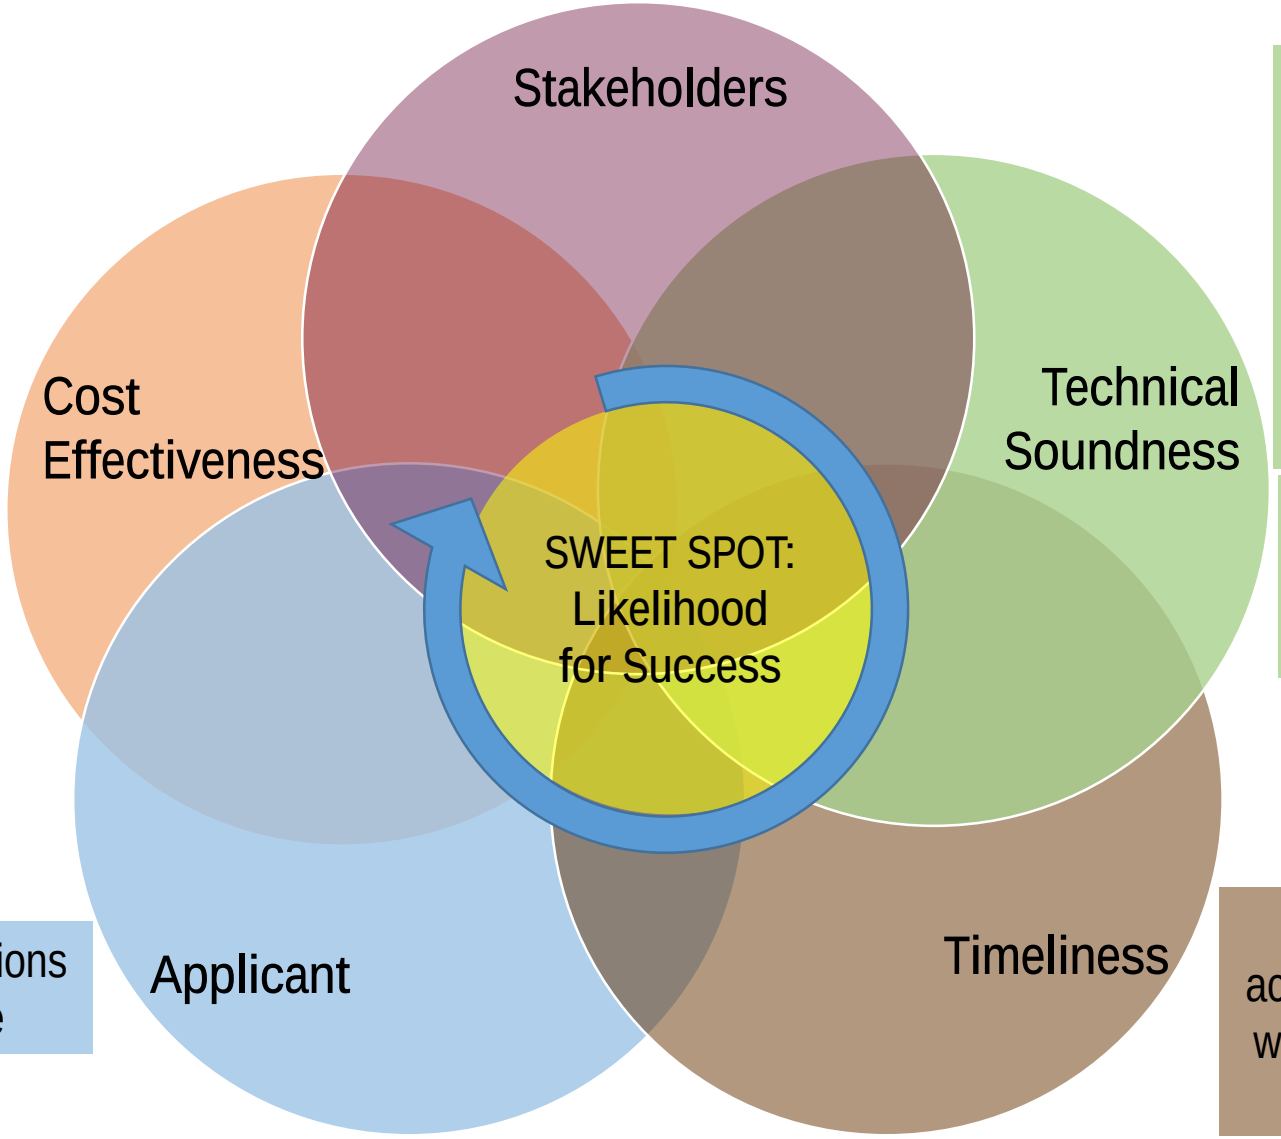
CRITERIA
How well project meets criteria for project evaluation:

CERTAINTY OF SUCCESS
Based on the organizational capacity of the applicant & likelihood the project will meet its stakeholder engagement objectives

Recommendation to Staff

Staff review recommendations from each regional review team & make a statewide funding recommendation to the Board based on available resources for the grant period & type.

STAKEHOLDER ENGAGEMENT



Evaluation Criteria
OAR 695-015-0070

"Stakeholder Engagement Project" means a project whose purpose is to communicate and engage with landowners, organizations and the community about the need for, feasibility, and benefit of a specific eligible restoration or acquisitions project or program that leads to development of eligible projects within an identified geography.

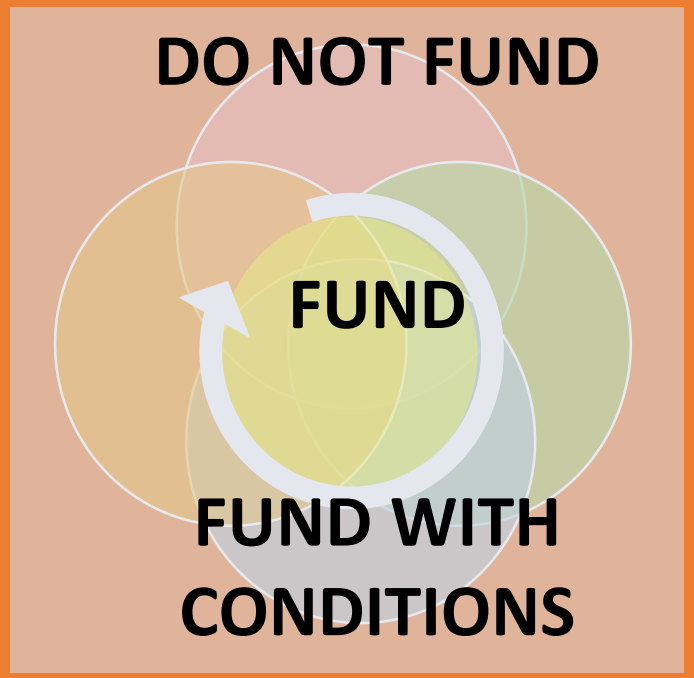
Projects whose primary purpose is education are NOT ELIGIBLE

Applicants engage with appropriate stakeholders in the appropriate geography

Likely effectiveness of multidirectional communication among the applicant & stakeholder

Expected outcomes of resulting restoration or acquisitions include protecting or restoring fish or wildlife habitat, watershed function, and or water quality or quantity

Evidence base linking engagement to eligible project types

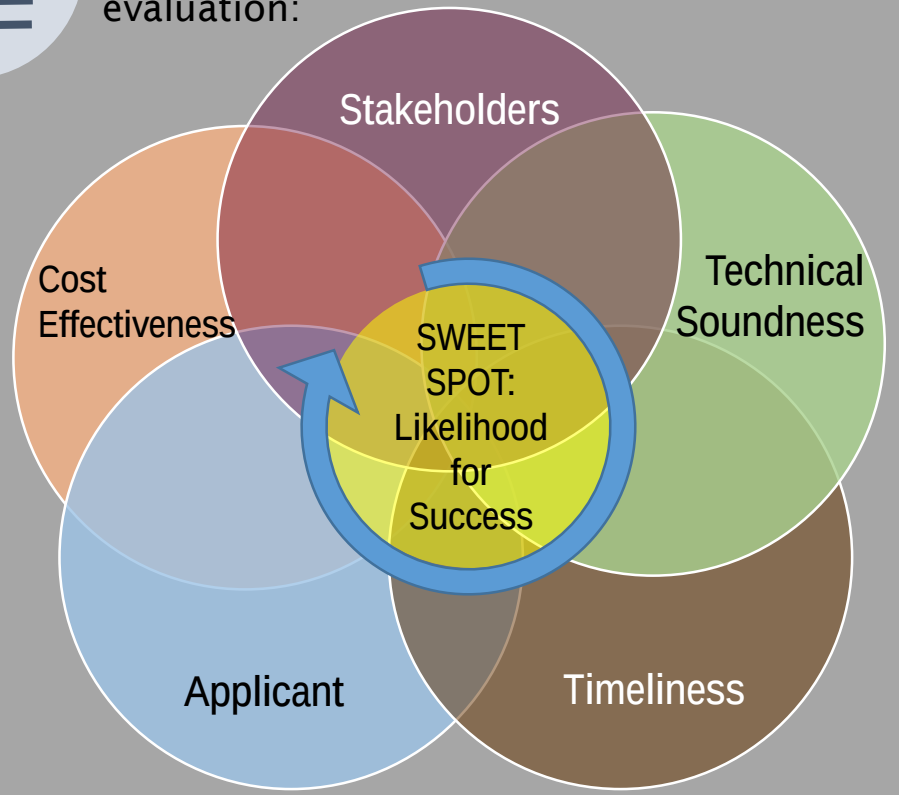


Shows qualifications & experience

Resulting restoration or acquisition projects, or program will lead to timely development of eligible projects

Open Solicitation – Monitoring Grants

PROVIDE PUBLIC BENEFIT FOR WATER QUALITY, NATIVE FISH AND WILDLIFE HABITAT, OR WATERSHED/ECOSYSTEM FUNCTION



Recommend

Regional team reviews & evaluates each project individually based on how well project meets criteria

Prioritize

CRITERIA
How well project meets criteria for project evaluation:

CERTAINTY OF SUCCESS
Based on the organizational capacity of the applicant & likelihood the project will meet its stakeholder engagement objectives

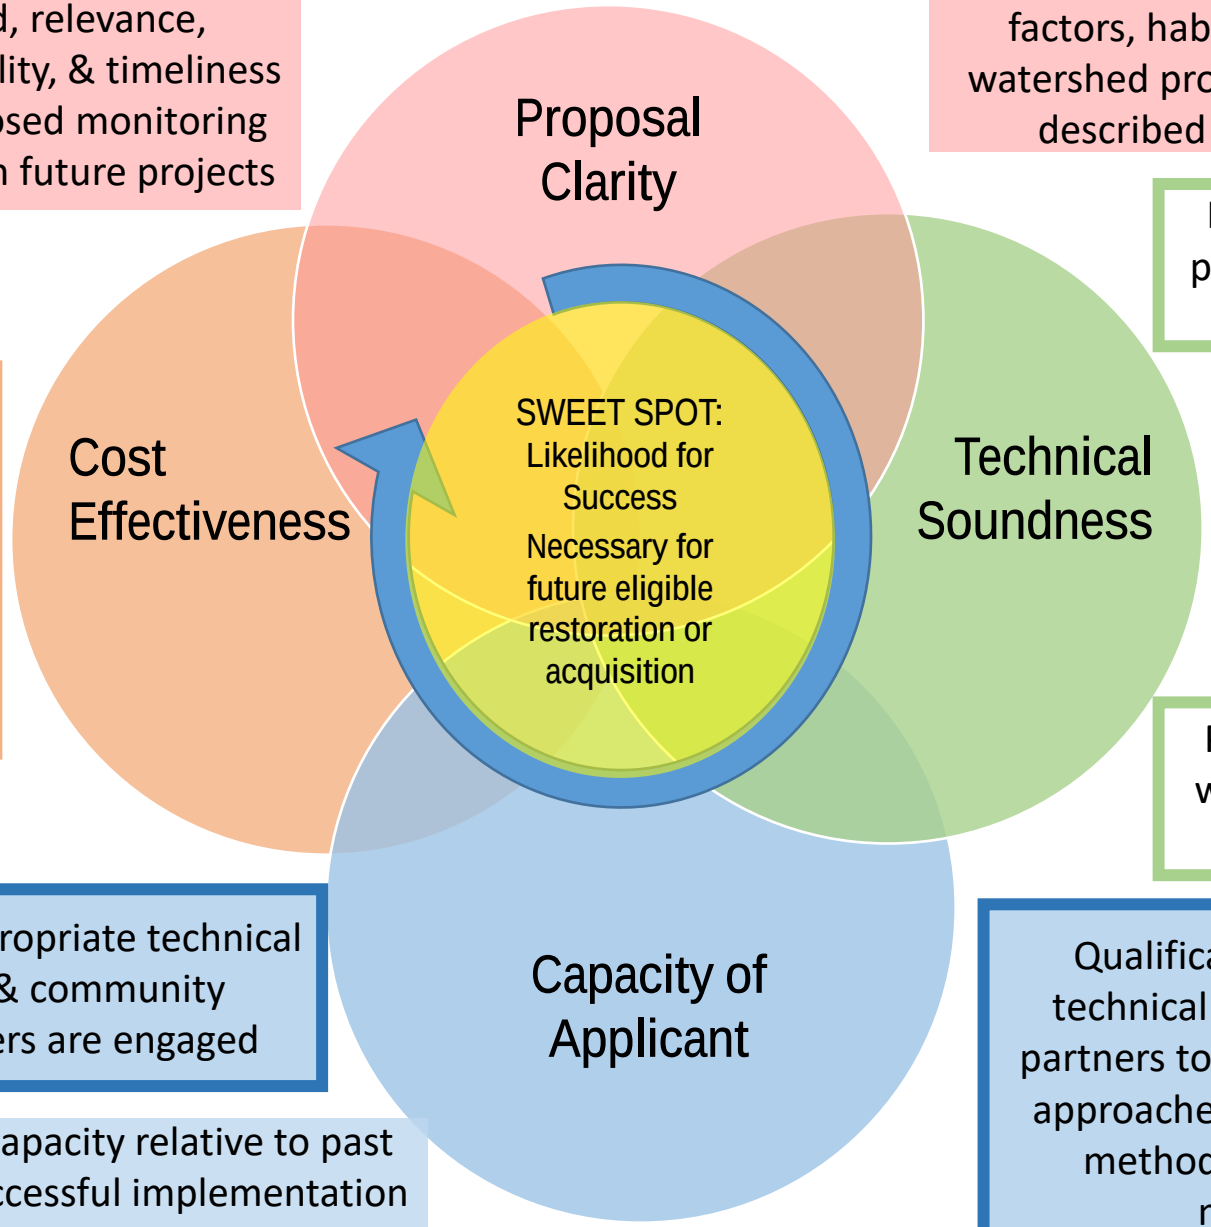
Recommendation to Staff

Staff review recommendations from each regional review team & make a statewide funding recommendation to the Board based on available resources for the grant period & type.

MONITORING

Evaluation Criteria
OAR 695-025-0140

Eligibility
Projects that gather & analyze data to:
1. Describe current watershed conditions
2. Establish trends about watershed conditions
3. Evaluate the specific effects of a restoration or acquisition project



Two Team Review

- OPMT Review
- RRT Review
- Both Teams Review

Complements existing data or current or planned monitoring efforts

Need, relevance, applicability, & timeliness of proposed monitoring to inform future projects

Monitoring relates to limiting factors, habitat conditions, watershed processes or actions described in local plans

Monitoring questions & how proposed monitoring methods will answer these questions

Proposed costs are appropriate for the work necessary to accomplish the objectives

Professionally accepted monitoring & analysis protocols, including quality assurance / quality control procedures to be utilized

Process by which data & results will be stored, reported, & made publicly available

How the appropriate technical experts & community stakeholders are engaged

Organizational capacity relative to past experience & successful implementation of monitoring projects

Qualifications & ability of applicant technical staff, consultants, or project partners to apply appropriate monitoring approaches & data collection & analysis methods to successfully complete monitoring activities

Region 1 - North Coast Restoration

Projects Recommended for Funding in Priority Order

Project #	Grantee	Project Title	Brief Description	Amount Recommended
223-1022	Trout Unlimited Inc	Tillamook Bay Wetland Connectivity and Fish Passage Project	Fish passage will be restored and a tidal wetland will be reconnected along Tillamook Bay with the replacement of a severely undersized culvert on Bayocean Road west of Tillamook.	505,060
223-1018	CREST	Nicolai-Wickiup Watershed Connectivity and Tidal Restoration - PHASE II	Critical rearing habitat for juvenile fish in the Lower Columbia River will be reconnected and tidal wetlands restored by creating a series of openings in two locations in the railroad prism.	497,338
223-1024	Oregon Wildlife Heritage Foundation	Deer Creek Willow Planting Project	Willow galleries will be planted in a valley bottom along a tributary of the Yaquina River to encourage the expansion of beaver populations. The ponds and dams that beaver create will restore natural function to the watershed and improve habitat for fish, including Oregon coast coho.	91,577
223-1017	Tillamook Estuaries Partnership	Heathershaw Planting Project	Native trees and shrubs will be planted and invasive species controlled in streamside habitat of the Little Nestucca River. Restoring a native forest will provide shade that will improve water quality and provide habitat for wildlife.	58,326
223-1021	Necanicum WC	Middle Necanicum Tributary Fish Passage and Habitat Improvement: Phase I	A legacy forest road and undersized culvert will be removed and the area regraded to restore fish passage and floodplain connection to a tributary of the Necanicum River.	74,033
223-1019	Upper Nehalem WC	Rock Creek Confluence Fish Passage Improvement	Fish barriers will be addressed at two locations within the City of Vernonia, including on Rock Creek, an important cold water tributary of the Nehalem River. The effort is part of a large water and sewer infrastructure project that will improve water quality in the Nehalem watershed.	268,158

Open Solicitation-2023 Spring Offering
North Coast (Region 1)

Application Number: 223-1015-22999
Project Type: Restoration
Project Name: North Beaver Creek Leach Property Riparian Restoration
Applicant: Lincoln SWCD
Region: North Coast
County: Lincoln
OWEB Request: $90,527
Total Cost: $113,345

Application Description This project would aim to restore the riparian buffer along North Beaver Creek within the rural residential/agricultural property parcel. The main issues currently impacting this location include a lack of canopy cover over the stream channel, and a displacement of native shrubs by reed canary grass (Phalaris arundinacea) and Himalayan blackberry (Rubus armeniacus). Additionally, recent logging sites border the riparian zone on both sides- a 1,275-ft stretch on the north side, and 400 ft on the south, which are largely devoid of trees or other sizable established vegetation to act as a buffer from sedimentation and pollution runoff. A gravel road also runs along the northern border of the property, coming as close as 70 ft of the stream in some places, further compounding the issue of a lack of natural buffer.
Funding from OWEB will be used to restore riparian function along an 1,800-ft stretch of stream by suppressing invasive vegetation; implementing a planting plan utilizing 35-75 ft wide buffers that will provide shade, eventual accumulation of large woody debris within the stream channel, and habitat for local wildlife; and installing exclusion fencing to prevent browsing pressure from deer, elk, and beavers while plants become established. As this property is a short distance upstream from another OWEB-funded restoration site implemented by the MidCoast Watershed Council and directly upstream of another prospective restoration property, this site presents an excellent opportunity to restore riparian function along 5,600 feet of contiguous stream habitat.

Review Team Evaluation

Strengths

- Establishing a healthy riparian corridor along North Beaver Creek will address water quality issues by providing shade that will contribute to an improvement in water temperature.
- The approach to control invasive species is multi-faceted by using a combination of manual and chemical techniques. Continuing plant establishment activities for four years post-planting will ensure the success of the project.
- Beaver Creek is a coho stronghold and contains high quality wetland habitat for rearing. Downstream, significant stream miles are in conservation ownership by both the Wetlands Conservancy and Oregon Parks and Recreation Department. Upstream, there is U.S. Forest Service ownership. This project addresses the critical habitat in between the two swaths of protected land.
- Fencing is proposed that is likely to keep livestock out of the riparian area.

- The plant species list has variety and includes a component of willows that could help reduce stream velocity and capture stream material. Slower velocities are important for fish during the winter months and encouraging the accumulation of streambed material will help address the incision that has degraded the aquatic habitat.
- The landowner may be interested in other restoration actions in the future, including large wood placement to restore instream habitat complexity.
- Applicant staff have worked closely with the watershed council on implementing similar projects in the past.

Concerns

- The planting approach may create high competition among seed and potted stock because the proposed plant density is very high, particularly for the seed.
- The application lacks a clear map showing the location of the different plant communities that would be helpful for understanding whether the planting plan matches site conditions.
- The application does not provide detail on the chemicals that will be used to treat reed canary grass or a clear explanation of the site preparation protocols that will be used. This information would be helpful to evaluate the likelihood proposed methods will effectively control reed canary grass enough to establish a native riparian plant community.
- A power line runs directly overhead through much of the planting area, and the application does not describe how the power line could impact the planting approach, such as restrictions or vegetation control that might be associated with the power line easement.
- The proposed planting plan is a high cost for the ecological benefit expected. Purchasing higher cost potted plant material may not be the best approach when planting the high densities that are proposed. Typically, high density plantings involve smaller and more low-cost plant materials, such as plugs or bare-root stock. The application lacks a clear rationale for using more expensive, larger stock in high densities.

Concluding Analysis

A healthy riparian corridor will be restored along a reach of Beaver Creek, a direct ocean tributary that provides habitat for anadromous fish species, including Oregon coast coho salmon. The re-establishment of native plants will provide shade to improve water temperature over time. The project is located near several other similar projects, which will maximize the benefit over a larger landscape by creating habitat connectivity.

Open Solicitation-2023 Spring Offering
North Coast (Region 1)

Application Number: 223-1016-23011

Project Type: Restoration

Project Name: Salmon SuperHwy Myrtle Creek Priority Fish Passage

Applicant: Tillamook County Public Works

Region: North Coast

County: Tillamook

OWEB Request: $203,060

Total Cost: $1,060,055

Application Description The proposed fish passage project is located at the road/stream crossing of Kilchis River Road and Myrtle Creek in Tillamook County, Oregon. The crossing is located approximately 600 feet upstream of Myrtle Creek's confluence with the Kilchis River. An existing 41-foot-long, 5.5-foot diameter culvert is undersized, and its outlet is perched approximately four feet above the downstream water surface elevation. As a result, it adversely affects aquatic organism passage, impeding adult and juvenile salmonid access to approximately 1.6 miles of upstream habitat as well as hampering both the natural stream processes and the stream's ability to transport organic matter. The Kilchis River basin historically supports Oregon Coast Coho (OCC) Salmon (ESA listed as threatened), Pacific Coast Chum Salmon, Oregon Coast Winter Steelhead, Pacific Lamprey, Oregon Coast Chinook Salmon, and Sea-run Cutthroat Trout. This project has the potential to increase habitat connectivity for these anadromous fish and restore access to historical spawning and rearing habitat. In addition, the culvert contributes to downstream fine sediment loading and requires an inordinate level of inspection and maintenance to avoid plugging and breaching. The proposed project will finalize project designs and specifications, remove the existing culvert, and construct a 42-foot-long concrete bridge. To ensure project stability and long-term fish passage, the project also will construct approximately 280 feet of roughened stream channel (with boulders, large wood, and a resting pool). The project will employ a staged construction method to provide continuous ingress and egress for residences and businesses beyond the crossing. OWEB funds will support contracted services needed to construct the replacement structure and will supplement funds and in-kind contributions from the U.S. Fish & Wildlife Service, Tillamook County, Oregon Department of Fish & Wildlife, and Tillamook Estuaries Partnership.

Review Team Evaluation

Strengths

- Replacing the road crossing on Myrtle Creek will result in improved passage to 1.6 miles of aquatic habitat in the Kilchis River watershed as well as allow for natural bedload transport through the stream reach.
- The project will benefit water quality by reducing the potential for road fill inputs to the stream that could result from failure of the existing structure.
- There has been a change in land ownership directly upstream of the site, and the current landowner is willing and supportive of the project.

- A broad partnership is behind the project, including partners from Trout Unlimited, U.S. Fish and Wildlife Service, and NOAA. Working together as the Salmon SuperHwy, the partnership has a proven track record of success with similar types of projects.

Concerns

- Upstream of the crossing, Myrtle Creek has a steep gradient and the stream bed is comprised of large cobbles and boulders, which is not ideal spawning material for anadromous fish. The habitat benefit will likely be focused on cutthroat trout and will provide minimal benefit for other anadromous fish species. There is low intrinsic habitat potential for Oregon coast coho salmon and limited capacity for spawning upstream due to the lack of gravel.
- Land uses upstream are commercial timber and an old rock quarry. More information about existing upstream habitat conditions and the potential for future restoration actions in reaches upstream of the project site would have been helpful for understanding watershed context for the investment.
- The application is unclear about the different funding sources in the project budget and how they all intersect with the project timeline.

Concluding Analysis

Improving passage at the project location on Myrtle Creek has long been a priority for both fish and wildlife and public works agencies. The road is an important emergency route and the current structure is at risk of failure. Previous efforts to replace the structure were stymied by an upstream landowner who was not interested in cooperating with the restoration effort. With a landownership change and a renewed focus by Salmon SuperHwy partners, passage will be restored to 1.6 miles of primarily cutthroat trout habitat.

Open Solicitation-2023 Spring Offering
North Coast (Region 1)

Application Number: 223-1017-23015
Project Type: Restoration
Project Name: Heathershaw Planting Project
Applicant: Tillamook Estuaries Partnership
Region: North Coast
County: Tillamook
OWEB Request: $58,326
Total Cost: $76,005

Application Description The Heathershaw project is located along the Little Nestucca River and unnamed tributary to the Little Nestucca River. The property is located at the junction of Irish Rd and Little Nestucca River Hwy (Hwy 130) approximately 1.3 miles south of the junction of Hwy 130 and Hwy 101. The property's tax lot is 5S9Wsec9#100.

The riparian areas included in the project are dominated by reed canary grass, include eroding and sloughing riverbanks, and lack a diversity of native tree and shrub species.

The project will aim to control invasive species and establish native tree and shrub species within the riparian areas of the project and conduct tree release activities for 4 years.

Monitoring will be conducted once a year for 5 years and will include photo-point monitoring and survival rate estimates.

The Tillamook Estuaries Partnership's (TEP) Backyard Planting program has been implementing riparian enhancement projects for 21 years. Partners include TEP's Northwest Oregon Restoration Partnership (NORP), Oregon Dept. of Environmental Quality, the US Forest Service, and Trout Unlimited.

Review Team Evaluation

Strengths

- Planting over five acres of riparian habitat along the Little Nestucca River will provide important benefits to the stream by reducing water temperature and decreasing impacts from bacteria. Healthy, functioning riparian vegetation has benefits for floodplain connectivity as well as habitat benefits for birds and mammals.
- The planting plan is appropriately detailed, and has clearly defined methods. The species list, site preparation, and planting strategy is technically sound and has been developed from decades of experience. The project is well-designed and includes an approach to test different site preparation and plant protection techniques prior to planting. This will ensure that the methods are site-specific and likely to achieve the goals and objectives.
- The project builds on other successful planting projects in the area and there may be potential for future restoration on adjacent sites.
- The budget is reasonable for the expected ecological benefit.

- The Backyard Planting Program is renowned in Tillamook County for consistently delivering successful riparian restoration projects and building relationships with agricultural landowners.

Concerns

- The project site is primarily on the north side of the stream due to tax lot boundaries. As a result, the newly planted riparian buffer may not be able to provide significant stream shading.
- The setback for planting next to the stream is limited in some areas due to the site constraints of a working agricultural landscape; however, any planted buffer width will provide benefit compared to no buffer.

Concluding Analysis

The Little Nestucca River suffers from high temperature and bacteria inputs, which this project will make strides toward addressing. The Little Nestucca river supports populations of coho, chinook, steelhead, and cutthroat trout. The project is likely to address water quality-related habitat limiting factors for these fish by establishing native trees and shrubs in the riparian area.

Open Solicitation-2023 Spring Offering
North Coast (Region 1)

Application Number: 223-1018-23016

Project Type: Restoration

Project Name: Nicolai-Wickiup Watershed Connectivity and Tidal Restoration - PHASE II

Applicant: CREST

Region: North Coast

County: Clatsop

OWEB Request: $497,338

Total Cost: $1,967,378

Application Description Located between River Mile (RM) 20 and 30 of the Columbia River in Clatsop County Oregon, four geographically distinct but functionally similar sites comprise the Nicolai-Wickiup Watershed Connectivity and Tidal
Restoration Project: Wolf Bay at Columbia RM 20 (46.169558, -123.695282), Agency Creek at RM 26 (46.186919,
-123.607724), Warren Slough at RM 27 (46.192721, -123.575337), and E. Aldrich Point at RM 30 (46.232615, -123.496397).

This proposal only seeks funds to complete Agency Creek and the Warren Slough projects (Phase II) in summer of 2024. Wolf Bay. and Aldrich (Phase I) were funded for construction in 2023.

The project area is located directly adjacent to the Lewis & Clark National Wildlife Refuge on the OR shoreline of the Columbia River (CR) within the Big Creek- Frontal CR (HUC 10). This project is a partnership between CREST, North Coast Land Conservancy (NCLC), Columbia Land Trust (CLT), Oregon Department of Forestry (ODF), and three private landowners (Connie and Bob Hunt, Hampton Lumber, and ODOT/PNWR Rail). All landowners strongly support project implementation and have been key advocates throughout the design process.

In the project area, foraging and rearing habitat for all local and upriver stocks of juvenile salmonids are limited by past land use (rail/hwy and ag.) developments. Restoration efforts will focus on the enhancement of CR mainstem-adjacent habitat at the base of the Nicolai-Wickiup watershed bisected by the railroad, reestablishing juvenile salmonid access to rearing habitats. The projects will expand several existing openings and create new openings in the railroad prism providing access to over 110 acres (43.93 of which from Agency and Warren) of rearing habitat for salmonids. New railroad breaches, reducing velocities at existing openings, and channel excavation will significantly reduce the distances between existing available habitat patches, increase wetland capacity, and restore natural hydrologic connectivity.

Review Team Evaluation

Strengths

- The project will reconnect the lower Columbia River with 44 acres of tidal wetland habitat and provide critical rearing habitat for lower Columbia River fish species.
- The restoration and reconnection of estuary habitat will provide a host of benefits to a wide variety of species, including songbirds, mammals, forage fish, and waterfowl.
- The designs are technically sound and will address known fish passage barriers with a range of approaches, including levee breaching, bridge installation, and creating new openings in the railroad prism.
- The project is ready for implementation with permitting underway and additional funding secured for implementation.
- Data from temperature loggers installed upstream and downstream of the railroad line was used to inform project development.
- The applicant has been diligent in working with the railroad and putting together a large-scale project that encompasses several different land ownerships and crossing locations.
- CREST has a proven track record in implementing similar types of projects and this will be phase two of this tidal connectivity effort in the Lower Columbia.
- The project costs are reasonable for the acreage of tidal wetlands that will be reconnected and the expected ecological benefits, especially when considering the challenging design logistics required by the railroad line.

Concerns

- The site constraints created by the railroad necessitate a more limited design approach for a higher cost than would be possible without the need to maintain the transportation infrastructure.

Concluding Analysis

This fish passage and tidal connectivity project builds on a strategic effort within the Lower Columbia River estuary to reconnect priority areas of tidal wetland with the river. The applicant has built an effective working relationship with the railroad and numerous private and public landowners along the railroad line that resulted in rigorous project development and planning. Project sites have been prioritized throughout the Lower Columbia that will provide strategic habitat for migrating and rearing fish. This project will contribute to a larger watershed connectivity that will collectively provide over 100 acres of tidal habitat for the myriad of species that depend on estuaries to thrive.

Open Solicitation-2023 Spring Offering
North Coast (Region 1)

Application Number: 223-1019-23018
Project Type: Restoration
Project Name: Rock Creek Confluence Fish Passage Improvement
Applicant: Upper Nehalem WC
Region: North Coast
County: Columbia
OWEB Request: $268,158
Total Cost: $342,307

Application Description The City of Vernonia is working on two fish passage improvements within the city limits, at Rock Creek and Bear Creek.

Existing infrastructure, namely the sewer system and a culvert in Adams Ave, have created fish passage barriers over the years due to poor construction and/or degradation over time.

Within Rock Creek, the barrier is created by the existing sewer pipe and encasing concrete which is exposed during low-flow events and creates an unsuitable jump height for several of the present fish species. Where Bear Creek crosses the Adams Ave ROW, there is a similar sewer impediment which impedes fish passage. In addition to the sewer in Bear Creek, the Adams Ave culvert has degraded and created additional scour pools which add to the problem of allowing fish upstream.

Bear Creek is a tributary to Rock Creek spanning 1.8 miles to the west into the hills surrounding Vernonia. Rock Creek is a major cool-water tributary to the Nehalem River spanning 28.8 miles upstream of Vernonia to the productive heaswaters. The proposed improvements are meant to remove the existing impediments and provide suitable conditions for fish migration while maintaining the necessary system functionality. Based on ODFW fish surveys, both waterways present migratory, spawning and rearing habitat for Chinook, Coho, Cutthroat Trout, Winter Steelhead, Lamprey, Largescale Suckers, Sculpins, and Crayfish. With this, it is known that different life stages of these species are present throughout the year and the variable flow patterns of the both creeks.

Improvements to fish passage are focused on removing the impediments and restoring creek connectivity. Project designs have already been created for these improvements through iterative design revisions based on consultation with ODFW and NOAA/NMFS. Improved passage in Rock Creek will be accomplished by removing the existing sewer infrastructure and grading back the vertical difference in the creek bed to suitable conditions.

Review Team Evaluation
Strengths

- The project will address two crossings, one on Rock Creek and one on Bear Creek, a tributary of Rock Creek. Rock Creek is a source of cooler water in the upper Nehalem watershed. Providing fish access to cold-water refuge will be beneficial to ESA-listed salmonids.
- The proposed fish passage work is part of a larger sewer infrastructure project that will improve water quality in Rock Creek.
- The Rock Creek watershed is a stronghold for fall and summer Chinook salmon. Oregon coast coho salmon and steelhead will also benefit from improved passage to rearing habitat.
- The applicant has a proven track record of successfully implementing similar types of projects.
- The watershed council and the City of Vernonia are building a partnership that is a catalyst for addressing other fish passage and water quality issues in the Rock Creek watershed.
- The work is cost-effective by combining the fish passage project with the larger infrastructure project.

Concerns

- The permitting pathway described in the application is unclear. A clearly defined permit pathway is helpful for evaluating whether the applicable permits will be obtained in a timely manner so the project can proceed according to the proposed timeline
- There are other barriers upstream of both creeks, including a board check dam installed by the City of Vernonia annually to create a community swimming area. The dam is removed when adult fish appear, but it is a complete barrier to all life stages of fish throughout the summer when the cool water refugia in Rock Creek would be most important for juvenile fish to access. While the ecological benefit of the project is limited by this upstream summer barrier, the City of Vernonia and the Upper Nehalem Watershed Council are working together on a passage solution at the check dam.

Concluding Analysis

Fish passage barriers on both Rock and Bear Creeks will be addressed during a larger sewer infrastructure project. Together, these project elements will improve water quality in waterways in and adjacent to the City of Vernonia in addition to providing for improved fish passage to upstream cold-water habitat. Removing the sewer line that crosses Rock Creek will not only make the creek more accessible for fish but it will also prevent the possibility of sewage leaks and overspill in the creek that threaten water quality. This project has potential to create momentum for continuing work to resolve the upstream barrier. Once a solution is found, fish passage could be restored to nearly 28 miles of habitat.

Open Solicitation-2023 Spring Offering
North Coast (Region 1)

Application Number: 223-1020-23021

Project Type: Restoration

Project Name: Sutton Creek Proposal Rock Loop Fish Passage Project

Applicant: Nestucca-Neskowin Watersheds Council

Region: North Coast

County: Tillamook

OWEB Request: $597,527

Total Cost: $1,104,968

Application Description 1) Sutton Creek is a 1.6-mile tributary of Neskowin Cr located in Tillamook County, at Neskowin. The headwaters are in the Suislaw National Forest and the creek flows through a beaver marsh wetland before reaching a residential neighborhood at its confluence with Neskowin Cr. Sutton Creek supports populations of ESA threatened coho salmon, winter steelhead, coastal cutthroat and Pacific lamprey.

2) In the downstream-most reach of the creek, two corrugated metal pipe (CMP) culverts at road crossings are undersized, failed/failing and not aligned with the channel. During storm events, the culverts fill with debris creating fish passage barriers and causing water to overtop banks flooding the neighborhood. In 2021, flooding overtopped both culverts resulting in damage to nearly two-dozen homes, washing away road fill at the downstream culvert exposing buried utility lines. One of the crossings is currently unusable.

3) The Nestucca, Neskowin, and Sand Lake Watersheds Council (NNSLWC) convened a technical review team and hired Stillwater Sciences to prepare 100% plans and a Basis of Design Report. The restoration project proposed here will replace the culverts with concrete box culverts following the stamped plans produced by Stillwater Sciences. This project will restore fish passage to 1.5 miles of spawning and rearing habitat for salmon and steelhead, including 0.8 miles of coho habitat.

4) The Project Team includes representatives from NNSLWC, the US Fish and Wildlife Service (USFWS), the US Forest Service (USFS), Trout Unlimited and Salmon Super Highway (TU & SSH), Tillamook Estuaries Partnership (TEP), and Proposal Rock Homeowners Association (PRHOA). ODFW will review and approve a Fish Passage Plan and will assist with fish salvage when work area isolation occurs prior to demolition and construction activities. USFS staff will provide federal and state permitting assistance for ARBO II and fish salvage under Wyden Authority rules.

Review Team Evaluation

Strengths

- The project is located just upstream of the mouth of Neskowin Creek, which has historically been an important place for juvenile fish to find refuge when they are flushed out during high water events and need to avoid being swept out into the ocean.
- There are multiple partners involved in the project that bring a breadth of technical expertise.
- Technical designs for the two crossings are underway and the project is nearly ready for implementation.

Concerns

- Additional details about the importance of Sutton Creek to fish and the expected ecological benefit from replacing the crossings would be helpful to better understand the ecological benefit of the project.
- Productivity of Oregon coast coho salmon and steelhead is only moderate in Sutton Creek. The coho population is dependent, meaning it relies on nearby independent populations for abundance. The restoration work may accomplish limited ecological benefit to ESA-listed fish for the cost.

Concluding Analysis

Fish passage will be improved on Sutton Creek by replacing two culverts with larger structures. The downstream crossing has already failed and the road is currently unused. Replacing failing road crossings is a priority for a gated community to address the need for emergency vehicle access. The project may have limited ecological benefit due to the dependent nature of the fish populations in the watershed and site constraints surrounding the crossings from the heavily residential area limits restoration opportunities that can be considered.

Open Solicitation-2023 Spring Offering
North Coast (Region 1)

Application Number: 223-1021-23035
Project Type: Restoration
Project Name: Middle Necanicum Tributary Fish Passage and Habitat Improvement: Phase I
Applicant: Necanicum WC
Region: North Coast
County: Clatsop
OWEB Request: $74,033
Total Cost: $94,878

Application Description 1) Upland from the Klootchy Creek Mainline and Middle Necanicum Mainline, this unnamed stream runs through Lewis and Clark Timberlands property. The Tributary drains into Klootchy Creek, and subsequently into the Necanicum River near milepost-3 on US-26. The tributary of focus for this project is a second-order fish-bearing stream that feeds into the Klootchy Creek/Necanicum system. Oregon Department of Fish and Wildlife surveys indicated that this stream supported ESA-listed coho, sea-run cutthroat, rough-skinned newts, red legged frogs and crayfish, and potentially winter-run steelhead.

2) It has been identified that a harvest road and failing culvert system is blocking fish passage to approximately 1.6-miles of type-F stream. Removing this barrier, widening the stream's width at the current barrier location to match with the floodplain, and reinforcing the new banks of the stream are all necessary to restore the stream's natural state.

3) Phase I of this project, which this grant proposal would support, will address the full decommissioning of the harvest road, removal of the failing culvert system, and excavation to return the stream system's width to the floodplain. In addition, measures will be taken to ensure that bank steepness, stream gradient and riparian vegetation are all addressed to protect against erosion and subsequent sediment transport, as well as increase the quality of the habitat as fish refugia.

4) Necanicum Watershed Council
Nuveen Natural Capital/Lewis and Clark Timberlands
Oregon Department of Fish and Wildlife
Chinook Indian Nation

Review Team Evaluation

Strengths

- The implementation plan for reconnecting 1.6 miles of stream habitat in a Middle Necanicum tributary is clear and technically sound. Road fill material and a collapsed culvert will be removed from a legacy timber harvest road and the streambank will be regraded to match the stream grade.
- The undersized culvert has caused sediment to build up and develop wetland habitat upstream. A large wood structure will be installed to retain that sediment in place so that no wetlands are lost.

- The stream supports populations of cutthroat trout and has potential to provide habitat for Oregon coast coho salmon. Removing the fish passage barrier will provide coho access to 1.6 stream miles located above the crossing that has high intrinsic habitat potential.
- The riparian buffer downstream is intact and in good condition.
- The project builds on previous downstream work to replace a culvert with OWEB funding.
- The partnership behind the project provides appropriate technical support for the project, including fish biologists from ODFW and a roads engineer from Nuveen Capital.

Concerns

- More details describing the plant species and locations planned for plantings would have been helpful for understanding the revegetation prescription even though the planting is a minor project component.
- The stream would benefit from the addition of large wood to increase habitat complexity and including it in the project would increase the ecological benefit gained from this investment. There is indication in the application that large wood placement is planned as a future phase two project.
- Including designs in the application would have been helpful to better understand the methods for decommissioning the timber road. The applicant, however, is engaging a roads engineer and fish biologist with relevant experience to implement the project.

Concluding Analysis

The watershed council has developed an effective partnership with an industrial timber landowner to restore stream habitat on a Necanicum River tributary. The existing timber road and culvert creates a full barrier for upstream fish migration. While coho distribution currently ends at the barrier, quality habitat exists upstream to which this project will restore access. Removing the failing culvert and restoring the streambank will connect quality upstream habitat with a downstream reach that has intact riparian conditions. The investment is reasonable for the expected benefits and is likely to lead to a phase two large wood placement project that will further improve habitat conditions.

Open Solicitation-2023 Spring Offering
North Coast (Region 1)

Application Number: 223-1022-23038
Project Type: Restoration
Project Name: Tillamook Bay Wetland Connectivity and Fish Passage Project
Applicant: Trout Unlimited Inc
Region: North Coast
County: Tillamook
OWEB Request: $505,060
Total Cost: $1,384,758

Application Description The proposed wetland connectivity and fish passage project is located at the road/stream crossing of Bayocean Road and Flower Pot Creek at milepost 4.1 approximately 5.5 miles West of Tillamook, Oregon. Here, a 14.6 acre tidal, estuarine wetland has become hydrologically disconnected from Tillamook Bay due to an antiquated, deteriorating, and undersized culvert and associated road prism where Flower Pot Creek meets Tillamook Bay. This problem culvert impairs tidal exchange and prevents native migratory fish from accessing tidal wetland rearing and upstream habitats in Flower Pot Creek. The culvert is 56 feet in length and 4 feet in diameter, situated within the tidal inundation zone. The tidal wetland provides valuable rearing habitat for anadromous fish utilizing Tillamook Bay including Oregon Coast Coho Salmon (ESA listed as threatened), Oregon Coast Chinook Salmon, Winter Steelhead Trout, Oregon Coast Chum Salmon, Pacific Lamprey, and Coastal Cutthroat Trout. The proposed project will eliminate the culvert and replace it with a 44ft bridge that will fully restore volitional fish passage and reconnect the estuarine habitat of Flower Pot Creek with Tillamook Bay. The new bridge will also eliminate the risk of culvert blowout and subsequent road closure. Bayocean Road meanders along the Southwestern edge of Tillamook Bay and is an important emergency and pedestrian route that connects the town of Tillamook to Cape Meares. The project also contains plans to enhance the estuarine habitat of Flower Pot Creek via channel stabilization and the use of large wood/root wads for additional fish habitat structure. OWEB funds will support contracted services needed to construct the replacement structure and will supplement funds and in-kind contributions from the U.S. Fish & Wildlife Service, Tillamook County, and Oregon Department of Fish & Wildlife, U.S. Forest Service.

Review Team Evaluation

Strengths

- The project will provide floodplain inundation and water quality benefits that will both improve watershed process and habitat for aquatic species in Tillamook Bay at Flower Pot Creek.
- There is a 14.6-acre tidal estuarine wetland that has become hydrologically disconnected from the Tillamook Bay. Tidal wetlands provide valuable rearing habitat for anadromous fish. Replacing the culvert on Bayocean Road will restore tidal exchange and fish access to this wetland, which will provide rearing habitat for all species of juvenile salmonid occurring in the coastal region.
- The opportunity to restore tidal wetlands to historic hydrology is uncommon and a high priority for the coast.

- The current culvert is still structurally sound but allows only for minimal connectivity with the bay. The proposed design will completely restore tidal connectivity.
- The project will benefit a wide array of species that utilize estuaries, including crab, rock fish, and other forage fish.
- The Salmon SuperHwy partnership is a high functioning efficient network of practitioners with an extensive track record of implementing similar projects.
- The costs for the project are reasonable for the expected habitat benefit.
- The project is ready for implementation with match funding secured.

Concerns

- No significant concerns are identified.

Concluding Analysis

A 4-foot undersized culvert will be replaced with a 44- foot bridge to restore watershed connectivity between Flower Pot Creek and Tillamook Bay. In addition to restoring fish passage at the site, tidal inundation will be restored to an approximately 14-acre wetland associated with the tributary. This project provides a unique opportunity to open fish passage and reconnect important tidal wetland habitat to Tillamook Bay, and has a high likelihood of success in restoring priority habitats for ESA-listed fish.

Open Solicitation-2023 Spring Offering
North Coast (Region 1)

Application Number: 223-1024-23051
Project Type: Restoration
Project Name: Deer Creek Willow Planting Project
Applicant: Oregon Wildlife Heritage Foundation
Region: North Coast
County: Lincoln
OWEB Request: $91,577
Total Cost: $118,022

Application Description The Deer Creek Willow Project is located in the Yaquina River Basin, 13.5 miles East of Elk City, Oregon approximately 2 river miles upstream from it's confluence with the Big Elk Creek. This stream has been designated as Essential Salmonid Habitat and is important spawning and rearing habitat for ESA listed Coho Salmon, Chinook Salmon, Winter Steelhead, Pacific Lamprey, and Coastal Cutthroat Trout.

This project aims to address factors limiting recovery and conservation of Oregon Coast Coho, which were identified in the Oregon Department of Fish & Wildlife's Coho Conservation Plan (2007) and NMFS ESA Recovery Plan (2016).

The project focus is to increase the quality and quantity of summer and winter rearing habitat for juvenile salmonids by restoring the riparian area within the project reach with native willow species to support existing beaver populations and promote their range expansion. By restoring the willow galleries that once dominated these valley bottoms, beaver populations will be able to thrive and return important ecological functions to the landscape by creating dams and ponds that restore floodplain connectivity, provide low velocity habitat for rearing juveniles, and mitigate water temperatures.

Project partners include the Oregon Department of Fish and Wildlife, The Oregon Wildlife Heritage Foundation, and the Mid-Coast Watershed Council.

Review Team Evaluation

Strengths

- Project actions will address a limiting factor for Oregon coast coho by improving habitat complexity. The restoration actions will also benefit Chinook and steelhead.
- The approach is appropriate for the site given the access constraints. The site is currently only accessible via ATV or on foot.
- The project utilizes a process-based restoration approach by attracting beaver to the Deer Creek watershed. A willow component will be planted in a reed canary grass dominated area, which will also help restore native vegetation in the riparian area.

- The planting plan is technically sound by incorporating primarily willow with a few other native species to match site conditions and a detailed plant establishment plan. Willow will be the easiest species to establish on the site and if it is successful there is a high probability that beaver will recolonize the area.
- The applicant is partnering with both ODFW and the MidCoast Watersheds Council to build capacity to accomplish the work.
- The project approach is cost-effective for the expected watershed benefit.

Concerns

- Reed canary grass suppression in the planting area will be limited to primarily hand operation techniques due to site access constraints. It may be challenging to achieve meaningful control.
- Due to limited site access, the applicant limited diversifying plant species they will be planting. The simple approach establishes a willow gallery to encourage beaver but there may be missed opportunities in improving biodiversity as a result.
- The applicant has had limited capacity to administer past OWEB grants and their current capacity to implement the project is unclear.

Concluding Analysis

Deer Creek contains high quality low gradient habitat for Oregon coast coho salmon and other aquatic species. This project will address a 10-acre portion of riparian area along the project stream reach that has become dominated by invasive species, particularly reed canary grass. Encouraging beaver back to the site by establishing a willow gallery is a low-cost process-based restoration approach that is likely to succeed at the project site.

Open Solicitation-2023 Spring Offering
North Coast (Region 1)

Application Number: 223-1025-23004

Project Type: Technical Assistance

Project Name: Gallagher Slough Fish Passable Tide Gate Upgrade

Applicant: Lower Nehalem WC

Region: North Coast

County: Tillamook

OWEB Request: $74,986

Total Cost: $96,339

Application Description The Gallagher Slough tide gates are located under Hwy 101 near its intersection with Hwy 53 between Nehalem and Wheeler. The 5 tide gates are deteriorating, top-hinged, wooden doors, 7 ft x 8 ft. Gallagher Slough drains approximately 1,031 acres dominated by agricultural land use and limited impervious area. The existing tide gates limit fish passage to both Gallagher and Pye Sloughs, which intersect just upstream of the gates. Diking, tide gates, and other modifications to the Nehalem Estuary have resulted in a 54.9% reduction in tidal wetland area (Brophy, 2019).

This project will develop 30% conceptual level designs for the Gallagher Slough tide gates. This level of design will be sufficient to determine if the gates can be retrofitted or if the entire structure will need to be upgraded. To accomplish this, an engineering firm will be contracted. Water monitoring equipment will be deployed by Tillamook Estuaries Partnership to measure water depth, temperature, and salinity inside and outside the gates. The engineering firm will conduct site and bathymetric surveys. This information will be used for a hydraulic analysis to determine the fish passage status of the current structure with a Muted Tidal Regulator (MTR) or the size required of a new structure. That model will also be used to predict the effects of the project on the site's current land use including inundation extent, depth, and frequency over time using tidal data and the locally collected data. This information will be used to inform a water management plan.

This project is being undertaken in collaboration with the Tillamook County Creamery Association, Tillamook Estuaries Partnership, Oregon Department of Transportation, and the Oregon Department of Fish and Wildlife.

Brophy LS, Greene CM, Hare VC, Holycross B, Lanier A, Heady WN, et al (2019) Insights into estuary habitat loss in the western United States using a new method for mapping maximum extent of tidal wetlands.

Review Team Evaluation

Strengths

- Preliminary design solutions for replacing tide gates will be developed to address a long-standing fish

passage barrier on Gallagher Slough, the largest slough in the Nehalem River estuary. Historically, the slough provided important rearing habitat that was important for all salmonid fish species and once supported very productive populations.

- The Gallagher Slough tide gates is ranked on the list of priority ODFW fish passage barriers.
- The project is support by a partnership that includes ODOT, the Tillamook Estuaries Partnership, and the Tillamook County Creamery Association.

Concerns

- The expected ecological benefit of a tide gate replacement or modification at the project location is unclear given the lack of quality habitat upstream. Water management changes will be necessary to realize benefits to fish and wildlife and the application contains limited detail about what the landowners might be willing to consider.
- Water quality in Gallagher Slough is very poor. Increased tidal exchange from a new tide gate may help address temperature and dissolved oxygen to a certain extent, but other land management changes, such as increasing riparian buffers and changing livestock management practices to protect riparian areas, may be necessary to realize any habitat benefits from increased fish passage. The application does not provide detail on any considerations to improve upstream habitat and water quality.
- The ownership of the tide gate is unclear in the application and the roles and responsibilities of funding and implementing the eventual project are not well described.
- The resulting restoration project from this technical assistance work will likely be expensive for the expected habitat benefits.

Concluding Analysis

Gallagher Slough historically provided important rearing habitat for fish, including coho salmon. The current tide gate structure is a set of five top-hinged, wooden doors with an outdated design that does not provide optimal fish passage. Replacing or upgrading the tide gate could provide access to tidal estuary habitat that is critical for juvenile fish; however, with the poor water quality, high temperatures, lack of riparian shade, and intensive grazing found along the slough's reach, providing new access to fish may be of limited ecological benefit unless significant management changes can be realized. Details in the application are lacking with regards to what management changes, if any, will be possible with a tide gate upgrade. It is difficult to assess the ecological benefit of improved fish passage without an understanding of whether water management changes and other habitat improvements are possible within the slough.

Open Solicitation-2023 Spring Offering
North Coast (Region 1)

Application Number: 223-1026-23039
Project Type: Technical Assistance
Project Name: Mary's Creek Culvert Replacements - Phase 1 Designs
Applicant: Tillamook Estuaries Partnership
Region: North Coast
County: Tillamook
OWEB Request: $42,053
Total Cost: $53,571

Application Description This technical assistance application is to fund Phase 1 - 30% design work for two culvert replacements on Mary's Creek, a tributary of Fawcett Creek in the Tillamook Bay Watershed of Tillamook County. Anadromous salmonid fish species occurring on the Tillamook watershed include spring and fall chinook salmon, coho salmon, summer and winter steelhead, and sea-run cutthroat trout. These two culverts are the two lowest fish passage barriers in Mary's creek before it joins Fawcett creek. Each culvert exists on a separate private property, owned by Robert Phillips and Bradley Pierce respectively.
Mary's creek was surveyed by Oregon Department of Fish and Wildlife (ODFW) biologists in the summer of 2022. Cutthroat trout and coho salmon fry were found present at the time of survey. The survey identified 1.19 miles of coho habitat upstream from the lowest fish passage barrier, and 1.78 miles of fish habitat upstream of the lowest barrier total.
The goal of this project is to secure complete engineering designs for replacement of both culverts with adequately sized structures and streambed simulation design.
Engineering designs will be contracted out to a private engineering firm. TEP will prepare and release an RFP for engineering designs, manage the engineering contract, and convene the technical team for design review.
Project partners include Oregon Department of Fish and Wildlife (ODFW), Trout Unlimited (TU), USDA Natural Resource Conservation Service (NRCS), and Tillamook County Public Works (TCPW).

Review Team Evaluation

Strengths

- Mary's Creek is a priority location in the Tillamook Bay watershed to restore habitat for Chinook, coho, steelhead, lamprey, and potentially chum. There is high potential for fish productivity upstream of two undersized culverts that are currently fish passage barriers, once they are improved.
- The application describes a clear need for the proposed design engineering plans for replacing two undersized culverts with the downstream crossing in an imminent stage of failure and the upstream crossing providing access to a community water source.
- A broad project partnership is behind the work, including local, state, and federal agencies. The applicant has a proven track record of success with similar projects.

- Intact riparian forest is present along portions of the stream reaches that provides shade and will likely contribute to future large wood recruitment into the stream.
- Previous review comments are addressed by providing additional alternatives analysis within the application. The design approach was also scaled back for the downstream structure to a level that is a better fit with the site conditions and the use of the road.
- Costs are reasonable for permit-ready designs for two crossings.

Concerns

- Construction access to the sites may be challenging due to the current road conditions, particularly the downstream crossing that has limited functionality.
- The stream would benefit from other habitat improvements in addition to the fish passage work in order to realize the full ecological potential of this project. Large wood additions would further encourage the stream's interaction with the floodplain.

Concluding Analysis

Mary's Creek is a tributary of Fawcett Creek in the Tillamook Bay watershed. The creek is prime habitat for a full suite of fish species, including Oregon coast coho salmon. Replacing the two road crossings will improve access to 1.8 miles of quality habitat for spawning and rearing. This is the second submission of this project for technical assistance funding after not being recommended in a previous cycle, and the applicant fully considered the comments from that review and improved the application. A technical team has been established that will help guide the design process, increasing the likelihood of success for the project to result in designs that will lead to improving passage for juvenile and adult migratory fish in Mary's Creek.

Open Solicitation-2023 Spring Offering
North Coast (Region 1)

Application Number: 223-1031-22991

Project Type: Stakeholder Engagement

Project Name: Necanicum Together: Landowner Engagement Program

Applicant: Necanicum WC

Region: North Coast

County: Clatsop

OWEB Request: $28,804

Total Cost: $43,346

Application Description 1) The Necanicum Basin is a relatively small watershed, amounting to just under 56,000 acres of drainage into the Pacific Ocean. The 21-mile river and its extensive tributary system are one of the Oregon Coast's four distinct populations of coho salmon that do not currently meet the sustainability criteria as defined by NOAA. The location of this project is the entirety of the Necanicum Basin, with priorities given to property owners with river/stream front land and on type-F streams.

2) As a rural-based Watershed Council with limited capacity (1.0 FTE), a hurdle that often results in missed restoration opportunities is the apparent disconnect between community and organization. The Necanicum Basin is rich with privately and publicly owned property that contain Type-F rivers and streams. This project is designed to proactively make a frequent connection between our community-based restoration work and the landowners in our basin that could both contribute and benefit from participating in restoration work.

3) This project is a multi-pronged outreach effort to connect landowners with the services and opportunities that the Watershed Council can provide. 1) We will be sending out 5 quarterly mailers with pre-stamped return postcards to landowners in the basin, asking for information and whether they may have interest in working with the watershed on a restoration effort. 2) Scheduling at least 4, but up to 6, local events for landowners to attend. Events will vary from simply "informational mixers" to conference style setup in which we'd invite folks from funding organizations like OWEB, ODFW, NOAA etc. to explain the benefits of restoration work with local WCs and 3) conduct time-intensive door-to-door campaigns to make a face-to-face connection with NWC staff and local landowners.

4) This project has indirect partners in the City of Seaside and City of Gearhart, which have both offered to assist with connecting to landowners through mailer assistance.

Review Team Evaluation

Strengths

- The communication strategy to engage landowners in the Necanicum Basin is technically sound and contains a diverse array of approaches, including mail contact, brochures, website content, and in-person events.

- A landowner contact list and map of interested landowners will be produced that will inform and identify future restoration projects.
- The applicant is working with ODFW to acquire fish distribution information to disseminate to landowners and interested community members.
- The applicant has the capacity to implement the project and the proposed engagement will build on success with recent fundraising and community engagement work.
- The costs are reasonable for the proposed work and deliverables expected.

Concerns

- It is unclear how the landowners will be identified and whether the scope of the project is targeted to high priority areas or the entire geography. Much of the landownership in the Necanicum watershed is commercial timber and there may be limited opportunities for diverse landowner participation.
- The project goals and success measures are not clearly stated within the application. More information on how the specific outreach approaches are expected to lead to future restoration projects would be helpful.
- The scope of the project may be ambitious for the available staffing resources.
- Brochures and mailings can be expensive and may not be the best approach to generating new landowner participation.

Concluding Analysis

The stakeholder engagement proposal is timely because there is new interest developing in the Necanicum watershed and new entities open to considering restoration. The applicant organization is actively looking to engage with a wider audience and bring new voices to the table in the Necanicum watershed. The proposed landowner engagement is likely to build relationships with that audience that could lead to opportunities to restore coho habitat.

Open Solicitation-2023 Spring Offering
North Coast (Region 1)

Application Number: 223-1027-22980
Project Type: Monitoring
Project Name: Lower Columbia Watershed Rapid Biological Assessment
Applicant: Columbia SWCD
Region: North Coast
County: Columbia
OWEB Request: $100,952
Total Cost: $134,951

Application Description 1) The Lower Columbia River Watershed Council (LCRWC) presides in Columbia County, Oregon serving an area centered on the Clatskanie River including all drainages from Mcbride Creek (Columbia USGS RM 82.5) to Kelly Creek (Columbia USGS RM 37.8). The LCRWC territory encompasses a contiguous drainage area of approximately 190,720 acres of Oregon's Lower Columbia River area. This expansive territory provides habitat for ESA listed Coho, Chinook, Steelhead, and Chum salmon along with non-listed coastal cutthroat trout, and lamprey (Pacific and brook).

2) Watershed assessments and plans drafted by local, state, tribal and federal entities have identified the lack of
basin-scale inventories of salmonid distribution, abundance, and habitat distribution in the LCRWC watersheds
as significant data gaps in efforts to prioritize areas for restoration and conservation. Previous assessments within
the LCRWC watersheds are outdated and/or do not provide the detail needed to establish restoration
goals for specific sub-watersheds or reaches within those streams.

3) This project proposes to conduct a Rapid Bioassessment (RBA) and Limiting Factors Analysis (LFA) Lite of 110.9 stream miles throughout the watershed of the LCRWC. The project will collect essential data
regarding salmonid distributions and abundance, and associated watershed characteristics that may serve as
limiting factors for salmonids. The goal is to determine seasonal habitat limitations for coho and steelhead and
develop a systematic approach to identify and implement restoration actions that address those limiting factors.

4) The project partners include:
Lower Columbia River Watershed Council
Columbia Soil and Water Conservation District

Bio-Surveys, LLC
Oregon Department of Fish and Wildlife (ODFW)
Oregon Department of Forestry (ODF)
Evenson Logging, Van Natta Brothers Logging, Weyerhauser

Monitoring Team Evaluation

Monitoring Team Strengths

- This project will provide information to update the outdated existing fisheries data that the application summarizes.
- The applicant will convene a technical advisory committee (TAC) to interpret the results and apply the information to plan future restoration strategies.
- The contractor is highly qualified to complete the work and has a proven track record of collecting the data as proposed and providing a comprehensive report that summarizes the information and opportunities for restoration.
- The budget is very detailed, and the contractor costs are reflective of the expenses to accomplish the monitoring and reporting objectives proposed in the application.

Monitoring Team Concerns

- The application contains redundant responses to different questions which made it challenging to find the details of the proposed monitoring project.
- The application didn’t describe how this project will incorporate the existing water quality data that the Columbia SWCD/Lower Columbia Estuary Partnership has been collecting with OWEB funds. This could prove very helpful given they are collecting continuous water temperature in this geographic area.
- Several of the monitoring questions that are posed in the application are vague and is not clear how they plan to answer them. For example, it is not clear how they plan to make the distinction between adult or juvenile barriers or how they plan to determine if previous restoration actions are functioning as intended.
- The study design did not clearly articulate which streams and reaches will be monitored. The uploaded map was difficult to read and did not explicitly identify which reaches would be surveyed.
- The applicant plans to identify thermal refugia, but the application does not provide a clear description of how that will be done.
- The application did not describe the quality assurance/quality control measures to ensure that high quality data will be collected, managed, and reported.
- The applicant proposes to store the data in an Access database but the application lacks details on how the data will be backed to ensure long term storage is successful.
- It is unclear whether the TAC members have been engaged yet or if they’ve committed to participate. The match related to the TAC members in the application was pending with no letters of commitment. Several of the TAC members listed in the application are not likely to possess detailed knowledge of the stream reaches to interpret the results.

Monitoring Team Comments

Review Team Evaluation

Strengths

- The monitoring approach utilizes a well-established protocol for Rapid Bio-assessments that is technically sound. Anchor habitats will be identified within the lower Columbia watersheds using an appropriate methodology.
- The project addresses a known data gap in fish distribution and habitat within the watershed.
- The selected contractor has relevant experience and a proven track record of implementing similar projects.
- A technical committee will be engaged to provide project oversight and additional expertise to the monitoring effort.
- The cost for the proposed monitoring is reasonable given the number of miles slated for survey.

Concerns

- The maps are unclear within the proposal as they only provide a very basic geography of the survey areas. The rationale for the locations selected for survey is also not well described within the application.
- The application lacks details about the methodology for the Limiting Factors Analysis “Light”.
- The proposed approach to conduct a spawning gravel inventory is not well described in the application and it is unclear how the data will be collected.
- Temperature data is listed as a parameter that will be monitored, but details are unclear. For example, it is unclear whether water temperature will be collected by continuous or grab sample monitoring or if the selected contractor has experience with temperature monitoring.
- Capacity to conduct the monitoring work is uncertain because the applicant has not been able to complete previous OWEB-funded projects due to staff turnover, low capacity, and organizational challenges.
- The application lacks letters of support or evidence of involvement from any of the proposed members of the technical committee.

Concluding Analysis

Rapid Bio-assessments have become a useful tool for restoration practitioners to plan and prioritize work within a watershed. There is limited information available currently within the geography covered by this proposal, and this monitoring work will refine fish distribution maps and identify stream reaches that contain anchor habitat. Partners working within the lower Columbia watershed have long suffered from a lack of strategy that comes with the lack of the information necessary to develop a suitable project prioritization approach, and this monitoring effort would take a step towards addressing that shortcoming. The application lacks clarity in several key areas, however, needed to better understand the project. More detail about site selection and the parameters beyond the typical Rapid Bio-assessment activities, such as water temperature and beaver populations, would have been helpful for evaluating the work

proposed.

Open Solicitation-2023 Spring Offering
North Coast (Region 1)

Application Number: 223-1028-23003

Project Type: Monitoring

Project Name: Collaborative Expansion of the Columbia County Water Quality Monitoring Program 2023-2026

Applicant: Lower Columbia Estuary Partnership

Region: North Coast

County: Columbia

OWEB Request: $270,865

Total Cost: $401,889

Application Description The Lower Columbia Estuary Partnership (LCEP), Columbia SWCD, and partners request $270,865 for a three-year water quality monitoring project in six key subbasins in Columbia County. Building on existing data collected since 2008, the project will expand monitoring efforts in Milton Creek, Scappoose River, Beaver Creek, Clatskanie River, and McNulty Creek watersheds for years 7-9 of continuous status and trends monitoring through our current program. These watersheds provide spawning, rearing, and refugia habitat for four ESA-listed groups of salmon and steelhead, and the Lower Columbia River (LCR) ESA Recovery Plan lists degraded water quality, elevated temperatures, and excessive fine sediments as limiting factors to their recovery.

The proposed work includes 1) continuing long-term data collection, measuring bacteria, temperature, turbidity, conductivity, dissolved oxygen (DO), and pH across 15 locations in the six focal watersheds; 2) adding continuous DO monitoring to these locations due to suboptimal conditions; 3) conducting a 2 yr eDNA study in Milton Creek sub-basins (11 locations) to identify E. coli sources; 4) collaborating with partners to integrate findings into restoration strategies, land-use plans, and best management practices.

Project partners, providing over $130,000 in match funding (a 48% total OWEB match), include the City of Scappoose, City of St. Helens, Columbia County, Columbia County Soil and Water Conservation District, Lower Columbia Watershed Council, Scappoose Bay Watershed Council, Tillamook National Estuary Partnership, Oregon Department of Fish and Wildlife, and Oregon Department of Environmental Quality. This project remains a high priority for addressing water quality issues and contributing to ESA-listed species recovery, ensuring a healthier ecosystem for future generations.

Monitoring Team Evaluation

Monitoring Team Strengths

- The proposed project including the bacteria eDNA source and continuous dissolved oxygen investigations will complement the existing water quality data that has been collected over several years with OWEB funding.

- This water quality monitoring project complements other local monitoring efforts in the Scappoose Bay watershed and the proposed rapid bioassessment by the Columbia SWCD.
- The applicant will follow established monitoring methods and are appropriate to answer their proposed monitoring questions.
- Continuing to collect the continuous water temperature and discreet water quality parameters at the existing sites for another three years will allow them to perform a statistical trend analysis.
- The applicant will apply several approaches to summarizing the results and making them publicly available including using tableau to visualize the data.
- The applicant has several years of experience collecting high quality data and summarizing the results in annual summary reports.
- The letters of support and match express that their technical expert and community engagement has been thorough and successful.
- The budget included sufficient detail and justification for the expenses necessary to accomplish the objectives proposed in the application.

Monitoring Team Concerns

- The application contained redundant responses to different questions which made it challenging to find the details of the proposed monitoring project.
- The application would have benefited from a description of what is achievable with the bacteria eDNA results from similar monitoring approaches in other areas.
- The application lacked details on the bacteria eDNA lab sampling approach and specific field monitoring quality assurance quality control measures that are necessary before samples are sent to the lab.
- The application was not clear how they will correlate water quality results with streambank conditions to identify hotspots, seasonal variations, and potential sources within the watersheds. It is not clear what streambank condition data exists to know if this task is achievable.
- The application only broadly describes that ODFW and the Columbia Public Health department will be involved.
- It was not clear on exactly how the interpretation of the water quality and bacteria eDNA data would be done and the finished product that would be generated to summarize the data that they are collecting.
- It was not clear if the applicant has the capacity to interpret the bacteria eDNA data to meet their monitoring questions to apply the data in a meaningful way.
- It was not clear if the budget amount was sufficient to allow enough staff time to collect year-round continuous dissolved oxygen data at 15 sites given that this is a challenging parameter to monitor which requires frequent site visits and time to review the resulting data sets.

Monitoring Team Comments

Review Team Evaluation

Strengths

- The proposed monitoring continues the collection of a long-running dataset. Multiple year data of this

nature is valuable.

- The applicant has a proven track record of success with water quality monitoring and managing data. The data dashboard and website are helpful tools for making the information publicly accessible.
- The project partnership has grown in recent years to encompass a diversity of participants within the monitoring geography.

Concerns

- The rationale for conducting dissolved oxygen monitoring year-round is not well described in the application, the need and applicability of using this data to inform future restoration is unclear.
- The project has broadened substantially to include eDNA and dissolved oxygen monitoring as well as the traditional temperature and bacteria data collection that has been conducted. The application appears to contain three separate projects in one application, and it is difficult to understand the need for the project expansion.
- There are a multitude of water quality parameters proposed for monitoring but understanding the project's end goal is challenging. There is an unclear path from the data being collected to informing the planning and prioritizing of restoration work.
- The eDNA project elements to trace E. coli sources can be a helpful tool for communicating with landowners, but this data is notoriously difficult to interpret to differentiate sources of E. coli, such as an elk herd versus a dairy. Higher frequency of sampling than what is proposed may be necessary to tease out sources of bacteria. It is unclear if the additional expense for this information is warranted due to the uncertainty in the results providing conclusive information about E. coli sources.
- Costs per year of monitoring have substantially increased, primarily due to the new project components and the labor-intensive nature of the dissolved oxygen monitoring. More information in the application explaining the increased costs for staff time and how the additional data is necessary for informing restoration would have been helpful in evaluating the cost-effectiveness of the work proposed.

Concluding Analysis

The project partners have a proven track record of implementing water quality monitoring in the Columbia County geography, and this project will continue data collection for an additional three years. The project recently expanded to include additional partners and monitoring parameters that could potentially provide new information on sources of bacteria and identify target areas where dissolved oxygen is a concern.

Open Solicitation-2023 Spring Offering
North Coast (Region 1)

Application Number: 223-1029-23027

Project Type: Monitoring

Project Name: Nestucca, Neskowin & Sand Lake Expanded Monitoring II

Applicant: Nestucca-Neskowin Watersheds Council

Region: North Coast

County: Tillamook

OWEB Request: $51,230

Total Cost: $77,191

Application Description

This project proposes to continue collection of stream temperature and bacteria data, initiated in 2022, in priority reaches of the Nestucca, Neskowin, and Sand Lake watersheds during 2023-25. This proposed 2-year extension represents the second phase of a planned 6-8 year project intended to capture data over a timeframe that will allow for statistically significant trend analyses. This monitoring program's goal is to fill a data gap on bacteria loads and stream temperatures in key locations to inform prioritization and planning for restoration projects. Existing water quality data collected by state and federal natural resources agencies and NGOs over the years (1998 to present), and a recent Sand Lake Basin Limiting Factors Analysis and Restoration Prioritization, indicate that surface waters in these basins are water quality limited the following ways:

1. Many mainstem stream reaches exceed the state temperature standard and are too warm to protect salmon and trout. However, limited information is available for the tributaries.
2. Fecal bacteria concentrations in Nestucca Bay are occasionally too high to allow human contact with the water as well as too high to protect human consumption of shellfish harvested from the Bay.
3. Fecal bacteria concentrations in Sand Lake and at Neskowin beach are frequently too high to allow human contact with the water, resulting in beach closures for Neskowin.

The current and historic data demonstrate that water quality problems exist, but the data are not high resolution enough to make decisions on prioritizing restoration in specific tributaries. This project is coordinating with the Tillamook Estuaries Partnership (TEP) and Oregon Department of Environmental Quality's (DEQ) Volunteer Water Quality Monitoring Program (VWQMP) with sites that complement their existing program and expand monitoring to priority tributary streams.

Project partners include field and technical volunteers, DEQ, and TEP.

Monitoring Team Evaluation

Monitoring Team Strengths

- The proposed project will build on the first phase of monitoring that was recently funded by OWEB and is currently being implemented.
- The applicant is following established monitoring methods that are adequately described in the application and have a DEQ approved Sampling and Analysis Plan.
- The water quality data will be submitted to DEQ, and the applicant will take several steps to make it publicly available including uploading the bacteria data on the "SWIM GUIDE" online platform.
- The applicant is working with the Tillamook Estuaries Partnership (TEP) and DEQ to develop their monitoring project and is working with the Neskowin Citizen Advisory Committee to distribute fact sheets to inform the landowners.
- The applicant is working with trained volunteers to assist in collecting bacteria samples and water temperature data which will improve community engagement.
- The applicant plans to analyze water samples for bacteria which will allow them to save time and money over time. Building this capacity in their community has the potential to provide an important service to others in their area.

Monitoring Team Concerns

- The uploaded maps did not include all the bacteria monitoring sites and it was not clear which sites are already monitored by TEP and which ones will be covered by the applicant.
- While the selection of monitoring sites that are publicly accessible are important it is not clear if their locations have a sufficient geographic distribution to answer their monitoring questions.
- The water temperature monitoring sites may not be adequate to document effects of completed projects (riparian, fish passage) since they are only located downstream of these restoration projects.
- The application did not include a description of the bacteria analysis lab methods that will be used to process the water samples and track the resulting data from the time the samples are delivered to the lab to when the analysis is completed.
- The application didn’t describe how they will incorporate quality assurance/quality control measures into the volunteer data collection efforts to ensure high quality data will be generated.
- The application did not include a detailed description of how the data will be analyzed and interpreted to answer their monitoring questions.
- The volunteer coordination efforts estimated in the budget may not be sufficient if there are fluctuations in volunteer participation.

Monitoring Team Comments

• Contact Spencer Sawaske at ODFW’s Water Division to coordinate on the water temperature monitoring.

• Incorporate the approved sampling and analysis plan measures to ensure the volunteers are collecting high quality data.

Review Team Evaluation

Strengths

- Water quality monitoring initiated in 2022 will be continued in priority reaches of the Nestucca, Neskowin, and Sand Lake watersheds.
- The applicant has a proven track record successfully implementing the proposed monitoring strategy.
- The work addresses key data gaps in both the DEQ's long term temperature monitoring and Tillamook Estuaries Partnership's bacteria monitoring.
- The geography proposed for the monitoring contains stream reaches that are impaired for temperature and bacteria.
- The application describes how the proposed monitoring will refine information about cold water refugia and impaired waterbodies, which will be used to prioritize areas for restoration.
- The proposed methodology is technically sound and utilizes DEQ protocols. The applicant is working closely with DEQ to determine trends and plans to display the information on a website platform to be accessible by the public.
- The applicant incorporated community input in order to refine the chosen sampling locations.
- The project is cost effective for the work proposed.

Concerns

- No significant concerns are identified.

Concluding Analysis

Water quality monitoring will be continued on impaired Tillamook County streams. Collecting additional years of data will expand the value of the data set in filling important data gaps in the selected watershed geography. The project partnerships with agencies and other organizations conducting monitoring in the county is likely to succeed in filling data gaps in bacteria loads and stream temperatures in key locations to inform prioritization and planning for restoration projects.

Open Solicitation-2023 Spring Offering
North Coast (Region 1)

Application Number: 223-1030-23053

Project Type: Monitoring

Project Name: Upper Yaquina Strategic Implementation Area Monitoring

Applicant: Lincoln SWCD

Region: North Coast

County: Lincoln

OWEB Request: $135,408

Total Cost: $174,508

Application Description The Strategic Implementation Area (SIA) is located in the eastern portion of Lincoln County and encompasses the Upper Yaquina watershed. The sub areas within the Upper Yaquina Watershed included in the SIA are HUC12 171002040102 Bales Creek-Upper Yaquina, and 171002040103 Little Elk Creek. These water bodies have both been identified as Oregon DEQ 303(d) listed for impairments concerning dissolved oxygen, high temperatures, and bacteria (fecal coliform and E. coli). Excessive sedimentation and lack of riparian vegetation, or replacement of native vegetation with invasive species such as Himalayan blackberry (Rubus armeniacus) and reed canary grass (Phalaris arundinacea) is another common concern in these watersheds.
Six DEQ monitoring stations are already present within these watersheds, providing baseline water quality data. Our proposal is to conduct further monitoring on a 4-year timeline with the goal of assessing for changes in water quality since these waterbodies were last assessed in 2016/2018, identify parameters of concern within each reach in order to better target our outreach efforts, and provide updated baseline data as future restoration efforts are implemented within the watershed.
Lincoln SWCD will be partnering with the Oregon Department of Environmental Quality (DEQ), the USDA Natural Resources Conservation Service (NRCS), Oregon Department of Fish and Wildlife (ODFW), MidCoast Watersheds Council (MCWC), and the Oregon Department of Agriculture (ODA).

Monitoring Team Evaluation

Monitoring Team Strengths

- The proposed project will complement the existing data collected at the monitoring sites established in the past and the one site the applicant has maintained since 2000.
- The applicant has an existing local monitoring team comprised of state and federal agencies that was convened to help establish the Strategic Implementation Area (SIA) monitoring approach.
- The applicant is partnering with the NRCS to collect qualitative stream condition data and to track conservation practices that are implemented in the project area.
- The applicant is partnering with DEQ to help inform the study design and interpret the monitoring results.
- The budget includes cost-saving measures including sending water samples to the local Hatfield Marine Science Center for bacteria analysis.

Monitoring Team Concerns

- The application didn't describe how this project would complement the SIA monitoring proposal that is providing resources to collect related water quality data in the same geographic area.
- The application language appears to be outdated given that the application describes a need to collect data to develop the TMDL and it has already been completed.
- The applicant doesn't describe the monitoring questions that they want to answer with the continuous water temperature and dissolved oxygen monitoring proposed in Objective 2 and includes the same monitoring questions posed in Objective 1.
- The applicant does not have a DEQ approved sampling and analysis plan despite the application describing that one exists.
- The application proposes to determine if Little Elk Creek is attaining water quality criteria and it was not clear if significant conservation actions have been implemented since 2018 to understand if this might be the case.
- The application doesn't describe the monitoring methods to collect the water quality data.
- The information provided in the methods section of the application isn't clear on how often they'll be downloading the data and who will be responsible for it.
- The application doesn't describe what specific data that will be measured using the Streamside Vegetation Assessment (SVA) and the SVAP2 to assess the riparian condition in objective 3.
- The application mentions collecting data with a solar pathfinder, but it was not clear how this data will be incorporated into the data analysis.
- The timeline doesn't describe when the vegetation assessment will occur.
- The application does not clearly describe the roles and responsibilities of DEQ to assist in the dissolved oxygen data collection and analysis to ensure this project will be successfully implemented.
- It is not clear if the applicant has the capacity to complete the water quality monitoring project as proposed given that their monitoring staff no longer work at the district.
- It was not clear how the staff time was estimated to determine if it is appropriate to complete the objectives proposed in the application.

Monitoring Team Comments

Review Team Evaluation

Strengths

- There is a broad partnership working on the Strategic Implementation Area (SIA) in Lincoln County and the proposed monitoring will result in water quality data in this geography.
- The applicant proposes a longitudinal profile sampling method as opposed to random site collection, which is an effective approach to understanding water quality.
- The applicant has coordinated extensively with DEQ.

Concerns

- The application lacks information explaining how the proposed monitoring complements and utilizes previously collected monitoring data.
- The application indicates that the TMDL is in development, but the TMDL has already been developed and is out for comment. The intersectionality of this work with the existing TMDLs is not well-described.
- The application states that there is an existing DEQ-approved Strategic Action Plan (SAP) but there is no evidence of an approved SAP.
- The application lacks detail in how the monitoring builds off of the standard monitoring conducted as part of the SIA, which is also funded by OWEB.
- It is unknown how the monitoring work will complement other monitoring conducted locally.
- The applicant has recently built staff capacity, but the experience of the organization's staff in conducting this type of monitoring is unclear. The inclusion of continuous dissolved oxygen monitoring will be a challenging first foray into water quality monitoring.

Concluding Analysis

Strategic Implementation Areas receive a limited base level of monitoring funding and this project will expand the amount of data collected through the SIA program. More detail describing how the proposed work will build on that base SIA monitoring and how the data will support TMDLs would have been helpful for understanding the need and relevance for the proposed monitoring. There is, however, value in maintaining momentum in monitoring the Upper Yaquina. With the TMDL completed in this basin, there is now a broader need for implementation monitoring and this project could make strides toward achieving that goal.

Open Solicitation-2023 Spring Offering
Southwest Oregon (Region 2)

Application Number: 223-2014-22977
Project Type: Restoration
Project Name: Coaledo Tide Gate Replacement for Fish Passage Improvement
Applicant: Coquille Watershed Association
Region: Southwest Oregon
County: Coos
OWEB Request: $773,104
Total Cost: $1,240,094

Application Description The Coaledo Drainage District (CDD) is a 9,800-acre drainage along the main-stem Coquille River in Coos County, Oregon. CDD contains 11.4 miles of coho salmon habitat and 490 acres of tidal wetland habitat, of which 289 acres are restored wetlands protected in perpetuity by ODFW. However, this area has been converted from its historic state by clearing, leveeing, tidegating, and draining for agricultural purposes. These actions have led to the degradation of tidal wetland habitats and/or restricted access to remaining wetland and tidal channel habitats for juvenile coho and Chinook salmon, as well as other species. Lack of slow-water refugia and off-channel habitat is a critical limiting factor affecting Oregon Coast coho populations with the access and restoration of tidal wetlands being a top priority action for recovery. To address these limiting factors, CoqWA has partnered with CDD, The Bridges Foundation, private landowners, ODFW, Coquille Indian Tribe (CIT), and the Coos Soil and Water Conservation District (CoosSWCD), with the assistance of River Design Group (RDG) and Nehalem Marine to implement a working lands restoration project that promotes ecological, economic, and social resiliency in the Coquille watershed.

This project will improve fish passage and restore hydrologic connectivity by replacing current deleterious infrastructure with three 8’x10’ box culverts, each fitted with an aluminum side-hinged tide gate and Muted Tidal Regulators to control upstream inundation and duration of gate door openness. Specifically, OWEB funds with match funds from ODFW, will pay for tide gate replacement actions, CoqWA staff time & mileage, project manager materials, and videography during implementation. A previously awarded OWEB grant, along with leveraged funds from CIT and Wild Rivers Coast Alliance (WRCA), will pay for replacement of a farm access bridge downstream of the tide gate, channel enhancements, and riparian enhancements.

Review Team Evaluation

Strengths

- The project design is technically sound and is likely to succeed in restoring fish passage for juvenile salmonids at the Coaledo tide gate. The design approach resulted from two OWEB Technical Assistance grants.

- The tide gate replacement will compliment nearby riparian planting and fencing projects. Restoring a more natural tidal exchange regime improves water quality by reducing stagnant water that normally pools behind poorly functioning tide gates. The water quality improvements from these projects collectively support TMDL plan implementation.
- Restoring fish passage to tidal wetlands is identified as a top priority action for coho recovery. Off-channel winter habitat located in tidally influenced lowland is important to ESA-listed coho and other species' life histories by providing critical habitat for over-wintering survival.
- The project leverages multiple nearby tide gate replacement and off-channel habitat projects that will collectively increase the footprint of available coho habitat, expanding on the 400 acres of restored tidal wetland from the China Camp Creek tide gate replacement project.
- The applicant has experience working in tidally influenced agricultural areas and adapted lessons learned from previous tide gate replacements into the project approach.
- The project team includes qualified professionals with relevant experience.
- ODFW, the largest landowner in the project footprint, is tasked with operation of the water management plan, which is critical to managing the area for maximum fisheries benefits.
- The project is ready for implementation with engineering designs, permits, and cost estimates.
- The budget incorporates the likely potential for inflation to increase project costs before implementation.
- There is a monitoring program that is actively evaluating the effectiveness of replacing tide gates and the use by juvenile salmonids of the habitat made available through these projects.

Concerns

- No significant concerns related to the tide gate replacement were identified during the review.

Concluding Analysis

Eleven miles of coho habitat and 490 acres of tidal wetland habitat will be made more accessible by replacing the Coaledo tide gate in the Coquille River watershed. Critical limiting factors affecting Oregon Coast coho populations will be addressed, including lack of slow-water refugia and off-channel habitat. Improving fish passage and restoring hydrologic connectivity will enhance ecosystem function to one of the largest basins in the freshwater Coquille estuary.

Open Solicitation-2023 Spring Offering
Southwest Oregon (Region 2)

Application Number: 223-2015-23001
Project Type: Restoration
Project Name: Willow Creek Riparian and Instream Restoration 2023
Applicant: Curry SWCD
Region: Southwest Oregon
County: Curry
OWEB Request: $78,847
Total Cost: $142,027

Application Description Willow Creek, a tributary of high importance to anadromous salmonids in the Floras Creek/New River watershed of northern Curry County, was relocated and straightened in the early 20th century to create more workable ground for livestock production. The combination of channel modifications and land clearing throughout the watershed resulted in degraded water quality and fish habitat. Efforts to restore conditions in the Willow Creek watershed began in the mid-1990s and have yielded positive results. The proposed project will build upon past and current efforts to further improve the condition of Willow Creek. The proposed project would yield 1.36 acres of riparian restoration and place eight large wood habitat structures along 0.57 miles of channel located between two recently treated reaches. The combination of these activities would improve water quality and habitat complexity in this vital watershed. Project partners include the Bureau of Land Management, Oregon Department of Agriculture, and landowners.

Review Team Evaluation

Strengths

- The proposed stream habitat improvement and tree planting will compliment nearby instream restoration and riparian plantings and will create habitat connectivity along approximately two stream miles on Willow Creek.
- Restoring the riparian plant community will increase shade that can prevent elevated water temperature and improve water quality, which supports TMDL plan implementation.
- Restoring instream habitat by adding large wood structures in lower Willow Creek will provide spawning and rearing habitat for Chinook, coho, and steelhead. This will address actions identified in a recovery plan for ESA-listed coho.
- The approach to treat invasive plant species on site is based on lessons learned from previous projects in difficult treatment areas that had positive results.
- The fence setbacks will provide a generous buffer for a functioning riparian area to become established. There are long-term plant establishment plans in place to support the vegetation growth until the plant community achieves a free to grow state.
- Alternatives to the proposed approach for wood placement and plantings were considered.
- The project team has experience successfully implementing similar projects and has established working relationships with the landowners.
- Partner support from BLM, ODA, and landowners is demonstrated by match.

Concerns

- Design information provided in the application for the instream wood structures has limited site specific details, such as log placement locations. Clarification was provided during the site visit that demonstrated how installation of the instream structures will fit within the footprint of the riparian restoration activities.
- Additional detail depicting the project activities on the map included in the application would be helpful for understanding the project site and locations of the proposed restoration treatments.

Concluding Analysis

The project builds on relationships developed with private landowners and expands the footprint of riparian and stream restoration in Willow Creek, which is a tributary of Floras Creek. The proposed restoration actions will improve water quality and instream habitat complexity, which will provide habitat benefits for all freshwater stages of salmonid life cycles.

Open Solicitation-2023 Spring Offering
Southwest Oregon (Region 2)

Application Number: 223-2016-23007
Project Type: Restoration
Project Name: Smith River Basin: High Priority Passage Improvements
Applicant: Smith River WC
Region: Southwest Oregon
County: Douglas
OWEB Request: $444,178
Total Cost: $2,296,682

Application Description

This project will take place at three separate locations within the Smith River Basin: Coon, Sweden, and Herb Creek. These three streams lie within neighboring 6th field subbasins, the West Fork Smith River (Coon) and South Sister Creek (Sweden & Herb). All project sites possess poorly functioning fish passage infrastructure, featuring undersized culverts and/or associated passage inhibiting instream concrete weirs. These structures limit anadromous fish passage at multiple life stages, reduce habitat connectivity, and impede natural stream fluxes and function.

The Smith River Watershed Council (SRWC) proposes to remove, replace, or modify a combined 11 barriers to fish passage between the project locations. SRWC has contracted River Design Group (RDG) to produce engineered designs for the placement of passage structures meeting ARBO II criteria, as well as all state and federal requirements at all three project locations. These designs include provisions for new bridge installations which will replace existing culverts, as well as removal or modification of associated instream concrete weirs. Additionally, RDG's drawings will include plans for the placement of either a nature-like fishway or instream large wood placements to act as grade control structures after the removal of culvert associated weirs.

Project partners include: Bureau of Land Management, Coquille Indian Tribe, Pacific Lamprey Conservation Initiative, Oregon Department of Fish and Wildlife, Oregon Department of Transportation, River Design Group, and Roseburg Resources Co.

Review Team Evaluation

Strengths

- Eleven fish passage barriers will be removed, modified, or replaced in the Smith River basin to improve access to 56 miles of spawning and rearing habitat important to chinook, ESA-listed coho, steelhead, and Pacific lamprey.
- Improving fish passage leverages significant investments in instream improvement activities implemented throughout the watershed by providing unimpeded access to restored stream habitat.

- The project team is experienced in restoration and includes the Bureau of Land Management, the Coquille Indian Tribe, The Pacific Lamprey Conservation Initiative, Oregon Department of Fish and Wildlife (ODFW), Oregon Department of Transportation, River Design Group, and Roseburg Resources Company.
- The project is ready for implementation with significant funding secured from a diversity of sources.
- The West Fork Smith River has an established ODFW Life Cycle Monitoring site that provides a long-term data set documenting fish usage. This information will be used to illustrate the impacts from improving fish passage on salmonid populations.

Concerns

- Final design work is not completed. Clarifying information was provided during the site visit indicating the designs are on track for completion by the 2024 instream work window.
- Additional details regarding revegetation efforts to reduce erosion following construction would be helpful to evaluate whether planting plans are adequate for stabilizing the site.

Concluding Analysis

Addressing fish passage barriers restores natural ecosystems processes beneficial to aquatic life, including improved sediment transfer, access to spawning habitat, expanded forage opportunities, and access to thermal refugia during summer months. Improving fish access to upstream stream reaches with quality habitat and cool water refugia is critical to protecting and restoring salmonid populations.

Open Solicitation-2023 Spring Offering
Southwest Oregon (Region 2)

Application Number: 223-2017-22996
Project Type: Technical Assistance
Project Name: Smith River Basin: High Priority Passage Design
Applicant: Smith River WC
Region: Southwest Oregon
County: Douglas
OWEB Request: $71,934
Total Cost: $313,543

Application Description

This project encompasses passage improvement design work at three streams within the Smith River Basin: Gold Creek, Vincent Creek, and Blackwell Creek. Gold Creek is the largest tributary of the West Fork Smith River, located 42 miles east of Reedsport Oregon. Blackwell and Vincent Creek are both tributaries to the main stem Smith River, 35 and 31 miles east of Reedsport respectively. The Smith River Watershed Council (SRWC) is seeking funding to address fish passage issues at five undersized and restrictive culverts. In addition to culvert replacement, designs will include the removal of three associated structures (two concrete weirs, and one high-gradient fish ladder). These underperforming passage structures restrict salmonid and native fish passage at all life stages, interfere with sediment transfer, and also threaten important junctions of Bureau of Land Management (BLM) road network used for local economic and recreational purposes. Funding would be utilized to contract an engineering firm to produce complete designs which incorporate all aspects of removal of legacy structures and installation of structures which meet all state and federal fish passage criteria.
Project partners include: Bureau of Land Management Coos Bay District, Oregon Department of Fish and Wildlife, National Fish and Wildlife Foundation, and Roseburg Resources Co.

Review Team Evaluation

Strengths

- The proposal clearly illustrates the need for engineered designs that address fish passage at five locations in the Smith River Basin with undersized culverts and associated concrete weirs.
- The resulting restoration will target critical habitat for ESA-listed coho, chinook, and steelhead. The project area also has stream reaches listed on the Department of Environmental Quality’s 303(d) list for temperature impairment.
- The project team is experienced in successfully using OWEB Technical Assistance projects to develop viable designs for addressing fish passage impairments.
- Addressing the passage barriers will restore a more natural sediment transport regime and improve habitat connectivity on three streams in the Smith River Basin.
- Project costs are appropriate for the work proposed.

Concerns

- Additional information describing evidence used to determine there is a potential threat for roadway infrastructure failure would be helpful to better understand the extent to which the selected culverts are a priority for replacement.

Concluding Analysis

The project builds on current momentum to improve fish passage throughout the Smith River Basin that is also leveraging significant investments in stream habitat improvement. The future restoration project will increase habitat connectivity for ESA-listed salmon species by improving access to approximately eight miles of aquatic habitat.

Open Solicitation-2023 Spring Offering
Southwest Oregon (Region 2)

Application Number: 223-2018-23012
Project Type: Technical Assistance
Project Name: Pipe Fork Land Purchase Assistance
Applicant: Williams Community Forest Project
Region: Southwest Oregon
County: Josephine
OWEB Request: $33,880
Total Cost: $48,530

Application Description The Pipe Fork property is a 320 acre land parcel containing a high quality Port Orford cedar and Old Growth sanctuary that is being sold by the Josephine County, facilitated by the Williams Community Forest Project. Pipe Fork Creek flows from springs on the side of Grayback Mountain down through a lush canyon and over several waterfalls on the Pipe Fork property.
Technical Assistance is needed to obtain a land sale contract, complete a Yellow Book Appraisal for due diligence to satisfy the purchase, and for completion and sale costs to The Conservation Fund with a bridge loan. A Yellowbook Appraisal is needed to satisfy timber values, property values, and detailed conditions of the land to be purchased to satisfy the interests of the seller and buyers.
Pipe Fork Creek property has been recently awarded funding to be purchased by a land grant with the US government Land and Water Conservation Fund. It will be placed within the adjacent Pipe Fork Research Natural Area (RNA) for Port Orford cedar through the Bureau of Land Management. BLM currently manages the Pipe Fork Creek RNA for Port Orford cedar adjacent to the property as one of three such areas in Oregon as secluded enclaves of native plants and wildlife surrounding the Port Orford cedar forest complexes. Pipe Fork Creek provides a valuable consistent flow of cool water into the Williams Creek stream system.
This Technical Assistance would provide the funding needed to help negotiate the land purchase from the Josephine County Commissioners and complete the sale and of the land through the many channels it will require.

Review Team Evaluation

Strengths

- The Pipe Fork Creek property has a high conservation value. The old growth forest provides cool water sources for salmon bearing streams of the East Fork Williams Creek and the Williams Valley and diverse habitats that support the easternmost stands of Port Orford cedar in Western Oregon.
- Conducting an appraisal for due diligence is necessary for any purchase of real property.
- Project partners are committed to protecting the conservation value of the property.
- Funding from the federal Land and Water Conservation Fund was awarded to purchase the Pipe Fork Creek property; the proposed technical assistance project will provide an appraisal to determine the property’s fair market value needed to complete this transaction.

- There is a clear potential for timber harvest to occur on the property under the current ownership that would adversely impact forest conditions. Purchase of the property for conservation would eliminate the risk to existing healthy forest conditions.

Concerns

- The application lacks information describing the transaction structure or roles of the parties needed to understand and evaluate the proposed objectives. For example, more detail about the survey and assessment work is needed to understand the deliverables expected from the technical assistance investment.
- It is unclear whether the applicant has relevant experience for completing real estate transactions.
- The application lacks details describing how some of the budgeted costs are directly associated with developing an appraisal. For example, negotiations and closing costs are not typically actions associated with developing an appraisal. Also, the Williams Creek Watershed Council is included in Contracted Services but there is no information explaining what the watershed council will produce as part of the due diligence for purchasing the property.

Concluding Analysis

Purchasing the Pipe Fork Creek Property and transferring it into a long-term conservation land holding will preserve a high-quality Port Orford cedar and old growth forest in the Williams Creek watershed. Obtaining due diligence products is necessary to purchase the property.

Open Solicitation-2023 Spring Offering
Southwest Oregon (Region 2)

Application Number: 223-2019-23024
Project Type: Technical Assistance
Project Name: North Fork Coquille River Subbasin Geomorphic Assessment
Applicant: Coquille Watershed Association
Region: Southwest Oregon
County: Coos
OWEB Request: $74,998
Total Cost: $115,638

Application Description The North Fork Coquille River, located in Coos County, Oregon, is a significant waterway that provides critical habitat for fish and wildlife and serves as the drinking water source for the city of Myrtle Point. Unfortunately, the river is subject to ongoing erosion and sedimentation, which threaten its long-term stability and the health of surrounding ecosystems and agriculture. To better understand the geomorphic processes that govern the river's behavior and develop effective management strategies, a comprehensive survey of the North Fork Coquille River is required. This proposed project aims to perform a detailed geomorphic assessment of the North Fork Coquille River, covering a stretch of approximately 53 miles from the river's headwaters to its confluence with the South Fork Coquille River. The survey will include a range of field-based measurements and an analysis of available data, such as channel cross-sections, bathymetric surveys, bank profiles, and topographic surveys. Additionally, a basin-wide remote assessment will be combined with a geomorphic survey of 9.5 river miles to create a finalized geomorphic analysis. Project partners include the Coquille Indian Tribe, Coos Soil and Water Conservation District, Natural Resource Conservation Service, Oregon Department of Fish and Wildlife, Oregon Department of Agriculture, the City of Myrtle Point, and Business Oregon. The results of this project will be critical for developing effective river management strategies that promote long-term stability and ecological health. Specifically, the survey data will be used to inform the development of sediment management actions, guide habitat restoration efforts, and identify areas of the river that are most vulnerable to erosion and sedimentation.

Review Team Evaluation

Strengths

- A geomorphic assessment will be completed to investigate bank erosion in the North Fork Coquille River. Partners will use this assessment to prioritize restoration actions and design future projects that will improve water quality, fish and wildlife habitat, and watershed health.
- The project approach will factor in past and future climate change conditions.
- The applicant has previous experience utilizing similar stream reach-based assessments to focus restoration on targeting causes rather than symptoms of watershed impacts.
- A clear need for the proposed technical assistance is described in the application, and the project objectives and expected products are clearly defined.

- Previous project evaluation comments are incorporated into the proposed technical assistance approach.
- Partner support is demonstrated by letters from ODFW, BLM, Curry SWCD, City of Myrtle Point, and Coquille Indian Tribe.

Concerns

- Additional information describing how the geomorphic assessment will inform identification, prioritization, and selection of future projects would be helpful for understanding how the product will be used.
- The cost effectiveness of individual activities is difficult to evaluate due to the use of lump sums in the application budget for contracted services.

Concluding Analysis

Understanding the drivers causing erosion impacts to the North Fork Coquille River system will be important to focus efforts on meaningful actions that address the bank erosion. The resulting information will also provide a communication tool for outreach to landowners and the community that can build support for and participation in future restoration. The North Fork Coquille River basin has high salmonid production potential; resulting restoration projects will improve habitat for coho, Chinook, and steelhead.

Open Solicitation-2023 Spring Offering
Southwest Oregon (Region 2)

Application Number: 223-2020-23048
Project Type: Technical Assistance
Project Name: Gold Ray Floodplain Restoration Technical Assistance Project
Applicant: The Freshwater Trust
Region: Southwest Oregon
County: Jackson
OWEB Request: $74,070
Total Cost: $97,070

Application Description The Gold Ray Floodplain Forest is located in Jackson County between the towns of Central Point and Gold Hill. The proposed project area is adjacent to the BLM Upper and Lower Table Rock recreation areas and county and state park lands. In 2009, Jackson County worked with the Rogue Valley Council of Governments (RVCOG) to successfully remove a 30+ foot tall channel spanning dam on the Rogue. The Gold Ray Dam had limited fish passage and held back coarse sediments for nearly a century. Dam removal immediately invigorated river habitat and resulted in fish returning to the hatchery at Lost Creek Dam nearly 1 month earlier than previously reported.

While dam removal improved fish passage and sediment transport processes, the project did not address the 350-acre floodplain forest upstream of the dam. Currently more than 150 acres of the floodplain lack overstory trees and are covered exclusively in invasive blackberry. Where mature overstory trees have persisted, the understory is dominated by invasives, limiting the ability of trees to establish. In addition to degrading the ecological conditions at the site, the high cover of flammable invasive species poses a fire risk.

The Freshwater Trust (TFT) proposes to administer a planning process through which the two primary landowners (Jackson County and Oregon Department of Fish & Wildlife) will identify site specific management and restoration actions that align with the landowners' desired future conditions, develop 10% designs for selected actions, develop the information needed for permitting, and develop cost estimates. This project will set the stage for implementation work on the full 350-acre project area and make it possible for TFT, Rogue River Watershed Council, Jackson Soil and Water Conservation District, RVCOG and other local partners to secure implementation funding and play a variety of roles in implementing the single largest floodplain restoration opportunity in the Rogue basin.

Review Team Evaluation

Strengths

- The project focuses on restoring the footprint from the Gold Ray Dam removal site, which is one of the rare larger connected floodplain areas in the upper Rogue. The application clearly describes the ecological significance of the site, the factors limiting the site's potential, and the importance of the proposed design technical assistance to develop successful restoration approaches.

- The project will address limiting factors identified in several conservation plans and restoration priorities in watershed plans, including the Rogue Restoration Action Plan (2016).
- The design approach is technically sound and appropriate data will be collected to inform designs, including lidar and baseline mapping.
- Landowners will be engaged in identifying actions that align with shared priorities, reviewing the suite of potential future restoration projects, and developing a prioritized list of projects for the design process. This is likely to foster long-term ownership and active management in the success of the future restoration.
- The resulting project will restore natural floodplain function at the Gold Ray Dam removal site and provide water quality and habitat benefits for a variety of native terrestrial, avian, and fish species.
- The project costs are reasonable for the scope of work.
- The project team has relevant experience and knowledge designing and implementing similar restoration.

Concerns

- Restoring floodplain forests will have limited impact on addressing the key limiting factors that threaten coho fish recovery, such as lack of instream habitat. Restoring floodplain forests, however, will still improve terrestrial and aquatic wildlife habitats on the Rogue's largest undeveloped floodplain.
- The project timeline may be ambitious for achieving the goals. Landowner engagement, developing and prioritizing actions, developing initial design approaches, and finalizing restoration plans will be challenging to complete within a one-year timeframe.

Concluding Analysis

When the Gold Ray Dam was removed and water levels in the Rogue River dropped, many of the floodplain trees died. This die-off of the overstory trees allowed increased sunlight at the floodplain forest floor that encouraged weed populations to grow. Currently more than 150 acres of the floodplain lack overstory trees and are covered exclusively in invasive blackberry. Ecological conditions in the project area are degraded and pose a fire risk. Developing designs for priority projects will put the floodplain back on an ecologically functioning and resilient trajectory and improve community safety. Restoration of one of the largest connected floodplains in the upper Rogue will provide a variety of benefits to stream function and the species dependent upon this important habitat type.

Open Solicitation-2023 Spring Offering
Southwest Oregon (Region 2)

Application Number: 223-2021-23050

Project Type: Technical Assistance

Project Name: Laurel Hill Push-Up Dam Fish Passage Project

Applicant: Applegate Partnership, Inc.

Region: Southwest Oregon

County: Josephine

OWEB Request: $75,000

Total Cost: $305,860

Application Description The Laurel Hill Push-Up Dam Fish Passage Project proposes to replace an annually constructed gravel push-up dam with a roughened channel on Williams Creek, near the confluence with the Applegate River. This project proposes to complete designs that will remove the last, most severe barrier, improve streambank stabilization upstream from the point of diversion, and irrigation efficiencies in the delivery of the water on the Bureau of Land Management's (BLM) Provolt Recreation Site. This project is located at river mile 0.1 on the mainstem of Williams Creek, a main tributary to the Applegate River near Provolt, Oregon. Replacement of the annual creek disturbance and nearly full spanning gravel push-up with a roughened channel and new headgate will provide year-round volitional fish migration for all life stages of ESA-listed Coho Salmon, fall Chinook Salmon, summer and winter Steelhead, Trout, and Pacific Lamprey. Williams Creek and its tributaries are among the most important producers of salmon and steelhead in the Applegate River watershed. Laurel Hill Push-Up Dam is listed on the Oregon Department of Fish and Wildlife (ODFW) 2019 Statewide Fish Passage Priority List as the 6th highest priority in the Rogue Basin.

This proposal seeks to address the final major active irrigation point of diversion and fish passage barrier in Williams Creek Watershed, building upon the Lower Bridgepoint Fish Passage Project completed in 2020 (OWEB grant 220-2015), and the Watts Toppin Fish Passage Project scheduled for implementation summer 2023. These projects are all within the lower two miles of Williams Creek and are similar in scale. Together, they will provide uninhibited access to valuable upstream spawning and rearing habitat. Project partners include Laurel Hill Ditch Association (LHDA), Rogue Basin Partnership (RBP), BLM, Williams Cr Watershed Council, and ODFW.

Review Team Evaluation

Strengths

- The application describes a clear need for designs to replace an annually constructed gravel push-up dam with a roughened channel on Williams Creek, near the confluence with the Applegate River. The designs will include improvements to the irrigation conveyance system that will be more efficient, reduce the quantity of diverted water, and allow more water to remain instream.

- The project will provide uninhibited access to critical rearing and cold water refugia habitat for steelhead, cutthroat, Pacific lamprey, and ESA-listed coho.
- Limiting factors affecting ESA-listed Coho identified in NOAA's 2014 Final Recovery Plan for the Southern Oregon/Northern California Coast (SONCC) will be addressed.
- The project partners have considered a range of alternatives to address the complex situation at the site related to the combination of the water diversion network, the seasonal push up dam height, and the stream gradient.
- The project will build habitat connectivity with upstream fish passage improvement projects and extends the footprint of neighboring BLM projects targeting side-channel habitat development and riparian health.
- Project costs are appropriate for the proposed design work.
- The project is timely with support from the Laurel Hill Ditch Company, the principal water users, along with agencies and other key partners, including Laurel Hill Ditch Association, Rogue Basin Partnership, BLM, Williams Creek Watershed Council, and ODFW. The range of support coming together presents an urgency for developing a solution that addresses the passage and diversion issues where previous efforts failed due to the lack of cooperation and support that exists now.
- The applicant is experienced in working on complex fish passage projects with water users and has incorporated lessons learned from past projects.

Concerns

- The landowner support letters are only for passage design and lack evidence indicating support for future water conservation expected from the improvements to the irrigation ditch system.

Concluding Analysis

Williams Creek and its tributaries are among the most important producers of salmon and steelhead in the Applegate River watershed. The future restoration project will improve the survival and growth of juvenile Coho salmon and steelhead by providing access to summer and winter rearing habitat, reducing water temperatures, and limiting water withdrawals. Improving fish passage at Laurel Hill Dam will facilitate access to habitat that has been restored and enhanced through over ten years of in-stream habitat restoration projects. The project is likely to succeed with momentum generated by project support from the irrigators.

Open Solicitation-2023 Spring Offering
Southwest Oregon (Region 2)

Application Number: 223-2022-23052

Project Type: Technical Assistance

Project Name: Cheney Creek - Fish Hatchery Road Culvert Replacement

Applicant: Applegate Partnership, Inc.

Region: Southwest Oregon

County: Josephine

OWEB Request: $75,000

Total Cost: $382,344

Application Description This project addresses the need for fish passage improvement at the Fish Hatchery Road Culvert on Cheney Creek, a main tributary to the Applegate River near Grants Pass, Oregon and public safety on Fish Hatchery Road. This project will remove a fish passage barrier on Cheney Creek by replacing an undersized box culvert on Fish Hatchery Road with a bridge. The 6 miles of high-quality upstream habitat provides critical spawning and rearing habitat for ESA-listed Coho Salmon, Chinook Salmon, Steelhead Trout, Coastal Cutthroat Trout, and Pacific Lamprey. Cheney Creek is a cold water refuge. These streams are increasingly important for survival as river temperatures rise in the summer months. This project complements Chinook and Coho restoration efforts ongoing throughout the Rogue Basin as well as general watershed restoration efforts within the Cheney Creek watershed by BLM and APWC. Engineering designs for the box culvert replacement will be developed by Josephine County and a contracted bridge construction firm. The designs will allow fish passage through a fully passable bridge design and the road realignment will improve public safety at a location known for vehicle accidents. Project partners include: Josephine County, BLM, Rogue Basin Partnership, and ODFW. This application will provide match funding for ODFW's application to the National Culvert Removal, Replacement, and Restoration Grant Program.

Review Team Evaluation

Strengths

- Designs will be developed to improve fish passage at Fish Hatchery Road Culvert in Cheney Creek, a tributary in the lower Applegate River.
- Limiting factors affecting ESA-listed Coho identified in NOAA's 2014 Final Recovery Plan for the Southern Oregon/Northern California Coast (SONCC) will be addressed.
- The project will benefit ESA-listed coho by improving access to six miles of upstream cold-water refugia.
- Passage improvement will leverage upstream instream habitat projects implemented by BLM.
- Partner support is demonstrated by letters included in the application from Josephine County, BLM, Rogue Basin Partnership, and ODFW.
- Project partners have the technical expertise needed to effectively design the restoration.
- A range of alternatives will be considered for the site conditions.
- The applicant is pursuing federal highway funding to implement the project.

Concerns

- An additional map that places the project area in the broader Cheney Creek geography would be helpful for understanding the larger watershed context for the project.

Concluding Analysis

Restoring access to stream habitat is vital to maintaining resilient populations of native fish species. Cheney Creek is a cold-water refuge. The high-quality upstream habitat provides critical spawning and rearing habitat for ESA-listed coho, Chinook, steelhead, Coastal Cutthroat Trout, and Pacific Lamprey. These streams are increasingly important for survival as river temperatures rise in the summer months.

Open Solicitation-2023 Spring Offering
Southwest Oregon (Region 2)

Application Number: 223-2023-23063
Project Type: Technical Assistance
Project Name: Iron Creek Fish Passage Project
Applicant: Applegate Partnership, Inc.
Region: Southwest Oregon
County: Josephine
OWEB Request: $75,000
Total Cost: $233,844

Application Description This project addresses the need for fish passage improvement at the Southside Road Culvert on Iron Creek, a tributary to the Applegate River near Grants Pass, Oregon at Southside Road. This project will remove a barrier that is on the Statewide Fish Passage Priority List on Iron Creek by replacing an undersized box culvert on with a bridge. The 2 miles of high-quality upstream habitat provides critical spawning and rearing habitat for ESA-listed Coho Salmon, Steelhead Trout, and Coastal Cutthroat Trout. Iron Creek is a cold water refuge. These streams are increasingly important for survival as river temperatures rise in the summer months. This project complements Coho restoration efforts ongoing throughout the Rogue Basin. Engineering designs for the box culvert replacement will be developed by Josephine County and a contracted bridge construction firm. Project partners include: Josephine County, BLM, Rogue Basin Partnership, and ODFW. This application will provide match funding for ODFW's application to the National Culvert Removal, Replacement, and Restoration Grant Program.

Review Team Evaluation

Strengths

- A technically sound approach will be used to develop fish passage improvement designs at the Southside Road Culvert on Iron Creek, a tributary to the Applegate River.
- The existing culvert hinders fish access to two miles of habitat with high intrinsic potential. Addressing passage will provide cutthroat trout, steelhead, and ESA-listed coho access to cold water refugia.
- The application describes a clear need for technical assistance funding to support project design.
- The project partners have considered a range of alternatives to address the complex situation at the site resulting from the road location on top of the culvert and the positioning of the structure on a bedrock drop with no jump pool for fish.
- Partner support is demonstrated by letters included in the application from Josephine County, BLM, Rogue Basin Partnership, and ODFW.
- Costs are reasonable for the scope of work presented in the application.
- The applicant is leveraging technical resources and diverse funding sources to increase the likelihood of success in completing the design and restoration products.

Concerns

- An additional map that places the project area in the broader Iron Creek geography would be helpful for understanding the larger watershed context for the project.
- Some information in the application about fish benefits may not be applicable to the project because it appears to be pasted from other applications.

Concluding Analysis

Developing designs to improve fish passage in Iron Creek will improve access to high-quality cold-water habitats in this perennial stream that is critical to the protection and recovery of salmonids and trout species in the Rogue River system. Restoring access to stream habitat is vital to maintaining resilient populations of native fish species. Iron Creek is a cold-water refuge. The high-quality upstream habitat provides critical spawning and rearing habitat for ESA-listed coho, Chinook, steelhead, coastal cutthroat trout, and Pacific lamprey. These streams are increasingly important for survival as river temperatures rise in the summer months.

Open Solicitation-2023 Spring Offering
Southwest Oregon (Region 2)

Application Number: 223-2024-23065
Project Type: Technical Assistance
Project Name: Siskiyou Field Institute Meadow & Riparian Restoration
Applicant: Siskiyou Field Institute
Region: Southwest Oregon
County: Josephine
OWEB Request: $55,691
Total Cost: $69,614

Application Description This project is located at the Siskiyou Field Institute (SFI) in Josephine County, Selma, Oregon, approximately 2.5 miles upstream from the confluence of Deer Creek and the Illinois River. The property spans 850 acres and includes nearly one mile of frontage with Deer Creek and nearly 20% of the Takelma Creek watershed. The location, size, water rights, unique plant communities, and riparian restoration potential make SFI a key location for conservation, connectivity, and positive impact on Deer Creek summer flows, temperature regulation, aquatic habitat, and community access. As SFI has recently submitted an updated draft management plan to OWEB that includes new baseline assessments of stream, riparian, and upland vegetation conditions, and prioritization and planning of key projects to be accomplished in the next 5 to 20 years, the focus now turns to the task of restoration design beginning with our lower 140-acre meadow complex along Deer Creek. The meadow complex has become increasingly dominated by pasture grasses and ODA priority noxious weeds that require aggressive treatment and two severely incised unnamed tributaries to Deer Creek that have been highly impacted by years of cattle grazing. The proposed Technical Assistance deliverables include 1) a technical design that would return a suite of species and habitat types that have otherwise become quite
rare on the regional landscape, 2) The development of a multi-agency Technical Review Team to assist with restoration planning and implementation, and 3) prioritized restoration projects with preliminary conceptual designs including a focus on community access and participation. Sound management and restoration directives and committed partners set the stage for future restoration implementation. Project partners include Rogue Basin Partnership, USFWS Partners Program, The Understory Initiative, BLM, USFS, Trout Unlimited, Oregon Department of Forestry, Lomakatsi, and private restoration consultants.

Review Team Evaluation

Strengths

- The application describes a clear need for the technical assistance design capacity to develop restoration actions identified in the conservation easement and management plan for the Siskiyou Field Institute (SFI) conservation property.
- The project site is protected by a conservation easement that will ensure long-term protection and maintenance of investments in habitat restoration.

- The property has significant ecological importance and has a high potential for restoring a functional riparian area and historic upland oak meadow habitats.
- Restoration progress on the SFI property is demonstrated by the development of a management plan and removal of an old diversion structure on Takelma Creek during summer 2023.

Concerns

- Including a detailed work plan for the restoration design contractor line item in the budget would be helpful for understanding the expected outcomes from this cost.
- It is unclear who will serve on the technical advisory team described in objective one of the application. The application lacks information describing the affiliation of the team members and there is no documentation in the budget or match sections indicating a commitment to participate in the project. Information describing the technical advisory team membership is needed to determine whether appropriate expertise will be engaged in the project.
- Additional detail describing the proposed survey and assessment tasks is needed to determine whether appropriate data will be collected to inform project designs. For example, a description of the habitat and species to be targeted and the data to be collected is needed to evaluate whether the design product is likely to effectively address factors limiting habitat potential.
- The objectives are described as general process steps instead of detailed deliverables. For example, there is no clearly stated product described in objective three for reducing the impacts from invasive weeds, such as a prescription for treating target invasive weed species along with a planting and plant establishment plan. The number and wide distribution of invasive weed species is a clear threat to the property. A coordinated, long-term plan and commitment to control them will be necessary for restoring native plant communities. It is not clear if this project will produce a framework for addressing invasive plant species on the property.
- It is unclear if the instream habitat design approach for objective four is site appropriate without details indicating where large wood structures and beaver dam analogs will be placed.
- Understanding the larger long-term goals for the property would inform the review regarding proposed design and treatment approaches and whether they are site appropriate and likely to achieve those goals.
- The budget has lump sums that lacks details needed to determine if the tasks and activities are appropriate based on the estimated costs.

Concluding Analysis

The property owned and managed by SFI provides an important opportunity to restore historic ecosystems at a location that can be used for outreach to other landowners in the area. While a Technical Assistance grant is needed to provide capacity for developing technically sound restoration designs, the application lacks details needed to evaluate the likelihood for the project to succeed.

Open Solicitation-2023 Spring Offering
Southwest Oregon (Region 2)

Application Number: 223-2025-22963
Project Type: Monitoring
Project Name: Basin Wide Temperature Monitoring of the Coquille
Applicant: Coquille Watershed Association
Region: Southwest Oregon
County: Coos
OWEB Request: $120,489
Total Cost: $174,821

Application Description The proposed Basin Wide Temperature Monitoring of the Coquille is located in Coos County on the Mid-South coast and will determine the spatial and temporal temperature regime of the Coquille Watershed to support management of anadromous fishes and further watershed restoration prioritization that was started by the Coquille Coho Strategic Action Plan (Coquille SAP). The Coquille is lacking in long-term, widespread temperature monitoring data. This lack of data is leading to an incomplete picture of water temperatures in the Coquille Basin and is impacting the ability of the Coquille Watershed Association (CoqWA) and partners to develop effective management strategies. Without a clear understanding of water temperatures across the Coquille River, it is impossible to prioritize restoration and conservation efforts in a way that optimizes their impact. Therefore, a secondary goal is to provide a comprehensive temperature dataset that will be useful to other stakeholders and resource managers.

The proposed basin wide temperature monitoring project will partner with the Coquille Indian Tribe (CIT) and Oregon Department of Fish and Wildlife (ODFW) to deploy 80 temperature loggers throughout the basin for a 3-year period. Temperature will be collected year-round at 15 locations with the remaining being paired logger locations to identify cold-water sources. Discharge measurements will also occur during the summer, low-flow field audits. Results will be distributed in an annual report and data will be available through ArcGIS Online. Additional project partners: BLM, USFS, CoosSWCD.

Monitoring Team Evaluation

Monitoring Team Strengths

- This monitoring project will fill spatial data gaps associated with the existing monitoring network that the Coos SWCD and Coquille Indian Tribe (CIT) operates and builds on the water temperature monitoring effort initiated by ODFW in 2022.
- The application’s monitoring questions are clear and the proposed monitoring methods they will follow are standardized procedures that enables them to collect the data to answer their questions.
- The study design pairs known tributaries with mainstem Coquille River locations to systemically identify cold water sources across the watershed.

- The applicant's definition of cold-water sources provides clarity on how they will be able to apply the data to answer their monitoring questions.
- The applicant will visit sites in August to measure tributary streamflow to quantify the cold-water source each stream is contributing to the mainstem.
- This project will use an electronic survey form developed in Survey 123 to minimize transcription errors and save time when uploading the field data into the database.
- The applicant will use R or Matlab to perform analyses to generate water temperature metrics and assess if the sites meet the cold-water source criteria to rank sites by the quantity of cold water each tributary is contributing in August.
- The data will be uploaded to DEQ to make the data publicly available and will develop a public facing Arc GIS Online map to make the data and site available to partners and interested parties.
- The applicant will write a report which will be distributed to the Coquille Strategic Action Plan team to help in the review and ground-truthing of their restoration priorities plan.
- The applicant and contributing partners all have experience collecting continuous water temperature and related field data in this basin.
- The applicant is working with technical experts and community that are part of the existing Coquille Strategic Action Plan team comprised of ODFW, BLM, NRCS, DEQ, CIT, Coos SWCD, Coquille Watershed Association, The Nature Conservancy and the Wild Salmon Center.
- The budget details the expenses needed for staff time by different tasks to complete the project as proposed.

Monitoring Team Concerns

- It is not clear if the applicant will incorporate the Coos SWCD's water temperature data into their database and into their data analyses.
- The application states the sites were prioritized from information in their action plan but lacked details on how that was done given the large watershed they are working in.
- The application didn't describe the rationale to understand why some sites are monitored year-round and others are only monitored seasonally.
- It was not clear if the applicant will reduce the large number of monitoring sites over time once they analyze the data to understand how dynamic the water temperature conditions are across the watershed.

Monitoring Team Comments

Review Team Evaluation

Strengths

- The proposed basin-wide water temperature monitoring will provide a better understanding of the spatial and temporal temperature regime in the Coquille Watershed that will be used to prioritize watershed restoration.
- The monitoring data will be used to support implementation of the coastal coho strategic action plan. Water temperature is a key limiting factor for ESA-listed coho, and the data will provide a better understanding of the range of its impacts on fish.

- The data will inform upcoming Total Daily Maximum Load development and associated restoration actions.
- The proposal has clear measurable and achievable objectives.
- Including water discharge measurements will improve analysis of temperature data.
- The project complements other current monitoring work by the applicant and project partners.
- Partner support is demonstrated by letters included in the application from Coquille Indian Tribe, BLM, USFS, Coos SWCD, and ODFW.
- The monitoring effort leverages ODFW work related to core cold water areas.
- The project will complement existing water temperature data and current monitoring efforts in the Coquille basin by expanding the geographic range of the data collected and increasing the level of partner coordination in deploying sensors.
- The applicant is qualified to do the work and has a track record with similar monitoring projects. The applicant also has a history of sharing and utilizing data collected to inform restoration actions.

Concerns

- It is unclear if ODFW is using a different stream temperature monitoring protocol than the one described in the application. The applicant should confer with ODFW on measurement protocols, especially for comparing monitoring data in larger river areas.
- Without information in the application describing the protocol that will be used to create discharge measurements, it is unclear whether professionally accepted monitoring methods will be used to collect this data.
- Measuring water temperature at 15-minute intervals will create a large amount of data that will require significant time to analyze and this additional data may not provide more insight into water quality conditions compared to less frequent monitoring intervals.

Concluding Analysis

A clear understanding of water temperatures across the Coquille River is needed to prioritize restoration and conservation efforts in a way that optimizes their impact. A comprehensive dataset will support science-based decision making to restore or conserve healthy water temperatures for native fish through projects such as riparian fencing and planting, creating off-channel habitat, and placing logs and boulders for pool habitat. Climate change is expected to increase water temperatures across the Coquille River, identifying current cold-water sources and prioritizing efforts to create thermal refugia into the future is vitally important.

Open Solicitation-2023 Spring Offering
Southwest Oregon (Region 2)

Application Number: 223-2026-22967
Project Type: Monitoring
Project Name: Benson and Big Wetland Restoration Project Monitoring
Applicant: Cascade Pacific RC&D
Region: Southwest Oregon
County: Coos
OWEB Request: $106,739
Total Cost: $177,878

Application Description The Tenmile Lakes area is a unique and significant watershed in regards to water quality, Coho productivity, and economically and socially to several Southern Oregon coastal region.
In the Tenmile basin, agricultural land-use is just 4% of the land-use in the watershed but our studies reveal that 100% of the historical wetlands were drained for agricultural land use, creating the largest and longest negative impact to native fish habitat and water quality in the basin. The Tenmile Lakes Steering Committee that includes Coos County, CTCLSUI, ODFW, DSL, ODEQ, City of Lakeside, WRLT, and TLBP developed the Tenmile Lakes Native Fish and Water Quality Restoration Plan (TLBP 2021) which prioritized wetland restoration within the priority tributaries of Big, Benson, and Johnson, above where they join the Lakes. In 2022, Partners were awarded funding from multiple sources and in-kind donations to implement the Big and Benson Wetland Restoration Projects. These two project will restore a total of 117 acres of palustrine emergent wetlands in the Tenmile Watershed.
Partners are seeking OWEB Monitoring funding to update our Tenmile Lakes Quality Assurance Project Plan (TLBP 2014) and implement on-the- ground effectiveness monitoring of the Big and Benson Creek wetland restoration project sites. This monitoring will track key channel and vegetation metric over time which will provide essential information for our wetland restoration and planting designs in the basin and the region.. OWEB funds will be utilized to support a Monitoring Field Technician, mileage, report supplies, Aerial Drone Surveys, and grant administration.

Monitoring Team Evaluation

Monitoring Team Strengths

- This project will monitor the effects of restoration that is aimed at addressing limiting factors that currently impact the water quality and native fish in the lake.
- This project will complement the historic data that has been collected at these sites.
- This resubmitted application has been revised based on the feedback from the review teams and has focused the monitoring to be a much simpler approach than previously proposed.
- The applicant will revise an existing quality assurance document and finish drafting a monitoring plan with these funds.

- The water quality data will be reviewed by the steering committee before being submitted to DEQ and a report will be made available on the applicant's website and uploaded to ODFW's data clearinghouse.
- The applicant has engaged community partners and technical experts by convening the Tenmile Water Quality Steering Committee, a group of local and state leaders which will help in reviewing the data and interpreting the results.
- The applicant has collected similar data in the past as part of a large-scale monitoring effort and their partners have experience collecting and reviewing similar data.

Monitoring Team Concerns

- The application doesn't include a monitoring question to understand what they hope to learn from the grab water quality monitoring component.
- The water quality sampling frequency (quarterly) grab sampling is not likely to provide enough information to evaluate the effects of the restoration projects.
- The application proposes to use methods based on vegetation surveys described in Roegner et al. 2008 and will be adapted to the wetland project characteristics but it was not clear what kind of adjustments would be needed or if this citation for monitoring tidally influenced wetlands is applicable to this project.
- The project will be implemented by a technician that will be hired if the project is funded and it was not clear how much training and supervision, they will have to implement the project as proposed.
- The application doesn't describe how they are tracking or estimating streamflow which may greatly influence the monitoring results and the impact of the restoration actions. This information is described briefly in the attached monitoring plan.
- Parts of the application were confusing to understand the need to finalize the draft monitoring plan that is attached that includes monitoring in the lake that is not related to the effectiveness proposed in this application.
- The application lacks detail on how the ground and drone-based data will be analyzed to detect changes over time to answer the monitoring question posed in the application.
- It was not clear if the budget is adequate to complete the analysis and reporting of the drone imagery.

Monitoring Team Comments

Review Team Evaluation

Strengths

- Tenmile Lakes Basin partnership has successfully implemented other large scale water quality and project effectiveness monitoring projects in the past.
- The proposed monitoring will provide data for evaluating the effectiveness of a project funded by an OWEB restoration grant. Data will be collected to document stream channel and vegetation responses to restoration treatments at two large historic wetland complexes located at the confluence of two main tributaries with Tenmile Lakes. The restoration actions are expected to provide important rearing habitat for ESA-listed coho, improve water quality through sediment filtering and temperature reduction, and restore wetland functions.

- The Tenmile Lakes watershed has a large beaver population that will likely move into the new habitat, collecting monitoring information in the restored wetland may provide a better understanding of responses to habitat changes.

Concerns

- It is unclear if the project timeline aligns with the proposed wetland restoration and will allow time to collect pre-project data.
- The monitoring protocols provided in the application lack information describing how data will be used to inform restoration.
- Additional information is needed to understand the technical soundness of the proposed vegetation survey protocols that are modified from professionally accepted methods to evaluate the constructed wetlands.
- The application lacks details describing the qualifications of the new monitoring technician. This position is key to the success of the project and additional information is needed to determine whether appropriate technical expertise will be engaged in the project.

Concluding Analysis

Nearly three million dollars has been awarded to restore 117 acres of wetlands in the Tenmile Lakes area. Monitoring the effectiveness of this restoration investment may be helpful to inform future projects restoring pasturelands to wetland complexes that existed prior to land uses that drained and channelized these wetlands. The application lacks information needed to determine whether the proposed monitoring is likely to succeed in documenting restoration effectiveness.

Open Solicitation-2023 Spring Offering
Southwest Oregon (Region 2)

Application Number: 223-2027-23023
Project Type: Monitoring
Project Name: IVWC Passive WQM 2024-25
Applicant: Illinois Valley WC
Region: Southwest Oregon
County: Josephine
OWEB Request: $156,836
Total Cost: $231,215

Application Description There is currently little water quality data on the Illinois River Basin located in Josephine County in southwestern Oregon. Illinois Valley Watershed Council (IVWC) proposes to address this paucity of water quality information by conducting water quality monitoring in the basin (HUC 17100311). The lack of water quality data makes it difficult for IVWC and other organizations in the area to make decisions, plan efforts, and/or evaluate the efficacy of projects generally. Specifically, IVWC would use water quality data to guide restoration efforts, design and implement a Pesticide Management Plan, engage with partners to write an updated Watershed Assessment Report, implement pollution control efforts, and engage local stakeholders.

IVWC's proposal is to strategically deploy passive monitoring units at 10 sites in the mainstem and tributaries of the Illinois River. USGS will process the field-deployed passive samplers, conduct the chemical analyses, calculate time-weighted average water concentrations of detected chemicals, provide interim reports as new results are available, and assist with data interpretation. IVWC will then conduct public engagement activities in collaboration with IVSWCD to disseminate results of water quality monitoring in the basin.

IVWC has collaboratively designed this project proposal in order to create a robust baseline dataset for the Illinois River Basin. Project partners include Illinois Valley Soil and Water Conservation District (IVSWCD), Oregon Department of Environmental Quality (DEQ), United States Geological Survey Columbia Environmental Research Center (USGS CERC), and the Integrated Ecology Research Center.

Monitoring Team Evaluation

Monitoring Team Strengths

- The applicant will coordinate this monitoring project with the Illinois Valley SWCD's current and planned water quality monitoring efforts.
- The applicant will follow quality assurance and quality control procedures that have been established by the USGS to deploy and retrieve the passive samplers.
- The applicant will develop a sampling and analysis plan in coordination with the USGS and submit it to DEQ for review.

- The applicant described the timing of the sampling which is largely based on streamflow and the likelihood of detecting presence of toxins in the watershed.
- The applicant is coordinating with the USGS staff that is highly qualified and will be training the applicant to deploy and retrieve the samplers.
- The USGS will process the samplers to analyze for the presence of toxins and assist the applicant in analyzing the data and interpreting the results.
- The data will be available in USGS's online data portal Science Base and submitted to DEQ.
- Results will be included in a GIS story map to make the data available to engage the general public.
- The application includes several letters of support that demonstrate the applicant has engaged the partners in the community and they are interested in the data that will be gathered.

Monitoring Team Concerns

- It is not clear if the sampling sites in this proposal are located near the SWCD's water quality monitoring sites to determine how the results can be integrated to characterize the watershed conditions.
- The applicant is relying on the USGS to manage, analyze and report the data and the application included little details on how that would be done to answer the monitoring questions posed in the application.
- The application describes the importance of collecting water temperature and streamflow data but lacked detail on how this data would be collected and incorporated into the data analyses.
- The application described the study design for the deployment of two different passive samplers across different seasons in 2024 but there was little information to understand the study design that resulted in a highly reduced monitoring effort in 2025 with fewer sites and use of one type of passive sampler.
- The narrative description of the 2025 monitoring effort is not consistent with the expenses estimated in the budget.
- The budget includes funding for two flow meters and the lack of information on stream flow monitoring methods in the application makes it challenging to determine if this proposed cost is appropriate to accomplish objective 1.
- It was not clear if the budget and timeline includes the activities to complete objective 3 to develop a pesticide management plan, update the watershed assessment report and prioritize restoration actions.

Monitoring Team Comments

Review Team Evaluation

Strengths

- Baseline water quality monitoring data will be collected in the Illinois River Basin that will be used to inform future riparian restoration projects.
- Data collected will inform Oregon Department of Agriculture and the Department of Environmental Quality's (DEQ) pesticide stewardship programs by providing water quality information in an area where there is currently little water quality data.

- Water quality impacts ESA-listed coho and other aquatic species. Additional information on existing conditions and locations where water quality is impaired will help with prioritizing restoration and outreach efforts.
- The applicant is working with United States Geological Survey and DEQ to establish a sample collection protocol.
- The methods described for detecting pesticide is technically sound.
- The United States Geological Survey input and oversight will provide capacity and appropriate technical expertise needed to implement the monitoring.
- The application includes a wide array of support letters that demonstrate the need and community support for the monitoring project.

Concerns

- It is unclear how sampling site locations were chosen. More detail in the application is needed to evaluate whether sampling locations is likely to provide information needed to accurately identify pollution sources and isolate the source points.
- Additional detail on how the data will be collected and analyzed is needed to evaluate the likelihood the project will succeed in informing future restoration.
- A map that includes other water quality sampling locations would provide helpful context for understanding the sites chosen and how they fit into the larger monitoring network.
- Placing water quality monitoring equipment at locations with public access could make the equipment vulnerable to vandalism and impact data collection.
- Showing Environmental Protection Agency collaboration on what is being tested for would provide a better understanding on the value of the approach.

Concluding Analysis

Potential impacts to human and aquatic life from unsafe pesticide inputs into streams is a growing concern in the Illinois Valley. The monitoring project will provide baseline water quality and quantity dataset that will lead to scientifically based assessment of the extent of pesticide presence. Water quality data will be used to guide restoration efforts, design, and implement a Pesticide Management Plan, and engage partners and landowners in implementing pollution control efforts.

Region 3 - Willamette Basin Restoration

Projects Recommended for Funding in Priority Order

Project #	Grantee	Project Title	Brief Description	Amount Recommended
223-3030	CREST	Palensky Highway 30 - Wildlife Underpass	Safe wildlife passage will be established under Highway 30 that will allow amphibians and small mammals to traverse between the floodplains of the Palensky Wildlife Area and the Tualatin Mountain forests.	496,787
223-3025	Long Tom WC	Long Tom River Dam Removal at Monroe	Monroe Dam will be removed to restore aquatic migration corridors and natural stream processes in the lower Long Tom River to benefit native fish and wildlife species.	798,201
223-3031	The Freshwater Trust	Upper Sandy River Basin Habitat Restoration Project - Zigzag River	The abundance and productivity of Sandy basin salmon and steelhead populations will increase by restoring access to habitat and accelerating the recovery of naturally-functioning conditions within the stream channels and floodplain areas of the Zigzag River.	439,900
223-3028	Greenbelt Land Trust	Oak Creek Preserve Restoration Phase 1	Wetland, prairie, and oak habitats will be restored on a former farm field that will support a diversity of rare and endangered prairie plant and wildlife species.	296,516
223-3027	Confederated Tribes of Grand Ronde	Takilth Floodplain Reforestation	Twenty acres of floodplain forest will be restored within the 104-acre Takilth Wildlife Area by removing a hazelnut orchard and planting native streamside hardwood trees and shrubs.	217,728
223-3024	Coast Fork Willamette WC	Creswell Butte: Oak Woodland Restoration	Upland prairie, savanna and oak woodland habitat structure will be restored to provide habitat for a diversity of native species on Creswell Butte located within the lower Coast Fork Willamette watershed.	384,237
Total Restoration Projects Recommended for Funding by RRT and OWEB Staff				**2,633,369**

Projects Recommended but Not Funded in Priority Order

Project #	Grantee	Project Title	Brief Description	Amount Recommended
223-3029	Long Tom WC	Child Center Stormwater Improvements for Drinking Water Protection	Urban water quality will be improved by installing green stormwater infrastucture that will reduce pollutants entering the McKenzie River.	306,412

Projects *Not Recommended* for Funding by RRT

Project #	Grantee	Project Title	Amount Requested
223-3026	Greenbelt Land Trust	Willamette Floodplain Forest Enhancement	198,267

Region 3 - Willamette Basin Technical Assistance

Projects Recommended for Funding in Priority Order

Project #	Grantee	Project Title	Brief Description	Amount Recommended
223-3032	Friends of West Salem Watersheds	Salem Floodplain Species Assessment and Natural Floodplain Functions Plan	A species assessment will be completed to support future floodplain development decisions in the City of Salem that assure floodplain ecological functions are considered and protected.	28,850
223-3037	Middle Fork Willamette WC	Finalizing Floodplain Restoration Designs & Permitting for Elijah Bristow State Par	Final designs will be completed for a process-based floodplain restoration project on the Middle Fork Willamette River that will result in habitat for native species such as Oregon chub, western pond turtle, spring Chinook salmon, and beaver.	75,000
223-3035	Luckiamute WC	It's Miller Time! Uncorking Habitat Potential in the Miller Creek & West Fork Luckiamute Sub-basins	Restoration plans will be developed to address impacts caused by splash damming and other historical practices to improve salmonid and lamprey production and improve water quality and storage in the upper Luckiamute sub-basin.	74,962
223-3036	Johnson Creek WC	Action Plan 2025-2035 Technical Assistance	The Johnson Creek Watershed Council's Restoration Action Plan will be updated to guide restoration activities to benefit fish, wildlife, and people in the Johnson Creek Watershed.	25,574
Total Technical Assistance Projects Recommended for Funding by RRT and OWEB Staff				**204,386**

Projects Recommended but Not Funded in Priority Order

Project #	Grantee	Project Title	Brief Description	Amount Recommended

223-3033	Ducks Unlimited Inc	Tualatin River National Wildlife Refuge-Onion Flats Project	Designs will be completed to restore fish passage, stream channel and habitat complexity, and functional wetlands that hold water during critical periods for fish and migratory birds on Rock Creek, a tributary of the Tualatin River.	39,771

Projects *Not Recommended* for Funding by RRT

Project #	Grantee	Project Title	Amount Requested
223-3034	Pudding River WC	Davis Creek Fish Passage Improvements Phase 1	62,698

Region 3 - Willamette Basin Stakeholder Engagement

Projects Recommended for Funding in Priority Order

Project #	Grantee	Project Title	Brief Description	Amount Recommended
223-3044	Benton SWCD	Benton County Oak Habitats Stakeholder Engagement	Oak woodland, savanna and prairie habitats will be assessed in Benton County. This information will be used to engage landowners in developing voluntary restoration projects to restore these habitats.	34,130

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3024-23037

Project Type: Restoration

Project Name: Creswell Butte: Oak Woodland Restoration

Applicant: Coast Fork Willamette WC

Region: Willamette Basin

County: Lane

OWEB Request: $384,237

Total Cost: $568,622

Application Description The 74-acre project is in Lane County along the southern border of the City of Creswell's urban growth boundary at Creswell Butte. Creswell Butte itself can be seen from the I-5 corridor and is within the City of Creswell’s viewscape. The property is currently owned by private landowners who enrolled their property into a Conservation Easement (CE) held by McKenzie River Trust (MRT). The easement did not come with operations and maintenance (O&M) funds. Years of limited management have left the legacy oaks and open meadow habitats overgrown with shrubs, cherry, and conifers. The risk of losing the legacy oaks that remain is imminent and with no action key habitat values will be lost forever. The project seeks to leverage Oregon Department of Forestry (ODF) fuels reduction and Oregon Department of Fish & Wildlife (ODFW) Oregon Recreation & Conservation Funding with OWEB restoration funding in order to restore the degraded upland prairie and oak habitats. Project partners include Coast Fork Willamette Watershed Council, MRT, ODF, ODFW, Natural Resources Conservation Service, Larry H Weaver & Sheila J Hale Living Trust and the Creswell Butte Technical Advisory Team which includes the previously mention organizations in addition to US Army Corps of Engineers, US Fish & Wildlife Service, and the City of Creswell.

Review Team Evaluation

Strengths

- The application has clearly defined project goals to restore and improve upland prairie, oak savanna, and oak woodland habitats and native species diversity on Creswell Butte located within the lower Coast Fork Willamette watershed.
- Previous application evaluation concerns related to the feasibility of removing large trees from the site are addressed by describing how skid roads will be used and shifting some restoration strategies to better match the site conditions. The budget also has more details describing project costs instead of providing lump sums.
- The project builds on an OWEB Technical Assistance Grant investment and previously completed restoration completed at Creswell Butte.
- The project has potential for raising awareness about habitat restoration because it is located on the edge of the City of Creswell and is highly visible.
- The target quantified habitat benefits expected from the project are reasonable. Restoring habitat on a hardwood butte will be valuable for migratory birds.
- Prescribed burns will be implemented in partnership with the Willamette Valley Fire Collaboration, which will provide the capacity and experience needed for using fire as a restoration treatment.

- The project site is protected by a conservation easement that will ensure long-term protection and maintenance of investments in habitat restoration.
- The applicant has the capacity and relevant experience for implementing the project.
- A diversity of partners and technical experts are engaged in the project and the Creswell Butte Technical Advisory Team. Partner support is demonstrated by letters and match from landowners, McKenzie River Trust, Oregon Department of Fish and Wildlife, Oregon Department of Forestry, and Ecostudies Institute.

Concerns

- The project location may be challenging for utilizing prescribe fire due to its proximity to the City of Creswell and roads.

Concluding Analysis

The proposed restoration is likely to contribute to addressing the degradation, loss, and fragmentation of upland prairie and oak habitats that has resulted in an overall significant decline of these habitats in the Willamette Valley. A combination of forest thinning, invasive plant control and re-seeding will be used to shift the site from a dense woodland to a mixed open oak and conifer woodland and prairie over the 73-acre conservation property.

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3025-23042

Project Type: Restoration

Project Name: Long Tom River Dam Removal at Monroe

Applicant: Long Tom WC

Region: Willamette Basin

County: Benton

OWEB Request: $798,201

Total Cost: $3,786,277

Application Description The project is centered around the Monroe Drop Structure, a 9-foot high, low head dam on the Long Tom River at river mile 6.6. It is the downstream-most barrier on the Long Tom River and blocks upstream fish passage for juvenile upper Willamette River spring Chinook, which are ESA-listed as threatened. The project would open up access to 15 miles of mainstem and tributary rearing habitat for juvenile Chinook. The dam also blocks or impedes passage for Pacific lamprey and coastal cutthroat trout that would otherwise use habitat upstream of the dam for spawning and rearing. The dam also disrupts sediment transport processes, increases water temperatures, and creates ideal conditions for warmwater predatory fish as well as algae blooms. There are two other USACE low head dams upstream of the Monroe Drop Structure on the Long Tom River. LTWC has been working with USACE for nearly 20 years to develop plans for improving fish passage at all three dams, and once that vision is realized fish passage will be restored to 100+ miles of habitat in the Long Tom and Coast Range tributaries where LTWC has restored dozens of mile of habitat in partnership with OWEB and other funders. The proposed project is the first step in achieving this vision and is the highest priority aquatic project in the Long Tom Watershed.

The project will remove the dam, restore the channel 1,000' upstream of the dam, replace a fish passage barrier culvert to provide access to 1/2 mile of off-channel habitat in historical Long Tom River channel segments adjacent to the dam, and replace the City's municipal water intake, which is located 600' upstream of the dam. The current intake will not function once the dam is removed, so its replacement is an essential component of the project to maintain the City water supply and allow the dam to be removed. USACE, City of Monroe, the Confederated Tribes of Siletz Indians, and the USFWS National Fish Passage Program are partners on the project.

Review Team Evaluation

Strengths

- The application has clearly defined restoration goals and objectives for restoring migration corridors for native aquatic species and fluvial processes in the lower Long Tom River.
- The project builds on previous OWEB Stakeholder Engagement and Technical Assistance Grant investments that resulted in the proposed restoration project.

- The project has previously promoted and will continue to promote public awareness for watershed restoration. The applicant conducted extensive stakeholder engagement to build support for removing the Monroe Dam.
- The Monroe Dam removal is the highest priority project for the Long Tom watershed and is a prioritized action in multiple watershed plans.
- Removing Monroe dam will connect 15 miles of upstream mainstem and tributary habitat that was historically used by juvenile spring Chinook. The applicant has implemented stream habitat restoration projects over the last 20 years above the dam that have benefitted trout. Once the dam is removed, spring Chinook and lamprey will be able to access and benefit from these restored stream reaches.
- Removing the dam and eliminating impounded water will decrease solar radiation, which will improve stream temperatures and provide further habitat benefit to native aquatic species.
- The project is ready for implementation with National Oceanic and Atmospheric Administration approval of the designs. It is also time sensitive to successfully utilize the US Army Corps of Engineers (ACE) Section 1135 program for funding.
- The applicant has capacity and relevant experience to implement the project.
- The project could potentially lead to future restoration on upstream drop structures. These structures are currently partial passage barriers for aquatic species and restoring complete passage will further improve stream habitat connectivity.
- The City of Monroe and the Confederated Tribes of Siletz Indians are co-sponsors for the project, which is required for the project to receive USACE Section 1135 funds. Partner support is also demonstrated by support letters from the City, Tribes, Oregon Department of Fish and Wildlife (ODFW), and the Upper Willamette Soil and Water Conservation District.
- Alternative solutions were fully vetted through extensive stakeholder engagement conversations. A habitat suitability index model was also used to model existing and predicted habitat benefits under different restoration alternatives.

Concerns

- The application lacks design information for the dam removal portion of the project that may have provided helpful context for understanding how the project will be implemented. The dam removal will, however, be funded by the USACE Section 1135 program through a design-build approach. The OWEB request is for relocating the City of Monroe drinking water intake, which is necessary for the dam removal objective to move forward. The application does include technical information needed to understand the design and associated costs for this project component.
- It is unclear from the application the extent to which ODFW was consulted in conversations about fish passage at the project site.
- Potential benefits to Chinook may be overstated in the application while other watershed benefits are understated. While Chinook will pass upstream and utilize the stream habitat, they are unlikely to use the 15 miles of habitat because there will still likely be preference for other nearby basins, such as the McKenzie River. Removing the dam will still provide significant benefits for restoring watershed functions and improving stream temperatures.

Concluding Analysis

The Monroe Dam, located six miles upstream of the confluence of the Long Tom River with the Willamette River, disrupts sediment transport, fish access to upstream habitat, and migration of other native aquatic species. The impoundment created by the dam also contributes to elevated water temperatures by increasing solar gain and residence time. The applicant implemented extensive

stakeholder engagement that led to this restoration opportunity by building whole community support in a small, rural city. This is a large, complex project and the applicant's coordination of partners, community outreach, and design work has generated the momentum for dam removal to proceed.

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3026-22965

Project Type: Restoration

Project Name: Willamette Floodplain Forest Enhancement

Applicant: Greenbelt Land Trust

Region: Willamette Basin

County: Benton

OWEB Request: $198,267

Total Cost: $249,519

Application Description Greenbelt Land Trust manages some of the most successful floodplain anchor habitat projects on the mid-Willamette. The proposed project is located across three permanently protected properties and collectively comprises over 800 acres: Harkens Lake, Horseshoe Lake and Little Willamette (Benton and Linn Counties). These properties were brought into the Willamette Wildlife Mitigation Program by BPA, OWEB, and ODFW for their strategic location and recognition of their outsized potential contribution to salmonid recovery efforts. Over the past ten years Greenbelt has converted well over 500 acres of ag-land into diverse floodplain forest, wetlands and prairies. Early on, we naively thought that active management finished once trees were free to grow. Ten years later we now realize that a second phase of restoration is needed to speed the development of the mature and complex floodplain forest characteristics that are so valuable to fish and wildlife. This project will implement mechanical thinning across hundreds of acres to establish a varied age and multi-layered riparian forest canopy. We will emphasize the development of large canopy trees, add understory native plant diversity, and replace areas dominated by invasive plant species with many acres of newly planted forest. These activities will expand the sites' food webs and resources for salmonids and a suite of OCS species, increase the acreage of floodplain forest, and promote improvements for water quality / quantity. Work will follow the land management plans approved / reviewed by OWEB, BPA and ODFW, while technical assistance is provided by the USFWS Partners for Fish and Wildlife Program, ODFW and Bob Altman. Greenbelt relies on restoration professionals such as Rosario Franco, Seven Oaks Nursery, Heritage Seedlings and Advanced Land Management. Our floodplain properties are demonstration sites for the conservation and restoration community and provide educational opportunities for students of all ages.

Review Team Evaluation

Strengths

- The application has clearly stated objectives for a strategic and rational treatment approach at locations where previous floodplain forest restoration projects had higher-than-expected survival outcomes. The sites were planted using high density plantings, which is a common planting method in the Willamette Basin for restoring floodplain forests. Typically planting projects experience a high mortality; high-density plantings are designed to allow for natural thinning to occur through plant mortality. The trees and shrubs planted at the project sites had high survival rates, which is creating a dense monoculture. The proposed thinning to reduce plant density and uniformity is likely to add

complexity to the plant community and habitat diversity that will benefit native species, such as songbirds. The resulting mixed story forest will provide a higher habitat value in the bottom land forest plant community.

- The proposed approach to mechanically thin floodplain forests is based on a successful 30-acre pilot completed by the selected contractor. Due to this test project, the applicant has data to accurately estimate costs for the proposed project. Thinning the floodplain forest now will be more cost-effective, before trees get larger and are more costly to treat.
- The project includes a combination of three properties that altogether total 800 acres located in Willamette Anchor Habitats. The properties have OWEB and Bonneville Power Administration Conservation Easements that will ensure long-term protection and maintenance of investments in habitat restoration.
- Prioritized actions in watershed plans, including the Oregon Conservation Strategy, will be implemented.
- There is potential for the project to lead to future restoration. Demonstrating success in restoring the bottomland riparian forest could lead to additional floodplain reconnection restoration with the participating landowners and neighbors.
- The application budget includes details clearly describing project costs.
- The applicant has capacity and relevant experience to implement the project and will be working with a contractor with relevant forestry experience.

Concerns

- No alternatives to the proposed approach were considered. For example, it might be possible that the plant community stratification will sort out in five more years through mortality without intervention. There may be merit to waiting to see how the sites respond to previous restoration strategies over a longer time period instead of intervening too early.
- There are no plans to leave large trees on the forest floor, all materials will be mulched instead. There could be a missed opportunity to provide habitat benefits for native species, such as amphibians, by leaving larger woody material on the ground.
- While the presence of invasive plants is currently low on the project sites, thinning and opening the forest could increase the risk of invasive plant species moving in.
- The proposed treatments may speed up the ecological processes leading to a diverse multi-layered floodplain forest; however, it is unclear if the treatments are necessary to achieve this outcome. The high-density planting method has been applied at locations across the Willamette Valley and this project could lead to future requests to retreat these sites. More information is needed to understand why intervention is needed to achieve meaningful ecological gains compared to monitoring the sites over a longer timeframe to see if the plant community achieves the desired habitat outcomes with time.

Concluding Analysis

High-density floodplain riparian forest plantings have been an innovative restoration approach used to mediate for plant mortality and for reducing the use of plant protection that typically is washed downstream, such as tree tubes. There are a couple of paths that could provide opportunities to learn more about next steps for this proof-of-concept approach. One is to give the sites more time to see if they naturally move towards a multi-story floodplain forest. There is potential for this path to result in missing an opportunity for developing an understory plant community due to the monoculture stands shading understory growth. The second potential path is to thin the sites as proposed. The proposed

project has potential for influencing how sites across the Willamette will be managed. If the application is resubmitted, the applicant is encouraged to incorporate a monitoring component so that restoration practitioners can better understand whether using thinning on sites with high survival is necessary for achieving desired conditions. Monitoring that includes the stocking density and a forest inventory with plant densities, height, and stems per acre by different species or plant types would be helpful to better understand the extent to which thinning treatment is needed. This information could contribute to better understanding site attributes that restoration practitioners might use to determine whether it is best to leave a site alone or if thinning is necessary to achieve multi-story floodplain forest habitat goals.

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3027-22968
Project Type: Restoration
Project Name: Takilth Floodplain Reforestation
Applicant: Confederated Tribes of Grand Ronde
Region: Willamette Basin
County: Polk
OWEB Request: $217,728
Total Cost: $275,531

Application Description

Takilth is generally located at -123.425/45.030 in Polk County, Oregon. This property is approximately 106 acres and is bordered by both Mill Creek and Gooseneck Creek, which converge to confluence on the property. The property is permanently protected by a Bonneville Power Administration conservation easement. The existing riparian habitat is 39 acres and is known to host native fish and wildlife species, including Oregon Conservation Strategy species such as: winter steelhead, Pacific lamprey, brook lamprey, coastal cutthroat trout, Northern red-legged frog, and Western pond turtle. In order to improve floodplain connectivity and riparian habitat in the area, this project proposes to convert 20 acres of mature hazelnut orchard back to riparian floodplain forest. This grant request includes contracted services for orchard removal, plant materials, plant establishment and project maintenance for 3 years. Partners on this project include the US Fish and Wildlife Service (USFWS), Natural Resources Conservation Service (NRCS), Oregon Department of Fish and Wildlife (ODFW), Polk County Soil and Water Conservation District (SWCD), Greater Yamhill Watershed Council (GYWC), and Bonneville Environmental Foundation (BEF).

Review Team Evaluation

Strengths

- The scope of work in the proposed solution section of the application has clear objectives and activities for converting a 34-year-old hazelnut orchard to a floodplain forest.
- The planting approach is technically sound and is based on the applicant’s experience restoring floodplain forests in other locations in the Willamette.
- The project site is protected by a conservation easement that will ensure long-term protection and maintenance of investments in habitat restoration.
- A variety of Oregon Conservation Strategy species are present on the property and will benefit from habitat restoration actions, including: coastal cutthroat, lamprey, Northern red-legged frog, and Western pond turtle.
- The applicant has identified a qualified contractor with specialized equipment for removing the hazelnut orchard.
- The applicant has capacity and relevant experience to implement the project.
- Partner support from Oregon Department of Fish and Wildlife, Polk Soil and Water Conservation District, Yamhill Watershed Council, Bonneville Environmental Foundation, US Fish and Wildlife Service, and Natural Resource Conservation Service (NRCS) is demonstrated through letters included in the application.

- It is likely the applicant will continue to plan and implement future stream and floodplain restoration that will build a variety of habitats over the 104-acre site.

Concerns

- There will likely be limited direct habitat benefits for fish or water quality improvements from the proposed restoration because the project footprint is disconnected from the adjacent stream. Benefits will likely remain within the 20-acre project footprint.

Concluding Analysis

Converting the hazelnut orchard to a floodplain forest is likely to be the first step in restoring a mosaic of Willamette Valley habitats on the project site. Re-establishing forest habitat and restoring more natural floodplain function also contributes to resiliency against impacts from climate change. The proposed project is likely to succeed in establishing native floodplain forest habitat that will leverage habitat on other nearby conservation properties, including NRCS easements and Noble Oaks, which is also owned and managed for conservation by the Tribe.

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3028-23009
Project Type: Restoration
Project Name: Oak Creek Preserve Restoration Phase 1
Applicant: Greenbelt Land Trust
Region: Willamette Basin
County: Benton
OWEB Request: $296,516
Total Cost: $379,503

Application Description Oak Creek Preserve (OCP; 144 acres, Benton County) is Greenbelt Land Trust's newest acquisition. In it's current state, the property is mostly farm ground, but it is brimming with incredible potential to connect the largest network of Conservation properties west of Corvallis. OCP is within the Oregon Conservation Strategy (OCS) Conservation Opportunity Area for Corvallis Area Forests and Balds (081). It is also within US Fish and Wildlife Service (USFWS) Corvallis West Recovery Zone for endangered plants. The property includes legacy oaks, grassland remnants and the potential to convert 137 acres of agricultural lands to the most beautiful restored native prairie we've ever done. Known Oregon Conservation Strategy Species in the area include Western Bluebird, White Breasted Nuthatch, Oregon Vesper Sparrow, wintering Western Meadowlark, Kincaid's Lupine, Nelson's checkermallow and Willamette daisy. Our goal is to provide habitat for all of these species. Greenbelt is about to finish a $7 million campaign focused on this iconic property and we are committed to the permanent protection and creation of resilient landscapes.
Native prairie and oak habitats are extremely rare, and this loss of habitat quality, quantity and connectivity has left many species in peril. Our goal is to reverse those impacts by doing the following:
• Permanently retire farming and create 133 acres of diverse wetlands and prairies to benefit rare plants, pollinators, amphibians and grassland birds.
• Restore 7.3 acres of legacy oak woodland and 3.5 acres of remnant upland prairie, controlling invasive shrubs, promoting oak longevity, and improving habitat for birds.
• Introduce Willamette Daisy, Nelson's checkermallow and other rare plants into restored prairies.
• Limit the occurrence and reduce the spread of target invasive species.
• Offer community/stakeholder events on the Property.
Partners include: OWEB, USFWS Partners & Recovery Programs, Grand Ronde Tribe, IAE and OSU.

Review Team Evaluation
Strengths

- The application has clearly defined restoration goals, objectives, and activities for restoring vernal

pools, diverse prairies, and legacy oak stands on Oak Prairie Reserve located west of Corvallis.

- The proposed methods for restoring wetland, prairie, and oak habitats are technically sound, utilizing a recipe of actions the applicant has effectively implemented in other locations. The planned actions include establishing the following threatened and endangered plants: Nelson's checkermallow, Bradshaw's lomatium, Willamette daisy, and golden paintbrush.
- The project is located within an Oregon Conservation Strategy conservation opportunity area and US Fish and Wildlife Service (USFWS) recovery zone for endangered plants. The proposed restoration will build habitat connectivity across thousands of acres of conservation lands.
- Several Oregon Conservation Strategy species will likely benefit from the proposed habitat restoration because they are known to be in the area, including: Western Bluebird, White Breasted Nuthatch, Oregon Vesper Sparrow, wintering Western Meadowlark, Kincaid's Lupine, Nelson's checkermallow, and Willamette daisy.
- The presence of native bird species indicates that the existing oak habitat area on the property is functioning well.
- The applicant has capacity to implement the project and relevant experience with similar projects.
- Project costs are reasonable.
- The proposed project is timely because invasive plant species have not yet established on the site that would require extensive treatment and site preparation. This will make restoration activities easier to implement and cost less.

Concerns

- The application lacks information describing how partners listed in the application abstract and referenced in an attachment will be involved in the project, including Confederated Tribes of Grand Ronde, Institute for Applied Ecology, and Oregon State University.
- Information describing plans for maintaining the open prairie, such as using prescribed fire, mowing, or herbicide application to control weeds, would be helpful for understanding long-term habitat stewardship strategies that will maintain restoration gains.

Concluding Analysis

Native grassland, wetlands, and oak woodlands that were once the dominant habitats historically found in the Willamette Valley will be restored across 144 acres of permanently protected land. Restoring ecosystem function will provide habitat benefits to native species, including species listed on the Endangered Species Act and species identified in the Oregon Conservation Strategy. The project addresses habitat fragmentation caused by various land uses by creating a corridor that connects 1,400 acres of conserved lands to the south with thousands of acres of oak, prairie, and forest habitat owned by Oregon State University to the north.

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3029-23017

Project Type: Restoration

Project Name: Child Center Stormwater Improvements for Drinking Water Protection

Applicant: Long Tom WC

Region: Willamette Basin

County: Lane

OWEB Request: $306,412

Total Cost: $399,952

Application Description This project is in Lane County at The Child Center (TCC), at the intersection of Marcola Rd. and Hayden Bridge Rd. on the McKenzie River.

The proposed work will significantly improve the function of existing green stormwater infrastructures (GSI) that manage stormwater from 1.9 acres of parking lots and roofs of TCC before entering the McKenzie River approximately 195' upstream of Eugene Water & Electric Board's (EWEB's) drinking water intake, providing almost no time for pollutant loads to dilute. Separately, TCC is engaged with Pure Water Partners (PWP) to restore their eight acres of riparian edge which is inundated with highly invasive plants. These activities will result in better flood attenuation, pollution management, riparian habitat, and drinking water for 176,000 EWEB customers, and both public and private wells.

GSI facilities provide stacked benefits, including addressing drinking water quality, aquatic life habitat, and habitat for upland species. Improved stormwater management will reduce the urban complex of pollutants entering the McKenzie River including heavy metals, petrochemicals, temperature, sediment & emerging pollutants of concern such as 6PPD-quinone from tire dust that has been shown to kill Coho Salmon within hours of exposure. Drinking water for EWEB's entire service area will be directly improved through pollution reduction. These same pollutants negatively impact aquatic life, so impacts to those species will be addressed by the same actions. Improved flood attenuation will reduce flash flood impacts like scouring and sediment movement. As the GSI is currently filled with invasive weeds, removing and replacing them with a dense planting of natives will reduce invasive pressure while improving upland habitat for birds and pollinators.

Project partners include TCC, EWEB, SUB, City of Springfield, PWP, McKenzie Watershed Council (MWC), and Urban Waters & Wildlife Partnership (UWWP).

Review Team Evaluation

Strengths

- The application describes a clear need to address stormwater pollution that has toxic effects on native aquatic species, especially salmonids.

- The methods for improving existing green stormwater management infrastructure at the project site are technically sound. Plans to utilize native plants and incorporating biochar into the soil to increase the capture of pollutants are above and beyond the minimal requirements for stormwater management infrastructure. The use of native plants will also provide pocket habitat that will support native birds and pollinators.
- The proposed restoration will address actions identified in federal, state, and local watershed plans, including the recovery plan for upper Willamette Chinook and steelhead, by reducing toxins from urban sources that impact fish.
- The project is ready for implementation with completed designs and feasibility study and is time-sensitive due to match dollars that must be spent in 2024.
- The project was ranked as a high priority site utilizing the stormwater project prioritization matrix developed by the applicant through a previous OWEB Technical Assistance Grant investment.
- The project site is in immediate proximity of the Eugene Water and Electric Board's water intake for drinking water; stormwater runoff from the property drains into the stream upstream of this intake. The project location is a high priority for removing stormwater toxins to benefit both stream habitat and to protect a drinking water source.
- The applicant has capacity and relevant experience to implement the project and has built a stormwater program by partnering with cities, water providers, and landowners in the Upper Willamette area.
- The application budget includes a detailed explanation that describes context for project costs.
- A diversity of partners support the project, which is demonstrated by letters and match contributions.
- The landowner is engaged in the Eugene Water and Electric Board's Pure Water Partnership program, which has received previous OWEB grant investments, to explore options for addressing invasive species and restoring the riparian area along the property.

Concerns

- The application objectives are unclear in describing a scope of work because they are stated as watershed benefit outcomes instead of specific, measurable steps for achieving the project goal.
- The current stormwater management infrastructure is underperforming even though the parking area is only ten years old. Information or data that was used as evidence to determine this infrastructure is failing and the extent to which it is impacting water quality would be helpful for understanding the priority for investing in the project.
- Additional information explaining the project need and how OWEB investment will target voluntary improvements would be helpful for understanding the project context. For example, it is unclear who the responsible party is for renovating a failing stormwater management system and why actions to address it are not automatically triggered through city regulation.
- Long-term plans and funding for maintaining the stormwater management facilities are unclear from the application. While the applicant will provide an operation and maintenance plan designed to ensure long-term functionality, it is unclear who will be responsible for implementing it and how maintenance will be funded.
- The landowner support and role in the project is unclear because there is no letter of support and there are no roles identified for the landowner, other than a pending match. It is unclear if the landowner will play a role in long-term maintenance.
- The overall project cost is high for the potential watershed benefit.

Concluding Analysis

The proposed project provides an opportunity to reduce stormwater potentially impacting aquatic habitats and drinking water. The investment will build on a strategic, programmatic approach to reduce pollutants in stormwater through voluntary measures and will offer an example to the community of a sustainable climate friendly landscape. A clear maintenance plan and resources to implement the plan will be important for maintaining the restoration investment.

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3030-23026
Project Type: Restoration
Project Name: Palensky Highway 30 - Wildlife Underpass
Applicant: CREST
Region: Willamette Basin
County: Multnomah
OWEB Request: $496,787
Total Cost: $2,932,607

Application Description Spanning between Portland and Scappoose in Multnomah County, OR, U.S. Highway (Hwy) 30 poses a significant barrier to wildlife movement between the floodplain wetlands along Multnomah Channel and the upland forests of the Tualatin Mountains. Amphibian species including 1) the northern red-legged frog (Rana aurora), a Federal Species of Concern, State Sensitive Species, and top-ranked ODFW priority among Oregon Conservation Strategy Species for the Willamette Valley and 2) Pacific treefrog (Pseudacris regilla) each migrate twice/yearly between the forests and floodplain wetlands. The 4-lane Hwy severely impacts this migratory pattern, with high mortality rates as amphibians are struck by vehicles as they traverse back and forth across the Hwy.

This project is a collaboration between CREST, the Oregon Department of Transportation (ODOT), and the Oregon Department of Fish and Wildlife. The designs call for a wildlife underpass that will convey migratory amphibians, while meeting the safety and design standards of ODOT. The result is a 130-foot long underground tunnel with a natural bottom substrate, natural light openings, and 600 linear feet of directional wall to guide amphibians and small mammals to the new crossing.

Two other partner projects along Hwy 30 are currently in feasibility and initial designs. The Harborton Wetland Amphibian Underpass (led by Oregon Wildlife Foundation and USFWS), and Crabapple Creek (led by Metro and LCEP). Each are examining the feasibility of installing additional wildlife underpasses beneath Hwy 30. If all projects are constructed there will be three (3) new wildlife crossings along 5.5 miles of Hwy 30 – greatly enhancing wildlife connectivity throughout this region. Since the Palensky – Highway 30 wildlife corridor is fully designed, permitted, and ready for construction there is an opportunity to learn a lot about design, construction and monitoring which can be put to use for the two subsequent wildlife corridor projects.

Review Team Evaluation

Strengths

- The application has clearly defined goals, objectives, and activities to establish safe wildlife passage for amphibians and small mammals under Highway 30. The proposed wildlife underpass will connect floodplain habitat in the Palensky Wildlife Area with the Tualatin Mountain forests.

- Installing the wildlife underpass will address actions identified in the Oregon Conservation Strategy for northern red-legged frogs, which is a Federal Species of Concern, State of Oregon Sensitive Species, and a top-ranked Oregon Department of Fish and Wildlife (ODFW) priority among Oregon Conservation Strategy Species for the Willamette Valley. The new wildlife underpass will also benefit other native species that need to move between habitats.
- The project location was selected based on ODFW data that indicates the project site is a mortality hotspot for northern red-legged frogs.
- The project is ready for implementation with designs at 100% completion, permits are secured, two-thirds of the funding is secured, and Oregon Department of Transportation (ODOT) has approved the designs along with project staging plans.
- Alternative design and project location options were evaluated before selecting the proposed strategy.
- The proposed project will leverage two related northern red-legged frogs migration passage projects on Highway 30, including one with an OWEB Technical Assistance Grant investment. The project is also associated with extensive salmon habitat restoration occurring on the adjacent Palensky Wildlife Area, which is 470 acres of floodplain wetlands, sloughs, ponds, and riparian forests directly along the Multnomah Channel.
- The applicant is engaging adjacent landowners to address potential impacts to adjacent properties that could occur during and after project implementation.
- The applicant is engaging appropriate partners and partner support is documented in letters included in the application.
- The applicant has capacity to implement the project and relevant experience with similar projects.
- The project cost reflects the migration and habitat benefits that will be gained for a priority conservation species.

Concerns

- Installing a wildlife underpass for amphibians is a proof-of-concept project that has not been done before. There is some uncertainty that the desired outcomes can be achieved. The well-documented frog mortalities, however, indicates the site is a significant migration corridor and is a reasonable located to pilot a wildlife underpass for amphibians.

Concluding Analysis

Highway 30 has disconnected an important northern red legged frog migratory corridor, causing elevated levels of mortality as frogs migrate back and forth across the four-lane highway between the Tualatin Mountains and the floodplain wetlands of the Multnomah Channel. Creating a wildlife underpass underneath Highway 30 is likely to provide unimpeded safe passage between large parcels of protected habitat, including the 470-acre Palensky Wildlife Area and the 354-acre upland forest protected and managed by Metro. Establishing a wildlife underpass will provide landscape scale habitat connectivity across the forests and wetlands of the Northern Willamette Valley along the Columbia River Bottomlands.

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3031-23031

Project Type: Restoration

Project Name: Upper Sandy River Basin Habitat Restoration Project - Zigzag River

Applicant: The Freshwater Trust

Region: Willamette Basin

County: Clackamas

OWEB Request: $439,900

Total Cost: $1,015,620

Application Description The Freshwater Trust (TFT) and US Forest Service (USFS) are taking the lead on the Upper Sandy River Basin Habitat Restoration Project-Zigzag River on behalf of the Sandy River Basin Partners (the Partners). The Sandy River originates on Mt. Hood and flows 56 miles northwest before entering the Columbia River near Portland, Oregon. The proposed project will address primary limiting factors by increasing off channel habitat/floodplain connectivity and large wood abundance on the Zigzag River (a tributary of the Sandy located within the upper Sandy sub-watershed). Proposed work is on public land managed by the USFS located near Zigzag, Oregon in Clackamas County.

Sandy River salmon and steelhead populations have declined over the last century due to degradation of habitat and other factors. The Partners have identified the upper Sandy sub-watershed among the top areas providing high quality habitat for the basin's native fish. The Partners are aligned on a near term goal of restoring this priority watershed to advance Sandy basin-scale restoration.

Restoration actions to be undertaken as part of the proposed project include: reactivation of flow to historic side channels and floodplain habitat; construction of large wood habitat structures; and placement of additional large wood in side channels and on stream margins. This project is part of a larger, multi-year, watershed-scale restoration effort and builds on similar successful projects completed in the basin by TFT and the Partners since 2008.

Review Team Evaluation

Strengths

- The proposed work is part of a large-scale restoration strategy that builds on momentum from and leverages investments in previously successful restoration that includes reactivating flow to historic side-channels and floodplain habitat, constructing instream large wood habitat structures, and placing additional large wood in side-channels and on stream margins.
- The applicant will use clearly defined restoration methods that have been applied in the Upper Sandy Basin for over a decade. The project builds on past practices by incorporating lessons learned from previous restoration. The proposed restoration techniques have been used in previous project phases to increase fish habitat abundance. Resulting fish counts indicate the approach is effective.

- The proposed restoration actions will address watershed limiting factors to Endangered Species Act (ESA)-listed fish recovery by restoring large wood abundance in Zigzag River and increasing off-channel habitat for Chinook, coho, and steelhead spawning and juvenile rearing.
- The map included in the application depicting planned and completed restoration provides a comprehensive overview of the long-term Upper Sandy Basin restoration strategy implementation.
- The applicant team provides tours that raise awareness about the impacts of stream restoration in restoring healthy native fish populations.
- The project team has a consistent track record for implementing similar high-quality projects. The team has relevant experience for designing the restoration treatments.

Concerns

- Including information describing how restoration practices are monitored and plans for identifying when long-term maintenance may be needed and how it is implemented would be helpful for understanding how long-term habitat gains are maintained.
- The application has limited documentation of project support with only one letter of support from partners even though the Sandy Basin Partnership has had a long relationship in collaborating and supporting projects. Documentation of additional partner support would strengthen the application.

Concluding Analysis

The proposed project builds on a phased stream restoration strategy that has been implemented since 2008 and has a record of producing quantified fish response to habitat improvements. The Sandy River watershed provides habitat to numerous ESA-listed fish species, making it a priority area for instream habitat restoration. The project has a high ecological benefit-cost ratio and certainty of success, which is guided by a multi-year strategic action plan and documented by monitoring data from previous phases of restoration.

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3032-22978

Project Type: Technical Assistance

Project Name: Salem Floodplain Species Assessment and Natural Floodplain Functions Plan

Applicant: Friends of West Salem Watersheds

Region: Willamette Basin

County: Marion

OWEB Request: $28,850

Total Cost: $39,850

Application Description The project includes the floodplains of the Willamette River, Mill Creek, Pringle Creek, Glenn Creek and all and flood prone areas within the urban growth boundary of the City of Salem.

The Salem reach of the Willamette River lies within Conservation Opportunity Area 60, Middle Willamette, as identified by the Oregon Conservation Strategy. This reach has incurred losses of 12% primary channel area, 16% side channels, 33% alcoves, and 9% islands according to the Biological Opinion of 2016. The BiOp further describes the conditions of the reach as: ” the formerly hardwood-dominated riparian forests along with mixed forest made up less than half of the riparian vegetation by 1990, while agriculture dominated. This conversion has reduced river shading and the potential for recruitment of wood to the river, reducing channel complexity and the quality of rearing, migration and spawning habitats”.

The project will develop a Floodplain Species Assessment and public information materials that will be used to inform the staff and public about floodplain dependent species and their conservation and reduce flood insurance rates in Salem. The project will also develop a draft Natural Floodplain Functions Plan that can be adopted by the City Council for additional CRS credits further lowering flood insurance rates.

As the capitol city and the second largest city in the state, Salem can provide a model approach to providing advance protection to floodplain species. This pilot can show other communities a way to address the apparent conflicts between the Endangered Species Act and the National Flood Insurance Program.

Current management of floodplain development in Salem does not consider ecological impacts of proposed development, only engineering standards. This project will provide the City of Salem with tools to identify measures to protect floodplain functions that are critical to riparian and aquatic species. The City of Salem is a critical partner.

Review Team Evaluation

Strengths

- Previous application evaluation concerns are addressed.
- A collaborative approach will be used to create a Floodplain Species Assessment and a Natural Floodplain Functions Plan to protect floodplain areas used by threatened and endangered species. The applicant is using FEMA guidance for the National Flood Insurance Program to proactively create a potentially replicable approach for meeting the program requirements while demonstrating that better information about ecological considerations can be incorporated into floodplain development programs at the local level.
- The expected product will compile information about each listed species, their habitat needs, and the management considerations necessary to protect them into the form of an assessment. This assessment could be used by the City of Salem as a planning resource to ensure ecological conditions of floodplains are considered when making floodplain development decisions. The assessment could also help inform land purchases for preservation in an urban area that could be otherwise purchased for development.
- A clear need for the proposed technical assistance is described in the application. Currently the City of Salem lacks staff capacity to address the ecological side of floodplain management. As a result, only engineering and flooding concerns are considered with development and not habitat concerns. This has led to stream health degradation typically seen in urban areas, including loss of habitat and side-channel complexity. Developing the proposed species assessment, is the first step for the City to have the information needed to integrate ecological concerns into the planning process.
- The applicant will coordinate with a diversity of agencies and non-profits, including Oregon Department of Fish and Wildlife (ODFW), Oregon Department of Agriculture (ODA), US Fish and Wildlife Service (USFWS), National Marine Fisheries Service (NMFS), Oregon Natural Heritage Program, and City of Salem to collect habitat data and form a plan that could lead to long-term protection of floodplain functions that will benefit endangered species.
- The example plan for the City of Monroe included in the application provides helpful context for understanding the expected product that will result from the proposed technical assistance.
- Information collected through the project will be made publicly available. The plan will be presented to the public and to the city council for approval.
- Partner support for the project is demonstrated by letters from Salem Audubon Society and West Salem Neighborhood Association. City of Salem support is demonstrated by staff involvement in the grant application and Letters of Support from the Public Works Director and Mayor, which was approved by the city council.
- Qualified technical experts with relevant experience will implement the project.
- Project costs are reasonable for the proposed technical assistance.

Concerns

- There is potential for the City to not actively use the plan to protect habitat; however, the city council unanimous decision to provide a letter indicates genuine intention. The plan is the first step for integrating habitat into planning decisions.

Concluding Analysis

Protecting floodplain habitat for threatened and endangered species is important for species recovery, and floodplain development is a major threat to their survival. The proposed Floodplain Species Assessment and Natural Floodplain Functions Plan has potential for serving as a model for providing

information needed for future floodplain development decisions to incorporate and protect ecological functions. The City of Salem is experiencing strong pressure for development and the City is using 20-year-old floodplain maps to make planning decisions. Current information describing floodplains and the species using them is needed to make planning decisions that incorporate habitat protection. The technical assistance product can help the City utilize preservation as a tool for creating ecological uplift.

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3033-22994

Project Type: Technical Assistance

Project Name: Tualatin River National Wildlife Refuge-Onion Flats Project

Applicant: Ducks Unlimited Inc

Region: Willamette Basin

County: Washington

OWEB Request: $39,771

Total Cost: $58,707

Application Description The 209-acre Onion Flats tract is part of a large marsh that once existed on the landscape within the Rock Creek drainage in the Tualatin River watershed. The Tualatin River National Wildlife Refuge located near Sherwood, Oregon, owns most of the historic Onion Flats wetland basin. 82 acres are privately owned working lands that support agriculture. The tract does support rearing habitat for Coho and brook lamprey, cutthroat trout, ESA Steelhead, waterfowl, and other wildlife, but use is inconsistent due to the variability in flooding that occurs on the site. Without functional water management infrastructure, the tract is subject to the flood stages of the Tualatin River: as river levels rise following wet season precipitation events, the basin floods; and as river levels drop, water recedes quickly. This drop in water levels results in a loss of floodplain wetland habitat and function.

Private landowners desire to continue the maintenance of working lands, thus limiting the implementation of a process-based restoration strategy that fully addresses stream and wetland function for the foreseeable future. Overarching goals are to develop a project concept that 1) restores wet season flooding patterns that occurred historically to provide more consistent habitat for migratory birds; 2) ensures passage for native aquatic species and explores options for improving stream function; and 3) maintains agriculture on private lands. This approach likely entails removal of a barrier and replacement with a step-pool system that will allow for aquatic species passage in Rock Creek, while retaining water on the floodplain after flood waters recede. Water can then be managed to inundate the tract between October and March for waterfowl and providing passage for aquatic species. The tract would be dewatered in April to support agricultural and refuge management operations.

Project partners will include US Fish Wildlife Service, Ducks Unlimited, ODFW and Pvt landowners.

Review Team Evaluation

Strengths

- The application has clear objectives and activities for designing water management infrastructure,

such as a step-pool system, to restore and maintain wetland habitat functions during critical periods for fish and migratory birds.

- Currently a structure in Rock Creek, a tributary of the Tualatin River, is prohibiting fish passage during non-flood conditions and prevents flood management. The resulting design will restore wet season flooding patterns that will provide natural habitat for migratory birds and improve stream function by providing passage for aquatic species.
- Multiple species will benefit from the expected future restoration project, including lamprey, coho, steelhead, waterfowl, and other wildlife.
- Partner support for the project is demonstrated by letters from US Fish and Wildlife Service (USFWS) and Oregon Department of Fish and Wildlife.
- The applicant has the capacity, relevant experience, and knowledge for implementing the project.

Concerns

- Onion Flats has mixed land ownership that includes USFWS properties and private agricultural lands. The USFWS is in the process of acquiring additional lands in the project area. There may be merit to waiting until the acquisition is complete and there are clear ownership boundaries before designing restoration. This would better facilitate capturing restoration opportunities on the new USFWS property into the project.
- It is unclear how the resulting design will address potential sediment issues. With standing water, sediment could build up, then recede back into the stream, and degrade water quality.
- It is unclear what considerations will be made to ensure the design will not lead to fish entrapment, which is a common concern related to projects designed to restore flooding and wetlands for bird habitat.
- Letters from the private landowners demonstrating support for the project concept would strengthen the application.

Concluding Analysis

A project concept and early design work will be developed that balances habitat with agricultural working lands. The resulting restoration is expected to restore historic wet season flooding patterns to provide more consistent habitat for migratory birds, improve stream function, and ensure passage for native aquatic species in Rock Creek while maintaining agriculture on private working lands.

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3034-23019

Project Type: Technical Assistance

Project Name: Davis Creek Fish Passage Improvements Phase 1

Applicant: Pudding River WC

Region: Willamette Basin

County: Marion

OWEB Request: $62,698

Total Cost: $90,664

Application Description The Davis Creek Fish Passage Improvement Project - Phase 1 (DFP1) is located in the Molalla-Pudding Subbasin of the Willamette Basin. The project site is in Marion County on Davis Creek, which is within the Lower Abiqua Creek 6th level HUC, near the City of Silverton. DFP1 addresses the restoration of freshwater aquatic habitat connectivity for salmonids including the federally-listed Upper Willamette River Winter Steelhead. Davis Creek is a West Cascades foothills headwater tributary to the temperature-impaired mainstem of Abiqua Creek within Willamette Valley. This technical design proposal will prepare the path for the construction of fish-friendly, modernized infrastructure under two private roads. The culverts are instream artificial obstructions limiting access to approximately 4.5 miles of spawning and rearing habitat. Funding for the DFP1 technical design will result in 60% designs, permits submitted to regulatory entities, and begin partnership development for Phase 2 which includes Marion County. Partnership for DFP1 includes the Oregon Department of Fish and Wildlife which will provide technical assistance, the Department of the Interior/Fish and Wildlife Service which will provide match funding through the National Fish Passage Program Funding, and the private landowners who will voluntarily allow the project to move forward. The Pudding River Watershed Council will coordinate the project and work closely with Waterways Consulting to move forward with the permitting process.

Review Team Evaluation

Strengths

- Davis Creek is a tributary of Abiqua Creek, which provides the highest quality fish habitat in the Pudding River watershed. Abiqua Creek is also temperature limited in the summer. Davis Creek could potentially provide temperature refugia for fish rearing because its north-south orientation provides afternoon shade. Addressing fish passage at road crossings on Davis Creek will open fish access to this rearing habitat in the summer.
- Landowner project support is demonstrated by letters included in the application.

Concerns

- The proposed technical assistance will result in designs to replace two culverts on private driveways. There are two county culverts located upstream of these driveways that are also fish passage barriers. The application indicates the future restoration project will open 4.5 stream miles. Passage to this 4.5 stream miles requires the county to address passage in a future phase two project;

however, there is no indication the applicant has communicated with the county or evidence the county will address these crossings. The proposed technical assistance will instead lead to opening approximately a tenth of a mile of stream habitat.

- It is unclear whether a range of alternatives will be considered, such as working with the landowners to reduce the number of crossings.
- The cost of the future restoration will be significant due to the stream channel width. Future crossings will require a large diameter culvert for one site and a 55-foot-long bridge for the second site. The cost will outweigh the benefit for the amount of stream length that will be made available in Davis Creek. While the Abiqua Creek basin has the highest density of steelhead in the Pudding River watershed, this watershed is not as high of a priority for Endangered Species Act (ESA)-listed fish compared to other Willamette tributaries, such as the Clackamas and Mackenzie Rivers.
- Including stream temperature data and other habitat data from the Rapid Bio Assessment in the application would be helpful to better understand stream conditions and the potential value for opening access to the stream habitat as temperature refugia.
- It is unclear whether the applicant has capacity to administer the project in addition to the existing projects in progress.

Concluding Analysis

The cost of the proposed technical assistance and resulting restoration is likely to be high for the limited habitat gains at a location that is not as high of a priority for ESA-listed fish compared to other Willamette tributaries. Investment in replacing the crossings on the private driveways would be more cost-effective if the upstream county culverts were included in the project so that connectivity of 4.5 miles of stream habitat is restored.

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3035-23061

Project Type: Technical Assistance

Project Name: It's Miller Time! Uncorking Habitat Potential in the Miller Creek & West Fork Luckiamute Sub-basins

Applicant: Luckiamute WC

Region: Willamette Basin

County: Polk

OWEB Request: $74,962

Total Cost: $93,847

Application Description The project is centered on Miller Creek and the West Fork Luckiamute River (WFLR) within the Upper Luckiamute 6th field hydrologic unit. Located in the northwest corner of the Luckiamute basin in Polk County, the project encompasses approximately 5.2 miles of Miller/WFLR from the confluence with the Luckiamute River. Historical practices such as splash dams, log drives, logging to the water's edge, and log removal impacted upper Luckiamute sub-basins, including Miller/WFLR. In addition to legacies of past practices, the site includes a remnant berm from the Valley & Siletz Railroad, bisecting the Miller/WFLR confluence. The project seeks to address lack of instream complexity and degraded riparian conditions by 1) conducting an alternatives analysis and selecting a preferred alternative for potential removal or modification of a portion of the berm and 2) surveying Miller/WFLR and developing a suite of restoration actions. Resulting projects will be designed to maximize habitat and water quality benefits for winter steelhead, Pacific lamprey, coho salmon, cutthroat trout, and, where appropriate, beaver.

Rapid bio-assessment snorkel surveys and temperature monitoring data indicate Miller/WFLR provide valuable habitat to steelhead, P. lamprey, and other salmonids and that there are also opportunities for enhancements. The Luckiamute Watershed Council (LWC) used NetMap, a fine-scale watershed-based modeling tool, in combination with field verification to prioritize restoration reaches for steelhead recovery. The proposed project area is the next priority site from that process. Partners include Starker Forests, Inc. (landowner), Manulife Investment Management (land manager), Bureau of Land Management, and Oregon Department of Fish and Wildlife. This area has long been identified as a priority but was paused due to other project commitments and site complexities. Now, the LWC, Starker Forests, and Manulife are aligned to move this project forward. It's Miller Time!

Review Team Evaluation

Strengths

- The application clearly links current site conditions to the causes of watershed disturbance that created them, which are primarily due to past logging practices such as riparian harvest, log removal, and flash dams. The resulting technical assistance is likely to succeed in developing restoration actions that address causes of watershed disturbance instead of symptoms.

- The proposed design work is technically sound by utilizing professionally accepted approaches and incorporating lessons learned from previous large wood placement projects.
- The restoration actions that will be designed will address habitat limiting factors identified in a number of watershed plans by addressing the lack of instream complexity and degraded riparian conditions.
- A map of all the applicant's restoration projects in the area is included in the application and provides context for understanding the potential cumulative impact of the applicant's watershed strategy.
- Stream temperature data is included in the application that confirms the project area has potential to provide cold water refugia for aquatic species, which is a priority for restoration.
- Alternatives will be identified and analyzed as part of the technical assistance project.
- Future restoration expected from the technical assistance will have significant benefit for the cost by maximizing water quality and providing habitat benefit for lamprey, steelhead, coho, cutthroat, and beaver.
- The applicant has the capacity, relevant experience, and knowledge for implementing the project.
- Partner support is demonstrated by letters from the landowners, Bureau of Land Management, and Oregon Department of Fish and Wildlife. The landowner's commitment to the project is demonstrated by their approaching the watershed council to pursue the project.
- Costs are reasonable for the expected products.

Concerns

- The railroad that bisects the project area may have historic cultural value, which may limit restoration options.

Concluding Analysis

Developing restoration actions to address habitat limiting factors caused by splash damming and other historical land use practices associated with logging will improve channel-floodplain interaction, stream habitat, and water quality that will benefit winter steelhead, Pacific lamprey, coho salmon, cutthroat trout, and beaver.

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3036-23062
Project Type: Technical Assistance
Project Name: Action Plan 2025-2035 Technical Assistance
Applicant: Johnson Creek WC
Region: Willamette Basin
County: Multnomah
OWEB Request: $25,574
Total Cost: $52,453

Application Description Johnson Creek Watershed Council proposes to update its existing 10-year Action Plan, which sunsets in 2025. The watershed covers 54 square miles, of which 67% is in Multnomah County and 33% in in Clackamas County and includes parts of the cities of Milwaukie, Portland, Gresham, and Happy Valley.

With the existing Action Plan (2015-2025), the Council and its agency partners confirmed limiting factors to watershed health, analyzed water quality data, assessed fish passage barriers, and prioritized riparian taxlots for shade enhancement using ORDEQ's Heat Source model.

Since that time, new watershed challenges and data have come to our attention that need to be incorporated into future restoration strategies. Climate change is the most significant driver in needing to update our Action Plan. We have eight years of new data that needs to be incorporated into articulating a new restoration strategy and Action Plan. In particular we wish to incorporate:
a) the impact of inline ponds on increasing stream temperature
b) eight new years of water temperature data
c) other water quality data and threats
d) recent instream habitat survey data
e) a new stormwater pipeshed analysis, which will assist us identifying focus areas for stormwater BMP projects to improve water quality and reduce hydromodification.

The Council and its partners for years have met monthly as a watershed restoration and monitoring technical work group, the Johnson Creek Interjurisdictional Committee. This committee will work together to update the Action Plan, with a Council Project Manager coordinating the effort and writing the plan. Partners include:

US Geological Survey, City of Portland, City of Gresham, Multnomah County, Clackamas County Water Environment Services, Oregon Dept of Environmental Quality, Oregon Dept. of Fish & Wildlife, Metro, City of Milwaukie.

Review Team Evaluation

Strengths

- The Johnson Creek Watershed Action Plan will be updated to integrate current water quality and habitat information and reassess watershed priorities and restoration opportunities.
- Eight years of stream temperature data will be utilized to classify stream reaches by temperature regime and inform action plan strategies for prioritizing restoration.
- The applicant has identified inline ponds as a significant contributor to increased stream temperature. Some ponds have been addressed through completed restoration. The new action plan will update information to better document the location, size, and other characteristics of the remaining inline ponds to prioritize them for restoration.
- The Johnson Creek fish passage barrier assessment will be updated and barriers will be re-prioritized to adjust the assessment after ten previously prioritized barriers have been addressed. The updated fish passage barrier assessment will also incorporate climate change considerations.
- BIPOC-led community partner organizations will be convened with agency partners to better understand heat islands in areas with low tree density and identify opportunities to address these heat islands by for example, removing pavement and replacing it with rain gardens.
- Public outreach is a significant focus for the applicant and this organization has experience in packaging information with marketing in mind for community and landowner engagement.
- The current action plan is included with the application and the quality of this plan indicates a technically sound product will likely result from the current project.
- The applicant has capacity and relevant experience to implement the project.
- Technical experts will be engaged in updating the Johnson Creek Watershed Action Plan through monthly interjurisdictional meetings.
- A diversity of partners support the project and their involvement is demonstrated by match and support letters, including East Multnomah Soil and Water Conservation District, Cities of Gresham and Portland, Multnomah and Clackamas Counties, US Geological Survey, and Oregon Department of Environment Quality.
- Costs are reasonable for the work proposed.

Concerns

- The action plan approach focuses primarily on stream related watershed concerns. Designing the action plan update to include more upland perspectives to capture the whole watershed up to the ridgetop would strengthen the product by providing a holistic watershed action plan.
- It is unclear from the budget how engagement with underserved communities will be funded. For example, there may be a need to incorporate costs for multi-lingual support and stipends to compensate for participants' time by breaking down financial barriers to participation. These strategies can increase the likelihood for success in engaging these underserved communities.

Concluding Analysis

As the applicant's current action plan sunsets in 2025, it is timely to update the plan with new information, reassess watershed issues, and reprioritize restoration actions. The applicant has a history of pursuing strategic restoration based on their action plan, which indicates the product is likely to lead to future

restoration. The new action plan will include priorities that will lead to ecological and social benefits by incorporating strategies that address community health concerns affecting underserved communities.

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3037-23064

Project Type: Technical Assistance

Project Name: Finalizing Floodplain Restoration Designs & Permitting for Elijah Bristow State Park - Phase 2

Applicant: Middle Fork Willamette WC

Region: Willamette Basin

County: Lane

OWEB Request: $75,000

Total Cost: $168,960

Application Description The 437-acre project area within Elijah Bristow State Park (EBSP) is at the confluence of the Middle Fork Willamette River with Lost Creek, below Dexter Dam, and between the Lane County towns of Jasper and Lowell. Historically this area was a dynamic floodplain with multiple, braided channels and sloughs, ephemeral gravel bars and islands, and extensive cottonwood gallery forests. Located below three large dams that have modified flows and altered the natural sediment regime, the dynamism of this floodplain has been lost. Gravel mining and building berms contributed to a more static environment. After the completion of a feasibility analysis, modeling and alternative analysis, and the creation of initial conceptual designs, the MFWWC conducted a Stakeholder Engagement process to foster tribal and community input and involvement in floodplain restoration. The engagement process included public events, tours, extensive landowner outreach, communication with federally recognized Tribes, and culminated in the creation of the Community Advisory Committee to represent diverse community interests. The MFWWC and the Technical Team of collaborating partners from Oregon Parks and Recreation Department (OPRD), Oregon Department of Fish and Wildlife (ODFW), Confederated Tribes of Grand Ronde (CTGR), US Forest Service (USFS), and US Army Corps of Engineers (USACE) seek funding to contract Wolf Water Resources to finalize engineered designs and complete project permitting. The MFWWC is submitting adjacent TA proposals to the Open Solicitation and the Willamette Anchor Habitat Investment Fund.

The Open Solicitation proposal will support development of Upper Zone designs to 60% completion and coordination to submit a Section 408 Alteration Determination Application to USACE. The Anchor Habitat Investment Fund proposal seeks support to complete Lower Zone designs to 60% completion, finalize the Upper Zone Designs, and bring designs for both zones to a permit ready status.

Review Team Evaluation

Strengths

- The application provides a clear explanation describing the need to finalize Stage 8 process-based floodplain restoration designs and initiate permitting processes.

- There is limited off-channel habitat on the Middle Fork Willamette River below Dexter dam and the future restoration project is likely to provide habitat benefits for multiple native species, including western pond turtle habitat, spring Chinook, lamprey, and Oregon chub.
- The Stage 8 restoration approach is reasonable for addressing limiting factors affecting stream habitat that resulted from loss of floodplain function in the Middle Fork Willamette River. While the Stage 8 concept is relatively new, it is becoming more widely accepted for restoring watershed process and function.
- Appropriate data and analysis will be used to inform the design.
- The proposed project builds on previous technical assistance and stakeholder engagement OWEB investments on a large-scale, complex river restoration project that will require a long-term approach to both design and implementation. The applicant has been strategic in parsing out project design and engagement efforts that aligns with the applicant's capacity and constraints from limited resources.
- The future restoration project will be highly visible because it is located on an 850-acre state park that is popular for recreation use.
- Appropriate partners are engaged in the project. Oregon Parks and Recreation Department (OPRD) support is demonstrated by a letter and in-kind match to participate in the project. The applicant along with OPRD has made impressive progress in securing support from recreation user groups utilizing Elijah Bristow State Park, including agreement on moving trails.
- The applicant has a technical team of qualified experts to help guide the project.
- A qualified contractor is implementing the design work.
- Project costs are appropriate for the proposed technical assistance.

Concerns

- The future restoration project will require moving a US Geological Survey (USGS) gauging station, which will impact long-term gauging data and options for future gauging techniques. Implementing the restoration may depend on the feasibility of moving this station. The applicant has initiated conversations with USGS to determine options for moving forward.
- The park infrastructure could limit restoration opportunities. The applicant's community engagement, however, has increased support for restoration and park users are participating in conversations to identify where there can be flexibility in where trails are located.
- Implementing a Stage 8 restoration approach below a flood control dam may have uncertain results due to the influence of the dam on stream flows and the supply of large wood; however, there is still significant potential for restoring floodplain conditions.

Concluding Analysis

Utilizing a process-based restoration approach at Elijah Bristow State Park will restore a portion of the Middle Fork Willamette River back to a dynamic, braided multi-channel meandering river through a cottonwood gallery floodplain forest. This will provide habitat benefits for key indicator species such as Oregon chub, western pond turtle, spring Chinook salmon, and beaver. The site provides opportunity to be highly visible to the public and serve as an example of process-based floodplain restoration strategies for areas between headwaters and downstream zones.

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3038-23069

Project Type: Monitoring

Project Name: Middle McKenzie Stage 0/8 Restoration Effectiveness Monitoring

Applicant: McKenzie Watershed Alliance

Region: Willamette Basin

County: Lane

OWEB Request: $362,696

Total Cost: $799,679

Application Description Process-based restoration to a Stage 0 or 8 condition is a relatively new approach to river restoration that is gaining interest in the scientific community. In theory, restoring river valleys to a Stage 0/8 condition (and processes that will sustain it) will have the greatest ecological uplift and resilience to disturbance and climate change, but project effectiveness has been largely untested. Short-term project effectiveness outcomes are encouraging, but there is still much to learn.

Partners within the McKenzie River watershed, including McKenzie Watershed Alliance (MWA), Eugene Water & Electric Board (EWEB), McKenzie River Trust (MRT), US Forest Service (USFS), Bureau of Land Management (BLM), and ODFW – all with direct involvement in this Effectiveness Monitoring (EM) Project – have a common vision to restore about 2,000 acres of the Middle McKenzie Valley and important tributaries to a Stage 0/8 condition (Attachment 1; 370 acres completed so far). Linked to this EM Project, partners have designed and developed the next round of valley-scale restoration projects on Finn Rock Reach (FRR) of the McKenzie River (150 acres, River Mile 55-56) and Quartz Creek (166 acres, River Mile 0-1.8), a major tributary to the McKenzie immediately downstream of FRR (Attachment 2). These projects are just down river from the town of Blue River in Lane County.

The goal of EM for these two restoration projects is to assess whether process-based restoration will indeed restore and enable fluvial and biological processes to reshape and sustain a Stage 0/8 condition over time and to help develop standards of practice for designing, constructing, and monitoring future Stage 0/8 projects. EM components include quantifying the hydrogeomorphic, ground water, habitat, macroinvertebrate, and Chinook spawning responses to restoration and using the results to inform future standards of practice, which are sorely needed in the growing field of process-based restoration.

Monitoring Team Evaluation

Monitoring Team Strengths

- This monitoring project builds off existing and completed Stage 0 restoration effectiveness monitoring efforts in surrounding locations with many of the same partners that have developed these monitoring approaches.

- This monitoring project will benefit from existing LiDAR data that is available for both project sites that was collected in 2022 and will be collected in 2024 and 2026 for post project comparisons.
- The project will utilize monitoring methods that are informed from past monitoring of Stage 0 restoration projects and are cited in scientific literature or existing agency's established methods.
- The application included an uploaded table that described the monitoring questions, and the restoration processes they are assessing.
- The monitoring study design was described for each monitoring objective and is appropriate for each monitoring question(s) posed.
- The data that will be collected will be maintained by the monitoring leads in databases that are consistently updated and backed-up. The leads will ensure the data management includes accurate metadata and records of all data collection activities.
- Individual reports will be written by the monitoring lead that is responsible for each data set and then combined into one comprehensive report in 2028.
- This project will share results and make the information available in a variety of ways, including posting reports on the internet, delivering presentations at conferences and the applicant is willing to work with OWEB to develop workshops or webinars.
- The project partners are highly qualified and have several years of experience collecting ground and remotely sensed data to monitor the effects of stage 0 restoration projects.
- The partners involved with this project have a good track record of sharing results of the restoration and monitoring efforts and their information is integrated into training restoration practitioners on how to implement this innovative restoration approach.
- The applicant and partners have worked extensively to engage the local community over time and is committed to engaging them into the future as these large-scale floodplain restoration and monitoring projects are implemented.
- The budget includes a detailed summary of the different monitoring components to demonstrate how the expenses were estimated and include sufficient time and resources for data analysis and reporting.

Monitoring Team Concerns

- It is not clear what existing data is available pre-restoration at Finn Rock for the phase 1 restoration project that was implemented in 2021 to understand if a before after study design can be implemented as proposed.
- The application focuses on monitoring changes from restoration that will occur immediately after the restoration are implemented and did not include a description of what potential plans there are for returning to the site to track changes over time as they continue to evolve. The application would have benefited from a description of how they would think of a returning timeframe in a period of years or after certain hydrological events or geomorphic conditions begin to emerge.
- The application didn't mention developing a Sampling and Analysis Plan for the macroinvertebrate monitoring and if that data will be submitted to DEQ.
- The status of the land ownership of the remaining 99 acres of the 181-acre project area on Quartz Creek was not clear as McKenzie River Trust is engaged in ongoing negotiations with the landowner and how that might impact the likeliness that the entire project will be implemented as proposed.
- It is not clear if sufficient time and funding is allocated in the budget for project management and monitoring coordination across all the monitoring components proposed to occur from 2023 to 2028.

Monitoring Team Comments

Review Team Evaluation

Strengths

- The application clearly describes the need and relevance of the proposed monitoring to evaluate the effectiveness of Stage 0 and Stage 8 process-based restoration approaches.
- A technically sound approach is proposed for using monitoring techniques to analyze results from Stage 0 and 8 restoration projects. This includes collecting baseline data, which is often overlooked with effectiveness monitoring projects.
- The methods for answering each monitoring question are appropriate. There are clear linkages between the monitoring questions and how they relate to river and biological responses to the restoration actions. The application also includes tables for the monitoring sites that describe SMART objectives linked to the monitoring questions.
- Monitoring results will be incorporated into the US Forest Service (USFS) Programmatic Aquatic Restoration Monitoring Strategy modeling framework. This will allow the data to be compared against other sites to create a synthesis of how the novel Stage 0 and 8 restoration method is performing at a regional scale. The findings will be used to inform future restoration projects implementing Stage 0 or 8 techniques.
- Partner support is demonstrated by letters from USFS, McKenzie River Trust, and Eugene Water and Electric Board, each of whom articulated how the results of the project will inform future restoration actions at their respective organizations.
- The applicant has capacity for implementing the proposed monitoring by working with partners, including Bureau of Land Management and USFS.
- The project team has relevant experience and expertise.
- The budget is reasonable for the broad temporal and spatial breadth of the project.

Concerns

- The proposed two to three years of post-project monitoring may be too short for answering questions about floodplain process activation, which may take a longer time to answer with statistically relevant data. Flow variations year to year could affect the accuracy of data interpretation. The McKenzie River system is a dynamic and changing landscape; it will take many years of analysis to understand how the wood, sediment, and water table are responding to Stage 0 and 8 restoration treatments. The applicant, however, plans to continue raising funds for long-term monitoring beyond the three years that may lead to the data collection needed to answer the monitoring questions.
- Some of the proposed monitoring components may not be necessary for answering whether Stage 0 or 8 floodplain conditions were achieved. While the Unmanned Aircraft Systems (UAS) and topobathymetric data could provide helpful information, it is unclear whether it is necessary to answer the monitoring questions. It is also unclear how the groundwater data will be more informative above and beyond collecting the proposed wetted width data.
- It is unclear whether alternative monitoring strategies were considered to increase the cost-effectiveness of the proposed monitoring approach given the limited availability of monitoring funds. For example, maybe one site could be monitored over a longer timeframe.
- The number of hours budgeted for applicant staff may not be enough for the work associated with the amount of data that will be generated over the project timeframe.
- It is unclear how the project goals and objectives will be affected if the match grant from Bonneville Power Administration is not secured.

Concluding Analysis

Process-based restoration to a Stage 0 or Stage 8 floodplain condition is a relatively new approach to river valley restoration. Significant investment has been made in projects utilizing this technique. Restoring unconfined river valleys to Stage 0 or 8 conditions and the processes that will sustain those conditions is expected to have the greatest ecological uplift and resilience to disturbance and climate change; however, project effectiveness has been largely untested. The proposed monitoring provides an opportunity to evaluate the effectiveness of Stage 0 and 8 restoration methods while also integrating those results into a broader USFS programmatic modeling framework with other projects sites regionally. Findings from this effort will likely inform future implementation of Stage 0 and 8 restoration that could improve implementation techniques and potentially determine more cost-effective adaptations when implementing these projects.

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3039-23029
Project Type: Monitoring
Project Name: Temperature Trend Monitoring: North Clackamas Watersheds
Applicant: North Clackamas Watershed Council
Region: Willamette Basin
County: Clackamas
OWEB Request: $87,625
Total Cost: $124,035

Application Description The North Clackamas Watersheds Council will continue its successful temperature monitoring program in Kellogg, Mt. Scott, River Forest, Boardman, & Rinearson watersheds into the 2024-26 time frame. We will track status & trends in watersheds essential to all salmonids & lamprey rearing, spawning, or migrating through the Willamette River system & use the data to prioritize key restoration actions to restore & maintain cold-water refugia (CWR) & to examine temperature drives to prioritize restoration over time.
We will extend the collection & analysis of A-level data at a minimum of 28 monitoring stations to gather 5 years of continuous data, building on two years of successful trend monitoring which began with non-OWEB funds in 2022. Sites are selected to characterize stream reaches, tributaries, & cold-water refugia sites, establish a 5-year baseline, & to detect trends related to climate, development & restoration. We will continue our rigorous quality control data, our partnership with technical experts.
We will share this data in presentations with stakeholders, agency partners, & funders of restoration projects. We will continue a successful process that integrates temperature data, along with fish use & fish passage information, into our Interagency Working Group framework & Watershed Action Plan system that prioritizes restoration work for both the Council & our agency partners. The first year of data already has already led to specific restoration activities. OWEB support will accelerate this progress toward restoration.

Monitoring Team Evaluation

Monitoring Team Strengths

- The proposed project will collect water temperature data to better understand this limiting factor to inform future restoration actions.
- There is a need for continuous water temperature in this area and this project will complement existing fish data being collected by partners in the basin and the water temperature collected by the applicant in 2022 and 2023.
- The applicant is following established water temperature monitoring methods described in a DEQ approved Sampling and Analysis Plan and will be updated to include the additional sites proposed in the application.
- The study design will include 20 long term permanent sites to monitor tributaries to the Willamette River based on the 2020 bioassessment across a variety of land uses and spatial distribution to track trends over time.

- The applicant will work with Portland State University to assist with the five-year trend analysis that they plan to complete.
- The applicant is hosting an existing interagency working group that serves as a forum for engagement with technical experts and community partners that increases collaboration and dissemination of information.
- The applicant has staff and an existing contractor that have the experience and qualifications to collect and report the data as proposed.
- The applicant uploaded a summary of the water temperature data they have recently collected that demonstrates their ability to review and assess the continuous data they are collecting.
- The budget includes expenses that are detailed by task and these proposed costs are appropriate to complete the work necessary to accomplish the objectives.

Monitoring Team Concerns

- The applicant only proposes to check on the water temperature loggers once mid-way through the field season which may not be sufficient in these smaller tributaries to ensure they are submerged throughout the monitoring season.

Monitoring Team Comments

• Contact Spencer Sawaske at ODFW's Water Division to coordinate on monitoring cold water refugia.

Review Team Evaluation

Strengths

- A technically sound approach will be used to collect water temperature data. There is a clear need for collecting the data to better understand stream temperatures in the North Clackamas watersheds and identify opportunities for maintaining and restoring cold water refugia, which is a limiting factor for Endangered Species Act (ESA)-listed fish.
- The proposed monitoring builds on previous data collection and examples of this data is included in the application, which demonstrates the project is likely to succeed in producing quality data.
- The water temperature data will be used to improve the fish passage assessment that is underway by providing information to prioritize restoration projects that will improve fish access to cold water reaches. This will provide habitat benefits for ESA-listed fish and lamprey species.
- The applicant has already developed a Sampling and Analysis Plan with Oregon Department of Environmental Quality (ODEQ) and will update it with the new proposed monitoring sites.
- The data will contribute to the state's Total Maximum Daily Load plan implementation by leading to projects that protect and restore cold water refugia.
- The applicant regularly engages community stakeholders to collaboratively implement work in the watershed.
- Previous monitoring results have been shared through public workshops, articles, and the applicant's website.
- The project costs are reasonable for the proposed work and the application budget provides details needed to understand expenses.

- The applicant has a track record collecting water quality data and using data to plan restoration. The application provides examples of projects that have already moved forward as a result of information learned from previous monitoring data.

Concerns

- Additional information describing how the factor analysis in objective two of the application will be completed would be helpful for better understanding how data will be analyzed. The application indicates Portland State University (PSU) and ODEQ will be engaged to help conduct the analysis so these details may be worked out later. PSU and ODEQ have the relevant expertise to assist the applicant with this data analysis.
- Checking water temperature loggers once mid-way through the field season may not be sufficient to ensure the loggers remain submerged throughout the summer in the smaller tributaries.

Concluding Analysis

The proposed monitoring project will extend and expand an existing monitoring program in the North Clackamas watersheds area. Water temperature data will be used to prioritize restoration and inform project designs to ensure they provide access to cold-water refugia habitat, a priority habitat limiting factor affecting ESA-listed fish in the North Clackamas watersheds.

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3040-23030
Project Type: Monitoring
Project Name: Restoration effectiveness monitoring of Taylor's checkerspot butterfly habitat
Applicant: Institute for Applied Ecology
Region: Willamette Basin
County: Benton
OWEB Request: $65,351
Total Cost: $88,825

Application Description Taylor’s checkerspot butterfly (TCB), a federally-listed endangered species, was once abundant in the Pacific Northwest. TCB are threatened by loss of habitat from agricultural development, fire suppression, urbanization, forest succession, the spread of invasive species, and genetic drift.
The goal of this project is to conduct pre- and post-treatment effectiveness monitoring to assess the success of restoration actions conducted under an OWEB project to enhance habitat conditions for TCB at nine sites in Benton County, Oregon. Two of these sites have extant populations of TCB and seven sites are considered high priority for TCB introductions.
Pre- and post-treatment effectiveness monitoring will 1) estimate the patch abundances of the two known TCB host plants, golden paintbrush (Castilleja levisecta), and English plantain (Plantago lanceolata), 2) estimate the cover of TCB nectar plants, and 3) assess habitat conditions. We will assess restoration efficacy by quantitatively comparing the pre- and post-treatment estimates of host and nectar plants, as well as assessing the change in habitat conditions.
By monitoring TCB habitat conditions, this proposal addresses a Draft Priority Recovery Action (USFWS 2022) of studying the response of TCB to management actions. Our assessment of restoration efficacy will directly inform future restoration efforts and recovery criteria for TCB. We currently have a poor understanding of how to restore habitat to benefit TCB and to date there is no established recovery plan nor guidelines. The OWEB restoration proposal that this proposal complements represents the largest effort to date to restore habitat for TCB in Oregon. Without the ability to evaluate the effectiveness of these actions, we risk spending precious time, effort and money on less-than-effective treatments.
Project partners include the USFWS, Benton County, Greenbelt Land Trust, and private landowners.

Monitoring Team Evaluation

Monitoring Team Strengths

- This project complements existing data at several of the same sites collected by the applicant in 2016 and data collected by the state of Washington on this rare butterfly habitat following the same monitoring protocol.

- The applicant will follow an established monitoring protocol they developed in coordination with the state of Washington.
- The applicant will incorporate necessary quality assurance and quality control measures to train field technicians and review field data for completeness and for transcription errors as it is transferred from paper field forms to be stored electronically.
- The results will be made available through a variety of ways including posting the final technical report on the applicant's website and presenting to the Prairie Plant Working Group. The final technical report will also be posted on Research Gate and the Cascadia Prairie Oak Partnership's technical library.
- The applicant is partnering with a variety of land managers in the Willamette Valley that are engaged and interested in restoration including state, federal, non-profit agencies and private landowners. The uploaded letters of support demonstrate this engagement and interest in applying the information that this project will produce.
- The applicant's staff are highly qualified to collect this data and have relevant experience developing and following monitoring protocols to collect specific data related to the Taylor's checkerspot butterfly and similar plant/butterfly species in the Willamette valley.
- The proposed costs are appropriate to complete the work necessary to accomplish the objectives.

Monitoring Team Concerns

- The proposed analysis of the vegetation cover data is simplistic, which will compare the results before and after with no statistical tests being performed.
- The analysis will only summarize one year of pre and post restoration data that will not account for other environmental factors that could affect the results. The application did not describe how the habitat data will be analyzed.
- It was not clear if pesticide applications in the surrounding landscape is a factor that can influence the effectiveness of the plant establishment and butterfly colonization efforts.

Monitoring Team Comments

Review Team Evaluation

Strengths

- The proposed monitoring is clearly linked to habitat restoration actions funded through an OWEB grant for Taylor's checkerspot butterfly (TCB), a federally listed endangered species.
- The monitoring project will provide critical data needed to assess the effectiveness of TCB habitat restoration actions that will inform current and future restoration practices.
- The monitoring actions are a priority in the draft US Fish and Wildlife Service (USFWS) recovery action plan for TCB. The protocols that will be used are listed in this plan and, therefore, are standardized. This allows for comparisons across sites.
- The applicant has capacity to implement the project and relevant experience pairing OWEB restoration and monitoring grants to restore habitats for Endangered Species Act-listed species and collecting effectiveness monitoring data to track progress and inform restoration strategies.
- A large and diverse working group of state, federal, university, non-profits, and landowners are participating in the project.

- Project costs are reasonable for the proposed monitoring.
- Data will be made available online on the applicant's website and through online libraries. The applicant also has a history of sharing monitoring results through presentations at practitioners' meetings and conferences.

Concerns

- The timelines for the restoration actions and monitoring actions are unclear in the application. It is unclear whether sites will receive chemical treatment at the same times as monitoring data will be collected. If these actions are co-occurring, it could potentially affect the butterfly population data.

Concluding Analysis

TCB is a federally listed endangered species that was once abundant in native prairies across the Pacific Northwest. Loss of habitat has led to a decline in their distribution to only 11 extant populations. The proposed monitoring is paired with an OWEB restoration grant to collect pre- and post- treatment data to assess habitat conditions and examine the effectiveness of restoring host plant communities in rebuilding the TCB population. There are currently no guidelines for TCB habitat restoration due to a poor understanding of how to establish these plant communities and how the TCB population will respond. The data collected will be used to adaptively manage current efforts based on plant and TCB response and inform future actions. This will support implementation of the draft USFWS recovery action plan for TCB, which identifies habitat enhancement as the top priority action for the species.

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3041-23033

Project Type: Monitoring

Project Name: Marys River Watershed Council Monitoring Phase 1

Applicant: Marys River WC

Region: Willamette Basin

County: Benton

OWEB Request: $153,297

Total Cost: $198,451

Application Description The Marys River Watershed Council (MRWC) proposes to collect continuous temperature data from surface waters in the Marys River River Watershed during the summer months of 2023 and 2024. This is a continuation of an existing trend temperature monitoring program begun thanks to matching support from Meyer Memorial Trust as part of the Model Watershed program. The goal of this program is to continue to fill a data gap of stream temperatures and trends in key locations to inform prioritization and planning for restoration projects. Sites are selected to characterize priority tributaries and stream reaches, detect trends, and collect baseline data. The MRWC proposes to deploy 35 monitoring stations within Benton and Lincoln Counties. These include the continuation of 15 active stations in the middle and upper Marys River watershed, reactivation of 7 historical monitoring stations, and addition of 13 stations at new locations of interest. Work will include field deployments, midseason checks, and retrieval of loggers, as well as data analysis. The MRWC will also implement appropriate quality assurance and quality control measures to ensure high-quality data that meets A-level standards, as defined by the Oregon Department of Environmental Quality (DEQ). As a result of this proposed work, 15 of the 35 proposed monitoring sites would have a total of 13 years of data. The MRWC will conduct an analysis of the full dataset to assess trends and examine relationships with external drivers of temperature. The MRWC will share data through presentations, landowner summaries, and will submit data to DEQ. Project partners include field and technical volunteers, private landowners, OSU Extension Service, City of Corvallis, Benton County Public Works, and the Luckiamute Watershed Council.

Monitoring Team Evaluation

Monitoring Team Strengths

- This project will complement existing water temperature and rapid bioassessment data collected by the applicant and additional water temperature data collected by partners in the watershed.
- The applicant will follow established water temperature monitoring methods and develop a Sampling and Analysis Plan that will be reviewed and approved by DEQ.
- This resubmitted application, included a response to concerns that were identified in the previous evaluation and provided additional information that improved the application’s technical soundness.
- The application included a detailed table that was uploaded that described which sites they will continue to monitor, which new sites they are proposing, how the data can be used and which questions they plan to answer.

- The applicant will follow data management procedures to store the raw data in a cloud-based file storage system and have backup copies on desktop computers.
- The applicant has a variety of staff that will implement this monitoring project and all of them have a range of experience collecting, managing and reporting this data. In addition, the applicant will hire a qualified monitoring coordinator to help manage the program and they will be trained by staff that have completed this work in the past.
- The applicant is engaging technical experts through a Technical Advisory Team (TAT) which includes several technical experts from state, university, federal and local partner organizations to analyze and interpret the results to inform future restoration and monitoring activities.
- The application includes several letters of support demonstrating their engagement efforts and commitment to participating on the TAT.

Monitoring Team Concerns

- It is unclear what will be completed during the second phase of the project since the conclusions they will draw at the completion of the first phase due to some sites having limited data.
- The quality of the previously collected water temperature data is unclear due to the limited capacity of the applicant to perform the monitoring and lack of a Sampling and Analysis Plan.
- The monitoring methods for measuring streamflow were not described in detail and the protocol was not cited. It was not clear if multiple water depth and velocity measurements will be taken across the wetted width.
- The application did not describe how the data will be analyzed to identify temporal trends for the 16 sites that have 10 years or more of data.
- It is not clear why the budget increased by $50,000 from the last time it was submitted.

Monitoring Team Comments

• Contact Spencer Sawaske at ODFW's Water Division to coordinate on monitoring cold water refugia.

• Consider incorporating the completed TMDL shade gap modeling results into the monitoring site selection process.

Review Team Evaluation

Strengths

- Previous application evaluation concerns are addressed. The applicant's response to feedback provided a linear connection that demonstrated how these concerns were addressed.
- The monitoring will build on previous data collection and examples of this data are included in the application.
- The proposed monitoring will support Oregon Department of Environmental Quality's (ODEQ) Total Maximum Daily Load plan implementation by leading to projects that protect and restore cold water refugia.
- The applicant is working with ODEQ to create a Sampling and Analysis Plan.

- Monitoring will occur in areas that were identified as critical habitat for steelhead and Chinook salmon.
- The applicant will have capacity to implement the proposed work because the budget includes funds for a monitoring coordinator.
- Data will be shared with landowners and partners.
- Partner support and roles are demonstrated by letters from Oregon State University, City of Corvallis, Benton County Public Works, Benton Soil and Water Conservation District, Natural Resource Conservation Service, and a technical advisory member.

Concerns

- The application includes an example of temperature data that was used to identify areas for restoration on a tributary and lists a number of restoration techniques that were implemented. Additional information describing how data is used to determine and select site-specific restoration techniques would be helpful to better understand how the data informs restoration.
- It is unclear why the current application has significantly higher costs compared to the previous application for a similar scope of work. The project cost is also higher compared to other similar monitoring projects.

Concluding Analysis

Stream temperature data will be collected to fill data gaps and determine trends in priority streams in the Marys River Watershed. The proposed temperature monitoring is likely to help the applicant identify locations of cold-water refugia, a priority habitat for Endangered Species Act-listed fish, to prioritize and plan strategic restoration projects.

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3042-23040

Project Type: Monitoring

Project Name: Effectiveness Monitoring of Floodplain Restoration at Elijah Bristow State Park_Pre-Impmlementation

Applicant: Middle Fork Willamette WC

Region: Willamette Basin

County: Lane

OWEB Request: $304,402

Total Cost: $380,927

Application Description Process-based restoration plans for Elijah Bristow State Park (EBSP) are in collaborative development between Oregon Parks and Recreation Department (OPRD), Middle Fork Willamette Watershed Council (MFWWC), Oregon Department of Fish and Wildlife (ODFW) among other diverse partners and stakeholders. The proposed 437 acre project area is located below Dexter Dam downstream to the Lost Creek confluence with the Middle Fork Willamette River, between the Lane County towns of Jasper and Lowell. Historically, EBSP was a dynamic floodplain with multiple braided channels and sloughs. Anthropogenic alterations such as gravel mining and dam construction have altered floodplain processes which has led to instream habitat degradation. Process-based restoration designs informed by Stage-0 and Stage-8 stream evolution model approaches will be implemented to restore floodplain function. To prepare for restoration, the MFWWC will develop a monitoring plan for the EBSP project area and conduct two years of pre-project monitoring to establish baseline conditions for a Before-After analysis of floodplain conditions and evaluate the effectiveness of restoration. Primary partners for this project include OPRD, Wolf Water Resources (W2r), ODFW, and the US Forest Service (USFS).

Monitoring Team Evaluation

Monitoring Team Strengths

- The application includes an objective to develop a monitoring plan that will synthesize data collected at Elijah Bristow State Park by other entities and incorporate that into the pre-project monitoring plan to avoid duplicate data collection.
- This project will monitor the effects of stage 0 restoration on terrestrial wildlife presence and abundance which has been lacking in other large-scale floodplain restoration projects.
- This project is making a focused effort to collect two years of pre-restoration data to be able to evaluate the effectiveness of this large-scale floodplain restoration project.
- The applicant has a clear plan for data management for a variety of data that will be collected including how the data will be stored on their server and backed up on an external hard drive.
- The applicant will interpret the data and include all the results in a monitoring report that will be shared on their website and uploaded to ODFW’s Natural Resource Information Management Program (NRIMP) clearinghouse and submit the water quality data to DEQ.
- The remote sensing contractor has the necessary experience collecting and analyzing similar data in largescale floodplain restoration projects.

- The applicant has engaged a variety of partners and have established a technical team which will review the monitoring plan and a community advisory committee to provide updates on the monitoring process to keep the public informed.

Monitoring Team Concerns

- Parts of the application were confusing, the applicant proposes to finalize a monitoring plan, yet this application proposes several detailed monitoring tasks with an extensive budget to support these efforts.
- This application will only support the collection of pre-restoration project data. The applicant will have to seek funding to collect post restoration data and evaluate the effectiveness over time.
- It is not clear what monitoring questions they are trying to answer by collecting bat and bird information since this was not included in objective three.
- The brief description of the bat monitoring methods described in the contractor's estimate that was uploaded to the application are not professionally accepted methods.
- The application does not describe the continuous dissolved oxygen monitoring methods and no citation was provided.
- The approach to filter water samples, freeze the filters and submit them for nutrient analyses later in the year is not a standard approach and it was not clear why this was proposed.
- Evaluating the project's success based on adult fish returns to Dexter dam is not likely to yield valuable information due to the variety of factors that affect fish returns across the basin.
- The application did not describe how they will track water releases at Dexter Dam and how they will incorporate gravel augmentation to understand project effectiveness.
- The timeline to hire a monitoring specialist, develop a Sampling and Analysis Plan, gather relevant data from agencies and complete the monitoring plan in four months is extremely ambitious and is not likely to be enough time to figure out the necessary details to ensure a successful monitoring approach.
- This monitoring proposal includes several complex monitoring efforts into one single application. A paired down application that proposes monitoring where capacity exists to identify a clear monitoring lead will increase the likelihood of success.

Monitoring Team Comments

Review Team Evaluation

Strengths

- Effectiveness monitoring could be helpful for documenting the proposed Stage 8 restoration planned for the Elijah Bristow State Park located downstream of Dexter dam in the Middle Fork Willamette watershed. The Stage 8 project is complex and will be challenging to implement due to the combination of the site being at a highly visible location with a high volume of park users and the influence of Army Corps dams on the hydrology and floodplain function. Utilizing the Stage 8 techniques will likely push the boundaries of what can be done to restore floodplain conditions using this process-based restoration approach. Documenting project effectiveness will, therefore, be important.

- The proposed monitoring methods will include collecting baseline pre-project data before starting restoration actions.
- Monitoring from previous Stage 0 projects completed by the applicant will be used to help inform the effectiveness monitoring at Elijah Bristow State Park.
- The project builds on previous OWEB stakeholder engagement and technical assistance investments at the Elijah Bristow State Park.
- Partner support is documented through letters and match from Oregon Parks and Recreation Department, US Forest Service, and Oregon Department of Fish and Wildlife.
- The project budget is reasonable for the breadth of the project.

Concerns

- The connection between the expected restoration actions, monitoring questions, and proposed monitoring actions are unclear. Information describing connections between the restoration that will be implemented and what the applicant expects to learn from the data to be collected would be helpful for understanding the need and relevance of the monitoring project.
- A large volume of metrics is proposed; it is unclear how the data will be used or if all the proposed metrics are needed for evaluating the effectiveness of the Stage 8 restoration. For example, while results from bat and bird data collection may be interesting, it is unclear how it will be used to directly inform restoration strategies. It is also unclear what will be learned from the nutrient monitoring that can be used for informing how Stage 8 restoration is implemented or determine whether Stage 8 restoration goals are met.
- The first objective in the application is to develop a monitoring plan. It is unclear if the application budget could be accurately estimated for the wide array of monitoring metrics proposed before a monitoring plan is established. It is also unclear how the detailed list of equipment and supplies was determined before the monitoring plan is completed.
- Some of the proposed methods are not standard protocols; information describing how the resulting data is likely to succeed in informing the effectiveness of the Stage 8 project implementation would be helpful for evaluating the technical soundness of these methods.
- While the applicant recognizes the limitations of using traditional monitoring methods on Stage 0 and 8 projects, some traditional monitoring methods are still proposed that are unlikely to be successful. For example, some of the proposed data collection will utilize randomized locations, which will likely not be effective because the same sites often cannot be accessed again after Stage 8 restoration treatments.
- While the application indicates monitoring results from the Coal and Staley Creeks Stage 0 projects will be incorporated, the application lacks information describing the existing data sets from these projects.
- It is unclear whether alternative monitoring strategies were considered to increase the cost-effectiveness of the proposed monitoring approach given the limited availability of monitoring funds. For example, monitoring fewer metrics that would provide more direct evidence on whether the Stage 8 project is performing as expected and inform future implementation approaches.
- It is unclear the extent to which the applicant has engaged with other practitioners implementing Stage 0 and 8 projects. Coordinating with practitioners implementing and monitoring similar restoration techniques could lead to cost savings and ensure similar monitoring approaches are used to compare projects across a broader geography.
- If the applicant is unable to hire a monitoring coordinator qualified to manage the complex monitoring project proposed, the applicant may not have capacity to complete the work and it could impact their ability to meet the project timeline.

Concluding Analysis

Process-based restoration to a Stage 8 condition is a relatively new approach to river valley restoration and significant investment has been made in projects utilizing this technique. Effectiveness monitoring to document whether these projects are achieving their expected outcomes is important for learning more about this novel restoration approach. The proposed effectiveness monitoring for the Elijah Bristow State Park Stage 8 project includes a high volume of diverse metrics and it is unclear if each metric is needed to determine whether the restoration technique is effective or the data will inform how these projects will be implemented. Developing a monitoring plan before pursuing funds for implementing the monitoring may provide a helpful tool for focusing the monitoring approach.

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3043-23057
Project Type: Monitoring
Project Name: Fire Effects Monitoring: Developing a Framework for Cultural and Ecological Health
Applicant: Ecostudies Institute
Region: Willamette Basin
County: Lane
OWEB Request: $189,530
Total Cost: $351,830

Application Description Prior to colonization of the Willamette Valley (WV) in the 1800s, Kalapuya people helped shape the fire regime and evolution of local ecosystems through the use of intentional cultural fire. Since the forced removal of Kalapuya people and a societal suppression of fire, less than one percent of prairie and oak fire-adapted habitats now remain in the WV. Consequently, the use of prescribed fire to help restore these habitats and steward the land is increasing in the region, in addition to the increased realization and need for Indigenous people and values to be prioritized in these efforts. However, there is limited established monitoring data on the effects of prescribed fire on ecological and cultural parameters that prioritize local Indigenous values and goals.

Ecostudies Institute plans to bring technical experts and local Indigenous people together on a team to collaboratively develop a prescribed fire monitoring framework that prioritizes Indigenous perspectives and values. Vegetation, soils, air quality, avian, and cultural resources monitoring protocols will be used to collect one year pre-burn data and two years of post-burn data on up to 10 burn units to begin establishing a baseline dataset that could be used for long-term monitoring purposes. With the help of the technical team, the data will be interpreted and used to inform and provide recommendations on prescribed fire implementation, monitoring approaches, and next steps for expanding the framework and establishing a long-term dataset.

Current partners in this project include the Confederated Tribes of Grand Ronde, Confederated Tribes of Siletz Indians, the City of Eugene, Natural Resources Conservation Service, The Nature Conservancy, and the Upper Willamette Stewardship Network. We plan to engage more partners during the technical team development process.

Monitoring Team Evaluation

Monitoring Team Strengths

- The applicant will be working with tribes in Oregon to apply their knowledge and cultural values to develop a monitoring approach of prescribed burns in the Willamette Valley.
- The applicant will collect the field data using a combination of digital data tablets or paper field forms and store it electronically in different software using a cloud-based file system.

- The applicant has the necessary qualifications to collect the vegetation, fuels, soil and bird data and cite a variety of professionally accepted field methods that might be followed after the monitoring plan is finalized.
- The applicant has engaged staff from the Confederated Tribes of Siletz Indians and Confederated Tribes of Grand Ronde which both provided letters of support that demonstrate their engagement and interest in participating in this project.
- At the end of the project all data will be interpreted and presented in a final report. The final report will be posted on the applicant's website, at the Cascadia Prairie Oak Partnership conference and website and results of this monitoring efforts will be presented at relevant local and regional forums.
- The applicant uploaded a separate table to the application that breaks down the staff time by task to understand how staff wages were calculated.

Monitoring Team Concerns

- The application lacked a description of the existing data that has been collected by partners in the Willamette Valley on completed prescribed burn projects, such as the Baskett Slough project and others implemented by the US Fish and Wildlife Service, Oregon Department of Forestry, Institute for Applied Ecology (IAE) and the Confederated Tribes of Grand Ronde.
- The application describes evaluating the effects of fire suppression in oak prairie woodlands, but it wasn't clear how the sites would be selected to specifically evaluate the impacts of this management strategy. In addition, it was not clear how past management history on each parcel of land will be incorporated into the data analyses to understand the effects of the prescribed burns.
- An important and key component of the project hinges on the engagement of tribes and other partners to develop the collaborative monitoring approach, which is to be completed before May 2024. It is not clear if six months is enough time for thoughtful and meaningful engagement with the tribes to occur, especially if there is a lack of consensus on what and where to monitor.
- Several of the details on the monitoring study design depend on the availability and access to prescribed burns and it was not clear if there will be a deliberate approach to stratify the sites to evaluate spring and fall burning regimes.
- It was not clear why IAE wasn't mentioned in this application since they seem to be a likely partner to engage in this project given their work with oak prairie restoration in the Willamette Valley.
- It is unclear if the costs are appropriate since a thorough review of the monitoring of prescribed burns in the Willamette Valley was not described in the application.
- It was not clear if expenses are included in the budget to compensate the tribes for their time to engage in this project in a meaningful way.
- The budget table includes substantial match for prescribed burn planning on four NRCS easement sites but there was no information in the application that describes what this match includes and where these sites are to understand how this relates to the project.

Monitoring Team Comments

Review Team Evaluation

Strengths

- The application clearly describes proposed work with a technical team and Tribes to design a monitoring framework and protocols for understanding the effects of fire to inform future burning

practices.

- The applicant has experience with ecological monitoring in Washington.
- The applicant will share reports with local and regional restoration practitioners, including Rivers to Ridges Partnership, the Upper Willamette Stewardship Network, and Cascadia Prairie Oak Partnership.
- Partner support is demonstrated by letters, including communications indicating support from the Confederated Tribes of Siletz Indians and Confederated Tribes of Grand Ronde.

Concerns

- "Cultural burning" is not clearly defined in the application, and it is unclear how the term is being used to describe a practice that is different from "ecological fire." The application indicates the applicant is the only dedicated prescribed cultural burn program in the Willamette Valley; however, the Confederated Tribes of Grand Ronde has been implementing prescribed burning for many years. It is unclear how the applicant's team is doing something different from the Tribes without a clear definition for cultural burning.
- It is unclear from the application how monitoring sites will be selected. The 30-year conservation concept map for the Willamette Valley Oak and Prairie Cooperative included in the application does not indicate where sites might be located. Four Natural Resource Conservation Service (NRCS) sites are referenced in the application; however, no details are provided that describe the site conditions and characteristics nor are these sites noted on the map.
- Coordination with some partners is unclear from the application. For example, there is no letter of support or match confirmation from NRCS included in the application related to the NRCS sites and secured match referenced.
- It is unclear how the proposed monitoring could complement existing data or other current monitoring because the application does not acknowledge the considerable related data that exists from multiple organizations.
- It is unclear whether the project budget is reasonable for the proposed monitoring because the monitoring plan and methods are not yet developed.
- More specific monitoring questions related to on-the-ground restoration actions would demonstrate how the proposed monitoring can inform future restoration. For example, a question about the effectiveness of reseeding immediately after a burn could directly inform future restoration practices.
- All of the proposed monitoring is focused on ecological datapoints; however, the application emphasizes that cultural fire is different from ecological fire. No potential cultural type metrics are described in the application that could be used for monitoring cultural burning. It is unclear why the project focuses on the impacts of cultural fire but describes monitoring ecological health in response to fire.
- It is unclear how the data will be used specifically to inform future restoration planning or practices. Burning has occurred for a long time in the Willamette, it is unclear how the data will help the applicant use fire differently compared to current practices by the Tribes and other restoration practitioners.

Concluding Analysis

There is value in learning more about fire and its effects on ecological, cultural, and community health. It, however, is unclear how the monitoring approach will lead to informing restoration that will improve habitat and watershed functions. The application does not describe how the applicant expects to use the resulting data specifically or how fire could be used differently based on what is learned from that data.

The application lacks details needed to evaluate the project with the monitoring review criteria. More information is needed to understand the technical soundness of the monitoring approach, how the data is necessary for carrying out restoration, and whether the significant investment is reasonable for the proposed work. Developing a monitoring plan before pursuing funds for implementing monitoring could provide the information needed to evaluate the monitoring project.

Open Solicitation-2023 Spring Offering
Willamette Basin (Region 3)

Application Number: 223-3044-23047

Project Type: Stakeholder Engagement

Project Name: Benton County Oak Habitats Stakeholder Engagement

Applicant: Benton SWCD

Region: Willamette Basin

County: Benton

OWEB Request: $34,130

Total Cost: $46,330

Application Description 1) Project location: Existing and potential oak woodland and savanna/prairie habitats will be assessed in all of Benton County. Our initial focus will occur in Core Conservation Areas identified by the Willamette Valley Oak and Prairie Cooperative and expand outward.
2) Project need: Oak habitats are some of the most imperiled habitats in the Willamette Valley eco-region. For years, Benton SWCD has worked with private landowners to restore oak habitats when we receive a request for assistance. However, the geographic extent of the oak habitat is unknown in Benton County and incomplete data prevents us from strategically targeting landowners in key areas for restoration. Identifying our target audience based on average acreage sizes, location within the county, and assessing their current management objectives and barriers to conservation will help us to develop a strategy for restoration and seek the appropriate funding sources. We might find that we need to develop better programming and funding opportunities for small acreage oak habitat owners.
3) Describe the proposed work: We intend to analyze the most current GIS data to determine oak habitats, as well as tax parcels to identify areas in which to target outreach. We will work with partners to host events highlighting oak restoration activities and funding opportunities. Focus groups will also serve to help us learn about local landowner motivation for oak restoration. Information gathered will inform project partners of landowner interest, location and parcel size to leverage funds for OWEB restoration grants, NRCS programs (EQIP and RCPP), and/or other sources of restoration funding.
4) Identify project partners
Natural Resources Conservation Service
Greenbelt Land Trust
Benton County Small Woodlands Association
Willamette Valley Oak and Prairie Cooperative
Trout Mountain Forestry
Marys River Watershed Council (WC)
Luckiamute WC
Long Tom WC
US Fish and Wildlife Service

Review Team Evaluation

Strengths

- A combination of data collection and stakeholder engagement actions is proposed to better understand opportunities for restoring oak habitat in Benton County. Products will be used to coordinate oak habitat restoration on properties that are 20 acres or less, which are often overlooked when considered as stand-alone projects.
- A variety of outreach methods, such as tours, workshops, focus groups, and landowner interviews, will be used to raise awareness of oak habitats and restoration opportunities.
- A group of technical partners are involved in the project, including: Natural Resources Conservation Service, Greenbelt Land Trust, Benton County Small Woodlands Association, Willamette Valley Oak and Prairie Cooperative, Trout Mountain Forestry, Marys River Watershed Council (WC), Luckiamute WC, Long Tom WC, and US Fish and Wildlife Service.
- Partner support is demonstrated by letters included in the application.
- A facilitator will be hired for the focus groups designed to obtain landowner input on oak restoration strategies.
- The applicant has capacity and relevant experience to implement the project.
- Costs are reasonable for the proposed activities.

Concerns

- The linkage between the success indicators for the proposed stakeholder engagement activities with future restoration is somewhat vague; however, the proposed activities are likely to generate landowner interest that could lead to oak habitat restoration.

Concluding Analysis

The combination of data analysis and landowner engagement is likely to lead towards a better understanding of oak restoration opportunities among private landowners in Benton County. Oak habitats are a priority strategy habitat in the Oregon Conservation Strategy. Coordinating opportunities to restore oak across properties 20 acres or less, which typically do not receive funds, could provide a collective impact in restoring oak across a broader landscape in the Mid-Willamette valley.

Open Solicitation-2023 Spring Offering
Central Oregon (Region 4)

Application Number: 223-4015-23014
Project Type: Restoration
Project Name: Lower Crooked Habitat Restoration - Silva Ranch
Applicant: Crooked River WC
Region: Central Oregon
County: Crook
OWEB Request: $241,819
Total Cost: $497,600

Application Description 1) The proposed work takes place on the Silva Ranch, located within the LCRSR area, approximately 4.5 miles northwest of Prineville. The project reach extends from approximately river mile (RM) 43 to RM 44.3.
2) The Crooked River Watershed Council and Natural Resources Conservation Service, through a Regional Conservation Partnership Program (RCPP), are working with private landowners between the City of Prineville and Smith Rocks State Park to implement the Lower Crooked River Strategic Restoration (LCRSR). The LCRSR is a comprehensive project intended to address key watershed deficiencies as recognized by the Mid-C Steelhead Recovery Plan (ODFW 2010), NRCS Hydrology Study (NRCS 2010), Lower Crooked River Watershed Assessment (CRWC 2008), and Deschutes Sub basin Plan (DBWG 2008) which all include an element of degraded fish and wildlife habitat, water quality, and riparian plant communities within the 19-mile Prineville valley reach of the mainstem Crooked River in Central Oregon.
3) The Silva Ranch project will include 1,680 linear feet of restoration treatments, large wood structures, bank sloping/planting, existing side channel connection at base flow, habitat promoting features inside channel. The proposed project will aid in steelhead and Chinook salmon reintroduction efforts in the greater Deschutes Basin, specifically for water quality, juvenile out-migrating habitat, and potential for adult holding/resting structure and long term wood recruitment.
4) Specific project partners include Portland General Electric, Crooked River Ditch Company, Crooked River Weed Management Area, Crook County SWCD, Confederated Tribes of the Warm Springs, City of Prineville, Oregon Watershed Enhancement Board, US Bureau of Reclamation, Ochoco Irrigation District, and the Oregon Department of Fish and Wildlife.

Review Team Evaluation

Strengths

- The project is part of a larger Lower Crooked River strategy the applicant and partners are implementing through the NRCS Regional Conservation Partnership Program to address key watershed limiting factors prioritized in watershed and recovery plans. The match funding provided by NRCS is secured and will support final design development and permitting.

- Sloping back streambanks, installing large wood structure, and restoring riparian vegetation to stabilize the bank can be a technically sound approach for arresting erosion while providing habitat benefit.
- The proposed restoration actions will build connectivity among restoration investments by tying directly into work completed by the neighboring Deschutes Land Trust and City of Prineville.
- The application includes letters of support from partners and the landowner.
- Previous project evaluations concerns are addressed by including additional details regarding revegetation treatments and engagement with adjacent landowners.

Concerns

- The application lacks details describing how CREP is integrated into the project design. For example, the CREP buffer is not identified in the project design; and it is unclear if seeding and planting components identified in the application will be part of CREP or implemented prior to CREP. Also, plant establishment costs included in the budget may not be appropriate if CREP is also funding plant maintenance. Without details describing plans for CREP, such as a map showing CREP components in relation to the proposed restoration actions, it is unclear if the project will take full advantage of the CREP investment.
- It is not clear how the seeding and planting components described in the application plant page will be implemented and how these components will be maintained to ensure success. There are no clear roles assigned between the applicant and landowner describing how plantings will be implemented and managed over time.
- The water quality benefit from the proposed treatment wetland is unclear. The application lacks key design specifications needed to evaluate whether the wetland design approach can effectively provide water quality improvements to irrigation tailwater, such as the hydrological residence time and the anticipated inflow volume. The application lacks information describing how the wetland feature will be maintained or who will be responsible for the maintenance.
- The ecological benefit from the proposed side-channel treatment is unclear. There is potential for the channel to fill in through sedimentation, contribute to elevated surface water temperatures, and cause increased predation from non-native warm water fish species using the side-channel as habitat.
- The streambank stabilization proposed will likely treat symptoms rather than root causes of watershed disturbance and may prioritize protection of agricultural lands over restoring natural watershed function. The instream habitat value of these treatments will be limited because most of the large wood structure installed will not interact with the river for most of the year.

Concluding Analysis

Restoration actions will be implemented to improve instream habitat and streambank stability along the Crooked River downstream of the City of Prineville. This section of the Crooked River has been heavily modified to support high value agriculture, making it a challenging environment to implement conservation actions that complement existing land use. The actions proposed are standard and effective practices to enhance habitat; however, the proposal lacks clarity around key design elements needed to understand the potential ecological benefit expected from the investment.

Open Solicitation-2023 Spring Offering
Central Oregon (Region 4)

Application Number: 223-4016-22961
Project Type: Restoration
Project Name: Lower Crooked Habitat Restoration - King Ranch
Applicant: Crooked River WC
Region: Central Oregon
County: Crook
OWEB Request: $399,288
Total Cost: $942,013

Application Description 1) Identify the project location - The King Ranch project site is located in the lower Prineville valley approximately six miles west from the city of Prineville. The ranch is on the north side of and adjacent to the Crooked River immediately downstream of the Lytle Creek confluence with the river.
2) Briefly state the project need - The purpose and need of this project is to address habitat limiting factors identified and described in the Middle Columbia Steelhead Conservation Plan (ODFW; 2010). It will address current conditions that do not fully support fish and aquatic needs and that impact water quality.
3) Describe the proposed work - The proposed work includes bank stabilization and restoration elements for side channel and mainstem areas centered on the use of large wood structures to sort and reduce sediment delivery, develop and maintain scour pools, and provide fish habitat (cover and refuge). Alcove habitat will be created and improved and river bar habitat areas will be enhanced to provide long term stability for fish and wildlife benefits. Revegetating key areas and in association with large wood structure locations will provide additional bank stability, shading to reduce stream temperature, and long-term detritus to the aquatic system.
4) Identify project partners - Partners include USDA-NRCS (designs, permits, wetland delineation, and some project oversight), Ochoco Irrigation District (irrigation system improvements), Crook County Soil & Water Conservation District (landowner outreach and project evaluation), King Ranch landowner (Greg and Karen Huston), and the U.S. Bureau of Reclamation (potential funder). Other traditional partners have offered letters of support but have no defined role in the project.

Review Team Evaluation

Strengths

- The project is part of a larger Lower Crooked River strategy the applicant and partners are implementing through the NRCS Regional Conservation Partnership Program to address key watershed limiting factors prioritized in watershed and recovery plans. The match funding provided by NRCS is secured and will support final design development and permitting.
- Improving side-channel and alcove features could offer instream habitat benefits and potential stream cooling affects through hyporheic exchange.
- Juniper trees will be sourced locally from adjacent uplands on the landowner’s property, reducing transportation costs.

- The proposed restoration actions will build connectivity among restoration investments by tying directly into work currently in progress across the river on a neighboring ranch where similar type conservation actions are being implemented.
- The landowner has previous experience as a contractor implementing restoration projects and will be able to offer lessons learned to improve implementation.

Concerns

- The application indicates water quality will be monitored but lacks details describing how this will be implemented.
- The streambank stabilization proposed will likely treat symptoms rather than root causes of watershed disturbance and may prioritize protection of agricultural lands over restoring natural watershed function. The river naturally wants to laterally migrate in the valley, stabilization will hinder this natural process. The instream habitat value of these treatments will be limited because most of the large wood structure installed will not interact with the river for most of the year.
- The application lacks details describing how the CREP program will be integrated with the proposed restoration, including the location and timing of CREP practices and the timeline for the planting activities outlined on the application plant page. Without details describing plans for CREP, such as a map showing CREP components in relation to the proposed restoration actions, it is unclear if the project will take full advantage of the CREP investment.
- Information describing where grass seeding will occur and how it will be implemented is needed in the application to determine whether the proposed seeding treatment is likely to succeed, and the seed mix is appropriate for the site conditions.
- The project may not be ready for implementation because permit applications have not been submitted.
- It is unclear if the existing hydrology will support the ecological benefits expected from enhancing the side-channel and alcove features. The application lacks detail describing the varying flow scenarios for when these features will be activated and provide habitat benefit. There is potential for the side-channel to fill in through sedimentation, contribute to elevated surface water temperatures, and cause increased predation from non-native warm water fish species using the side-channel as habitat.

Concluding Analysis

A suite of restoration actions will be implemented to improve fish and wildlife habitat and water quality along the Crooked River. Existing high value agriculture dominates the historic floodplain of the Crooked River in this valley located downstream of Prineville. The actions proposed are standard and effective practices to enhance habitat; however, the proposal lacks clarity around key design elements needed to understand the potential ecological benefit expected from the investment.

Open Solicitation-2023 Spring Offering
Central Oregon (Region 4)

Application Number: 223-4017-22970

Project Type: Restoration

Project Name: Deschutes River Flow Restoration - Arnold Irrigation District Phase Two

Applicant: Arnold Irrigation District

Region: Central Oregon

County: Deschutes

OWEB Request: $250,000

Total Cost: $12,708,667

Application Description Arnold Irrigation District (Arnold or the District) operates over 39 miles of canals and laterals in the Deschutes Basin. The original system was built over a century ago by early settlers using methods and materials available to them at that time: open canals lined with porous volcanic rock. The open canals cause a tremendous amount of seepage, resulting in loss of nearly 50 percent of the water withdrawn. Thus, with the current system, Arnold must withdraw double the amount of water delivered to patrons.

Phase Twoof the Arnold Irrigation District Flow Deschutes Basin Restoration Project (herein referred to as ‘this phase ’ and/or ‘project’) will enclose 23,175 length-feet (LF) of open canal into leak-free piping to eliminate the seepage loss and restore 12.6 cubic-feet-per-second (CFS) of flow to the Deschutes Basin during the spring and winter. The water conserved will be protected instream for the benefit of water quantity, water quality, and habitat for native and listed species in the Deschutes Basin. This phase is a continuation of Phase 1 which enclosed 17,022 LF of open canal and conserved 11.2 cfs.

Review Team Evaluation

Strengths

- The project is the second and final phase of a multi-year effort to restore streamflow in the Deschutes River that will improve instream habitat conditions for fish and wildlife, specifically targeting the Oregon Spotted frog.
- The proposal clearly describes details for converting four miles of open irrigation canal into leak free piping, including the piping length, associated costs, and expected conserved water amounts.
- The project cost is reasonable for the expected benefit by securing up to 12.6 cfs of conserved water instream.
- Converting leaky open ditch canals to buried HDPE pipe is identified as an effective strategy to meet ecological objectives in the Deschutes River Basin Habitat Conservation Plan (2022).
- The project is ready for implementation with permits and matching federal funds secured.
- The applicant is collaborating with other irrigation districts in Central Oregon to creatively seek opportunities to assist one another amongst drought conditions. Specifically, the applicant will work directly with North Unit Irrigation District (NUID) to provide conserved water realized during the irrigation season, and in return NUID will release conserved water amounts from Wickuip reservoir during the winter months per direction from USFWS to support Oregon spotted frog habitat.

Concerns

- It is unclear how much of the expected conserved water will be realized due to reductions in water allocations in response to current drought conditions.
- The application attachments contain a significant amount of information that is not directly relevant to the actions outlined in the scope of work described in the proposed solution section. For future application submittals, the applicant is encouraged to consider uploading materials relevant to only the actions identified in the application.
- The cost effectiveness of individual project components is difficult to evaluate due to the use of lump sums in the application budget.

Concluding Analysis

This final project phase proposed by Arnold Irrigation District will complete the district's system improvement plan to pipe and pressurize the irrigation system to improve streamflow in the Deschutes River while providing water reliability to its patrons. The District, alongside all other irrigation districts in Central Oregon, are working diligently to address the roughly 50% seepage loss occurring in delivery canals. This project is timely to utilize significant federal match investments being made in the basin. The substantial increase in water remaining instream will directly impact and improve the natural hydrograph, support state and federally listed fish species, and support riparian habitat important for wildlife.

Open Solicitation-2023 Spring Offering
Central Oregon (Region 4)

Application Number: 223-4018-23002
Project Type: Restoration
Project Name: Upper Drews Creek Fish Passage
Applicant: Lake County Umbrella Watershed Council
Region: Central Oregon
County: Lake
OWEB Request: $263,335
Total Cost: $329,835

Application Description Drews Valley Ranch is located 21 miles west of Lakeview in Lake County, Oregon. The 11,400-acre ranch is surrounded by the Fremont-Winema National Forest and includes nine miles of streams, eight tributary creeks, a reservoir, and grassy wet meadows. The ranch is home to more than 185 species of birds, fish, and mammals, including the bald eagle and red-band trout.

The Upper Drews Creek Fish Passage Project was initiated in the summer of 2020 as the Lake County Umbrella Watershed Council secured an Oregon Watershed Enhancement Board Technical Assistance grant to survey the project sites and develop a 60% design plan to address fish passage. The lower diversion is a fish passage barrier when stop logs are in place, which overlaps a critical time fish migrate out of Drews Reservoir upstream to spawn.

A design plan has been developed and cost estimates have been retained from a local engineering firm. The Council is seeking construction funds to implement work to restore fish passage at an irrigation diversion on Drews Creek to provide access upstream, while maintaining flood irrigation to the wet meadows. The project will compliment and build upon several conservation actions that have been implemented on the ranch over the last three decades, including a conservation easement, four fish screens, improved fish passage, cross fencing, and off-site water developments.

Project Partners involve Drews Valley Ranch, Oregon Department of Fish and Wildlife, US Fish and Wildlife Service, and Anderson Engineering and Surveying.

Review Team Evaluation

Strengths

- Previous project evaluations concerns are addressed by removing the streambank stabilization treatments.
- The fish passage solution will support volitional movement of fish and lamprey, which are of high importance in Drews Creek. This project will make available an additional 1.5 miles of stream habitat during the irrigation season and improve access to the entire upper watershed in the non-irrigation season.

- The applicant is working with a private landowner that has implemented previous fish passage solutions on other parts of the ranch as well as enrolled a portion of the property in a conservation easement.
- The application includes a grazing management plan that is thorough.
- The ditch associated with the water diversion proposed for modification is already screened to ensure no fish are entrained in irrigation ditches.
- The applicant has successfully implemented similar types of fish passage projects.
- The applicant is working with Ducks Unlimited on projects nearby and will utilize their expertise to investigate the upstream barrier to develop conceptual solutions for further expanding habitat connectivity.

Concerns

- There is a known fish passage barrier 1.5 miles upstream of the project location, and downstream there is no fish passage on Drews Reservoir. These barriers limit the potential habitat access that could be gained from the investment.
- The project area is largely devoid of riparian vegetation and could benefit from riparian enhancements.
- It is unclear what the fish population assemblage and distribution is within the Drews Creek basin above Drews Reservoir. It is also unclear what the timing is for species migrating to and from spawning and rearing habitats above the reservoir. This information would be helpful to better understand the value this fish passage project will have for native fish.

Concluding Analysis

Fish passage will be addressed along Drews Creek in Lake County. The project builds off momentum gained in providing volitional fish passage in the Drews Creek basin above Drews reservoir. Drews Creek is an important tributary in the Goose Lake watershed by supporting a wide array of native aquatic species endemic to the Goose Lake basin that will benefit from the increased stream habitat connectivity expected from this project.

Open Solicitation-2023 Spring Offering
Central Oregon (Region 4)

Application Number: 223-4019-22950
Project Type: Restoration
Project Name: Foley Butte Holistic Restoration
Applicant: Crooked River WC
Region: Central Oregon
County: Crook
OWEB Request: $188,680
Total Cost: $285,775

Application Description Foley Butte Ranch, located in the northwest corner of Crook County, Oregon, encompasses 30,655 acres of timberland, creeks, meadows, and mountains. This property is known for its abundant wildlife species, including Mule deer, Rocky Mountain elk, Cougars, Black bears, Bobcats, coyotes, grouse, chukar, and native fish species in the creeks. Within the Foley Butte property there are several different HUC-6 watersheds, this grant will focus on the Allen Creek Watershed. Working on a large property of this size offers a unique chance for large scale watershed restoration work throughout the uplands, and several different headwaters of tributaries to McKay creek, with McKay creek being a main tributary to the Crooked River. This application will address several limiting factors identified in this area by working with project partners to address habitat needs on a holistic landscape scale.
2. This specific project area has suffered from past grazing management regimes that have allowed cattle to overgraze the riparian corridors along streams throughout this property, causing native vegetation to be nearly void along the riparian areas. Grazing management has also led to the encroachment of western juniper, and the decline of forbs, shrubs, and quaking aspen.
3. Project elements include cutting 88.2 acres of encroached Western Junipers, protecting and enhancing 5 acres of sensitive aspen stands by removing encroaching conifers and 4-strand wildlife-friendly fencing. Six springs will be developed with one spring including an above ground cistern for emergency wildfire water storage. 17.84 acres of CREP will be enrolled along Allen Creek, with VerticalPost Structures and large wood, enhancing the riparian corridor, an additional 4 acres of non-CREP riparian fence will be installed in the uplands, lastly 7 acres of weed treatment.
4. Project partners include the following: CRWC, Nuveen Natural Capital, Crooked River Weed Management Area, and Crook County SWCD.

Review Team Evaluation

Strengths

- Previous project evaluations concerns are addressed by including additional details regarding CREP enrollment, activities, budgets, and timeline.

- The landowner is new to the area, has an interest in conservation, is donating material from on-site, and is actively engaging local partners to develop restoration plans to improve fish and wildlife habitat.
- The grazing management plan included in the application offers insight on how the property will be managed for livestock to maintain restoration investments.
- The upland spring developments will facilitate improved livestock distribution and remove their dependence on riparian areas to access water. They will also be fenced with wildlife friendly fence and have escape ramps for wildlife.
- The instream habitat structures proposed for Allen Creek are likely to improve aquatic habitat conditions for juvenile and adult fish. This stream is designated as critical habitat for Mid-Columbia Steelhead.
- The applicant is engaging appropriate partners to assist with implementation of the conservation actions. The application includes support letters documenting how partners plan to engage in this project.

Concerns

- Juniper removal may not be the highest priority action to promote forest health and improve watershed function on the property. Photos in the application indicate there has been pine and fir mortality along with aggressive past forest management that has led to a degraded forested landscape that poses a risk to watershed and riparian function. Focusing on improving the health of the pine and fir stands over juniper removal may be a higher priority for restoration.
- The landowner needs a water right to store water in a cistern for the purpose of wildfire emergencies and there is no water right associated with this use in the project area.
- It is unclear how much area around the proposed spring developments will be fenced.
- The budget includes material costs for the large woody debris described in objective three of the application but does not contain installation costs.

Concluding Analysis

A new landowner who recently purchased a 30,000-acre ranch on Allen Creek in the Crooked River watershed will be engaged to restore upland, aspen, and riparian habitats. The actions outlined in the application present a holistic suite of restoration activities that are likely to improve habitat for upland species and aquatic species, including Rocky Mountain elk, Mule deer, steelhead, and Redband trout. The applicant is encouraged to work with the landowner to develop a property wide forest management plan as part of the project.

Open Solicitation-2023 Spring Offering
Central Oregon (Region 4)

Application Number: 223-4020-23028
Project Type: Restoration
Project Name: Irrigation Modernization and Winter Flow Augmentation Project Segments 1 and 2
Applicant: North Unit Irrigation District
Region: Central Oregon
County: Jefferson
OWEB Request: $500,000
Total Cost: $20,800,000

Application Description The North Unit Irrigation District (NUID or the District) Irrigation Modernization and Winter Flow Augmentation Project Segment 1-2 (Project) will enclose a portion of Lateral 43, a 34,040 length feet (LF) open porous irrigation canal into leak free HDPE piping to conserve 5.3 cubic-feet-per-second (CFS) of water previously lost to seepage. The water conservation achieved by this project will (1) improve conditions for ESA-listed species including the Oregon spotted frog; (2) improve water quality; (3) improve and stabilize agricultural production through water supply reliability; and (4) eliminate water delivery and operations inefficiencies.

NUID and its delivery system is located in the Deschutes Basin near Madras, Oregon in Jefferson County. The district is under contract with the U.S. Bureau of Reclamation to operate the North Unit project that withdraws water from Wickiup Reservoir with a diversion on the Deschutes River in Bend. The district operates 65 miles of main canal and 235 miles of laterals that were built nearly a century ago as a part of President Franklin D. Roosevelt's New Deal emergency relief program. The open canals were lined with volcanic rock that causes 37% of the water withdrawn to be lost due to seepage. Thus, along with other irrigation districts in the region, NUID is committed to enclosing the open canals and laterals into leak free pipe to conserve water and restore flows to the Deschutes Basin.

NUID is a junior right holder on the Deschutes and with the persistent drought in the region have experienced an exponential uptick in fields left fallow due to lack of water that threatens a major food source for the region and nation. Upon completion, this project will allocate the 5.3 cfs of conserved water to irrigation use during the spring and summer, and release the same amount of water in the winter months for the benefit of the ESA-listed Oregon Spotted Frog habitat near Wickiup Reservoir.

Review Team Evaluation

Strengths

- The proposal clearly describes details for converting 34,040 length feet of open porous irrigation canal into leak free piping, including the piping length, associated costs, and expected conserved water amounts.

- The applicant and engineer have demonstrated experience in successfully implementing similar irrigation projects.
- The restoration proposed implements actions identified in a habitat conservation plan. Converting leaky open ditch canals to buried HDPE pipe is identified as an effective strategy to meet ecological objectives in the Deschutes River Basin Habitat Conservation Plan (2022).
- The applicant will release conserved water amounts from Wickuip reservoir, where they own storage water rights, during the winter months per direction from USFWS to support Oregon spotted frog habitat.
- The project is ready for implementation with secured federal match funds.

Concerns

- It is not clear why the applicant prioritized the specific laterals proposed for piping. There is no information describing how these laterals fit into the overall system improvement plan for the North Unit Irrigation District.
- The application attachments contain a significant amount of information that is not directly relevant to the actions outlined in the scope of work described in the proposed solution section. For future application submittals, the applicant is encouraged to consider uploading materials relevant to only the actions identified in the application. For example, the entire system improvement plan is not necessary, only specifics related to the actions in the application.
- It is unclear if the project is ready for implementation. Final designs were not complete at time of application, and it is not clear if State permits are secured.
- The project cost is high for the ecological return on investment.
- The cost effectiveness of individual project components is difficult to evaluate due to the use of lump sums in the application budget.

Concluding Analysis

The North Unit Irrigation District, alongside all other irrigation districts in Central Oregon, are working diligently to address the roughly 50% seepage loss occurring in delivery canals. This project is timely to utilize significant federal match investments being made in the basin. The water conservation expected from this project will improve water quality and conditions for ESA-listed species, such as the Oregon spotted frog.

Open Solicitation-2023 Spring Offering
Central Oregon (Region 4)

Application Number: 223-4021-23036
Project Type: Restoration
Project Name: Tumalo Irrigation District Deschutes Basin Restoration Group 6b
Applicant: Tumalo Irrigation District
Region: Central Oregon
County: Deschutes
OWEB Request: $200,000
Total Cost: $5,465,625

Application Description The Deschutes River and its tributaries, including Tumalo Creek, suffer from low summer streamflows that are a major limiting factor for fish habitat and water quality in the basin. Restoring live flow in the basin is a regional and state-wide objective championed by local, state, and federal entities. For nearly three decades, Tumalo Irrigation District (TID) has been pursuing a water conservation program to provide a permanent solution to system-wide water losses caused by porous open irrigation canals. Since the mid-1990s, TID and its funding partners have enclosed over 154,704 length feet (LF) of open canal into leak-free piping, resulting in 27 cfs of return flow to Tumalo Creek and the Deschutes Basin.

This current phase of the Project conserves 1.1 CFS of water and returns 0.85 cfs to Tumalo Creek during the irrigation season and Crescent Lake during the storage season by enclosing a portion of the Columbia Southern Lateral in 36-42” diameter HDPE piping. The 0.85 cfs conserved by this project that will be returned instream will be protected by the Allocation of Conserved Water statute.

This Project has a direct and immediate impact on water conservation and instream flow restoration. One hundred percent of the publicly funded conserved water through each phase of the SIP will be returned and protected instream; providing substantial water quality and quantity benefits to the Deschutes Basin; with a majority being returned to Tumalo Creek. Tumalo Creek, Crescent Creek, the Little Deschutes River, and the Deschutes River are listed as impaired waterways under Section 303(d) of the Clean Water Act.

Review Team Evaluation

Strengths

- The project will protect streamflow in Tumalo Creek, a cold water refugia during the summer irrigation season, which may aid in decreasing stream temperatures in the Deschutes River system.
- The proposed project builds on previous phases completed by the applicant that successfully enclosed open porous irrigation canals into leak free pipe and restored streamflow through water conservation in the Tumalo and Crescent Creek watershed.
- The protected water storage in Crescent Lake expected from the project will allow for additional flow releases into Crescent Creek that will enhance Oregon spotted frog and native fish habitat.
- The applicant, design team, and contractors have the expertise to successfully implement the project.

Concerns

- The application attachments contain a significant amount of information that is not directly relevant to the actions outlined in the scope of work described in the proposed solution section. For future application submittals, the applicant is encouraged to consider uploading materials relevant to only the actions identified in the application.
- The cost effectiveness of individual project components is difficult to evaluate due to the use of lump sums in the application budget.
- It is unclear how much water quality benefit the conserved 0.85 cfs will have on the Middle Deschutes river and the extent to which it can contribute to cooling water temperatures.

Concluding Analysis

The project continues implementation of the applicant's watershed action plan to restore streamflow by piping leaky open ditch canals. The approach has proven to be effective in achieving desired streamflow restoration outcomes that benefit ESA-listed and other native fish species and contribute to improved water temperature conditions in the Deschutes basin.

Open Solicitation-2023 Spring Offering
Central Oregon (Region 4)

Application Number: 223-4022-23041

Project Type: Restoration

Project Name: J.C. Boyle Reservoir Riparian Habitat Buffer Fencing

Applicant: Trout Unlimited Inc

Region: Central Oregon

County: Klamath

OWEB Request: $201,258

Total Cost: $355,231

Application Description (1) This project is located on JC Boyle Reservoir, a reservoir on the Klamath River in Klamath County Oregon. (2) In November 2022, the Federal Energy Regulatory Commission issued a license surrender order for the Lower Klamath River Hydroelectric Project. Dam removal will start with Copco 2 Dam in 2023 and Copco 1 Dam, Iron Gate Dam and J.C. Boyle Dam in 2024. Water levels on J.C. Boyle Reservoir will be drawn down in the spring of 2024 and expose the lake bottom for the first time since 1958, and the dam will be removed later in 2024. The newly exposed sediment and riverbanks needs to be protected in order to successfully establish native vegetation. (3) This project will install a riparian buffer fence on J.C. Boyle Reservoir at the high-water mark to exclude range cattle, feral horse grazing, deleterious ATV use, and protect historical and cultural sites in the reservoir footprint. Fencing will also protect the mouth of Spencer Creek, which will be restored as part of the reservoir drawdown process. The fence will have walkthrough areas to allow access for recreational activities. Native planting and seeding in the reservoir footprint will be completed by project partners as part of the dam removal restoration process. (4) Project partners include Klamath River Renewal Corporation (KRRC), Resource Environmental Solutions (RES), Bureau of Land Management (BLM), Oregon Department of Fish and Wildlife (ODFW), Modoc Nation, and Green Diamond Resource Company.

Review Team Evaluation

Strengths

- The timing of this project is aligned with the JC Boyle dam removal and restoration of the native riparian vegetation in the reservoir area.
- The fencing proposed is a necessary component to ensure restoration of the JC Boyle reservoir area is protected once the dam is removed. The fencing will protect sensitive habitat as native vegetation is re-planted along the reservoir soils and anadromous salmonids return to this section of Klamath River.
- Fencing specifications will be wildlife friendly to promote wildlife movement while inhibiting livestock and ATV access.
- The applicant is engaging appropriate partners to assist with implementation of the conservation actions. The application includes support letters documenting how partners plan to engage in this project.
- The project will protect cultural resources important to the Modoc Nation.
- The cost of the fence is reasonable and was estimated based on previous fencing projects.

Concerns

- At the time of application, the exact footprint of the fence location is still unknown. It is also unclear who will maintain the fence and how future maintenance will be funded to ensure the restoration investment is sustained to ensure resource protection. Final designs and landowner engagement are ongoing and will be determined prior to dam removal.
- OHV use is heavy in the area adjacent to JC Boyle reservoir; however, the applicant has not engaged the OHV community.
- The application indicates public awareness activities are planned but provides few details describing how and when these will occur. The timing of the dam removal is quickly approaching, and it will take time to effectively engage the vast number of partners and community stakeholders affected by this project.

Concluding Analysis

The entire perimeter of the JC Boyle reservoir footprint will be fenced to ensure protection of newly exposed soils once the JC Boyle dam is removed. The applicant learned there was no funding allocated to this effort as part of the dam removal project and stepped up to take the lead on this project component last minute. The project is time-sensitive because once the reservoir sediments are exposed in early 2024 after the dam is removed, they will immediately be vulnerable to disturbance.

Open Solicitation-2023 Spring Offering
Central Oregon (Region 4)

Application Number: 223-4023-23059

Project Type: Restoration

Project Name: LPID Irrigation Modernization Project
Phase 2

Applicant: Lone Pine Irrigation District

Region: Central Oregon

County: Crook

OWEB Request: $475,000

Total Cost: $3,498,000

Application Description Location: With canals in Jefferson, Deschutes & Crook counties, water flows from Deschutes River & overflow spills into Crooked River. Phase 2 includes Crook & Jefferson County. OWEB Region 4, Coor 44°22'40"N/ 121°04'24"W. Need: Addresses watershed concerns. Conveyance system water loss, water delivery & operation inefficiencies, fish & aquatic habitat instream flow, reduce public risk, increase property safety, improve water quality, local agriculture economic sustainability & resilience, legally protects a portion of conserved water instream. Improving water resources is a Deschutes Basin focus & coordinated effort of 8 irrigation districts. Work: Strategies to construct an efficient system, reduce energy & permanently restore Deschutes River flows. The project will realign canal systems, eliminate 4.11 miles of open canal & laterals, pipe & pressurize 10.89 miles of canals/laterals, save 3,219 acre-ft annually at a rate of 5.2 cfs. Phase 2 will install 4.2 miles of main canal/laterals: MC = 1305 ft 36", 1155 ft 32”, 1610 ft 30”, 2295 ft 26”, 2770 Lft 24”, 2195 ft 16”, totaling 11,330 ft HDPE pipe; lats = 2575 ft 12”, 6385 ft 10”, 1310 ft 6”, 845 ft 4”, totaling 11,115 ft HDPE pipe installed. LPID has a System Improvement Plan, Addendum-Alt C w/specific project details, Preliminary Investigative Report. Open earth ditch canals evaluation of seepage loss using state-of-the-art equipment found a loss of 5.2 cfs at measurement. Eliminating 20% seepage loss helps restore flows in Deschutes River. In-stream flows benefit endangered species & water quality, including spotted frogs, chinook salmon, mid-Columbia steelhead & bull trout. Piping the system eliminates spills improving Crooked river water quality. Partnerships: With DBBC & DRC, LPID coordinates & shares resources & assets to conserve water, improve farm/ranch services, enhance river conditions for wildlife/recreation. FCA helped develop the SIP, PIR, Watershed/EA. USDA/NRCS gives funding/technical assistance.

Review Team Evaluation

Strengths

- The project is the second and final phase of a multi-year effort to restore streamflow in the Deschutes River to improve instream habitat conditions for fish and wildlife, specifically targeting the Oregon Spotted frog.
- The proposal clearly describes details for converting over four miles of open porous irrigation canal and laterals into leak free piping, including the piping length, associated costs, and expected conserved water amounts.

- The restoration proposed implements actions identified in a habitat conservation plan. Converting leaky open ditch canals to buried HDPE pipe is identified as an effective strategy to meet ecological objectives in the Deschutes River Basin Habitat Conservation Plan (2022).
- The project is ready for implementation with secured permits and federal match funds.
- The applicant is collaborating with other irrigation districts in Central Oregon to creatively seek opportunities to assist one another amongst drought conditions. Specifically, the applicant will work directly with North Unit Irrigation District (NUID) to provide conserved water realized during the irrigation season, and in return NUID will release conserved water amounts from Wickuip reservoir during the winter months per direction from USFWS to support Oregon spotted frog habitat.

Concerns

- It is unclear how much of the expected conserved water will be realized due to reductions in water allocations in response to current drought conditions.
- The application attachments contain a significant amount of information that is not directly relevant to the proposed actions outlined in the scope of work described in the proposed solution section. For future application submittals, the applicant is encouraged to consider uploading materials relevant to only the actions identified in the application.
- The cost effectiveness of individual project components is difficult to evaluate due to the use of lump sums in the application budget.

Concluding Analysis

This final project phase proposed by the Lone Pine Irrigation District will complete the district's system improvement plan to pipe and pressurize the irrigation system to improve streamflow in the Deschutes River while providing water reliability to its patrons. The District, alongside all other irrigation districts in Central Oregon, are working diligently to address the roughly 50% seepage loss occurring in delivery canals. The project is timely to utilize significant federal match investments being made in the basin. The water conservation expected from this project will increase streamflow, which will improve water quality, habitat, and habitat availability in the Deschutes River downstream from Wickiup Reservoir.

Open Solicitation-2023 Spring Offering
Central Oregon (Region 4)

Application Number: 223-4024-22951

Project Type: Technical Assistance

Project Name: Planning for Restoration due to Bootleg Fire

Applicant: Klamath Lake Land Trust

Region: Central Oregon

County: Klamath

OWEB Request: $74,263

Total Cost: $113,967

Application Description The 280 acres of land owned by the Klamath Lake Land Trust (KLLT) on and around the Sycan River that had been forested prior to the Bootleg Fire in summer 2021 is the subject of this funding request. The property is located north of Beatty, OR.

We anticipate that the impacts from the fire will include erosion, degraded water quality, loss of habitat, and invasive species intrusion. We also anticipate that reforestation will be more challenging as a result of climate change, which will result in warmer temperatures in the region, more instances of drought due to less snowpack, diminished water quality, increased pests and invasive species.

KLLT requests funding to help facilitate the development of a current conditions report and restoration plan for the property. These goals will be achieved by working in partnership with KC Harvey and the Klamath Tribes, with input from the OR Department of Forestry.

Review Team Evaluation

Strengths

- The Sycan River property, owned and managed by the Klamath Lake Land Trust (KLLT), has an array of habitat types, including sage steppe, dry type Ponderosa pine, riparian, and instream. Potential future restoration of these habitats will likely benefit native fish and wildlife and water quality.
- The applicant is utilizing the Burned Area Emergency Response Assessment (BEAR) developed for the Bootleg fire as a basis to inform project objectives.
- The Klamath Tribes are a partner on this project, their engagement is demonstrated by a letter of support. The Klamath Tribes have been partnering with KLLT on past restoration efforts on the Sycan River property.

Concerns

- Specific ecological goals that will be used to determine the baseline metrics needed to inform a restoration plan are not identified in the application. Without this, it is unclear how the assessment will lead to restoration benefiting fish and wildlife habitat and water quality.
- It is unclear from the application how appropriate technical resources and partners in the region will be engaged in the baseline conditions assessment work. There is no information in the application or support letters describing efforts to partner or collaborate with agencies or organizations involved in post fire recovery work.

- An out of state consultant will be engaged exclusively to carry out the baseline conditions assessment and develop the restoration plan. It is unclear if the consultant has relevant experience to characterize and assess a post fire landscape in Klamath County.
- State agency engagement and support for the project is unclear because there are no letters of support from any State agency included in the application.
- Livestock from neighboring landowners continue to cause significant damage to riparian habitats on the property; however, it is unclear from the application how the applicant plans to address this trespass through the restoration plan.
- The severity of the Bootleg fire on the property was sporadic and mostly impacted portions of the Ponderosa pine stands. The application lacks information describing current forest management and the desired future condition that will be used for restoration planning and meet the landowner's vision for dry type Ponderosa pine habitats. It is unclear what metrics will be collected for the baseline conditions assessment that will inform restoration actions to promote forest health and resiliency.
- The project cost is high for the expected products. Additional detail is needed in the application budget to evaluate whether costs are reasonable and necessary for the proposed work.

Concluding Analysis

The Klamath Lake Land Trust proposes to complete an assessment that characterizes resources on their Sycan River property. The application lacks critical details describing the metrics that will be collected as part of this assessment and how metrics will be used to develop and prioritize a list of restoration actions.

Open Solicitation-2023 Spring Offering
Central Oregon (Region 4)

Application Number: 223-4025-23005

Project Type: Technical Assistance

Project Name: Chewaucan Working Wetland Reconnaissance

Applicant: Lakeview SWCD

Region: Central Oregon

County: Lake

OWEB Request: $74,279

Total Cost: $93,029

Application Description The Chewaucan Watershed consists of a 53-mile-river, several tributaries, and thousands of acres of flood irrigated pasturelands, which provide stopovers and breeding grounds for thousands of migratory and resident bird populations. Additionally, these marshes provide sustainable forage for family ranching operations. Lake Abert, a hypersaline pluvial lake, is the end point within this watershed, additionally supporting migratory birds. The river and surrounding area provides habitat for the Chewaucan redband trout, mule deer, and sage grouse.

Five catastrophic wildfires have burned 75 percent of the upper watershed, likely resulting in drastic changes to the entire catchment. The Lakeview SWCD is undertaking a comprehensive analysis of the working wetlands in the lower 17 miles of the Chewaucan River Basin, approximately 25,000 acres known as the Upper and Lower Chewaucan Marshes. An in-depth field reconnaissance will provide area resource managers with information necessary to understand the current watershed conditions, document any completed restoration projects, help identify source problems along with restoration opportunities, and prioritize areas of concern. Known natural resource concerns include invasive weeds, infrastructure inadequacies, streambank erosion, and potential threats to aquatic habitat.

Our project would begin in late 2023 with a workshop to engage stakeholders and compile existing information. Reconnaissance would occur in spring and summer of 2024, with a final report detailing findings and treatment recommendations by fall of 2024 and shared through a final stakeholder workshop in early 2025. The remainder of 2025 will be used to pursue funding for additional action plans and restoration efforts based on the final survey and reconnaissance findings. Project partners include Lake County Umbrella Watershed Council (LCUWC), private landowners, Oregon Department of Fish & Wildlife (ODFW), and Intermountain West Joint Venture (IWJV).

Review Team Evaluation

Strengths

- Baseline watershed conditions data will be collected for the Chewaucan working wetlands to prioritize future restoration. The project area has never been fully assessed for its fish and wildlife habitat enhancement potential. Local technical experts have indicated the area has ecological importance to migratory birds, sage grouse, and redband trout.

- The project footprint spans a large geography in the Chewaucan River Basin that is privately owned by only three landowners. Access to this approximately 25,000-acre area was previously not possible. New management and landowner willingness have opened new opportunities for conservation.
- Wet meadows and marshes located in the project area support nesting habitat for a suite of birds. For example, the area is known for supporting large quantities of Sandhill cranes and Trumpeter swans.
- The Chewaucan marsh is located along the pacific flyway within the SONEC region and is adjacent to other similar type habitats significant to migratory birds, such as Lake Abert and the Warner Lakes Valley.
- Sage steppe habitat designated as core areas for greater sage grouse surrounds the Chewaucan marsh; the wet meadows on the project site are important habitat features for sage grouse and provides habitat connectivity with the surrounding area.
- Partner support for the project is demonstrated by letters of support included in the application.

Concerns

- It is unclear what types of restoration projects are envisioned for within the marsh and wetland areas that will likely be identified through the proposed technical assistance.
- The project focuses on addressing terrestrial invasive plant species within agricultural operations; it is unclear how future restoration actions will address habitat limiting factors and improve native wetland and meadow function.
- It is not clear how the baseline assessment described in the application will lead to future restoration that provides habitat benefits for native fish. The Chewaucan River, which serves as a fish migration corridor, has been ditched and channelized to support agriculture production and is disconnected from the adjacent meadows. Additional information describing potential restoration concepts that is likely to be considered, such as reconnecting the river with the meadows, would be helpful to better understand potential future ecological outcomes.
- While the consultant identified to assist with this effort has experience working in rural communities to generate interest and collaboration amongst landowners, partners, and technical expertise in terrestrial habitats, it is unclear if the consultant has the necessary wetland and marsh background to adequately assess and characterize these habitat types.
- The landscape has been heavily modified to support agriculture. It is unclear how willing the landowners are to make land use changes that will be recommended to improve fish and wildlife habitat and water quality.
- The use of Traditional Ecological Knowledge (TEK) is not appropriate in the context provided in objective two of the application. TEK does not refer to recent history from the last 150 years, but instead refers to knowledge of Indigenous people from pre-European settlement history.

Concluding Analysis

An assessment and characterization of lands encompassing approximately 25,000 acres will be completed to develop restoration projects. Understanding existing resources and the conservation potential within a large geography is a reasonable first step to strategize future restoration investments. The application lacks detail describing how the assessment will lead to restoration actions that will improve wetland and marsh function, water quality, and fish and wildlife habitat.

Open Solicitation-2023 Spring Offering
Central Oregon (Region 4)

Application Number: 223-4026-23043
Project Type: Technical Assistance
Project Name: Fifteenmile Managed Underground Storage Pilot Testing 2023
Applicant: Wasco SWCD
Region: Central Oregon
County: Wasco
OWEB Request: $75,000
Total Cost: $129,373

Application Description Located in Wasco County, the Fifteenmile Watershed includes lands drained by Fifteenmile Creek which discharges into the Columbia River. Fifteenmile Creek flows through the town of Dufur, located 15 miles south of The Dalles. The Fifteenmile watershed is home to federally-listed (threatened) wild Mid-Columbia steelhead, a culturally-significant population of Pacific Lamprey, other native fish species, and a vibrant farm community. The project location is 6 miles upstream from Dufur, near river mile (RM) 35. Surface flows in Fifteenmile Creek are over-allocated in the summer months, and the Watermaster regulates off junior water right holders to protect senior users during the irrigation season. Low stream flow and associated high temperature have been identified as primary limiting factors for viable fish populations. Summer low-flow temperatures in reaches of Fifteenmile Creek often exceed temperature thresholds for salmon and trout rearing, migration and spawning.
Subsurface storage of cool water has been identified through previous studies as a feasible approach to enhance summer streamflows, and improve temperature conditions for migration and rearing. The concept is to divert and treat cool water from Fifteenmile Creek during higher flow winter/spring months, store it in a deep, confined aquifer and return the water during low flow periods.
In April of 2023 the pilot basin was constructed and pilot testing had begun, however throughout the testing soils in the basin were not filtering the water at the capacity and water quality needed for subsurface storage. This application will provide further technical assistance to refine the pilot project to ensure and verify the design parameters for the full-scale diversion and treatment system to produce a source water quality that meets standards for injection and storage.
Partners include the Wasco County SWCD, Fifteenmile Watershed Council, ODA, OWRD, DEQ and ODFW. (See Attached Agency Roles Diagram)

Review Team Evaluation

Strengths

- The project continues the exploration of aquifer storage recovery to address streamflow and water temperature concerns along Fifteenmile Creek, an important stream for Mid-Columbia summer Steelhead.
- The applicant has worked for multiple years developing a pilot design concept that is likely to succeed in using cool water stored underground to enhance summer stream flows and improve temperature conditions for fish migration and rearing.

- The pilot project will continue to test and refine the design to embark on an expensive, larger project build out.
- The project builds off past efforts that increased streamflow during critical summer months, including the Fifteenmile Action to Stabilize Temperatures (FAST) program.
- The applicant and partners have a long history of implementing restoration and collecting monitoring data.

Concerns

- It is unclear whether water returned instream at the point of diversion will result in flow downstream at the lower reaches of Fifteenmile Creek because the stream reaches below this point of diversion are known to go sub-surface during summer months.
- It is difficult to evaluate the ecological value of the expected conserved water without details about the future instream water right, including the priority date and the water right holder.

Concluding Analysis

Using aquifer storage is a bold and innovative approach that could prove to be an effective solution for restoring flow during critical summer timeframes. The current technical assistance project is the final design step for a pilot project that has potential to be a long-term solution to providing adequate water flow and temperature conditions for Middle Columbia Steelhead and other fish species in Fifteenmile Creek.

Open Solicitation-2023 Spring Offering
Central Oregon (Region 4)

Application Number: 223-4027-23049

Project Type: Technical Assistance

Project Name: Lower East Fork Hood River & Baldwin Creek Fish Passage & Habitat Restoration Design

Applicant: Hood River WS Group

Region: Central Oregon

County: Hood River

OWEB Request: $73,101

Total Cost: $275,976

Application Description This project will take place on the Lower East Fork Hood River and Baldwin Creek, located within the Hood River Watershed in Hood River County. The Hood River Watershed Group (HRWG), in partnership with the Confederated Tribes of the Warm Springs (CTWS) and private landowners, will develop fish passage and instream habitat restoration designs along the Lower East Fork and Baldwin Creek, a critical clearwater tributary to the Lower East Fork.

The purpose of these projects will be to restore aquatic habitat as an aid to the recovery of ESA-listed spring Chinook salmon, winter steelhead, and coho, as well as resident cutthroat and rainbow trout. Improving instream habitat and fish passage are listed as priority actions within the Hood River Basin Partnership Strategic Action Plan (2021) and multiple local planning and assessment documents. These documents identify the lack of habitat quantity and quality, including passage barriers, channel stability, habitat diversity, and sediment load, as primary factors limiting the natural production of spring Chinook, steelhead, and other salmonids in the East Fork Hood River.

This project will develop 90% restoration designs, resulting in 1.2 miles of instream habitat restoration on the Lower East Fork Hood River, and 1.25 miles of restored instream habitat, improved passage to approximately two miles of stream, and reconnection of up to 11 acres of floodplain on Baldwin Creek. Work will include topographic surveying, hydrologic and hydraulic modeling, cultural resource surveying, wetland delineations, and 90% design drawings. HRWG will pursue implementation funding with the completed designs.

Project partners include Hood River Watershed Group (project manager), CTWS (cash match), and project landowners.

Review Team Evaluation

Strengths

- The application clearly articulates a need for developing engineering plans to support future fish passage and habitat enhancement projects along Lower East Fork Hood River and Baldwin Creek.

- The applicant and partners have a long history of implementing similar types of projects.
- Support from the private landowners affected by the project is demonstrated by letters included in the application.
- Using existing LiDAR data that provides detailed topographic information will result in cost savings.
- The inclusion of cultural resource surveys is appropriate for the project design stage.
- Baldwin Creek is a clear water tributary to the East Fork Hood River that provides critical habitat for aquatic species.
- The project area along the East Fork Hood River is protected by a conservation easement managed by the Columbia Land Trust that will ensure long-term protection and maintenance of investments in habitat restoration.
- Habitat upstream of both project locations have high intrinsic habitat value for Steelhead and Chinook.

Concerns

- It is unclear from the pictures provided in the application whether the perched culvert acts as a fish barrier.

Concluding Analysis

The project continues momentum the applicant and partners are building to engage private landowners in an urban-rural interface to implement fish passage and instream and floodplain habitat enhancement opportunities. The future restoration project will increase the quantity and access to spawning, rearing, and overwintering habitat for winter steelhead, spring Chinook, coho salmon, and resident trout in the Lower East Fork Hood River and Baldwin Creek. Ecological processes, including stream-floodplain interaction, riparian function, and maintenance of instream habitat complexity, will also be restored and provide further fish habitat benefits.

Open Solicitation-2023 Spring Offering
Central Oregon (Region 4)

Application Number: 223-4028-23056

Project Type: Technical Assistance

Project Name: Enhancing Salmon Habitat on the Mainstem Columbia River through Control of Invasive American Shad

Applicant: Ecotrust

Region: Central Oregon

County: Wasco

OWEB Request: $74,881

Total Cost: $98,631

Application Description The proposed project, “Enhancing Salmon Habitat on the Mainstem Columbia River through Control of Invasive American Shad”, aims to enhance the freshwater habitat of mainstem Columbia River and create ecological benefits for salmon by significantly reducing the abundance of the invasive American shad species through increased harvests by tribal fishers. Development of dams in the Columbia River have created an ideal habitat for American shad, which are now contributing to deleterious conditions for native salmon populations. Shad harvests will decrease ecosystem stressors, enhance freshwater habitats, and build economic resilience for tribes of the Columbia Basin.

Ecotrust will provide technical assistance to support the collaborative development of a Strategic Action Plan that will lead to increased tribal shad harvests through strategies such as developing a commercial shad fishery and new market channels for shad products. Utilizing a community-centered approach, funding from OWEB will build upon current stakeholder engagement efforts and support the critical next step of developing a Strategic Action Plan to develop a shared vision and define the full scope of work, including geographic extent, a phased approach timeline, and the range of strategies to to be piloted.

Project partners currently include Columbia River Inter-Tribal Fish Commission, Oregon State University, and individual tribal fishers and natural resource experts. Additionally, we are engaging tribal leaders from the Yakama Nation, Warm Springs, Umatilla, and Nez Perce Tribes, as well as the Bureau of Indian Affairs, U.S. Army Corps of Engineers, and others. Ecotrust is a 501c3 based in Portland and holds nearly 30 years experience in providing TA and supporting efforts to increase regional resilience to a changing climate and advance lands and waters stewardship practices to be more ecologically restorative and economically just. Our project partners have requested we serve as project lead.

Review Team Evaluation

Strengths

- The application clearly articulates a need for developing a strategic action plan for managing non-native American shad in the Columbia Basin.

- A thoughtful and unique approach is proposed to restore native salmonids in the Columbia Basin by creating economic opportunities to reduce invasive shad that are crowding salmonid habitat.
- The applicant is engaging tribal leaders from the Yakama Nation, Warm Springs, Umatilla, and Nez Perce Tribes, as well as the Bureau of Indian Affairs.

Concerns

- It is unclear if there will be an ecosystem improvement from the implementation of the plan. There is not enough evidence that indicates removing invasive shad will have a beneficial impact on native salmonids.
- American shad have done extremely well in the Columbia River, there is concern the species will again recolonize and outcompete native salmonids if shad harvests cannot be sustained.
- It is unclear whether all the appropriate stakeholders are engaged. For example, commercial fishery involvement is not described in the application and this community likely has experience and expertise that could offer insight into harvest methods and techniques to reduce incidental by-catch of ESA-listed fish.
- More clarity is needed on the catch rate in relation to selective harvest methods to understand the extent of potential ESA-listed species caught as bi-catch.
- American shad is native to the East coast of the United States and is harvested for food and other markets, their experience and expertise could offer valuable insights to this effort, yet there is no mention of engaging with those involved.
- It is unclear how Oregon Department of Fish and Wildlife (ODFW), Washington Department of Fish and Wildlife (WDFW), and Army Corps of Engineers will serve in developing the strategic action plan. Engagement with these entities will be essential for the plan to be successful.

Concluding Analysis

A strategic action plan will be developed to control invasive American shad populations to benefit native salmonids. American shad have a huge presence in the Columbia River that could offer economic opportunities to Tribes and reducing their population could increase habitat available for native salmonids. There are too many unknowns to discern what long-term ecological value this project could offer to native fish.

Open Solicitation-2023 Spring Offering
Central Oregon (Region 4)

Application Number: 223-4029-22979

Project Type: Monitoring

Project Name: Brattain Post Fire Restoration Project Effectiveness

Applicant: Fort Rock/Silver Lake SWCD

Region: Central Oregon

County: Lake

OWEB Request: $252,269

Total Cost: $324,724

Application Description 1) Our project effectiveness monitoring project is on private lands in the 2020 catastrophic Brattain wildfire scar, which negatively affected eight 12- digit HUCs in the upper Chewaucan and Anna River watersheds, with landscape level ecological degradation. The small incorporated town of Paisley is our work hub.
2) Post fire recovery work focused on improving aquatic habitat and water quality for the Chewaucan Redband trout (state status – vulnerable, potentially at risk) through erosion abatement. This included aerial seeding and aerial herbicidal application (OWEB grant #s222-8501-22392 and 220-8011-19315), with more recent OWEB funds (grant #s 222-8501-22392 and 222-8501-22727) for burnt wood removal as site preparation for seeding. With this high level of Oregon based investment, there is a need to evaluate aerial seeding success with naturally revegetating vegetation to guide other similar post fire restoration work in the Great Basin system.
3. Our project proposal is for a comprehensive monitoring plan in two phases with an initial focus on natural revegetation by deep rooted bunchgrasses compared with aerial seeding, and a phase 2: herbicide application / seeding, by slope, aspect, burn severity, and soil type. This will include vegetation and soil parameters. Our approach will utilize ground surveys for absolute measurements, drone aerial imagery for larger area coverage, and satellite imagery for a watershed approach, resulting in relevant and timely information for restoration , cost effectiveness of restoration methods, and outreach tools for land management agencies and producers. An on site postfire assessment will complete phase 2.
4. Project partners include private landowners, Oregon State University Department of Animal and Rangeland Sciences (OSU ANRS), Oregon State University Lake County Extension (OSU Extension), Bureau of Land Management (BLM), United States Forest Service (USFS), and Lake County Umbrella Watershed Council (LCUWC).

Monitoring Team Evaluation

Monitoring Team Strengths

- This project will produce information that is needed to better inform post-fire rangeland seeding.
- The proposed project will follow established protocols to collect field and drone-based data that are cited in the application.

- The applicant has engaged the local community to recruit interested private landowners to perform this monitoring and the letters of support demonstrate public landowners are interested in applying this information to implement fire rehabilitation projects in the future.
- The applicant is working with a qualified university professor and OSU Extension staff that have experience collecting, analyzing and reporting rangeland data in Oregon.
- This project will report results and share findings in several ways including hosting a field day, working with OSU Extension to produce a publication, and developing a peer reviewed manuscript.

Monitoring Team Concerns

- The application does not describe how the data will be stored long term and how it will be made accessible to the public or interested natural resources professionals.
- The application has very limited information on quality assurance and quality control procedures of the vegetation and soil samples that will be collected and delivered to the OSU lab for analysis.
- The applicant is measuring effects in and outside of exclosures which will measure changes associated with grazing, but no monitoring question was posed to understand what purpose the monitoring of vegetation in and outside grazing exclosures will serve.
- It is not clear how the interpretation of the monitoring results will account for how the lands were grazed after the fire in 2020 and after restoration was initiated in December 2022.
- It is not clear if the reseeding in the Fall 2023 will treat the three polygons and paired treatment and control sites in the same way to allow this study design to be implemented as proposed.
- It is not clear who is performing the drone monitoring and if they have the necessary qualifications and experience to collect and analyze the data.
- The application lacked details on how the drone data would be managed, analyzed and integrated to apply detailed information across a wider geography.
- The application lacked information to explain why the weather station is being installed, what parameters are being recorded, how that data will be managed and how that data will be used in the data analysis or interpreting the results.
- It was not clear how the three different locations' site-specific conditions will be incorporated into the data analysis and interpretation.
- The budget was not clear how the project manager and university contractor's hours were estimated to determine if they were appropriate to complete the objectives as proposed.
- The budget does not include expenses to perform the drone monitoring and it is not clear if there are adequate resources to complete objective 3.
- It is not clear why the professor's hourly rate is different than what was proposed in a separate application that was submitted.

Monitoring Team Comments

N/A

Review Team Evaluation

Strengths

- The proposed monitoring is likely to answer key questions public land managers, private landowners, and resource entities face when determining post fire seeding needs and specifications.

- The use and utilization of drone imagery will provide valuable data at the appropriate scale to answer the monitoring questions proposed.
- The maps included in the application are informative and useful to understand the monitoring site locations and their context within the greater Brattain fire scar landscape.
- Partner and agency engagement is demonstrated by their involvement in project development and letters of support.
- The applicant and partners have the appropriate skills and experience to carry out the proposed monitoring.
- The collaboration with OSU Extension in Lake County will generate landowner guides and materials that the ranch community can use as tools to promote native vegetation recovery post fire.

Concerns

- The application lacks information describing grazing management occurring throughout the project area. It is unclear whether livestock are currently accessing the project area, and if so, how that disturbance will be accounted for in the study. It is also unclear in the application what the timing, duration, and amount of livestock use will be within the project area.
- The application does not describe how the drone data will be analyzed; clarification provided during the site visit indicated OSU will be analyzing this data.
- The two-year project timeline may be too short for answering the proposed monitoring questions. Site access could be difficult depending on precipitation levels due to the remote locations in high elevation. It may take a longer timeframe to access sites and collect the data needed to answer the monitoring questions.
- It is not clear what type of pre-project data is available to accurately characterize pre-fire vegetation conditions that can be used to compare with post-fire seeding treatments and evaluate the effectiveness of these treatments.

Concluding Analysis

The proposed monitoring is designed to answer key questions regarding the effectiveness of post fire aerial seeding to control erosion compared to naturally revegetating areas not seeded. The data from this project is likely to provide valuable information that will be used to inform adaptive management and restoration actions in fire scarred areas.

Open Solicitation-2023 Spring Offering
Central Oregon (Region 4)

Application Number: 223-4030-23034

Project Type: Monitoring

Project Name: Assessing the Long-Term Effectiveness of Juniper Removal on Water and Vegetation Response

Applicant: OSU Office of Sponsored Research & Award Admin

Region: Central Oregon

County: Crook

OWEB Request: $239,694

Total Cost: $323,877

Application Description This project will be conducted at the long-term Camp Creek Paired Watershed Study (CCPWS), 60 miles southeast of Prineville, OR. The CCPWS started in 1994 and has continuously provided essential information regarding the implications of juniper removal in the hydrology and the ecology of the site. Numerous producers, SWCDs, and state and federal agencies use this study as a reference for planning and decision-making regarding juniper removal.

Juniper stand reduction in one of the watersheds in 2005 has resulted in significant and sustained vegetation and water response benefits. However, in recent years we have observed a decline in the hydrologic response, as indicated by lower soil moisture and groundwater levels. Severe drought conditions in several parts of the state and noticed re-establishment of juniper in the treated sites add significant stress to the restored landscape.

At 20 years post-treatment, we are a critical time to improve the understanding of the expected longevity of the treatment and identify critical thresholds that warrant discussing adaptive management strategies to maintain the health of restored ecosystems as we move forward.

This project aims to assess the long-term effectiveness of juniper stand reduction on soil, water, and vegetation variables in the treated areas compared to the untreated. We also look to replace failing equipment and install an enhanced sensor network to continue monitoring the hydrological response to juniper removal.

The main partners for this project are the OSU Department of Animal and Rangeland Sciences, Crook County, BLM-Prineville District, Hatfield Hyde Land Trust, and OSU-Extension.

Monitoring Team Evaluation

Monitoring Team Strengths

- The proposed project will complement existing vegetation, soil and hydrologic data that has been collected since 1994.
- The applicant has been working on this project since 2013 with the staff that has worked on this project since it began in the 1990’s.
- The applicant has the necessary qualifications and experience to complete this project as proposed.
- The applicant is working with many technical experts, landowners, and land managing organizations in the broader geographic area.

- The letters of support demonstrate a high level of engagement to share monitoring results and inform future land management approaches related to juniper management and removal.

Monitoring Team Concerns

- The application poses several monitoring questions and there is a lack of detail, particularly on the data analyses to understand how they will be answered.
- The application doesn't describe how the new data that is being added to the project will be analyzed in the Before After Control Impact (BACI) study design framework.
- It is not clear how they will analyze the data to parse out the impacts of drought and juniper reestablishment.
- The timeline to collect, analyze and report the results is unlikely to be met with data collection and analysis occurring in September 2025 and a final report being completed in the same month.
- It is not clear why the professor's hourly rate is different than what was proposed in a separate application that was submitted.

Monitoring Team Comments

N/A

Review Team Evaluation

Strengths

- The application provides a clear need to answer key questions about the lifespan of juniper treatments and understand when it is necessary to retreat landscapes to maintain ecological benefits.
- The proposed project is a continuation of an existing monitoring program led by the applicant and partners to assess the long-term effectiveness of juniper removal on water and vegetation response.
- Ecologically important data relevant to managing western juniper-dominated landscapes, including soil type, soil moisture, vegetation type, and moisture uptake, will be evaluated to inform adaptive management, such as the best timing and method for secondary juniper treatment.
- The applicant has capacity and technical capabilities to carry out and report on monitoring results.
- Partner and agency engagement is demonstrated by their involvement in project development and letters of support.

Concerns

- The two-year project timeline may be too short for answering the proposed monitoring questions. If the two years are similar in weather and precipitation conditions, it may be difficult to determine if the data is indicating a landscape response to juniper treatment or drought conditions.
- It is unclear whether pre-treatment data exists for groundwater that can adequately characterize current conditions and be used to compare with post-treatment impacts on groundwater levels. It is unclear whether the methods can effectively answer the monitoring question related to juniper treatment effects on groundwater conditions.

Concluding Analysis

The proposed monitoring will continue efforts initiated in 1994 to understand Western juniper impacts on hydrology and vegetation. This long-term project has provided a plethora of data that has been published in scientific journals, which are utilized and referenced by land managers. The data will be used to assess the long-term effectiveness of juniper stand reduction in restoring the ecological and hydrological conditions in sagebrush and perennial grass communities and inform decisions related to secondary juniper treatment.

Open Solicitation-2023 Spring Offering
Central Oregon (Region 4)

Application Number: 223-4031-23055

Project Type: Monitoring

Project Name: Hood River Basin Partnership Restoration Effectiveness Monitoring Plan

Applicant: Hood River WS Group

Region: Central Oregon

County: Hood River

OWEB Request: $77,480

Total Cost: $99,063

Application Description This project will develop a restoration and conservation effectiveness monitoring plan for the Hood River Watershed. The Hood River Basin Partnership (Partnership) seeks to develop a monitoring plan to evaluate the effectiveness of projects identified for implementation in Watershed 2040: Hood River Basin Partnership Strategic Action Plan (SAP). Strategies and projects identified in the SAP range from instream fish habitat and floodplain restoration, to water quality improvement, and restoration of instream flows. Projects occur on both public and private lands with multiple project sponsors and funding opportunities.

The Partnership proposes to develop a robust monitoring plan that will enable members to measure progress in implementing restoration, conservation, and water quality projects, get feedback on restoration techniques, evaluate the effectiveness of cumulative actions in achieving ecological outcomes, and implement adaptive management to improve restoration. Monitoring plan metrics will build off what partners currently collect, and add or refine metrics, methodologies, and spatial and temporal distribution of sites where gaps exist. Pre-existing metrics (e.g., continuous temperature monitoring, stream habitat data) and protocols will be reviewed and described in the monitoring plan to ensure consistent application and transparency. New metrics will provide data that are robust and repeatable and focus upon ecologically relevant outcomes. Additional deliverables will include the development of a relational database, methods and an application for data analysis and display, and programmed tablets for field data collection.

Project partners are the Hood River Watershed Group, the Hood River Soil and Water Conservation District, Confederated Tribes of the Warm Springs, US Forest Service Hood River Ranger District, East Fork Irrigation District, Middle Fork Irrigation District, Farmers Irrigation District, and Oregon Department of Fish and Wildlife.

Monitoring Team Evaluation

Monitoring Team Strengths

- This project will develop a monitoring plan that will incorporate existing monitoring data in the Hood River basin to evaluate future restoration actions.

- The applicant uploaded a monitoring plan developed by the same contractor to demonstrate how the plan could be organized and the metrics that can be generated to monitor restoration projects.
- The applicant is working with several partners that have developed a Strategic Action Plan to guide future restoration efforts.
- The contractor that provided a cost estimate is highly qualified and has experience developing monitoring plans for organizations and partnerships that are evaluating similar restoration actions in the Pacific Northwest.
- The applicant will engage technical experts that are participating in the Hood River Basin Partnership through two new committees they plan to form, including the habitat and water conservation technical advisory committees.
- The budget was developed with a consultant that has developed a similar monitoring plan recently following a similar process.

Monitoring Team Concerns

- The application lacked detail on many of the tasks to be completed and were not well connected to the contractor’s proposal that was uploaded to the application, which contained more details.
- The application proposes to have the contractor develop a single database to handle all the different types of data to be collected. Developing a single database for different types of data can be a big undertaking and it was not clear if the contractor had the necessary qualifications for this task.
- It is unclear if the budget is adequate to incorporate the different existing data sets and build a database that can manage the existing and new data.

Monitoring Team Comments

N/A

Review Team Evaluation

Strengths

- The application clearly demonstrates a need for developing a monitoring plan to evaluate whether the Partnership's restoration and conservation actions are leading to the intended ecological outcomes.
- Developing a monitoring plan will be cost-effective by reducing redundant efforts by partners in the basin.
- The data analysis protocols are clearly defined and outlined in the application.
- The selected contractor has the appropriate skill set and tools to develop the plan. The example monitoring plan uploaded to the application was completed by the contractor and developed for similar types of restoration work in the Grand Ronde watershed.
- The applicant and partners have a long history of working collaboratively in the Hood River basin.
- Previous project evaluations concerns are addressed by including additional details on data types, database structure, and the Shiny application development, which is an interactive application that summarizes data for sharing with the public.

Concerns

- There are no concerns.

Concluding Analysis

A monitoring plan will be developed for the Hood River watershed to quantify the effectiveness of restoration actions that will be completed over the next 20 years by the applicant and its partners. Data will be used to evaluate whether the Hood River Basin Partnership's restoration and conservation actions are leading to intended ecological outcomes, including optimal stream flows, quality instream and riparian habitats, and improved water quality for salmon and steelhead at all freshwater life history stages.

Open Solicitation-2023 Spring Offering
Central Oregon (Region 4)

Application Number: 223-4032-23058

Project Type: Monitoring

Project Name: Response of a threatened amphibian to drought and bullfrog removal

Applicant: Trout Unlimited Inc

Region: Central Oregon

County: Klamath

OWEB Request: $282,149

Total Cost: $352,718

Application Description Drought and invasive species degrade wetlands and impact a variety of aquatic species including the threatened Oregon Spotted Frog (Rana pretiosa; OSF). Our proposed project extends data collection via partnership with an engaged landowner, USGS, and Crater Lake National Park (CLNP), to better understand OSF recovery through drought and removal of invasive Bullfrogs (Lithobates catesbeianus; BF). The original project (2019-2023) collected data on abundance, distribution, and habitat use by OSF and BF near Fort Klamath, Oregon. This period included 3 of the driest recent years in the area, affording the opportunity to document shifts by OSF from breeding in ponds during early wetter years to breeding in a small perennial creek in dry later years. This response underscores the value of refuge habitats of longer hydroperiods to support drought resilience. Recent pond drying also bolstered BF control success, and along with our removal of >750 BF of multiple life stages, they are nearly eliminated from the site. In this current project we are requesting support to continue removing BF from the one ditch where they remain in this key area - it is the upstream-most breeding in the subdrainage, and restored wetlands further up host only native frogs. We will monitor OSF breeding and adult use of the creek and ponds on the main study site with a focus on documenting recolonization in the ponds they left during the driest years. We will use breeding surveys and mark-recapture sampling of OSF to quantify abundance, survival, and recolonization/dispersal. Extended study capitalizes on an experienced team of partners, a robust multi-year dataset, and the installation by CLNP of 2 pairs of PIT tag antennae along the creek. Data from the passive arrays are yielding valuable insights on timing and intensity of use by tagged OSF in the creek. Results will inform OSF recovery efforts in the Klamath basin and across the species' range.

Monitoring Team Evaluation

Monitoring Team Strengths

- This project complements the monitoring data that has been collected with an OWEB monitoring grant and leverages the existing PIT tag arrays operated by the National Park Service (NPS).
- The application includes an explanation of how the existing data has been applied to learn which bull frog life cycle stage to focus on to effectively remove them from the study area.
- The applicant applied their knowledge from the previous monitoring effort to guide their proposed objectives.

- The applicant will evaluate the quality and confidence in the data by their ability to detect frogs during the surveys.
- The applicant will follow established methods and quality assurance/quality control procedures that have been established by the USGS.
- The applicant will provide regular updates to the project partners and Oregon Spotted Frog (OSF) working groups in OR and WA.
- The data will be submitted annually to ODFW and to the USFWS as part of the scientific data collecting permit and recovery permit requirements.
- The applicant will produce a technical USGS publication or peer reviewed journal article summarizing results and interpreting the findings.
- The contractor working on this project is highly qualified and has over four years of experience collecting data in the same project area working with the landowner.
- There are several technical experts from the NPS and USGS working on this project.

Monitoring Team Concerns

- The application does not include a thorough explanation of monitoring methods.
- The study design does not explain why bullfrog removal ends in 2026 but field data including OSF breeding survey extends into mid-2028. The study design also does not describe why other OSF sampling including abundance and mark-recapture sampling ends in 2027.
- The application does not describe how the data will be analyzed to understand how each monitoring question will be answered, especially the first question posed in objective one.
- It is not clear how this project will document the water irrigation and use by the landowner to interpret the water year type's influences on habitat conditions, frog abundance and distribution.
- The application mentioned briefly a SNOTEL site on how past years snowpack conditions varied over the last 15 years, but it was not clear how this data will be incorporated into the proposed project.
- The application doesn't describe how the drone data will be collected and how the imagery will be processed to assist in completing objective two.
- The application did not describe how community stakeholders are engaged.
- The contractor's ability to complete final technical reports in a timely manner has been historically unreliable.
- The budget and justification do not include expenses to perform the drone monitoring and it is not clear if there are adequate resources to complete objective 2.
- The field crew expenses are the same across all five years, yet the amount of data collected varies across the project management schedule – for instance only OSF breeding surveys extend into 2028 and all the other work ends in 2027.

Monitoring Team Comments

N/A

Review Team Evaluation

Strengths

- The proposed project will leverage PIT tag arrays established in Sun and Annie Creeks by Crater Lake National Park staff to track Bull trout. These PIT tag arrays can also be used to record passing tagged frogs. This collaboration will track valuable insights on the timing and intensity of habitat use by tagged Oregon spotted frog (OSF) in the creek.
- Drought conditions have caused OSF to move out of historic pond habitat and into creek habitats. Monitoring information has helped researchers understand the species adaptability. Additional data collection will provide a better understanding of OSF responses to drought and the value of refugia habitat in dry years.
- Bull frogs are almost eliminated from the project area through OWEB funded grants. Additional funding to extend monitoring will capitalize on the robust dataset already collected for OSF and provide information on the effectiveness of removing Bull frogs. The results can be used to inform future management strategies for removing this predator from OSF habitats.
- The applicant and USGS have a long history of working on similar projects in the Klamath basin geography.
- The proposed work addresses conservation actions identified in the 'Conservation Agreement for the Oregon Spotted Frog in the Klamath Basin of Oregon' interagency plan and the Oregon Conservation Strategy.

Concerns

- The project costs seem high for monitoring across a small geographical area.
- It is not clear why additional PIT supplies is needed for this project, information describing supplies needed to achieve the monitoring objectives would be helpful for evaluating whether costs are reasonable and necessary for the proposed work.
- It is unclear if or how engagement with neighboring landowners is occurring, particularly around Bull frog presence on neighboring ranches.

Concluding Analysis

The Oregon spotted frog (OSF) is listed as a threatened species on the Endangered Species Act list and populations in the Upper Klamath Basin are at serious risk. The project will continue to gather valuable data on OSF habitat use during all life stages, and the species adaptability during drought conditions and response to Bull frog removal. Extending the monitoring allows the OSF dataset to reach a duration that will enable a more detailed analysis of OSF survival in relation to drought and reduction in Bull frog distribution that can inform how and where to implement conservation measures.

Region 5 Total OWEB Staff Recommended Board Award	**1,875,260**

Region 1 - 6 Grand Total OWEB Staff Recommended Board Award	**12,461,865**

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5026-22913
Project Type: Restoration
Project Name: Clover Creek Irrigation Round 2
Applicant: Keating SWCD
Region: Eastern Oregon
County: Baker
OWEB Request: $64,436
Total Cost: $124,004

Application Description Located within the Keating Soil and Water Conservation District northeast of Baker City, as well as within the Lower Powder Strategic Implementation Area boundary, the Clover Creek Irrigation Round 2 project will address ongoing water quality and water use efficiency concerns in Clover Creek, a direct tributary to the Powder River.

Currently, 65 acres of agricultural farm ground is flood irrigated through a series of earthen ditches diverted out of Clover Creek, a perennial stream. Although it can be effective, flood irrigation at the project site contributes sediment, debris, organic matter, and inorganic matter directly into Clover Creek, negatively impacting water quality throughout the Powder River Watershed.

To mitigate the water quality concerns and to improve on-farm irrigation efficiency, the Clover Creek Irrigation Round 2 project is proposing to install one center pivot irrigation system, eliminating flood irrigation and tailwater at the project site. This project is a continuation of large grant #220-5026, Clover Creek Irrigation, which was approved for funding in the fall of 2019. The landowner was ready to implement the project in 2020; however, with the rapidly rising costs of material and fuel, we soon discovered that the original project budget would not be sufficient to complete the project in its entirety. Round 2 will complete the project by installing the pivot with a flow meter, mainline, bubbler, and new steel head gate. Project partners include the Keating SWCD and the landowner.

Review Team Evaluation

Strengths

- The application clearly describes the irrigation conservation actions proposed on this 65-acre farm field, including previous delays in the project history.
- The maps uploaded with the application show that the work is within an Oregon Department of Agriculture (ODA) Strategic Implementation Area (SIA) and Oregon Department of Environmental Quality (DEQ) conducts water quality monitoring in the area, demonstrating this water quality improvement work is a priority for both agencies.
- Converting from flood to sprinkler irrigation will have water quality and quantity benefits to Clover Creek and the Powder River and both are priority streams for conservation in the Keating Valley.

- The application identifies three restoration alternatives, and the applicant will implement the appropriate alternative due to increased water savings, cost effectiveness, and field shape.
- When installed, this irrigation conversion may be a catalyst for other conservation projects in the Lower Powder SIA, which is an area where landowners have not completed many conservation practices in the past.
- The landowner is actively working to treat weeds, improve riparian conditions, and improve irrigation practices on their property indicating the irrigation system is likely to be implemented and operated as proposed.
- The project team, including the landowner, have the capacity to implement and maintain the project as proposed.
- The Keating SWCD has a proven track record of managing and completing projects as proposed and according to the project schedule.

Concerns

- This application is a phase 2 project to complete work that was proposed in phase 1 and due to pipe price inflation in 2019 the original budget is not sufficient to complete the proposed work. The phase 2 budget does not clearly describe the new total project cost and while the site visit clarified the total cost is $110,411, this information is lacking in the application.

Concluding Analysis

Converting sixty-five acres from flood to sprinkler irrigation in the Keating Valley will reduce water diversion for current crop production and improve water quality in Clover Creek. The Partnership of the Keating SWCD and the landowner working to improve water resource conditions is in support of ODA's Lower Powder SIA program and may encourage additional on-farm conservation in the area. Irrigation water management is a top priority for the area and likelihood of success is high.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5027-22943
Project Type: Restoration
Project Name: Skinner Irrigation
Applicant: Keating SWCD
Region: Eastern Oregon
County: Baker
OWEB Request: $83,920
Total Cost: $183,463

Application Description The Skinner Irrigation project is located within the Keating SWCD and within the Lower Powder Strategic Implementation Area (SIA); near Baker City, Oregon. This project will address 66 acres of flood-irrigated pasture ground that is currently causing erosion and untreated runoff on uneven terrain. Sourced from Balm Creek, which is in the Lower Powder SIA focus area, an irrigation ditch transports water to the project site where it is then diverted into a series of earthen ditches to irrigate the property. As flood irrigation water is “pushed” across the field it collects sediment, debris, E.coli, and organic and inorganic material adding it back into Balm Creek and ultimately into the Powder River. The completion of this project will convert 66 acres from flood irrigation to sprinkler by installing one center pivot. The landowner realized these water quality issues and is partnering with the Keating SWCD to mitigate these concerns.

Review Team Evaluation

Strengths

- The application clearly describes the irrigation conservation actions proposed on this 66-acre farm field and review concerns from the previous application are addressed in this application.
- The maps uploaded with the application show that the work is within an Oregon Department of Agriculture (ODA) Strategic Implementation Area (SIA) and Oregon Department of Environmental Quality (DEQ) conducts water quality monitoring in the area, demonstrating this water quality improvement work is a priority for both agencies.
- Converting from flood to sprinkler irrigation will have water quality and quantity benefits to Balm Creek and the Powder River and both are priority streams for conservation in the Keating Valley.
- A conversion from flood to pivot irrigation will use less water at the point of application in the field for current crop production and may result in more water left in Balm Creek.
- When installed, this irrigation conversion may be a catalyst for other conservation projects in the Lower Powder SIA, which is an area where landowners have not completed many conservation practices in the past.
- The project team, including the landowner, have the capacity to implement and maintain the project as proposed.
- The Keating SWCD has a proven track record of managing and completing projects as proposed and according to the project schedule.

Concerns

- No concerns were expressed at review.

Concluding Analysis

Converting sixty-six acres from flood to sprinkler irrigation in the Keating Valley will reduce water diversion for current crop production and improve water quality in Balm Creek. The Partnership of the Keating SWCD and the landowner working to improve water resource conditions is in support of ODA's Lower Powder SIA program and may encourage additional on-farm conservation in the area. Irrigation water management is a top priority for the area and likelihood of success is high.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5028-22957

Project Type: Restoration

Project Name: Dry Creek Phase III WQ Improvement

Applicant: Owyhee WC

Region: Eastern Oregon

County: Malheur

OWEB Request: $51,183

Total Cost: $170,644

Application Description The Dry Creek III Water Quality Improvement project is located 2 miles South of Arock. The project area consists of 77 acres of hay/pasture cropland irrigated with gated pipe. Tailwater containing sediment, nutrients and bacteria flow off the project area into Dry Creek, Jordan Creek, and the Upper Owyhee River. The proposed work includes converting 77 acres from gated pipe to sprinkler irrigation through the installation of 1 pivot system, 8-inch pipeline and required electrical connections. Project partners include the landowner, Owyhee Watershed Council and Agrilines Irrigation.

Review Team Evaluation

Strengths

- The application has clearly defined project goals and objectives.
- Maps included in the application provide ample detail for understanding the project vicinity and proposed restoration components, along with its proximity to prior implemented projects.
- Pivot irrigation is appropriate for the topography in the project area. The irrigation system will serve as a demonstration to other landowners in the area and may encourage future water conservation projects.
- The application identifies four restoration alternatives, and the applicant will implement the appropriate alternative based on field shape and economic feasibility.
- The new irrigation system will reduce sediment, nutrient, and bacteria runoff from the project site, and improve water quality in Dry Creek, Jordan Creek, and the Upper Owyhee River.
- The project team, including the landowner who has completed several conservation projects on the farm, have the capacity to implement and maintain the project as proposed.
- The Owyhee Watershed Council has a proven track record of managing and completing projects as proposed and according to the project schedule.

Concerns

- The application identifies benefit to sage-grouse, and it is unclear how the proposed work will benefit this species. The proximity of sage-grouse leks to the work area is not identified and this benefit may be overstated.

Concluding Analysis

Converting 104 flood irrigated acres to pivot irrigation will reduce irrigation wastewater in the project area and reduce sediment, nutrient, and bacteria runoff. The project is likely to succeed in continuing work in the Jordan Valley area that implements Oregon Department of Agriculture (ODA) and the Department of Environmental Quality (DEQ) water quality improvement objectives for the Upper Owyhee River.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5029-22958
Project Type: Restoration
Project Name: Boulder Flat Irrigation Phase I
Applicant: Eagle Valley SWCD
Region: Eastern Oregon
County: Baker
OWEB Request: $275,101
Total Cost: $491,477

Application Description The Boulder Flat Irrigation Phase I Project is located in northeast Baker County, within the Eagle Valley SWCD boundary, approximately five miles north of Halfway, Oregon. The project site is situated between the main Pine and Clear Creek and represents a high-priority area for bull trout recovery actions in Pine Creek Basin; specifically for water quality and fish habitat improvements.
The project site currently hosts flood irrigation practices on 249 acres of pasture/hay ground. All tailwater from the flood-irrigated pasture empties into Clear Creek and then into Pine Creek a few short miles downstream. Flood irrigation is inefficient, and the resulting runoff contains excess nutrients, sediment, E. Coli, debris, and organic matter that are negatively impacting water quality and critical native fish habitat downstream from the site.
The Phase I proposed project will convert 81 acres from flood to a more efficient sprinkler irrigation method by installing two center pivots, one new “community” headbox, two off-channel watering troughs, and 8,500 feet of pipe to convert from an open earthen ditch to a closed pipe system. The landowner has already applied for funding for part of this project through Idaho Power’s Pine Creek Water Efficiency Program. The project was reviewed by a 12-member panel and awarded funding to be used towards an expanded project detailed in this application. The landowner has partnered with Eagle Valley SWCD in this application and expanded the project to provide additional benefits to water efficiency and quality Clear Creek and Main Pine Creek.

Review Team Evaluation

Strengths

- The application has clearly defined project goals and objectives.
- Maps and photos included in the application provide ample detail for understanding the project vicinity and proposed restoration components, along with its proximity to prior implemented projects.
- The application identifies two restoration alternatives, and the applicant will implement the appropriate alternative based on topography and cost effectiveness.
- The proposed project will address Oregon Department of Environmental Quality (DEQ) and Oregon Department of Agriculture (ODA) priorities for improving water quality and the restoration approach comprehensively addresses water quality, water quantity, soil conservation and priority bull trout habitat.
- The letter of support from five landowners demonstrates that stakeholders are engaged in the project.

- The project has secured funding from Idaho Power demonstrating applicant engagement with appropriate partners to complete the work.
- The project team, including the landowner, has the capacity to implement and maintain the project as proposed.
- The Eagle Valley SWCD has a proven track record of managing and completing projects as proposed and according to the project schedule.
- The work completed in this phase 1 project will contribute to work in an upcoming phase and this is a cost-effective approach.
- Project costs are commensurate with the anticipated watershed benefits resulting from water conservation for current crop production and improved water quality.

Concerns

- The application focuses on benefits to water conservation and water quality improvement and does not describe how this conservation work contributes to bull trout habitat improvement, which is a species prioritized for restoration in the Eagle Valley.

Concluding Analysis

Converting eighty-one flood irrigated acres to pivot irrigation will reduce irrigation wastewater in the project area and reduce sediment, nutrient, and bacteria runoff. The project is likely to succeed in continuing work in the Eagle Valley that implements ODA and DEQ water quality improvement objectives.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5030-22966
Project Type: Restoration
Project Name: Johnny-Bill Irrigation Efficiency Project
Applicant: Powder Basin WC
Region: Eastern Oregon
County: Baker
OWEB Request: $302,006
Total Cost: $400,006

Application Description The Johnny-Bill Irrigation Efficiency Project is located within the Powder Basin in the Pine Creek Watershed. The project site is in Baker County, approximately 1.8 miles Northeast of Halfway, Oregon.

This project encompasses 135 acres of flood irrigated hay and pastureland. Flood irrigation on this property is inefficient due to deteriorated ditches which have widened and incised. Flood tail waters run directly into East Pine Creek, carrying sediment and waste. Water quality and quantity are both concerns for East Pine Creek. East Pine Creek is 303(d) listed as impaired for temperature year-round, supports a small population of federally threatened Bull Trout, and supports native Redband Trout.

The goal of this project is to improve water quantity and quality in East Pine Creek by converting 135-acres of flood irrigation to sprinkler irrigation. 1 half center pivot will be installed in conjunction with 5 wheel lines, and a mainline pipe will be installed to facilitate the sprinkler system. Sprinkler systems will improve water efficiency, allowing more water to remain in East Pine Creek throughout the irrigation season, reducing water temperature and improving fish habitat. Sprinkler irrigation will improve water quality by eliminating flood tail water runoff into the creek. Riparian fencing will be installed on unfenced portions of the creek and off-channel watering sites will be developed to further eliminate erosion, sedimentation, and to protect riparian vegetation.

The Johnny-Bill Irrigation Efficiency project is a collaborative endeavor between the landowners, Idaho Power Company, and the Powder Basin Watershed Council, and potentially OWEB. This project is part of Idaho Power’s 2023 Water Efficiency Program (WEP). This project was submitted to the WEP Review Team for evaluation and was elected for funding in March 2023. This will be the 4th WEP project undertaken by the landowner in partnership with Idaho Power.

Review Team Evaluation

Strengths

- The application has clearly defined project goals and objectives.

- Maps and photos included in the application provide ample detail for understanding the project vicinity and proposed restoration components, along with its proximity to prior implemented projects.
- The application references survey data for redband and bull trout in the project reach and a grazing management plan is uploaded with the proposal, making it clear how the project area will be managed to improve fisheries habitat post implementation.
- The application identifies three restoration alternatives, and the applicant will implement the appropriate alternative based on ranch grazing rotation, topography, adjacent ranch infrastructure, and cost effectiveness.
- Improved irrigation methods, additional fencing, and a livestock watering system are needed on the property to manage livestock and reduce irrigation wastewater. The proposed work will contribute to improved aquatic habitat and water quality in the project reach.
- The proposed project will address Oregon Department of Environmental Quality (DEQ) and Oregon Department of Agriculture (ODA) priorities for improving water quality and the restoration approach is comprehensive addressing water quality, water quantity, soil conservation and priority bull trout habitat.
- The project has secured funding from Idaho Power demonstrating applicant engagement with appropriate partners to complete the work.
- The project team, including the landowner who has completed previous OWEB-funded restoration projects, has the capacity to implement and maintain the project as proposed.
- The Powder Basin Watershed Council has a proven track record of managing and completing projects as proposed and according to the project schedule.
- Project costs are commensurate with the anticipated watershed benefits resulting from water conservation and improved water quality.

Concerns

- Fence maintenance is identified as match in the budget, but this work is not described in the application, and it is unclear how the maintenance will contribute to the longevity of this restoration investment.

Concluding Analysis

Converting 135 flood irrigated acres to sprinkler irrigation and improving livestock management on the property will reduce irrigation wastewater and reduce sediment, nutrient, and bacteria runoff. The project is likely to succeed in continuing work in the Eagle Valley that implements ODA and DEQ water quality improvement objectives, as well as bull trout recovery for East Pine Creek near Halfway.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5031-22981
Project Type: Restoration
Project Name: Steely Eyed Water Quality Improvement
Applicant: Malheur WC
Region: Eastern Oregon
County: Malheur
OWEB Request: $153,221
Total Cost: $309,978

Application Description

1) The project is located in the Vale Bench priority area, roughly 10 air miles from Vale.

2) Water quality improvement in the Malheur Basin is one of the top restoration priorities. Water quality improvement is achieved through on-farm irrigation infrastructure improvements and management. Malheur Watershed Council in cooperation with irrigation districts and private landowners has been systematically improving water quality through irrigation system conversions over the past 20 plus years across the Malheur Basin. This is one of our first projects in our new priority area in the Vale Bench. We were just successful in obtaining a BOR WaterSmart grant to pipe canals in this area.

3) We plan to improve water quality in Bully Creek and the Malheur River by converting 75 acres of flood irrigated pasture and hay fields to sprinkler irrigation by installing:

- Pivot 1
- Pivot 2
- 20 HP pump
- 5 HP pump
- pivot tie in (2)
- pump station 1
- pump station 2
- electrical allowance
- 2400 feet of conduit
- 2400 feet of 6-inch pipe
- 7624 feet 4-inch pipe
- 1180 feet 10-inch pipe
- 8224 feet trench lay and back fill
- 19 Risers
- 6 gun carts
- fitting allowance
- Flow meter

- Idaho Power hook up
- Water Right Transfer

4) Project partners include the landowners, Vale Irrigation District, NRCS and the Malheur WSC.

Review Team Evaluation

Strengths

- Pivot irrigation is appropriate for the topography in the project location. The irrigation system will serve as a demonstration to other landowners in the area and may encourage future water conservation projects.
- The new irrigation system will reduce sediment, nutrient, and bacteria runoff from the project site, and improve water quality in Bully Creek and the Malheur River.
- Reducing sediment, nutrient, and bacteria laden runoff from the property will contribute to water quality benefits to the Malheur Basin, and flood to sprinkler irrigation conversion is a Oregon Department of Environmental Quality (DEQ) Total Maximum Daily Load (TMDL) action plan priority.
- The applicant has secured funding from the BOR Water Smart program to implement irrigation water management work in the Vale Bench, demonstrating that the applicant is engaging with appropriate partners to implement water conservation.
- The project team has the capacity to implement and maintain the project as proposed.
- The Malheur Watershed Council has a proven track record of managing and completing projects as proposed and according to the project schedule.

Concerns

- The application is overly succinct and lacks necessary detail including why two pumps are necessary to operate the pivot irrigation system, how the recently acquired BOR Water Smart funds will contribute to upcoming work in the Vale Bench priority area, and why this property is strategic in the Vale Bench.
- A brief alternative analysis is included in the application, but it does not describe the selection process or why the proposed alternative is selected.
- The project goal and objective are not clearly stated, and information is lacking about how the restoration work will be accomplished, making it difficult to determine if the project will be implemented using clearly defined methods appropriate for addressing the watershed problem.

Concluding Analysis

Converting 75 irrigated acres from flood to sprinkler application will reduce irrigation wastewater. The proposed irrigation conversion in the Vale Bench area will further efforts to implement Oregon Department of Agriculture and DEQ water quality improvement objectives by reducing sediment, nutrient, and bacteria delivery to Bully Creek and the Malheur River. The application narrative lacks necessary details, and, if resubmitted, the applicant is encouraged to write applications that fully answer each application question and address the noted concerns.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5032-22982

Project Type: Restoration

Project Name: Twirly Bird Water Quality Improvement

Applicant: Owyhee WC

Region: Eastern Oregon

County: Malheur

OWEB Request: $123,357

Total Cost: $158,678

Application Description The Twirly Bird Water Quality Improvement project is located 7.5 miles South of Adrian near the Oregon/Idaho Border. The project area consists of 21 acres of gated pipe irrigated hay/pasture farmland. Tailwater containing sediment, nutrients and bacteria flow off the project into the 5.7 Canal and the Snake River. The proposed work includes converting 21 acres from gated pipe irrigation to sprinkler irrigation through the installation of 36 solid set sprinklers and all required water conveyance and electrical infrastructure. Project partners include the landowner, Owyhee Watershed Council and Agrilines Irrigation.

Review Team Evaluation

Strengths

- The application has clearly defined project goals and objectives.
- Maps included in the application provide ample detail for understanding the project vicinity and proposed restoration components.
- Solid set irrigation is appropriate for the topography in the project area. The irrigation system may serve as a demonstration to other landowners in the area and may encourage future water conservation projects.
- The application identifies four restoration alternatives demonstrating the project team considered other options and the selected alternative is based on topography, field shape, and cost effectiveness.
- The new irrigation system will reduce sediment, nutrient, and bacteria runoff from the project site.
- The project team has the capacity to implement and maintain the project as proposed.
- The Owyhee Watershed Council has a proven track record of managing and completing projects as proposed and according to the project schedule.

Concerns

- The irrigation delivery ditch is in poor condition and carries sediment, nutrients, and bacteria to the project site and the Snake River. It is not clear if converting from flood to sprinkler irrigation will reduce contaminated irrigation wastewater contributions to the Snake River.
- The project site is not close to other water conservation projects, is not in a water quality improvement priority area, and the work appears opportunistic rather than strategic.
- Project costs are not commensurate with the anticipated watershed benefits resulting from water conservation and improved water quality.

Concluding Analysis

Converting Twenty-one flood irrigated acres to sprinkler irrigation will reduce irrigation wastewater and reduce sediment, nutrient, and bacteria runoff at the project site. While water quality benefits will be realized at the project site, the delivery ditch continues past this property and contributes contaminated wastewater to the Snake River, and the likelihood of water quality improvement in the basin is unknown.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5033-22983
Project Type: Restoration
Project Name: Willow Water Quality Improvement
Applicant: Owyhee WC
Region: Eastern Oregon
County: Malheur
OWEB Request: $144,305
Total Cost: $303,792

Application Description The Willow Water Quality Improvement project is located 1 mile NW of Adrian along Mendiola Road. The project area consists of 76 acres of furrow irrigated row crop farmland . Tailwater containing sediment, nutrients and bacteria flow off the project area through a small drainage, into the Kingman Irrigation Drain and the Snake River. The proposed work includes converting 76 acres from furrow irrigation to sprinkler irrigation through the installation of 2 pivot systems, solid set handlines in pivot corners and all required water conveyance and electrical infrastructure. Project partners include the landowner, Owyhee Watershed Council and Agrilines Irrigation.

Review Team Evaluation

Strengths

- The application has clearly defined project goals and objectives.
- Maps included in the application provide ample detail for understanding the project vicinity and proposed restoration components, along with its proximity to prior implemented projects.
- Pivot irrigation is appropriate for the topography in the project area. The irrigation system will serve as a demonstration to other landowners in the area and may encourage future water conservation projects.
- The application identifies four restoration alternatives, and the applicant will implement the appropriate alternative based on cost effectiveness, crop rotation, and water quality improvement outcome.
- The new irrigation system will reduce sediment, nutrient, and bacteria runoff from the project site, and improve water quality in Kingman Drain and the Snake River.
- Reducing sediment, nutrient, and bacteria laden runoff from the property will contribute to water quality benefits to the Snake River, and flood to sprinkler irrigation conversion is a DEQ Total Maximum Daily Load (TMDL) action plan priority.
- The project team, including the landowner, have the capacity to implement and maintain the project as proposed.
- The Owyhee Watershed Council has a proven track record of managing and completing projects as proposed and according to the project schedule.
- Project costs are commensurate with the anticipated watershed benefits resulting from water conservation and improved water quality.

Concerns

- A large terrace will be removed to accommodate pivot #2 and this cost is not included in the application budget.

Concluding Analysis

Converting seventy-six flood irrigated acres to pivot irrigation will reduce irrigation wastewater in the project area and reduce sediment, nutrient, and bacteria runoff. The project is likely to succeed in continuing work in the Adrian area that implements ODA and the DEQ water quality improvement objectives for the Snake River.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5034-22984
Project Type: Restoration
Project Name: In the Hart of Jacobsen Gulch
Applicant: Malheur WC
Region: Eastern Oregon
County: Malheur
OWEB Request: $43,655
Total Cost: $91,603

Application Description

1) The project site is about 5 miles from Ontario. It is with in the Jacobsen Gulch priority area and very near the Snake River.

2) Water quality improvement in the Malheur Basin is one of the top restoration priorities for the Malheur Watershed Council. Willow Creek has been a focus area for the Council and other agencies since the late 1990s. Improved water quality is achieved through on-farm irrigation infrastructure improvements and management. The Council in cooperation with irrigation districts and private landowners has been systematically improving water quality through irrigation system conversions over the past 20 plus years across the Malheur Basin. This project complements several recently completed and on-going water quality improvement projects in the Jacobsen Gulch priority area.

3)The proposed project will convert 20 acres of flood irrigated fields to sprinklers by installing:

-- One 15 HP pump
-- Electrical panel for the pump
-- One filter
-- One flow meter
-- 600 feet of 6-inch 125# pipe
-- 800 feet of 4-inch 125# pipe
-- 400 feet of 3-inch 125# pipe
-- 60 feet of 10-inch 80# pipe
-- 1,800 feet dig lay and backfill pipe
-- Misc valves and tees
-- 1,360 feet of wheel lines
-- Handlines to irrigate poplar trees and corners
-- Idaho Power hook-up
-- Water Right Transfer

4) Partners are the landowner, NRCS, Owyhee Irrigation District and the Malheur WSC.

Review Team Evaluation

Strengths

- Water quality monitoring data collected in Jacobsen Gulch is summarized and uploaded with the application, clarifying the strategic nature of the proposed work in the Jacobsen Gulch priority area.
- Maps included in the application provide ample detail for understanding the project vicinity and proposed restoration components, along with its proximity to prior implemented projects.
- Hand and wheel line sprinkler irrigation is appropriate for the topography in the project location. The irrigation system will serve as a demonstration to other landowners in the area and may encourage future water conservation projects.
- The poplars on the property, while not native or in a natural configuration, provide limited wildlife habitat and the irrigation system will maintain this valuable habitat until the trees are harvested.
- The new irrigation system will reduce sediment, nutrient, and bacteria runoff from the project site, and improve water quality in the Snake River.
- Irrigation water management in Jacobsen Gulch is a priority for the Malheur Watershed Council, the Owyhee Irrigation District, and the Natural Resources Conservation Service (NRCS) demonstrating the strategic nature of the proposed work.
- Reducing sediment, nutrient, and bacteria laden runoff from the property will contribute to water quality benefits to the Snake Basin, and flood to sprinkler irrigation conversion is a DEQ Total Maximum Daily Load (TMDL) action plan priority.
- The project team has the capacity to implement and maintain the project as proposed.
- The Malheur Watershed Council has a proven track record of managing and completing projects as proposed and according to the project schedule.

Concerns

- The poplar grove will be irrigated with hand lines, and it is questioned if this is a viable irrigation method in a planted forest.

Concluding Analysis

Converting twenty irrigated acres from flood to sprinkler application will reduce irrigation wastewater. While limited in scale, the proposed irrigation conversion in the Jacobsen Gulch priority area will further efforts to implement ODA and DEQ water quality improvement objectives by reducing sediment, nutrient, and bacteria delivery to the Snake River.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5035-22986
Project Type: Restoration
Project Name: Trout Creek Ecosystem Resiliency
Applicant: Powder Basin WC
Region: Eastern Oregon
County: Baker
OWEB Request: $177,776
Total Cost: $244,508

Application Description This project is on Trout Creek in the North Fork Burnt River watershed, approximately 45 miles southwest of Baker City, southeast of Whitney Valley on lands administered by the Whitman Ranger District of the Wallowa Whitman National Forest. Watershed issues addressed are: 1) degraded groundwater recharge and water storage functions, 2) limited water table maintenance supporting narrower riparian vegetation communities, 3) limited zones for water quality filtering, and 4) excessive bank erosion resulting in streambeds with abundant fine silts. Throughout the 2.5-mile project reach, the creek is incised, not connected with its broad historic floodplain, and beaver are not present. The result is a stream with an altered potential riparian vegetation community including upland species, simplified aquatic habitat and one that is more efficient at routing water out of the system. Both Trout Creek and the North Fork Burnt River experience very low summer base flows and water temperatures that exceed state water quality standards (303d water quality impaired for water temperature). We propose to utilize low-tech process-based restoration techniques (beaver dam analogues – BDAs) to reconnect Trout Creek with its historic floodplain and facilitate restoration of the native willow community by fencing to exclude ungulates from five one-acre protection areas and developing upland water sources for domestic livestock. This is a collaborative project between the Powder Basin Watershed Council and Wallowa Whitman National Forest. OWEB funds will be used to support PBWC staff, pay work crews to implement the work, contract upland water developments, and purchase fencing materials, PPE, equipment and tools.

Review Team Evaluation

Strengths

- The applicant proposes to use low-tech process-based restoration techniques including beaver dam analogs (BDA) and post assisted log structures (PALS) to improve water storage function, riparian vegetation communities, and water quality on Trout Creek and these methods are appropriate for the valley type.
- Upland livestock watering systems will be installed providing infrastructure to help keep domestic livestock away from Trout Creek and increase the chance of stream restoration success.
- The project concept is based on a similar project on Camp Creek in Baker County that is being administered by the Powder Basin Watershed Council.

Concerns

- The project does not have a design making it difficult to determine if project objectives will be met, if implementation methods are appropriate, or if the project is ready for implementation.
- The project will require environmental compliance review and construction permits from several agencies. The proposed work is in a conceptual phase making it difficult to determine if the environmental compliance package is likely to be achieved.
- It is unclear in the application how many livestock watering systems will be installed or the location of each system making it difficult to determine the effectiveness of this livestock management tool.
- Conditions upstream of the project area are not clearly described in the application and it is difficult to determine how the proposed work may be affected by stream and floodplain processes upstream.
- The youth labor force proposed to construct the project is an untested model at the time of this application. The application does not describe the scope of work to be completed by youth crews, therefore it is unknown if the work can be completed as proposed.

Concluding Analysis

The Powder Basin Watershed Council proposes to restore a 2.5-mile reach of the Trout Creek aquatic and valley bottom ecosystem 45-miles southwest of Baker City. The work will provide ecosystem services by distributing cold and clean water temporally and spatially, providing abundant quality fish and wildlife habitat, and increasing resiliency to wildland fire. The application lacks design and completed environmental compliance, the youth labor force model is untested, and the project is not ready for implementation. If the application is resubmitted the applicant is advised to address the concerns identified in this evaluation.

OWEB Request: $368,150

Total Cost: $492,450

Application Description The project will take place in the Harney Basin, within the Donner und Blitzen (Blitzen) river watershed. The project proposes to install an electronic fish barrier (E-barrier) near the mouth of the Blitzen river where it reaches Malheur lake. The goal of the project is to assist the management of invasive common carp (carp) that are negatively effecting water quality in the Malheur lake and the Blitzen river. During low water years (~6 out of 10 years) This barrier will be used to stop carp from 1) spawning in the river which is their only viable location on dry years. 2) using the river as a refugia when the lake water quality, depth, ice make it uninhabitable to carp. 3) Use the electronic barrier to easily capture and remove huge amounts of carp from the watershed. The project will require design, installation, and effectiveness monitoring of the proposed barrier. Project partners will include Malheur National Wildlife Refuge, High Desert Partnership, Oregon Department of Fish and Wildlife and Friends of the Malheur National Wildlife Refuge.

Review Team Evaluation

Strengths

- Carp removal from the Malheur Lake and Blitzen River is an effective method to treat the cause of poor water quality in the system, improve submergent and emergent aquatic vegetation, and improve Pacific Flyway migratory bird habitat.
- The partnership has successfully trapped and removed large amounts of carp from the system in the past and these removal efforts have led to improved lake habitat conditions.

Concerns

- The application does not clearly state the project objectives or provide information on how the objectives will be met. The narrative does not describe how the barrier will be powered, operation procedures are not included, it is unclear who will operate the system, and the barrier design is conceptual and based on communication with the manufacturer from two years ago.
- The project schedule shows many steps to implement the project, but the proposal narrative does not describe each step and it is unclear if the applicant will use clearly defined methods appropriate for addressing the carp problem in the system.
- Carp removal alternatives are not included in the application narrative, and it is unclear if the proposed barrier is a viable and preferred solution.

- It is unclear why some adult carp will be PIT tagged, why adult carp tracking through the barrier system is necessary, or how this method provides benefit to the project.
- Given the lack of proposal clarity and uncertain technical soundness it is unclear whether the proposed solution is cost effective in terms of watershed benefits.
- The budget lacks sufficient detail to determine whether costs are reasonable.

Concluding Analysis

The High Desert Partnership proposes to install a carp barrier on the Blitzen River near its confluence with Malheur Lake. The barrier will keep adult carp from entering the Blitzen River system and this will limit carp spawning during low water years when the river is the only viable spawning area. The application lacks elements essential to determine the likelihood of project success, and if the application is resubmitted the applicant is advised to address the concerns identified in this evaluation.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5037-22990
Project Type: Restoration
Project Name: The Last Two Pieces of the Puzzle
Applicant: Malheur SWCD
Region: Eastern Oregon
County: Malheur
OWEB Request: $65,442
Total Cost: $110,874

Application Description 1. The proposed project is located approx. 3 miles northwest of Vale and less than 3.5 miles from the Malheur River.
2. Poor water quality is the primary limiting factor for the Malheur River. The project will address water quality improvement for on-farm system. This project will take advantage of the pressurized system already in place on the farm.
3. Pasture Conversion -10 acre
1380 feet of 6 inch 100#Pip Pipe 720 feet of 4” inch 125#IPS Pipe 600 feet 3 inch 125# IPS Pipe
2700 feet Dig/Lay Backfill
15 Riser Assembly w/ Senniger 8025 Gun 1 Manifold & Tie In
1257 ft of old 2 strand boundary fence removed on west side of pasture.
2626 ft of new 6 strand fence for three sides
230 lbs grass seed

Small Pivot-3 acre
540 feet 4” 125# Pip Pipe
1300 feet #4 Cable in Conduit w/Controls 1300 feet Dig/Lay/Backfill
1 Pivot Tie in w/4” valve
1 Tie into Existing Mainline 1 Pivot Pad
1 10 hp Pasco Pump 1 Pump Tie In
1 Electrical Service
1249 ft of new 6 strand fence
69 lbs grass seed

Additional fence removal of 2317 feet of old 2 strand fence on north side boundary fence with new 6-strand fence, and 2387 ft new 6 strand fence on east side of existing 40-acre pivot that will provide an alley for livestock to
move back and forth on non-irrigated land.

4. Working with landowner and Vale Oregon Irrigation for a water right transfer.

Review Team Evaluation

Strengths

- The solid set portion of the proposed irrigation system will reduce sediment, nutrient, and bacteria runoff from the project site, and improve water quality in the Malheur River.
- Reducing sediment, nutrient, and bacteria laden runoff from the property will contribute to water quality benefits in the Malheur River, and flood to sprinkler irrigation conversion is a DEQ Total Maximum Daily Load (TMDL) action plan priority.

Concerns

- Two-strand fence exists on the property and the applicant proposes to replace this fence with six-strand fence. The fencing is not included in the attached map, and it is not clear how replacing an existing fence addresses limiting factors or watershed issues identified on the property or in the Malheur Basin.
- A pivot installation is proposed for an unirrigated three-acre field on the property. It is not clear how adding irrigation to this currently dry field addresses limiting factors or watershed issues identified on the property or in the Malheur Basin.
- The Malheur SWCD currently has eleven open grants and twenty-one grants in the monitoring phase with OWEB. It is unclear whether the grantee has the capacity to implement this project as well as complete their existing thirty-two OWEB projects that are open or in the monitoring phase.

Concluding Analysis

Converting 10 irrigated acres from flood to sprinkler application will reduce degraded water quality runoff on the farm. Adding a pivot to three non-irrigated acres will not have water quality benefits and there is no clear rationale for replacing the existing fence on the property. The applicant is encouraged to seek OWEB funding for projects that have clear watershed benefits.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5038-23008
Project Type: Restoration
Project Name: Pivoting on South Road G revised
Applicant: Malheur WC
Region: Eastern Oregon
County: Malheur
OWEB Request: $116,007
Total Cost: $245,558

Application Description 1) The project in the Willow Creek Focus Area. It is 0.9 miles from the town of Willow Creek.

2. Water quality improvement in the Malheur Basin is one of the top restoration priorities for the Malheur Watershed Council. Willow Creek has been a focus area for the Council and other agencies since the late 1990s. Improved water quality is achieved through on-farm irrigation infrastructure improvements and management. The Council in cooperation with irrigation districts and private landowners has been systematically improving water quality through irrigation system conversions over the past 20 plus years across the Malheur Basin. This project complements several recently completed and on-going water quality improvement projects in the area.

3. The proposed project will convert 122 acres of flood irrigated fields to sprinklers by installing:

-- One pivot
-- One Cornell 3 phase pump
-- 1,520 feet of 10 inch 100# PIP pipe
-- 1,540 feet Cable Wire
-- Connection to pipeline
-- Electrical Panel
-- Flow Meter and
-- Apply for a water right transfer if needed.

4. Partners are the landowner, NRCS, Vale Irr. Dist, and the Malheur WSC.

Review Team Evaluation

Strengths

- The applicant addressed concerns from the previous evaluation in this application by adding a dry wheel package to the pivot design.
- The project objectives are clearly stated, the pivot installation methods are defined and appropriate for the location, and the project is ready to implement.

- The application includes information on work accomplished over the past 25 years in the Willow Creek area. This provides watershed context and demonstrates how this project will build upon a long standing and successful water quality improvement effort in the area.
- The new pivot irrigation system will connect to a piped lateral that replaced an open ditch delivery system, which demonstrates the strategic nature of the proposed work.
- Converting 122 flood irrigated acres to sprinklers will address water conservation priorities in the Willow Creek focus area.
- Reducing sediment, nutrient, and bacteria laden runoff from the property will result in water quality benefits to Willow Creek, and flood to sprinkler irrigation conversion is a DEQ Total Maximum Daily Load (TMDL) action plan priority.
- Ongoing water quality monitoring will document water quality trends in the watershed.
- The project team has relevant experience and a proven track record implementing irrigation water management projects.

Concerns

- No concerns were expressed at review.

Concluding Analysis

Converting 122 flood irrigated acres to pivot irrigation will reduce irrigation wastewater in the project area and reduce sediment, nutrient, and bacteria runoff. The project is likely to succeed in continuing work in the Willow Creek area that implements ODA and DEQ water quality improvement objectives for the Malheur River watershed.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5039-23025

Project Type: Restoration

Project Name: East Moraine Community Forest (EMCF) Virtual Fence Project

Applicant: OSU Office of Sponsored Research & Award Admin

Region: Eastern Oregon

County: Wallowa

OWEB Request: $80,112

Total Cost: $134,893

Application Description This project focuses on Wallowa County's East Moraine Community Forest (EMCF), a unique locale recognized as the largest glacial moraine in North America. To protect this area from the pressures of development, the County purchased the moraine in 2021 as a community property to be managed and showcased as a multi-use landscape. Currently the 1791-acre EMCF hosts a multitude of plant and wildlife species (including the endangered Spalding's catchfly), rare plant communities utilized for cultural purposes by the Nez Perce Tribe, sustains a managed forest, serves as a grazing resource to livestock producers, and is visited by hundreds of people each year who navigate the six-mile-long trail system that overlooks majestic Wallowa Lake. This area is highly visible and serves as a showcase of how multiple uses can complement one another when thoughtful management tools are employed. This project seeks to utilize virtual fence technologies to implement an adaptive grazing system within EMCF to address a number of issues including: 1) improving upland condition, 2) protecting vulnerable populations of Spalding's Catchfly, 3) protecting cultural-use areas important to tribal gatherers and 4) reducing fencing infrastructure that impedes wildlife movement and recreational access. To accomplish this, we will manage livestock distribution and grazing pressure using virtual fence (VF) technologies in conjunction with improving upland water access and wetland protection. Prior to turn out, cattle will be fitted with VF collars and trained to respond to the auditory and stimulus cues. Using the technology, cattle grazing, and distribution can be set and adjusted in real time as needed to meet land management objectives. Cattle will be excluded from sensitive and important areas without the need to build physical fences, thereby improving the health and function of these upland ecosystems. Partners are Oregon State University, Wallowa Resources, and the Wallowa County Commissioners.

Review Team Evaluation

Strengths

- The journal articles, grazing management plan, maps and photos included with the application add clarity to the project objectives and provide information on how the objectives will be met.
- The project will be implemented using clearly defined methods that are appropriate for improving natural resource conditions on the property and the work is ready for implementation.

- Virtual fence is a flexible and transportable grazing management system that can move livestock without the use of traditional permanent fence that is detrimental to native wildlife.
- Virtual fence has the capacity to both exclude domestic livestock from sensitive areas as well as contain stock in areas where grazing is intended.
- The project location is on public property owned by Wallowa County, the technology will be on display to the public, and this setting may encourage additional use of this method in the surrounding area.
- Spalding's Catchfly, an endangered plant species identified for preservation in local and regional conservation documents is present on the property, and the proposed livestock management methods will work towards the conservation of this plant.
- The purpose of the grazing management plan for the property is to protect sensitive areas, improve cultural uses of the property, and improve wildlife habitat which will improve watershed function and ecosystem processes.
- The project team has relevant experience and a proven track record implementing grazing management projects.
- Oregon State University has a proven track record of managing and completing projects as proposed and according to the project schedule.
- Project costs are commensurate with the anticipated watershed benefits resulting from the improved grazing management infrastructure on the property.

Concerns

- The uploaded grazing management plan and virtual fence journal articles contain many pages of text and related information. The application does not indicate which sections of each document are relevant to the project, making it time consuming for reviewers to determine how each document supports the proposal narrative.
- Equipment line items in the budget for a 6x10 utility trailer with wood floor is entered twice and it is unclear why two trailers are needed. This issue was discussed at the site visit and the applicant clarified that equipment line items are for one trailer and one base station. The applicant is advised to review applications for errors prior to submission.

Concluding Analysis

Improving grazing management on public property on Wallowa Lake's east moraine near Joseph is an important step to improve native fish, wildlife, and endangered plant habits in the area. The proposed virtual fence and upland water developments will improve domestic livestock distribution, allow for the removal of traditional permanent fence, and showcase an emerging livestock management technology. The project team has relevant experience and likelihood of success is high.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5040-23044
Project Type: Restoration
Project Name: Pounds of Efficiency II
Applicant: Malheur SWCD
Region: Eastern Oregon
County: Malheur
OWEB Request: $71,586
Total Cost: $233,035

Application Description 1. Located 6.7 miles west of Ontario, in the Morgan Bench Priority Area.

2. 1320 feet of leaking irrigation lateral in the middle of the field makes it hard to meet the goal of partners in the Morgan Bench Priority Area, also known as NRCS 'Valley View Priority Area with zero runoff that will improve water quality.

3. The proposed work will replace 1320 ft of broken concrete pipe with 1320 Feet of 12" 125# IPS Pipe.. Replace wheel lines on 40 acres with two center swipe pivots. That will be pressurized with two pumps, two flow meters This Conversion from wheel lines to pivot system will improve efficiency by 15 %.
A water right transfer will be needed.

4. The partners for this project are the landowner, Malheur County SWCD, NRCS and Owyhee Irrigation District and Romans Precision Irrigation (RPI)

Review Team Evaluation

Strengths

- Converting 40 wheel line irrigated acres to a pivot application system and replacing a 1,320-foot leaking irrigation lateral pipeline will address water conservation priorities in the area.
- The project is in the Morgan Bench Priority Area is a focus area for the Natural Resource Conservation Service (NRCS) to improve water quality in the Malheur River.
- Reducing sediment, nutrient, and bacteria laden runoff from the property will result in water quality benefits to the Malheur River and flood to sprinkler irrigation conversion is a DEQ Total Maximum Daily Load (TMDL) action plan priority.
- Ongoing water quality monitoring will document water quality trends in the watershed.
- The project is near previous and future on-farm irrigation improvements demonstrating the strategic nature of the proposed work.
- The project team has relevant experience implementing irrigation water management projects.

Concerns

- Water quality monitoring is mentioned in the application, but a summary of past water quality data is not present in the application, making unclear the extent to which the proposed project will address water quality impairments.
- A brief alternative analysis is included in the application, but it does not describe the selection process or why the proposed alternative is selected.
- A conversion from the existing sprinkler irrigation to a pivot will not result in a significant reduction in irrigation wastewater, making it unclear if the project will achieve the stated watershed benefits.
- The Malheur SWCD currently has eleven open grants and twenty-one grants in the monitoring phase with OWEB. It is unclear whether the applicant has the capacity to implement this project as well as complete their existing thirty-two OWEB projects that are open or in the monitoring phase.

Concluding Analysis

Converting 40 irrigated acres from wheel line to pivot application will improve irrigation efficiency by a maximum of only 15%. The proposed irrigation conversion in the Morgan Bench Priority Area may further efforts to implement ODA and DEQ water quality improvement objectives by nominally reducing sediment, nutrient, and bacteria delivery to the Malheur River. It is unclear how the proposed alternative was selected, and the magnitude of watershed benefit is unclear.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5041-22969
Project Type: Technical Assistance
Project Name: Colony Creek Flood Irrigation
Applicant: Harney SWCD
Region: Eastern Oregon
County: Harney
OWEB Request: $73,939
Total Cost: $93,796

Application Description 1) The Colony Creek irrigation system is located on Colony Creek, just 5 miles from the Nevada border in southern Harney County southeast of Fields, Oregon.

2) The existing structures need replacement due to their inability to adequately distribute surface water to historical wet meadow floodplains.

3) The requested funds will support survey and design for the replacement structure to improve water delivery. Funding will support a topographic survey and development of a digital elevation model, draft engineering design sufficient for permitting and cost estimating, and initiation of regulatory compliance.

4) Project partners are the Harney Soil and Water Conservation District, Oregon Department of Fish and Wildlife, Oregon Water Resource Department, Ducks Unlimited and the landowners/irrigators.

Review Team Evaluation

Strengths

- Project design data will be collected to initiate environmental permitting that will be required for the restoration work this technical assistance seeks to design.
- The design work seeks to address habitat limiting factors for Pacific Flyway birds identified in regional conservation and recovery plans.
- Appropriate stakeholders are engaged in the project and the project team is qualified to accomplish the proposed technical assistance work.
- The Harney SWCD has the capacity to manage and implement the project as proposed.

Concerns

- The application lacks clarity and describes a generalized design approach for work at this remote location.
- It is unclear in the application how the proposed design work may be affected by water rights and how irrigation water is managed by Oregon Water Resources Department (OWRD) in the project area.

- The application narrative references two creeks in the project area; it is unclear where the irrigation point of diversion is located on Colony Creek, and the photos of a second creek nearby does not add clarity to the proposal.
- A design method alternative analysis demonstrating that a range of options will be considered is not articulated in the application, which is an important consideration given the remote location of the design work.
- Match funding from Ducks Unlimited (DU) is detailed in the application and it is unclear if DU will contribute this match if they are not awarded the design contract.
- The project objectives lack site specific detail for this remote work area, and it is unclear if project costs align with the work necessary to accomplish those objectives.

Concluding Analysis

The Harney SWCD proposes to complete preliminary design sufficient to inform a restoration project budget and initiate regulatory compliance for an irrigation water delivery project near Fields. The application narrative and budget are generalized and not site specific to the work area making it difficult to determine if the design work is likely to succeed. The applicant is encouraged to write and budget future technical assistance applications that are site specific.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5042-22971
Project Type: Technical Assistance
Project Name: Beaubien Diversion Structure
Applicant: Harney SWCD
Region: Eastern Oregon
County: Harney
OWEB Request: $75,000
Total Cost: $95,040

Application Description 1). The project is located 3.5 miles east of Burns, Oregon in Harney County and is situated along the Foley Slough.
2). The project aims to replace the instream Beaubien diversion structure, which is the third irrigation diversion structure along the Foley Slough. The requested funds will be used to complete the necessary landowner outreach, ecological planning, survey and design, and permitting. The project will affect the adjacent floodplain to the north, west, east and south. The existing water diversion structure has caused significant erosion on the banks of the slough and no longer adequately and safely backs up water across the historic floodplain.
3). An 85% competed engineering design will be developed for review and consistent with the Harney Basin Wetland Initiative and its partnership.
4). Partners directly involved include the Harney County Watershed Council, Ducks Unlimited, Oregon Water Resource Department, Oregon Department of Fish and Wildlife, Harney Soil and Water Conservation District, and the private users.

Review Team Evaluation

Strengths

- The design work proposed in the application is supported by several assessments stating that flood irrigated wet meadow restoration is critical in this area for Pacific Flyway migratory birds.
- Appropriate stakeholders are engaged in the project and the project team has accomplished similar technical assistance work.

Concerns

- The application lacks clarity and describes a generalized design approach for the Beaubien Diversion Structure.
- An alternatives analysis demonstrating that a range of options are considered is not articulated in the application, which is an important consideration to determine likelihood of success.
- Match funding from Ducks Unlimited (DU) is detailed in the application and it is unclear if DU will contribute this match if they are not awarded the design contract.

- During the site visit the review team visited an example diversion structure that is eroding on the downstream side of the structure; it is unclear if the applicant and design team are incorporating lessons learned into their design process.

Concluding Analysis

The Harney SWCD proposes to complete preliminary design sufficient to inform a restoration project budget and initiate regulatory compliance for an irrigation water delivery project near Burns. The application narrative and budget are generalized and not site specific to the work area making it difficult to determine if the design work is likely to succeed. The applicant is encouraged to write and budget future technical assistance applications that are site specific.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5043-22972
Project Type: Technical Assistance
Project Name: Cow Creek Floodplain Restoration Project
Applicant: Harney County Watershed Council
Region: Eastern Oregon
County: Harney
OWEB Request: $75,000
Total Cost: $94,856

Application Description 1). Cow Creek floodplain restoration site is about 17 miles northeast of Burns, Oregon in Harney County. It is located between the Malheur National Forest and Hwy 20. The Toelle Ranch owns the property where the project will take place.

2) Cow Creek needs restoration due to its (a) incising creek bed (b) inability to adequately flood into side channels (c) flood its historic floodplain footprint and d) provide adequate riparian and floodplain vegetation for wildlife.

3). The requested funds will support survey and design for restoration of the stretch of Cow Creek. Funding will support a topographic survey and development of a digital elevation model, drafted engineering design sufficient for permitting and cost estimation, and invitation of regulatory compliance.

4) Partners: Landowner, Harney County Watershed Council, Harney Soil and Water Conservation District, Ducks Unlimited, Oregon Water Resources, and Oregon Department of Fish and Wildlife.

Review Team Evaluation

Strengths

- The design work proposed in the application is supported by several assessments stating that flood irrigated wet meadow restoration is critical in this area for Pacific Flyway migratory birds.
- The project location is in core sage-grouse habitat and the design work will lead to restoration actions that improve mesic habitat critical to sage-grouse survival.
- Appropriate stakeholders are engaged in the project and the project team has accomplished similar technical assistance work.
- Project actions align with the work necessary to accomplish the project objectives in this project location near Burns.
- The current ranch management is likely to support and maintain aquatic and upland habitat benefits implemented on this ranch.

Concerns

- The application does not describe current grazing management, how the riparian areas on the ranch are protected, or how sage-grouse viability is promoted through current management, all of which are helpful to determine likelihood of success.
- The application narrative is not clearly written, making review of the narrative challenging.
- An alternatives analysis demonstrating that a range of options are considered is not articulated in the application, which is an important consideration to determine likelihood of success.
- The restoration work resulting from this technical assistance to connect a down cut stream to its adjacent floodplain may be an opportunity to increase watershed resiliency and mitigate the effects of climate change; however, this potential benefit is not articulated in the application.
- It is unclear if the budget is adequate to accomplish the project objectives.

Concluding Analysis

The Harney County Watershed Council proposes to complete preliminary design sufficient to inform a restoration project budget and initiate regulatory compliance for an irrigation water delivery and floodplain connection project near Burns. The application narrative and budget are generalized and not site specific to the work area. The resulting design, if the above concerns are addressed, is likely to lead to restoration that improves sage-grouse and Pacific Flyway bird habitats.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5044-22973

Project Type: Technical Assistance

Project Name: Soldier Creek Wet Meadow Restoration Project

Applicant: Harney County Watershed Council

Region: Eastern Oregon

County: Harney

OWEB Request: $75,000

Total Cost: $94,856

Application Description 1). Soldier Creek wet meadows is located about 9 miles northeast of Burns, Oregon in Harney County. It is located below the Malheur National Forest north of Hwy 20 and east of hwy 395. The Soldier Creek, LLC owns the property where the project will take place.

2). The Soldier Creek wet meadow habitat needs restoration. The objective is to improve its flood irrigation efficiency by upgrading the irrigation infrastructures: (a) Stop and reverse incising and erosion of meadow and channels that are disconnecting flow from floodplain; (b) Replace and improve floodplain infrastructure to effectively flood wet meadow habitat; (c) Improve forage for spring migratory waterbirds and improved habitat for local wildlife and neotropical nesting birds.

3). The requested funds will support survey and design for restoration of the Soldier Creek project area. Funding will support a topographic survey and development of a digital elevation model, drafted engineering design sufficient for permitting and cost estimation, and invitation of regulatory compliance.

4). Partners: Harney County Watershed Council, Harney Soil and Water Conservation District, Ducks Unlimited, Oregon Water Resources Department, and landowner/irrigator.

Review Team Evaluation

Strengths

- The design work proposed in the application is supported by several assessments stating that flood irrigated wet meadow restoration is critical in this area for Pacific Flyway migratory birds.
- Appropriate stakeholders are engaged in the project and the project team has accomplished similar technical assistance work.
- The Harney County Watershed Council has the capacity to manage and implement the project as proposed.
- Project actions align with the work necessary to accomplish the project objectives in this project location near Burns.

Concerns

- The application is not clearly written, making review of the narrative challenging.
- The application identifies that the project will affect sage-grouse but does not describe how sage-grouse will benefit from the proposed actions.
- An alternatives analysis demonstrating that a range of options are considered is not articulated in the application, which is an important consideration to determine likelihood of success.
- It is unclear whether the budget is adequate to accomplish the project objectives.

Concluding Analysis

The Harney County Watershed Council proposes to complete preliminary design sufficient to inform a restoration project budget and initiate regulatory compliance for an irrigation water delivery project near Burns. The application narrative and budget are generalized and not site specific to the work area. The resulting design work, if the above concerns are addressed, is likely lead to restoration that improves Pacific Flyway bird habitats.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5045-22988

Project Type: Technical Assistance

Project Name: Lava Butte Upland Management Design

Applicant: Owyhee WC

Region: Eastern Oregon

County: Malheur

OWEB Request: $30,828

Total Cost: $39,828

Application Description The Lava Butte Upland Management Design project is located approximately 14.5 miles NW of Jordan Valley in the Lower Cow Creek/Anawalt area of the Owyhee Uplands. The project area is in the Cow Lakes PAC and Core Sage Grouse habitat. Lack of water sources across 7,307 private land acres limits grazing distribution, degrades wildlife habitat, and impacts vegetative composition. The proposed work includes 100% survey/design of four livestock watering systems on two different properties by a licensed engineer, as well as development of livestock grazing/management plans. Project partners include the Owyhee Watershed, RSI Engineers, Cow Lakes Grazing Association and Skinner Ranches.

Review Team Evaluation

Strengths

- Project goals and objectives are clear in the application, and the maps provide ample detail of the project vicinity.
- Additional watering troughs on the 7,307-acre ranch will facilitate proper grazing management, which will provide opportunity to graze invasive annual grasses (IAG) to reduce their presence and promote native vegetation that will benefit sage-grouse and other native wildlife.
- Current grazing management is flexible and does not appear to have negative impacts to sage-grouse habitat. The addition of permanent water sources will add grazing rotation flexibility, which will help improve native bunchgrass understory species.
- Appropriate stakeholders are engaged in the project and the project team has accomplished similar technical assistance work in remote locations.
- The Owyhee Watershed Council has the capacity to manage and implement the project as proposed.
- The budget rates are reasonable given the remote project location, and the overall project cost is commensurate with the expected design result.

Concerns

- An alternatives analysis demonstrating that a range of options are considered is not articulated in the application, which is an important consideration to determine likelihood of success.

Concluding Analysis

The Owyhee Watershed Council is proposing to design a stock watering system for a 7,307-acre rangeland grazing area near Jordan Valley. The resulting restoration work will improve grazing operations and provide the tools needed to properly manage this sage-steppe plant community in sage-grouse habitat. With this improved management the likelihood of project success is high.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5046-22997

Project Type: Technical Assistance

Project Name: Chesnimnus Creek Williams Restoration Design

Applicant: Nez Perce Tribe

Region: Eastern Oregon

County: Wallowa

OWEB Request: $74,250

Total Cost: $191,700

Application Description The Chesnimnus Creek Williams Restoration Project is part of a multi-phased effort proposing to complete designs, permitting, and all necessary documents to implement a thoroughly vetted instream and floodplain restoration project benefitting limiting life stages of ESA listed steelhead between RM 4.6 and 9.1 in Chesnimnus Creek. Chesnimnus Creek is a tributary of Joseph Creek, located in the northern end of Wallowa County. Although the Joseph Creek steelhead population is among the most viable in the region, its headwaters do not originate in high elevation snowpack dominated mountains, which makes this watershed extremely susceptible to changes in temperature and hydrologic regimes.
With legacy logging effects, roads, agricultural practices, and other anthropogenic influences within the Joseph Creek watershed, current habitat conditions in Chesnimnus Creek are significantly deviated from its historic ecosystem function. This departure has negatively impacted many physical and biological aspects of the watershed, resulting in various life stage impairments to steelhead and Pacific lamprey, of which this project aims to improve through a suite of priority restoration actions.
In addition to the Nez Perce Tribe, the Grande Ronde Model Watershed (GRMW), the landowners, project funders, the Oregon Department of Fish & Wildlife (ODFW), and other Atlas Implementation Team partners will be instrumental in the successful completion of this project.

Review Team Evaluation

Strengths

- The application describes a clear need to design restoration along a 4.5-mile reach of Chesnimnus Creek to improve Endangered Species Act (ESA)-listed steelhead habitat and improve watershed resiliency to mitigate the effects of climate change.
- Work proposed in the application addresses limiting habitat factors identified in the Wallowa Atlas strategic action plan and other regional steelhead recovery plan documents.
- An alternatives analysis demonstrating that a range of options are considered is included in the application, which is an important consideration to determine likelihood of success.
- Project objectives are sequential and clearly written and include scheduled design review check- in intervals with the Atlas team and the landowner.
- Appropriate data will be collected to inform project designs and professionally accepted engineering approaches will be applied to accomplish the final design and environmental compliance documents.

- The landowner, state and federal agencies, the Nez Perce Tribe, and the watershed council are engaged in the project and the project team has accomplished similar technical assistance work in remote locations.
- The Nez Perce Tribe has the capacity to manage and implement the project as proposed.
- Ample project match is secured from a variety of partners demonstrating that appropriate stakeholders are engaged in the project and committed to project implementation.
- The budget rates are reasonable given the remote project location, and the overall project cost is commensurate with the expected design result.

Concerns

- No concerns were expressed at review.

Concluding Analysis

The Nez Perce Tribe proposes to complete design and all permitting requirements for a project addressing degraded aquatic, floodplain, and riparian habitat on Chesnimnus Creek near Enterprise. The resulting restoration guided by this design work will occur in steelhead habitat, restore habitat necessary for beaver colonization, and guide future restoration that addresses Oregon Department of Environmental Quality concerns.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5051-22995
Project Type: Stakeholder Engagement
Project Name: Engagement with Water
Applicant: Malheur WC
Region: Eastern Oregon
County: Malheur
OWEB Request: $148,267
Total Cost: $185,863

Application Description

1) Our proposed project will cover the Malheur River Watershed.

2) The Basin has several natural resource issues. The river has the some of the worst water quality in Oregon. One of the primary contributors is irrigation induced erosion. Bull trout, a federally listed species, is in the upper reaches of the Malheur River. It requires riparian areas in good condition and the Vale Irrigation District needs help to maintain a minimum pool in Beulah Reservoir. Weeds in riparian areas are an ever increasing problem. We need to engage landowners directly to address this specifically.

3) We are proposing to hire a Engagement Project Manager. Their responsibilities will be to engage the producers in the basin, conduct 4 workshops/townhall meetings to discuss irrigation efficiency opportunities, weed management in riparian areas, and present eco-friendly bank stability methods. We will contract with a local company to produce two newsletters distributed both in print and electronically, continuous updates of our website, and develop electronic media publications twice a year for 2 years.

4) Partners include NRCS, Vale Irrigation District, Mesa Communications, Malheur Basin residents, and local natural resource agencies.

Review Team Evaluation

Strengths

- The Malheur Watershed Council (MWC) will hire an engagement project manager who will conduct workshops, town hall meetings, contribute to the watershed council newsletter, provide updates to their website, and contribute to other electronic media publications, which will engage landowners, agencies, and the public in the Malheur watershed.
- The stakeholder engagement methods are designed to reach local, state, and federal agencies, private landowners, and public land managers, as well as nonagricultural producers in the Malheur watershed.

- The engagement methods described in the application will encourage multi-directional communication between stakeholders in the basin. The proposed work builds on work ongoing since the late 1990s, when the council began water quality, weed management, and riparian improvement work in the basin.
- The proposed stakeholder engagement work is timely and will result in the development of eligible restoration projects, especially in the Vale Bench priority area where the Bureau of Reclamation (BOR) Water Smart program will fund the conversion from open irrigation ditch delivery to piped delivery systems.
- There is not a dedicated MWC staff member working on stakeholder engagement in the basin, there is a need for this service, and the proposed work will improve relationships between agencies, landowners, and the interested public.
- MWC has the necessary experience and a proven track record of implementing the proposed stakeholder engagement activities.

Concerns

- Additional information linking the engagement activities to eligible restoration will add clarity to the application, especially regarding riparian weed control in the basin.
- The project schedule details multiple engagement events, and the budget has one line item for outreach materials making it difficult to determine if costs are reasonable and necessary for the proposed work.
- Travel is not detailed in the budget and this cost is necessary to complete the proposed stakeholder engagement work.

Concluding Analysis

The MWC proposes to hire an engagement project manager who will initiate stakeholder engagement efforts in the Malheur watershed regarding irrigation water, riparian weed, and aquatic habitat management. The proposed work will highlight the importance of improved water quality, aquatic, and upland habitats and how private landowners and public land managers can facilitate these improvements.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5047-22993
Project Type: Monitoring
Project Name: Checking On Things: WQ Monitoring
Applicant: Malheur WC
Region: Eastern Oregon
County: Malheur
OWEB Request: $258,826
Total Cost: $348,826

Application Description

1) Location. Priority areas for irrigation improvement activities in the lower Malheur and Owyhee River Basins. We propose to sample at 9 sites on the Malheur River, Bully Creek, Willow Creek, and drains that flow into these streams. We will sample in the Owyhee Basin at 2 sites on the Owyhee River and 6 important drains. These are all sites where we have monitored for many years
2) NRCS and the Malheur WSC have identified priority areas for irrigation/water quality improvement projects and the Owyhee WSC has identified focus areas as well. We are applying for grant funds to implement on farm conversions to sprinkler irrigation and to pipe dirt ditch laterals for better water management. We need to assess if our efforts are successful in improving water quality in the Malheur River, Bully and Willow Creeks, and the Owyhee River. This monitoring is an important component of our recently awarded BOR WaterSmart grant for piping laterals in the Vale Bench.

Continued monitoring is necessary to quantify water quality improvements and to characterize further changes in water quality related to changes in land and irrigation management over time. Continued monitoring is critical to show agricultural producers that current agricultural practices are contributing to water quality impairment and to demonstrate that their efforts to improve land and irrigation management can be effective and worthwhile. This message is important and of great interest to producers in these basins.
3) We are proposing to sample water from 17 locations twice a month from May to October. Sample parameters will be:
-- Total and ortho Phosphorus
-- E. coli
-- Total Suspended Solids (TSS)
We propose to install flow gauges at 7 sites and use data from 3 permanent sites to calculate pollution loads.
4) Project partners are the NRCS, Vale Oregon Irrigation District, Owyhee Irrigation District, BOR Lab in Boise, Idaho Power, and the Malheur and Owyhee WSCs.

Monitoring Team Evaluation

Monitoring Team Strengths

- This proposed project will collect data that will complement the historic data collected at many of the sites since the 1990s.
- The applicant is working with experienced contractors to collect and analyze the data, the uploaded report demonstrates the ability to collect and report the data as proposed.
- This project will share results with a technical team that consists of OWEB, OWRD, ODA and DEQ and have them review the final data analysis report before it is completed.
- Findings from this monitoring project will be presented in watershed council meetings, to landowners and featured in outreach efforts in their newsletter.
- The application includes a detailed budget that describes how expenses were estimated across this three-year project.

Monitoring Team Concerns

- The application doesn't show a clear plan to describe how irrigation efficiency projects and agricultural practices will be quantified to interpret water quality results.
- The application doesn't describe how this monitoring project connects to the BOR Water Smart grant to focus their efforts in the Vale area.
- The application justifies monitoring stream water level every four hours because it is cheaper than standard methods to collect it every 15 minutes. It was not clear how they determined that 6 water level measurements every day is sufficient to meet their data analytical needs that ultimately allows them to answer their monitoring questions.
- The application cites multiple methods for measuring streamflow, including the velocity index method for estimating flow at gaging stations but it was not clear how they would determine which sites this method would be applied.
- The monitoring protocols detailed in the "Water Quality Monitoring Guidebook" that is cited is over 20 years old and is considered outdated. This document does not include monitoring methods for total suspended solids or E. coli.
- The data management approach includes storing their data in a master excel file and relies on the BOR lab to back up their water quality data. It is not clear what approaches are taken to store their streamflow data to ensure it is backed up.

Monitoring Team Comments

Review Team Evaluation

Strengths

- The application addresses concerns identified in the previous application by describing how long-term water quality trends will be determined and describing methods to engage the agricultural community.
- The summarized water quality data, maps, and photos included with the application help describe the proposed water quality and flow monitoring work.
- Three years of monitoring are proposed in this application, which is appropriate and necessary to inform priority areas for water quality improvement and to identify eligible restoration work.

- Previous data indicates Bully Creek, Willow Creek, the Malheur River, and the Owyhee River have impaired water quality. Data collection using Department of Environmental Quality (DEQ) approved methods for temperature, flow, phosphorus, E. coli, and total suspended solids will contribute critical data that will support the Malheur Total Maximum Daily Load (TMDL) implementation.
- The West Bench, Harper, Little Valley, and Willow Creek areas are prioritized by Oregon Department of Environmental Quality (DEQ), Oregon Department of Agriculture (ODA), Natural Resources Conservation Service (NRCS), and Bureau of Reclamation (BOR) for irrigation water management improvement. The proposed monitoring will track water quality changes and help prioritize upcoming restoration work in these geographies.
- The proposed water quality data collection will be used to demonstrate the need for future restoration work that will be proposed in funding applications to NRCS, BOR, and Oregon Water Resources Department (OWRD).
- The applicant has a proven track record collecting, analyzing, distributing, and presenting water quality data for the Malheur and Owyhee basins.
- The project team consisting of the Malheur and Owyhee Watershed Councils, Vale Oregon Irrigation District (VOID), BOR, NRCS, Owyhee Irrigation District (OID), and Idaho Power have successfully partnered on past monitoring projects.
- Incorporating existing stream flow data from BOR, Idaho Power, and U.S. Geological Survey is a cost-effective approach.
- Project costs are commensurate with the expected water quality data collection, analysis, and distribution benefits.

Concerns

- The application does not describe why the proposed monitoring is necessary for the implementation of the BOR Water Smart grant recently awarded to the Malheur Watershed Council.
- Water quality monitoring in the winter months will add clarity to the overall water quality picture in the basin, and it is unclear why monitoring is not conducted during this time.

Concluding Analysis

The Malheur Watershed Council proposes to monitor flow and water quality in the Lower Malheur and Owyhee River basins where improved irrigation water management is a priority. The data collection will inform and prioritize conservation work, document before and after conditions, and facilitate restoration partnerships.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5048-23000

Project Type: Monitoring

Project Name: Powder Basin Macroinvertebrate Status and Trend Monitoring

Applicant: Powder Basin WC

Region: Eastern Oregon

County: Baker

OWEB Request: $38,111

Total Cost: $51,932

Application Description This project proposes continued status and trend macroinvertebrate monitoring by the Powder Basin Watershed Council (PBWC) to assess water quality and condition in the Powder, Burnt, and Brownlee sub-basins. Previous macroinvertebrate surveys in 2018 found results showing significant impairments in biodiversity throughout many of the sampled stream reaches, particularly lower elevation reaches. Given the changes in hydrological conditions and restoration actions in the basin since 2018, identifying trends in macroinvertebrate biodiversity is a high priority for the PBWC and provides baseline data toaddress several important watershed issues. First, this project allows the council to assess the changes in biodiversity at reference sites between 2018 and 2024, and to correlate them to water quality metrics, allowing us to identify important or limiting water quality variables and sites where these issues can be addressed through restoration efforts. Next, the council is looking to use this project to identify changes in macroinvertebrate biodiversity in and near restoration sites by establishing baseline data at current and future restoration projects and at nearby natural beaver dams. The Council is also using this project to help our organizational partners use macroinvertebrate samples to identify and inform management activities in the basin. Wallowa-Whitman National Forest will partner in this project with a focus on monitoring the impact of forest management activities in the Baker City Municipal Watershed. Oregon Department of Environmental Quality will also partner with an interest in using this data to establish status and trends in the Powder Basin as part of their ongoing monitoring and TMDL assessment efforts. Finally, the Council’s intention is that the data generated by this project will be useful in identifying reaches where restoration efforts to improve water quality and habitat conditions for macroinvertebrates, fish, wildlife, and people.

Monitoring Team Evaluation

Monitoring Team Strengths

- This proposed project will complement the macroinvertebrate data that was collected in 2018 and the long-term water quality monitoring data set.
- The application clearly states the different monitoring questions they are trying to answer with the collection of macroinvertebrates.
- The data will be submitted to DEQ to be stored in their database and shared with the Wallowa-Whitman National Forest.

- This project will engage volunteers to assist in data collection that will assist in community engagement.
- The project will follow the same targeted riffle field methods for the sites that will be repeated and will follow the multi-habitat sampling field methods to evaluate the effectiveness of beaver dam analogs which are appropriate given the different objectives proposed in the application.
- The application provides a thorough description of the analyses they will complete for each of the monitoring questions that are proposed in the application.
- The staff listed in the application have the necessary qualifications and experience and are working with a qualified contractor to process the macroinvertebrate samples.
- The budget costs are appropriate for the work necessary to complete the objectives proposed in the application.

Monitoring Team Concerns

- The application lacked details on the previously funded monitoring grant that is referenced and informed the development of this project.
- The value of using macroinvertebrate data across the three different objectives may be different based on which questions they are asking.
- It is not clear how the applicant will incorporate available streamflow data to characterize the variable flow conditions across the 2018 and 2024 sampling periods to assist in interpreting the results.
- The applicant doesn’t describe how the results of the thinning project will be communicated with interested community partners beyond the Wallow-Whitman National Forest.

Monitoring Team Comments

Review Team Evaluation

Strengths

- Monitoring proposed in this application is timely and relevant because the Powder Basin Watershed Council (PBWC) previously collected macroinvertebrate data in Baker County, and this follow up monitoring may inform future restoration project locations.
- Monitoring locations are strategically selected to resample locations with prior collected macroinvertebrate data, as well as the addition of sites to characterize the results of implemented restoration work.
- The Oregon Department of Environmental Quality (DEQ) is engaged with the monitoring design and the applicant will seek volunteer assistance to gather the macroinvertebrate data, demonstrating engagement with community stakeholders.
- DEQ will assist with the data analysis and the PBWC will submit the data to the DEQ database demonstrating that the data will be properly stored, reported, and made publicly available.
- Project costs are commensurate with the proposed monitoring data collection, analysis, and distribution and the use of volunteers to collect the data is a cost-effective approach.

Concerns

- It is unclear how the proposed macroinvertebrate monitoring ties into the larger water quality monitoring effort conducted by the PBWC in Baker County.
- The application proposes status and trend monitoring but describes effectiveness monitoring (EM) for low tech restoration work in the basin and it is unclear if the monitoring as proposed can accomplish EM objectives.

Concluding Analysis

The PBWC proposes to sample macroinvertebrates in Baker County where improved water quality is a priority. The data collection will inform Oregon Department of Agriculture and DEQ water quality improvement planning in the Powder Basin and will inform future restoration work.

Open Solicitation-2023 Spring Offering
Eastern Oregon (Region 5)

Application Number: 223-5049-23054
Project Type: Monitoring
Project Name: Ecological linkages between birds, water patterns, and vegetation
Applicant: Audubon Society of Portland
Region: Eastern Oregon
County: Harney
OWEB Request: $132,908
Total Cost: $273,855

Application Description The Harney Basin is a snowpack-dependent closed-lake basin in southeastern Oregon. As with other regions in the west, increasingly variable weather patterns (i.e. prolonged drought and wetter wet years) has created concern for myriad migrating and breeding bird species which depend on a gradient of wetlands habitat. Much attention has been paid to migrating waterfowl use of the Harney Basin during migration, less attention has been paid to nesting birds and migrating shorebirds, for whom stopover habitat (rest and refueling locations) is diminishing at an alarming rate.. Several species of landbirds (bird species that depend primarily on terrestrial habitats) have experienced population declines and are predicted to experience shifts in distribution and abundance associated with climate change, particularly in woody riparian and upland habitats. Understanding temporal and spatial use patterns of birds in the Harney Basin is essential to prioritizing, developing and evaluating the efficacy of restoration projects in this region.

For over a decade, Portland Audubon has worked with Harney Basin partners, largely through the Harney Basin Wetlands (HBWC) and the Comprehensive Conservation Plan Collaboratives to inventory and monitor bird populations at Malheur National Wildlife Refuge (MNWR). In 2019, we expanded our efforts to the Silvies Floodplain. As our work expands, continued funding for our on-the-ground staff (including seasonal staff) has become increasingly important to implement projects to understand the ecological linkages between birds, water patterns, and vegetation.

This project will fund our continued work to assist with monitoring migrating and breeding birds in the Harney Basin by supporting both a seasonal and permanent staff working on these projects. Data collected and a report summarizing findings will be provided to project partners as an outcome to this project.

Primary partners on this project include USFWS and HBWC partners .

Monitoring Team Evaluation
Monitoring Team Strengths

- This proposed project will complement the existing data set on Malheur National Wildlife Refuge and in surrounding areas that were funded in a previous OWEB monitoring grant.
- The applicant will follow established bird monitoring methods that are cited in the application.
- The applicant describes how the different data sets will be managed and stored in a variety of databases depending on the data type ensuring long term data storage and availability.
- The data will be reported in official reports to OWEB, through social media, peer reviewed journals, and Audubon publications which will help in making the data widely available to a variety of audiences.
- The applicant has experience collecting bird data in the area for 5 years and working with volunteers that have experience with the monitoring methods.
- The applicant engaged a variety of technical experts and community partners that are working in the area to provide input on the sites to be selected, monitoring questions to be answered and how data will be used.
- The applicant will incorporate training and overlapping surveys to ensure the data that is collected by volunteers is useful.

Monitoring Team Concerns

- The applicant does not describe how the monitoring that was completed with the previous OWEB monitoring grant informed restoration to demonstrate how additional monitoring can inform future restoration or acquisition projects.
- It was not clear what data is needed to feed the WET model to understand if this is a useful tool to understand how wetland extent and transitions are occurring.
- The application was challenging to understand all the different bird monitoring efforts and the accompanying study design that will be followed to answer the monitoring questions posed in the application.
- The application only provides study design details (site selection, parameters and frequency) for the song meter data collection and the Project IBiS surveys, there is no information provided for the bird monitoring projects at Malheur National Wildlife Refuge, the Silvies Floodplain and in the Harney Basin, Silvies and Harney Lake Breeding Bird Surveys.
- The monitoring methods for collecting drone data are not described or cited.
- The application doesn’t describe how data will be analyzed to determine long term population trends of key bird species, how the proposed drone imagery will be incorporated into the hydroperiod and vegetation data analysis or how they plan to compare bird use of wet meadow and riparian habitat in the Buena Vista unit to the southern end of Blitzen Valley.
- The application doesn’t include a description of staff qualifications or experience with vegetation monitoring and analyses.
- The application doesn’t include a description of the work to justify the $16,000 in the budget to purchase a drone.

Monitoring Team Comments

Review Team Evaluation

Strengths

- The proposed monitoring data will support a long-term bird species inventory and contribute to building an improved monitoring plan for the Malheur National Wildlife Refuge (refuge).
- There is a clear need for the monitoring work and the data is relevant, applicable, and timely and will inform future restoration projects.
- Data and results from the monitoring is identified as needed in local strategic planning documents, the data will be stored appropriately, and results will be made publicly available.
- The applicant has the organizational capacity to implement the project as proposed and has relevant experience implementing similar monitoring work.
- The monitoring work incorporates bird song meters that can gather a large volume of data. The song meters operate remotely without project staff attendance, and this is a cost-effective method for gathering bird presence information.

Concerns

- The application is unclear regarding why a drone purchase is necessary to complete the monitoring as proposed. The use of a federally approved drone is required for use on the refuge, and while not articulated in the application, this issue was clarified during the project site visit.
- It is unclear in the application how the proposed monitoring complements past monitoring accomplished during the Harney Basin Wetlands Focused Investment Partnership (FIP) and how this monitoring is guided by past monitoring results.
- The need, relevance, applicability, and timeliness of the proposed monitoring is not clearly linked to future restoration, and it is unknown how past monitoring has led to restoration on the refuge.
- The budget does not clearly describe how salary match contributes to the monitoring goals and objectives.

Concluding Analysis

The Audubon Society of Portland proposes to continue monitoring migrating and breeding birds in the Harney Basin and this work is a priority to inform conservation and habitat restoration. The monitoring will identify needed habitat types, help the partnership prioritize restoration locations, and facilitate restoration partnerships.

Region 1 - 6 Grand Total OWEB Staff Recommended Board	**12,461,865**

Open Solicitation-2023 Spring Offering
Mid Columbia (Region 6)

Application Number: 223-6015-22911

Project Type: Restoration

Project Name: Morrow County Grassland Restoration of Annual Grass-Invaded Habitat

Applicant: Morrow SWCD

Region: Mid Columbia

County: Morrow

OWEB Request: $191,950

Total Cost: $280,700

Application Description Our proposed project is focused on restoring grassland habitat located within the Columbia Plateau Ecoregion, specifically the foothills to the north of the Umatilla National Forest. This area is identified by Oregon Department of Fish and Wildlife as a conservation opportunity area extending from Rock Creek to Butter Creek. Historically this habitat was comprised of lush bunchgrass prairies and healthy riparian corridors. It has since been degraded by agriculture, over grazing, fire, urban growth, changing climate, and encroachment by invasive species including exotic annual grasses. Invasive annual grasses have out competed desirable species, reduced native species diversity, suppressed forage production, decreased the nutritional quality of forage, and disrupted the historical fire regime. These shifts have negatively impacted livestock and wildlife species by reducing the quantity and quality of available forage resulting in poor production and population declines. Research conducted throughout our county over the last 4 years found that annual grass selective herbicides applied in a moderately infested area can be an effective way to restore rangeland habitat and improve the quantity, quality, and composition of vegetation. Given these results we propose the Morrow County Grassland Restoration of Annual Grass Invaded Habitat project. The proposed project aims to restore 3,500 acres of annual grass invaded rangeland habitat using the selective herbicide Rejuvra. Project partners contributing financially and with project implementation include Morrow Soil and Water Conservation District, Oregon Department of Fish and Wildlife, Natural Resource Conservation Service, Morrow County Weed Department, and Heppner Rural Fire District.

Review Team Evaluation

Strengths

- Invasive grass control is a top priority for landowners in this area and there is support for treatment from the owners of 3,500 acres.
- The applicant is engaging appropriate partners, including the Weed Department, Fire District, ODFW and NRCS.
- The applicant has a successful track record of implementing and managing OWEB grants.
- The budget is appropriate for the identified project components. Estimates are based on local vendor quotes and neighboring counties to develop accurate costs.

Concerns

- Priority areas for treatment are unclear. Without this information it is not possible to understand the watershed context for the proposed work.
- A more strategic approach is needed before the work proceeds. The treatment areas appear to be scattered across the County.
- The application lacks a grazing plan post invasive annual grass treatment. One year of rest may be insufficient to maximize treatment success.
- Without locations selected it is unclear if work will occur near areas of high infestation, which may negate benefits of the work.
- The map in the application is unclear regarding values the colors represent.

Concluding Analysis

Invasive annual grasses have outcompeted desirable species and reduced native species diversity in the area. Using Rejuvra© to combat invasive annual grasses has shown to be effective. Morrow SWCD proposes to treat 3,500 acres of annual grasses by selecting acres for treatment within Morrow County using an application and ranking process. Applications will include multiple screening questions and SWCD staff will then rank them based on selection criteria. The proposed project lacks a strategic approach to identifying treatment areas.

Open Solicitation-2023 Spring Offering
Mid Columbia (Region 6)

Application Number: 223-6016-22953
Project Type: Restoration
Project Name: Battle Creek Upland Improvements
Applicant: South Fork John Day WC
Region: Mid Columbia
County: Grant
OWEB Request: $106,428
Total Cost: $142,077

Application Description The Battle Creek Ranch is located in Grant County, Oregon, approximately 2.5 miles West of the town of Dayville. This property includes the Battle Creek watershed, with multiple side tributaries. The Battle Creek Ranch is approximately 1,462 acres with approximately 5,000 acres of BLM allotted ground intermixed with the private land. The South East corner of the property is bordered by the ODFW Phillip W. Schneider Wildlife Area, and classified as critical winter range habitat for mule deer.

Battle Creek is listed as a Critical Habitat Stream for Mid-Columbia Steelhead and is also listed on the DEQ 303d list for temperature with a 7-day average of daily maximum of 74.5 with 122 days exceeding temperature standards.

Vernoy Walker recently purchased this property in 2022, and we have toured the property multiple times with many partners in order to assist in developing a master restoration plan for the ranch. This property is dealing with legacy livestock use issues, degraded upland vegetation, stream channel incision, Juniper encroachment, and invasive species (annual grass and noxious weeds). With the assistance of the landowner, Grant SWCD, and NRCS, we are approaching this property with a phased approach. We will first address the Juniper encroachment issue, so that Grant SWCD Weed Control can treat noxious weeds, and annual grasses. Then we will begin a low-tech process based riparian restoration effort for Battle Creek.

Review Team Evaluation

Strengths

- The project as proposed is technically sound, with a well laid out plan to remove juniper and other invasive plants from the property.
- The work described in the application will implement specific actions in prioritized geographies identified in local and regional planning documents.
- Juniper is outcompeting desirable native grasses, forbs, and shrubs and the removal of juniper will help ameliorate this condition.
- The applicant has a proven track record of implementing similar projects and continues to improve their restoration approach by incorporating lessons learned from previous projects.

Concerns

- Bureau of Land Management (BLM) lands are interspersed in the project area, and it is unclear how treatment on BLM lands will be integrated with treatment on private land.
- As a project component listed in the application, the landowner completed work on the reservoir to increase capacity, but the dam that feeds the reservoir is a partial passage barrier, potentially negating the project's habitat benefits.

Concluding Analysis

The South Fork John Day Watershed Council is working with a new landowner to address legacy land management issues in the Battle Creek watershed. The project proposes to improve upland health in critical mule deer winter range by removing juniper in Mid and Lower Battle Creek. In addition to annual grass and noxious weed control, future efforts are planned to include low-tech process-based restoration; however, watershed benefits from work to increase capacity on the reservoir is not clear.

Open Solicitation-2023 Spring Offering
Mid Columbia (Region 6)

Application Number: 223-6017-22954

Project Type: Restoration

Project Name: Gable and Thompson Creek Hydrologic Improvement

Applicant: Wheeler SWCD

Region: Mid Columbia

County: Wheeler

OWEB Request: $103,928

Total Cost: $136,295

Application Description 1) This project is located in the southern portion of Wheeler County, in the Bridge Creek Watershed, near the headwaters of Gable Creek and the confluence of Thompson Creek, on privately owned property, west of the town of Mitchell, OR. 2) The landowner farms all agriculture fields across the property through an 11-line pivot system that is all gravity fed from a pond; however, Western Juniper expansion in the uplands and riparian areas has resulted in encroachment on all the agricultural production and the multiple perennial stream systems that feed into the ESH listed portion of Gable Creek and Bridge Creek. Juniper encroachment, with an effect of reduced precipitation infiltration, has increased over the years due to historical wildfire suppression. This has created a limitation on stream and aquifer availability creating water quality and quantity issues, as well as a loss of native vegetation with increasing annual grass invasions that degrade wildlife habitat and their food source. In addition, the spring sources are in need of redevelopment as the springs were developed many years ago and no longer function as desired. The pipeline that feeds into a series of troughs have become clogged with algae matter restricting the flow and creating water quality and quantity concerns for livestock and wildlife. Also, the trough system lacks storage and stability causing sedimentation from ground disturbance by heavy animal use under wet conditions. 3) This project seeks to strategically conduct mechanical and hand cut Juniper treatments along priority northern slopes, excellent for producing forage and groundcover essential for wildlife species. This release of sequestered upland water supply will restore the upland conditions and the watersheds dynamic function. In addition, two springs will be developed to distribute grazing and provide terrestrial wildlife upland water source. 4) Project partners include OWEB, Wheeler SWCD, and the landowner.

Review Team Evaluation

Strengths

- The application includes detailed maps and photos with descriptive captions, which is useful in reviewing the project objectives.
- The applicant has the capacity to manage and implement OWEB-funded projects.
- Applicant staff are getting trained on developing grazing management plans.

Concerns

- It is not clear how the proposed work will improve ecological conditions, rather than improve forage for domestic livestock on the property.
- The application does not address the “why” each juniper stand will be treated, which is needed to evaluate the technical soundness of the application.
- Spring developments are not always exempt from regulation by OWRD. The proposed spring developments must be coordinated with OWRD to ensure regulatory compliance.
- It is unclear how the proposed work fits with the larger RCPP effort in the area.
- The stated benefits of carbon sequestration and improved water flow may be overstated in the application.
- Streambanks on the property are severely altered by livestock management on the property and there are no grazing management strategies articulated in the application.

Concluding Analysis

Wheeler SWCD proposes to remove 399 acres of Western juniper in Gable and Thompson Creek watersheds. The proposed project may provide some upland ecological benefits by removing juniper and developing springs as upland water sources; however, water quality and quantity benefits from the project are unclear based on the information provided in the application.

Open Solicitation-2023 Spring Offering
Mid Columbia (Region 6)

Application Number: 223-6018-22959
Project Type: Restoration
Project Name: Jones SF Long Creek Fence
Applicant: Grant SWCD
Region: Mid Columbia
County: Grant
OWEB Request: $165,837
Total Cost: $227,229

Application Description This project includes the construction of approximately 5.5 miles of 4-strand wire fence, water gaps, stream crossings, and riparian escape gates, to improve riparian conditions around approximately 2.75 miles of the South Fork of Long Creek; this reach provides spawning and rearing habitat for ESA-listed summer steelhead. The allotment contains multiple other water sources including developed and undeveloped springs, intermittent streams, and stock ponds. Fence construction will be consistant with the Oregon Department of Fish and Wildlife's fencing specifications. Title II funds will support construction costs for approximately 3 miles of fence; Oregon Watershed Enhancement Board looks to support the remaining 2.5 miles. The Oregon Watershed Enhancement Board will supply all materials, for 5.5 miles of fence.

Without a riparian fence, cattle tend to loiter near the stream causing degraded streambanks, lack of diverse channel morphology, diminished riparian vegetation, degraded water quality, lack of fish and wildlife habitat, and uneven distribution of grazing through the allotment. A riparian fence would address these issues by excluding cattle from the stream allowing the natural vegetation to regrow and banks to heal.

The South Fork of Long Creek is a perennial tributary of Long Creek, a tributary of the Middle Fork John Day River. Project partners include the landowner, the permittee, the Malheur National Forest, and Grant SWCD. Unrestricted livestock access to the creek and associated riparian areas have degraded site conditions affecting aquatic habitat, water temperatures, and streamside vegetation.

Review Team Evaluation

Strengths

- The application articulates the project benefits of excluding livestock grazing in the riparian area of the South Fork Long Creek, including improved channel morphology and riparian vegetation.
- The area is a high priority for restoration of steelhead habitat and actions are supported by several restoration plans.
- The applicant is experienced and qualified for this type of work.
- Fencing cost and installation rates are reasonable for the work proposed.

- The project cost is commensurate with expected watershed benefit in this active steelhead spawning and rearing area.

Concerns

- It is unclear if NEPA and environmental compliance has been initiated for the project, which is important to complete the project in a timely manner.
- The application provides detailed fence specifications, but it is unclear whether the design meets ODFW wildlife friendly specifications.
- A map showing this project and past projects would help determine how the proposed project fits within the watershed context.

Concluding Analysis

The application proposes to protect 2.75 miles of South Fork Long Creek in an area that is critical habitat for steelhead. Proposed work will protect spawning and rearing habitat; however, there is no letter of support from the USFS which would help demonstrate support for this project on public lands. Additional information on required project maintenance would strengthen the application.

Open Solicitation-2023 Spring Offering
Mid Columbia (Region 6)

Application Number: 223-6019-22962
Project Type: Restoration
Project Name: High Izee Enhancements
Applicant: South Fork John Day WC
Region: Mid Columbia
County: Grant
OWEB Request: $124,263
Total Cost: $198,353

Application Description The High Izee Ranch is approximately 14,000 acres that includes the headwaters of Pine Creek (a main tributary to the South Fork John Day River) and is within winter range for both Rocky Mountain Elk and Mule Deer. The ranch is located about 5 miles west of the junction between the South Fork Road and Izee-Paulina Hwy.

The High Izee Ranch has a recent new landowner that reached out to the South Fork John Day Watershed Council to improve their natural resources. They are hoping to maximize their efforts with this grant from already secured projects through the NRCS Sage Grouse Initiative which includes forestry thinning on 2000 acres (Crooked River watershed) and the South Fork John Day Watershed Regional Conservation Partnership Program (RCPP) entailing forestry thinning on 202 acres. This project is just one piece of the ongoing efforts with hopes of continued restoration in the form of low-tech process-based restoration on the property streams.

We are requesting funds to cut, pile, and burn 100 acres of mixed conifer as well as develop 2 spring sources including protective fencing and wildlife escapement ramps. The forestry unit is on a north facing slope with species of Ponderosa pine, Douglas fir, Grand fir, and Western Juniper. About 5 acres of aspen and 10 acres of large mountain mahogany are included in the 100-acre thinning project to promote healthy stands.

Project partners include the South Fork John Day Watershed Council (SFJDWC), High Izee Ranch, and the Natural Resource Conservation Service (NRCS).

Review Team Evaluation

Strengths

- The proposed project includes forest thinning with a future phase addressing process-based stream restoration through consideration of beaver dam analogs (BDAs), a phased approach will make work more achievable and a higher likelihood of success.
- The proposed actions are supported by conservation plans in the area and are prioritized in the NRCS-funded Regional Conservation Partnership Program.
- Removing juniper and thinning conifers may result in improved stream flows, although technical evidence for this should be referenced in the proposal.

- This project complements Regional Conservation Partnership Project (RCPP) funding in the South Fork John Day to remove Western juniper, thin overstocked forest, and promote native vegetation including the protection of aspen.
- The landowner has completed similar work and has worked with the applicant for assistance on projects providing watershed benefits on their properties.

Concerns

- Addressing invasive annual grasses following forest thinning may be needed and is not discussed in the application or included as an objective.
- The spring developments may provide more benefit to domestic livestock than native wildlife.
- There may not be enough troughs prescribed for the number of livestock on the property.

Concluding Analysis

This project builds on efforts from the South Fork John Day Watershed Council to remove juniper and thin conifers, improving watershed health in the South Fork John Day. Proposed work will also improve aspen and mountain mahogany stands that are critical to wildlife in the project area. Future work is to include low-tech process-based restoration actions in streams on the property. In future applications, the applicant should clearly articulate expected watershed benefits.

Open Solicitation-2023 Spring Offering
Mid Columbia (Region 6)

Application Number: 223-6020-22974

Project Type: Restoration

Project Name: Upper Cottonwood Creek Instream Restoration

Applicant: Monument SWCD

Region: Mid Columbia

County: Grant

OWEB Request: $141,907

Total Cost: $214,890

Application Description 1) The proposed project is located in northwest Grant County approximately 13 miles south of the town of Monument, Oregon in the Cottonwood Creek drainage (HUC 170702020905).
2) Cottonwood Creek is critical spawning and rearing habitat for ESA listed Threatened Middle-Columbia River steelhead that drains into the North Fork John Day River.
3) This project will implement various low- tech process-based restoration (LTPBR) structures including beaver dam analogues (BDA) and large woody debris (LWD) within Cottonwood Creek. This will improve LWD retention, attenuate flows, improve floodplain connectivity, aggregate sediment, and increase riparian hardwood productivity. The increased physical complexity within the channel will be utilized by steelhead and benefit steelhead and their habitat. Along with instream restoration work 14,200 feet of riparian fence will be built. The area of Cottonwood Creek where instream habitat will be implemented, is currently protected by a riparian fence. However, a section of fence will be moved back farther from the stream to protect a wet meadow feature from cattle disturbances. Additionally, a 4 strand barbed wire fence will be built downstream of the project site in preparation of phase 2. This restoration action will limit the duration and extent of grazing on Cottonwood Creek. Cattle exclusion will result in reduced trampling of hydric soils, decreased soil compaction, increased soil porosity, and accelerated recovery of sensitive plant communities. This project will reroute ~ 400 feet of an access road that is at high risk of erosion; which will allow the landowner continued use of the access of road, minimize road related water quality concerns, and allow for natural erosion including good spawning gravels and fines. Lastly, the project includes the develop of 3 upland water sources (i.e. springs).
4) Partners for this project include Chad Engle (Landowner), Monument SWCD, The Warm Springs Tribe, USFWS, & ODFW.

Review Team Evaluation

Strengths

- The treatment sites selected for this project will benefit from the proposed instream restoration work and riparian fence.

- The restoration plan uploaded with the application is helpful to determine project appropriateness and provides necessary background watershed data to inform the project development.
- The application cites information sources that supports the need for instream habitat.
- Local and regional conservation plans identify the need for the proposed work to improve fish habitat.
- Multiple funding partners are engaged demonstrating the capacity of the applicant and the project partnership.
- Monument SWCD is capable of managing, designing, and implementing this type of project.
- The landowner is an engaged natural resource steward and has implemented similar work on lands they manage.

Concerns

- It would be helpful to know where mussels are in the project reach and to incorporate habitat and best management practices during construction.

Concluding Analysis

Monument SWCD proposes to install low-tech process-based restoration structures within Cottonwood Creek. The proposed work will increase floodplain connectivity and channel complexity that will improve steelhead habitat. The need for improved fish habitat is clearly outlined in the restoration plan, as well as local and regional conservation plans. The applicant has the capacity to adaptively manage the project which improves the likelihood of success.

Open Solicitation-2023 Spring Offering
Mid Columbia (Region 6)

Application Number: 223-6021-22989

Project Type: Restoration

Project Name: Cottonwood - Butte Creek Upland Renovation

Applicant: Wheeler SWCD

Region: Mid Columbia

County: Wheeler

OWEB Request: $99,766

Total Cost: $206,531

Application Description 1)This project is located in the Cottonwood - Butte Creek Watershed HUC 6 (170702040501) Southeast of Fossil, Oregon in Wheeler County. 2) Over the years Western Juniper encroachment has increased due to the restriction and suppression of fire creating issues both with water quality and water quantity. This has also created the loss of native bunchgrass communities, vegetation, increasing annual invasives that overall degrade and compromise wildlife habitat and their food source. 3) This project proposes to reduce the negative impacts that Western Juniper imposes on the watershed function by mechanically removing 318 acres of invasive Western Juniper, developing 7 springs, installing 9 600-gallon stock water tanks to improve water quantity and quality for distributing proportional livestock grazing. In addition, 155 acres of broadcast seeding will be dispersed throughout areas that were disturbed within the juniper treatments. 4) Project Partners include OWEB, NRCS, Wheeler SWCD, and the landowner.

Review Team Evaluation

Strengths

- The project aligns with both the Natural Resources Conservation Service (NRCS) Conservation Implementation Strategy (CIS) in Butte Creek and the Lower John Day Canyons Restoration Initiative.
- The application includes a juniper management plan with a description of post-project maintenance.
- Treating the juniper while it is still small is both efficient and protects existing shrub and grass communities from becoming degraded by encroaching juniper competition.
- The landowner has completed similar projects with positive results that inform this project.
- Grazing will be managed post-project to improve native grass growth.
- NRCS Regional Conservation Partnership Program (RCPP) funds will be leveraged to expand the restoration footprint and multiply the benefits of the project.
- The budget uses NRCS rates and design standards and reflects current market values for the project components.

Concerns

- Some quantified benefit statements in the application are pulled from the literature, may not be appropriate for this location, and may be overstated.

Concluding Analysis

This project focuses on upland health by removing 318 acres of Western juniper and developing spring sources. Proposed project components complement other NRCS work in the watershed focused on upland watershed health. The SWCD has successfully completed similar projects and is working with the landowner to manage the property to improve watershed conditions.

Open Solicitation-2023 Spring Offering
Mid Columbia (Region 6)

Application Number: 223-6022-23020

Project Type: Restoration

Project Name: Rock Creek Riparian Fencing, Planting, and Livestock Distribution

Applicant: Gilliam SWCD

Region: Mid Columbia

County: Gilliam

OWEB Request: $208,279

Total Cost: $498,159

Application Description This project is located in Gilliam County on 3.2 miles of Rock Creek. The project begins on river mile 27 of Rock Creek on two landowners. This reach of Rock Creek remains one of few that have not been fenced, planted, and enrolled in the Conservation Reserve Enhancement Program (CREP). This project would enroll over 100 acres into CREP, install 38,680 feet of riparian fence, plant nearly 6,000 riparian plants, install 20,000 feet of cross fence, and develop seven sources of off-site water. The CREP contracts will be effective October 1st, 2023. This section of Rock Creek in nearly void of riparian vegetation, and the need for plantings and exclusion fencing is a priority.
Project partners include OWEB, Farm Service Agency, Natural Resources Conservation Service, Gilliam-East John Day Watershed Council, Gilliam SWCD, and private landowners.

Review Team Evaluation

Strengths

- The proposed project is adjacent to similar work, both planned and completed, in Rock Creek.
- There is active steelhead spawning and rearing in the area, but steelhead habitat is lacking in the reach and the proposed work will help improve conditions.
- Enrolling in CREP will improve riparian, instream, and fish habitat conditions that will benefit steelhead.
- The landowner is engaged in the project and is willing to fence off productive farm ground with the riparian fence in order to achieve project objectives.
- The applicant is experienced and successful in their planting methods, which include tillage and weed control.

Concerns

- The application lacks clarity on the planting plan, it is unclear what the planting methods and locations are.
- The watering system appears large for the number of animals run on this operation; additional engineering input may provide clarity.

Concluding Analysis

Gilliam SWCD proposes to exclude 3.2-miles of Rock Creek from grazing, plant the riparian area and develop off-site water. This project builds on over 30 miles of Rock Creek already enrolled in CREP, adding to the cumulative benefits for steelhead. The applicant is encouraged to consult with a professional engineer for the design of the stock water system to ensure propre sizing.

Open Solicitation-2023 Spring Offering
Mid Columbia (Region 6)

Application Number: 223-6023-23022
Project Type: Restoration
Project Name: Thirtymile Watershed Forest Management
Applicant: Wheeler SWCD
Region: Mid Columbia
County: Wheeler
OWEB Request: $311,686
Total Cost: $418,994

Application Description 1)This project is located in the Thirtymile Watershed, approximately 15 miles Northeast of the town of Fossil, OR in Wheeler County. Thirtymile Creek is one of the three highest priority areas in the Atlas Prioritization ranking {John Day Basin Partnership Strategic Action Plan pg 53}. 2) The expansion of Western Juniper, over-stocked forests, limited water availability, and the invasion of annual grasses has degraded the state of the Thirtymile Watershed. Historical wildfire suppression has allowed the encroachment of Western Juniper into forest stands and grasslands where the species previously did not inhabit. This encroachment has created a limitation on aquifer availability resulting in water quality and quantity issues, as well as the loss of native vegetation that degrades wildlife habitat and their food source. As Western Juniper has expanded into these forests stands, all deciduous species are compromised. This amount of canopy cover creates additional competition for water and nutrients, and increases fuels loads that risk catastrophic wildfires. This has also made these dense forest stands vulnerable to disease and pest infestation as canopy cover restricts healthy mature trees from thriving. 3) This project proposes to address the negative impacts Western Juniper imposes and thin overstocked forest stands to a healthy density to restore multiple functions in the Thirtymile Watershed. The project will also develop one spring and install pasture/crossing fencing to improve water storage capacity and help distribute grazing. 4) Project partners include OWEB, NRCS, ODF, and the landowner.

Review Team Evaluation

Strengths

- The landowner is using a forest management plan for the property to improve forest health conditions including reducing beetle infestations and improving fire resilience.
- Similar work is occurring in the watershed through the Lower John Day Canyons Restoration Initiative RCPP.
- The proposed work addresses actions in a specific geography identified in local and regional planning documents.

Concerns

- The application is unclear regarding watershed benefits and if the project is improving flow or making the property more fire resilient.

- The application lacks clarity on what is needed on the property and what is proposed in the application.
- The capacity of the landowner to complete the work as proposed is unclear.
- Technical soundness is difficult to determine since it is unclear how the project objectives and actions will result in identifiable watershed benefits.
- The costs outlined in the budget seem high for forest thinning in the region.

Concluding Analysis

The landowner has demonstrated commitment to pursuing restoration on the property; however, the proposed project may not be ready for implementation. The application lacks details necessary to evaluate the ecological benefits to fish and wildlife habitat. If resubmitted, the applicant is encouraged to address the concerns noted above.

Open Solicitation-2023 Spring Offering
Mid Columbia (Region 6)

Application Number: 223-6024-23032
Project Type: Restoration
Project Name: Sixmile Creek Habitat Restoration
Applicant: North Fork John Day WC
Region: Mid Columbia
County: Grant
OWEB Request: $139,460
Total Cost: $194,780

Application Description 1)This project will take place on Sixmile Creek, a tributary of the lower Middle Fork of the John Day in Ritter, Oregon. Specifically this first phase of work will take place on the Titus property, above the 15 road culvert, and the upper half of the Kennedy property. 2)The Ritter Fish Habitat Assessment performed in 2021 identified several deficiencies in fish habitat on Sixmile Creek as well opportunities to improve hydrologic function and water storage. Limiting factors within the creek include Degraded riparian area, channel structure and complexity, floodplain degradation, altered hydrology, sediment, water quality, and low flows. A general lack of instream complexity driven by a lack of wood structures drives the vast majority of these factors. 3) This project proposes to improve fish habitat and watershed function in Sixmile Creek via the placement of large wood structures and construction of beaver dam analogues (BDAs) and post assisted log structures (PALS) . This project will also involve planting and fencing to improve stream shading and riparian conditions. 4) This project is a cooperative effort between the North Fork John Day Watershed Council (NFJDWC), the Ritter Land Management Team (RLMT), the Oregon Department of Fish and Wildlife (ODFW), and the United States Fish and Wildlife Service (USFWS). NFJDWC will be the project lead, providing primary project oversite, contract oversite, planting, some materials, and project monitoring. RLMT will assist with project oversite, planting, and maintenance, ODFW will provide direct assistance with implementation as well as consultation to project design and oversite of instream work. USFWS will provide assistance with permitting and funding for habitat improvements on two additional properties.

Review Team Evaluation

Strengths

- The proposed work will add significant aquatic habitat within Sixmile Creek.
- Steelhead occupy Sixmile Creek below the culvert downstream of the project, with redband trout present throughout the creek.
- Project partners, including Ritter land Management Team, ODFW, and USFWS, are appropriate and capable of completing the proposed work.
- The prescription for each property as described in the basis for design report, is appropriate and reflects the current conditions and restoration needs for each location.
- The letters of support and the site visit showed the landowners are engaged and enthusiastic for the proposed restoration work.

- The ODFW Habitat Program is a partner and will be involved in project implementation.
- Low-tech process-based restoration is new for the Council, but ODFW has appropriate experience and expertise and will assist in implementation.
- Project costs are commensurate with anticipated watershed benefits of instream and riparian improvements and protection.

Concerns

- The watershed assessment was not uploaded with the application; it would have helped clarify the phases described in the application
- There is a downstream barrier that may preclude upstream access to one of the proposed locations, but the watershed council is starting to work with the landowner.

Concluding Analysis

The North Fork John Day Watershed Council proposed to improve fish habitat and overall watershed process and function within Sixmile Creek. Appropriate partners are engaged, and landowners are enthusiastic to improve instream and riparian habitat. The watershed council is working on implementing actions identified in a 2021 fish habitat assessment and this project is likely to lead to additional work in the Sixmile Creek watershed addressing fish habitat needs.

Open Solicitation-2023 Spring Offering
Mid Columbia (Region 6)

Application Number: 223-6025-22960

Project Type: Technical Assistance

Project Name: Big and Little Meadow Canyon Creeks Assessment and Action Plan

Applicant: Walla Walla Basin Watershed Foundation

Region: Mid Columbia

County: Umatilla

OWEB Request: $70,527

Total Cost: $105,321

Application Description Big and Little Meadow Canyon Creeks are located approximately 12 miles southeast of Milton-Freewater in Umatilla County, Oregon. Both creeks are tributaries of the North Fork Walla Walla River, which flows into the mainstem Walla Walla River approximately 9 miles downstream of its confluence with Big and Little Meadow Canyon Creeks. The two creeks are neighboring sub watersheds with a smaller unnamed creek in between them. (See Big and Little Canyon Creek Assessment and Action Plan Map). The creeks originate where springs drain into two large wetted meadows in their uplands. The assessment area encompasses 4.86 square miles from their confluences with the North Fork Walla Walla River up to their headwater springs. The current conditions of aquatic habitat, water temperature and flow are unknown for these subwatersheds.
The Big and Little Meadow Creeks Assessment will complement other water quality and habitat improvement efforts in the basin. Several floodplain and habitat restoration, spring reconnection, fish passage, and riparian restoration projects downstream of this assessment area have been completed or are in the design stage, including the North Fork Sam's Rea five-mile restoration project.

Big and Little Meadow Canyon Creeks have the potential to provide off-channel rearing habitat for ESA-listed steelhead, bull trout and redband trout and deliver additional spring and summer flow to the North Fork Walla Walla River. This assessment will allow us to understand current aquatic habitat conditions, temperature and flow rates for Big and Little Canyon Creeks. This will be done by conducting stream and habitat surveys as well as setting up two monitoring sites for flow and temperature. This assessment area is also located in a Strategic Implementation Area (SIA) designated by the Oregon Department of Agriculture, which focuses on implementing projects that improve water quality in local watersheds.

Review Team Evaluation

Strengths

- There is a high likelihood for watershed restoration in the work area proposed, with multiple landowners already working with the watershed council on habitat restoration in the North Fork Walla

Walla River.

- The SWAT model mentioned in the application is an appropriate tool to accomplish project objectives.
- The applicant has the experience and capacity to implement the work as proposed.
- The watershed council is familiar with the survey protocols mentioned in the application and has completed similar analyses on other projects.

Concerns

- Landowner maps would be helpful to understanding the geography of the project area.
- Upland stock watering/pond development may not fit well with the SWAT modelling proposed, as springs, ponds, and upland resources may be confounding factors to the SWAT model output.
- It is important for the habitat surveys to be completed at the same time of year across years.
- The application does not include an adequate calibration and validation approach for the SWAT model. The described use of the model may not lead to the results sought in the application. One year of stream flow is not sufficient to inform the resulting water balance.
- The project team may need more landowner buy-in to accomplish the work across the geography identified in the proposal.
- The proposal may be more compelling with participation from the upper most landowner. Additional stakeholder engagement may be necessary prior to developing the action plan.
- Mussels should be included as a variable to be considered during the planning and development phase.

Concluding Analysis

The Walla Walla Basin Watershed Council is proposing to develop an assessment and action plan for Big and Little Meadow Canyon Creeks, tributaries to the North Fork Walla Wall River. The Big and Little Meadow Canyon Creeks Assessment will complement other water quality and habitat improvement efforts in the basin. While the applicant is familiar with the proposed SWAT modeling, the application lacked information to understand the calibration and validation approach for analysis.

Open Solicitation-2023 Spring Offering
Mid Columbia (Region 6)

Application Number: 223-6026-22992

Project Type: Technical Assistance

Project Name: Strategic Action Plan Update

Applicant: Walla Walla Basin Watershed Foundation

Region: Mid Columbia

County: Umatilla

OWEB Request: $54,796

Total Cost: $74,124

Application Description This strategic action planning effort will focus on the Walla Walla River Watershed in northeastern Oregon, with particular attention given to the impacts of climate change and the promotion of diversity and inclusivity in watershed management. The Walla Walla River Watershed area encompasses 1776 square miles, 487 square miles in Oregon, and 1288 square miles in Washington. The Walla Walla Basin Watershed Council (WWBWC) last updated its Strategic Action Plan (SAP) in 2014 (see ProposalLinks upload for a link to the current SAP). Since then, the watershed council and its partners have completed numerous projects in the basin that were identified in the prior SAP. Additionally, funding for watershed projects has evolved to focus on areas not currently covered in the existing SAP, including climate change adaptation, resilience measures, and inclusivity initiatives.
Critical components such as clear and concise Communications and Funding Plans are also missing from the current SAP. This proposal seeks to address the changes in the current conditions of the watershed, complete an update to the 2014 SAP, and produce a watershed council Communications and Funding Plan. The updated SAP will emphasize the need to address climate change impacts, such as increased drought, flooding, and wildfire risks, and promote the engagement of underrepresented communities in watershed management and decision-making processes.
The partners of this process include the current WWBWC Board of Directors, representing different sectors within the basin. These partners will work collaboratively to ensure that climate change adaptation and mitigation strategies are integrated into the updated SAP and that the plan fosters an inclusive, equitable, and diverse approach to watershed management.

Review Team Evaluation

Strengths

- A varied and relevant list of actions are addressed in the application that will result from the planning effort.
- A data driven adaptive management strategy is described in the application and this will lead to relevant restoration in the future.
- Project objectives are sequential and relevant to achieving conservation and restoration work post planning.
- The application includes letters of support from relevant partners enhancing the capacity of the planning effort.

- The watershed council has a successful track record of implementing this type of project.

Concerns

- The mission, goals, and objectives for the council are not articulated in the application.
- The application is unclear regarding how the watershed council will fully strategize with the Walla Walla 2050 planning effort.
- It is unclear how this planning effort will address climate change and flooding that is present and becoming more frequent in the Walla Walla basin.

Concluding Analysis

The Walla Walla Basin Watershed Council is taking the next steps in updating their strategic action plan and identifying a roadmap for achieving the council's goals and objectives, which include the recovery of ESA-listed steelhead and bull trout populations. The watershed council is engaging the appropriate partners, and the team is working across state lines to accomplish planning for the Walla Walla basin in addition to the Oregon portion of the basin.

Open Solicitation-2023 Spring Offering
Mid Columbia (Region 6)

Application Number: 223-6027-23010

Project Type: Technical Assistance

Project Name: West Branch Bridge Creek Aquatic Inventory and Fish Passage Assessment

Applicant: Wheeler SWCD

Region: Mid Columbia

County: Wheeler

OWEB Request: $74,656

Total Cost: $136,545

Application Description 1) This project will take place in the subwatershed of West Branch Bridge Creek HUC 12 (170702040302), located on 10.58 miles of West Branch Bridge Creek, where West Branch Bridge Creek leaves Ochoco National Forest entering privately owned property to the confluence of Bridge Creek. 2) As a result of topography and the elevation of its headwaters relative to its mouth, West Branch Bridge Creek subwatershed encompasses important climate refugia containing critical habitat for ESA listed Mid-Columbia O. mykiss and Redband Trout. Although past restoration activities towards the headwaters have improved parts of the system, the effects of channelization, floodplain degradation, and other upland problems remain. To lead into a ridgetop to ridgetop watershed restoration effort to ecologically restore the landscape; a full assessment of the system is needed. 3) Despite the relative importance of West Branch Bridge Creek in maintaining water quality and anadromous fish populations, no comprehensive assessment of the watershed has yet occurred. This proposed assessment will help landowners and managers understand the current watershed conditions and how land use practices may have affected watershed conditions and functions. In addition, USFS will be contributing to part of the assessment by taking inventory on 0.94 miles of West Branch allowing this project to have data from the headwaters to the confluence. The Wheeler SWCD views the assessment as a necessary first step in systematically working towards and accomplishing restoration goals. This assessment and subsequent action plan will facilitate the planning and prioritization of future projects. 4) Project partners include OWEB, Wheeler SWCD, ODFW AQI, USFS, and participating landowners.

Review Team Evaluation

Strengths

- The narrative is complete in its description of the problems, partnerships, landowner support letters, goals and objectives.
- Proposed work will utilize the Oregon Department of Fish and Wildlife (ODFW) Aquatic Inventories Project (AQI) surveys that will result in a clear picture of habitat conditions on both USFS and private lands.
- The data gathered will be readily available to the public and agencies post data collection. The data will inform future restoration by assessing post-restoration effectiveness.
- The proposed work is in an Oregon Department of Agriculture (ODA) focus area and the water quality and fish habitat data will be analyzed in combination.

- Fish passage is a key issue addressed in the assessment.
- Multiple contributing partners including the Oregon Department of Fish and Wildlife Aquatic Inventories Project (ODFW AQI), the United States Forest Service (USFS), and landowners are identified in the application, showing support for the project.

Concerns

- The survey methods described in the application would benefit from additional clarity in the narrative on how the different surveys will be integrated together.
- Mussels need to be part of the restoration planning baseline leading to restoration work so that restoration projects do not adversely affect mussel habitat.
- The budget for ODFW under contracted services is a lump sum, making it unclear how this budget item relates to project objectives and deliverables.

Concluding Analysis

Bridge Creek is identified in many plans as a priority for conservation and restoration of steelhead habitat and other aquatic species. The proposed assessment leverages work already occurring within the ODA focus area to identify conservation and restoration actions aimed to improve water quality. The applicant is taking a strategic approach to the assessment, proposing additional fish habitat assessment utilizing ODFW AQI surveys.

Open Solicitation-2023 Spring Offering
Mid Columbia (Region 6)

Application Number: 223-6029-22998
Project Type: Stakeholder Engagement
Project Name: Watershed Stewardship Workshops
Applicant: Walla Walla Basin Watershed Foundation
Region: Mid Columbia
County: Umatilla
OWEB Request: $62,834
Total Cost: $152,208

Application Description In the 29 years the Walla Walla Basin Watershed Council (WWBWC) has operated, the organization has effectively identified opportunities and engaged with rural stakeholders in pursuit of projects to improve multiple aspects of the watershed. Demographically, past contacts allude to missed opportunities; previous partners have all been Caucasian, a fractional majority in our basin. Additionally, projects have historically not been performed within city limits. This not only overlooks important opportunities for beneficial projects, but also hinders the visibility of the work being done by WWBWC.
The WWBWC proposes to increase the number of urban and/or Hispanic stakeholders through a series of workshops, offered in both English and Spanish, that will focus on informing the community about our basin's issues including inadequate stream flow, high water temperatures and sediment loads, poor habitat complexity, groundwater declines, and fish passage obstructions, which impact the basin's populations of ESA-listed salmonids (summer steelhead and bull trout) and spring Chinook salmon. For increased accessibility, these will be recorded and uploaded to our website. As relationships with new, diverse stakeholders grow we will have more access to information from both urban and Hispanic basin water stewards. Community members will be able to engage with WWBWC staff and partners to identify future projects, volunteerism, and ecologically safe practices.
The WWBWC will partner with local, state, and tribal organizations to present topics such as water trusts/transactions/rights, river habitat restoration, basin groundwater, working with beavers, urban water conservation, pesticide stewardship, and living in a changing climate. This approach aims to foster a sense of unity while promoting shared responsibility and collaboration among diverse community members, empowering active participation in the protection and enhancement of our basin's health and sustainability.

Review Team Evaluation

Strengths

- The project proposes to engage appropriate audiences, including underserved, urban, and Hispanic community members.
- The application specifies restoration actions in the watershed, including stream and riparian complexity, floodplain connection, and streamflow that would result from the engagement work.

- This model of engagement is new in the community and there is merit to testing this method to reach underserved populations.
- The applicant is coordinating with the library and other community institutions and facilities to engage the target audience.
- The proposed work is timely in combination with watershed council strategic planning and Walla Walla 2050 planning efforts in the basin.
- The budget is reasonable for the expected engagement of the Hispanic community in the Milton-Freewater area.
- All the concerns summarized in the previous application evaluation are addressed.

Concerns

- A cohesive approach to engagement beyond Milton-Freewater is not clearly articulated in the application.
- Objectives are not quantifiable, and it is unclear how meaningful discussion will be evaluated.
- It Is not clear how the Hispanic community will be effectively engaged in the proposed work.

Concluding Analysis

The Walla Walla Basin Watershed Council proposes to engage underserved community members to identify future projects and present a variety of practices to enhance watershed health. Stakeholder engagement efforts to expand diversity, equity, and inclusion in outreach targeting water quality and restoration is important. The Watershed Council is taking the lead in addressing urban water quality improvement needs. However, there is concern that workshops and online surveys may not be the correct platform for the intended engagement. The application does not identify specific entry points to engage the Hispanic community.

Open Solicitation-2023 Spring Offering
Mid Columbia (Region 6)

Application Number: 223-6030-23013

Project Type: Stakeholder Engagement

Project Name: Dry Creek and Lower Pine Creek Assessment Stakeholder Engagement

Applicant: Walla Walla Basin Watershed Foundation

Region: Mid Columbia

County: Umatilla

OWEB Request: $24,517

Total Cost: $31,998

Application Description Project Location: The project's primary focus will be the Dry Creek subwatershed. However, Dry Creek is a tributary to Pine Creek, so this project will also encompass the lower ten miles of Pine Creek to ensure connectivity to the Walla Walla River (see attached project map). This is a bi-state project with 1353 acres of the total 32,469 acres located in Washington state. BPA funding will be used for work that's being conducted in Washington state.

Project need: The Dry Creek subwatershed faces numerous threats to its ecological health, including habitat fragmentation, lack of riparian vegetation, water quality degradation, loss of native anadromous fish populations, and fish passage barriers. The stakeholder engagement project is the first phase in a more significant subwatershed assessment planned to begin in the fall/winter of 2024.

Proposed work: The proposed work will focus on stakeholder engagement activities, including outreach events, educational materials, and one-on-one and group meetings with landowners to discuss the need for and potential benefits of a subwatershed assessment and the potential for restoration or water acquisition projects in the Lower Pine and Dry Creek subwatershed. The project will also include developing an outreach plan and identifying potential funding sources and other partners.

Project partners: Project partners will include the Umatilla County Conservation District, state and local government agencies, the Walla Walla Water 2050 Basin Advisory Committee (led by Oregon, Washington, and CTUIR), and other stakeholders interested in the health of the Dry Creek subwatershed and the Walla Walla River Watershed as a whole. These partners will be involved in planning and implementing stakeholder engagement activities and will help ensure the long-term sustainability of the proposed assessment and restoration or water acquisition projects.

Review Team Evaluation

Strengths

- Relevant participants including the Umatilla County Conservation District, the Walla Walla Water 2050 Basin Advisory Committee, and private landowners are involved.
- The proposed work is appropriate and a high likelihood that it will lead to restoration work in the watershed, with a clear line from engagement to technical assistance and restoration.
- Steelhead and Chinook use the lower watershed, while redband trout occupy the upper reaches; the proposed engagement will address limiting factors impacting fish populations including habitat fragmentation, water quality degradation, and fish passage barriers.
- This effort may lead to addressing known fish passage barriers in this system.
- The Walla Walla Basin Watershed Council has the necessary experience and is capable of the proposed work.

Concerns

- Letters of support would be helpful to understand the need for community engagement and likeliness that engagement will result in restoration; it is unclear if there is a receptive audience for the proposed engagement.
- Success indicators may not be quantifiable as described in the narrative.

Concluding Analysis

The Walla Walla Basin Watershed Council proposes to engage partners and local landowners to build support and increase participation in a sub watershed assessment. The proposed work is intended to increase participation in the assessment that will lead to identifying restoration actions in the Dry Creek and Lower Pine Creek watersheds. Addressing the need for partner and landowner engagement prior to implementing the watershed assessment is an appropriate action to strengthen the future assessment.

Open Solicitation-2023 Spring Offering
Mid Columbia (Region 6)

Application Number: 223-6028-23006

Project Type: Monitoring

Project Name: Hydrological Trend Monitoring in the Walla Walla Basin

Applicant: Walla Walla Basin Watershed Foundation

Region: Mid Columbia

County: Umatilla

OWEB Request: $113,273

Total Cost: $185,566

Application Description This project is located in the Oregon portion of the Walla Walla Basin in Umatilla County near the town of Milton-Freewater. The project will measure water temperature and stream flow in the Walla Walla River, its tributaries and distributaries, and also measure water levels in the underlying shallow alluvial aquifer during a 2 year period. Data are needed to guide current planning efforts aimed to address the Basin's inadequate water supply to meet the needs of aquatic life as well as agricultural and municipal uses. The Walla Walla Watershed is utilized by ESA-listed bull trout, summer steelhead, and reintroduced spring Chinook salmon, which are limited by lack of summertime flow and high water temperatures. Monitoring will document current conditions and describe trends to inform development of projects to restore watershed function and increase in-stream flows.

BPA will be the source of match for this project and project partners (non-match) include private landowners, Confederated Tribes of the Umatilla Indian Reservation, Oregon Water Resources Department, City of Milton-Freewater, Hudson Bay District Improvement Company, Walla Walla River Irrigation District, Fruitvale Water Users Association, and members of the Walla Walla Water 2050 project and Bi-State Flow Enhancement Study.

Monitoring Team Evaluation

Monitoring Team Strengths

- This project will provide data that supports several efforts including the Walla Walla Water 2050 Plan, the Bi-State Flow Enhancement Study, and a basin-wide hydrology study led by the US Geological Survey (USGS).
- This project will complement the existing water temperature, ground water and surface water data that the applicant has collected over the last 20 years.
- The applicant provides a clear path on how the monitoring questions will be answered by continuing to collect data at existing sites for the next two years.
- The applicant follows established monitoring methods and are cited and described in the application.
- The applicant will update their existing Sampling and Analysis Plan and submit it to DEQ for review.
- The applicant is using specific software to manage the large amount of continuous data and will develop comprehensive annual reports that are posted on their website.

- The applicant has the necessary qualifications and experience to collect and report the data and has a proven track record to share the information with partners in the basin to inform on the ground actions.
- The applicant is engaging with technical experts from the Oregon Water Resources Department, Washington Department of Ecology, Confederated Tribes of Umatilla Indian Reservation and the USGS as part of the Walla Walla Water 2050 Plan.
- The applicant has a history of working with private landowners and partners within the community as demonstrated by the large number of monitoring sites on private land and the letters of support that were uploaded to the application.
- The budget is extremely cost effective given the number of sites to be monitored over two years.

Monitoring Team Concerns

- The application mentions a need to collect more air temperature data to understand the impacts of the flood of 2020, but it was not clear how this additional data will be incorporated into the trend analyses.
- It was not clear if the applicant will be able to sustain collecting streamflow measurements every two to six weeks at all the 25 gaging stations over the next two years.
- It was not clear why funding is needed for a fiscal technician to complete this project as proposed.

Monitoring Team Comments

Review Team Evaluation

Strengths

- Data collected in this project is used by partners, such as the US Geological Survey (USGS), in the Walla Walla Water 2050 planning process that will lead to OWEB eligible restoration or acquisition projects.
- The applicant has access to multiple monitoring sites, demonstrating an effective working relationship in the community.
- The website and data sharing portal the applicant uses is important in distributing data to local users.
- The watershed council staff are qualified to implement the project and coordinate with multiple organizations, including across the state line in Washington.

Concerns

- It is not clear how the data collected has been used to inform water management over time.
- Some of the proposed data will be collected using methods that are not typically used and the data may not integrate with other agencies data sets.

Concluding Analysis

The proposed project will provide data that supports several efforts, including the Walla Walla Water 2050 Plan, the Bi-State Flow Enhancement Study, and a basin-wide hydrology study led by the US Geological Survey (USGS). The applicant has a history of working with private landowners and partners within the community as demonstrated by the large number of monitoring sites on private land and the letters of support that were uploaded to the application. This project complements a long-term data set that has been collected over the last 20 years.

OREGON WATERSHED ENHANCEMENT BOARD

Agenda Item J

FIP Partnership Learning Project

Board Meeting October 23-25, 2023

Oregon
Tina Kotek, Governor

OREGON WATERSHED ENHANCEMENT BOARD

775 Summer Street NE, Suite 360
Salem OR 97301-1290
www.oregon.gov/oweb
(503) 986-0178

Agenda Item J supports OWEB's Strategic Plan priority #3: Community capacity and strategic partnerships achieve healthy watersheds.

MEMORANDUM

TO: Oregon Watershed Enhancement Board

FROM: Jillian McCarthy, Partnerships Coordinator
Denise Hoffert, Partnerships Coordinator
Eric Hartstein, Senior Policy Coordinator

SUBJECT: Agenda Item J – Partnership Learning Project III
October 23-25, 2023, Board Meeting

I. Introduction

This report introduces the Partnership Learning Project – Part 3. The full report is available as Attachment A to the staff report.

II. Background

OWEB has two primary partnership-focused grant programs:

1. The Focused Investment Partnership (FIP) program, which seeks to invest in partnerships who's approach strategically prioritizes activities at a large scale with the goal of accelerating progress toward restoration of priority species and habitats. FIP funding supports partnerships in pursuing conservation initiatives with up to $12 million over six years. Since the program's inception in 2015, there have been three cohorts of partnerships awarded funding throughout the state, and OWEB is currently soliciting for a fourth cohort (see Item D-5 Focused Investment Partnership Update).
2. The Partnership Technical Assistance (P-TA) grant program, which supports planning and coordination efforts. The P-TA grant program was initially associated with the FIP program and grants were described as FIP 'Development' or 'Capacity Building'. As the intent of this grant program was to broadly develop and maintain high-performing partnerships, P-TA grants were moved out of the FIP program in order to differentiate the two programs more clearly. Since 2015, there have been multiple offerings for this program as it has transitioned from FIP to P-TA.

In previous biennia, the board has awarded funds for FIP Effectiveness Monitoring, including some funding for the Bonneville Environmental Foundation to engage contractors in comprehensive evaluation of the FIP grants. This latest version of the Partnership Learning Project was awarded funding during the January 2023 board meeting.

III. Partnership Learning Project

The purpose of the Partnership Learning Project is to better understand what partnerships need to be resilient and to maintain a high level of performance, and how OWEB can support these partnerships to achieve desired ecological outcomes.

Jennifer Arnold of Reciprocity Consulting has led the development of the project in multiple phases. Part one was focused on partnerships receiving planning and coordination grants (now P-TA grants). This was presented to the board at its July 2017 meeting. Part two brought in the first cohort of FIP partnerships and was presented to the board at its June 2018 meeting. Part three of the project includes outreach to the over 30 funded partnerships associated with the P-TA and FIP programs to examine strengths of high performing partnerships, strategies to enhance accountability and performance, and elements of partnership resilience.

IV. Recommendation

This is an information item only. Ms. Arnold and OWEB staff will be at the October board meeting to present the report and answer questions about the Partnership Learning Project III.

REPORT DESIGN & GRAPHICS CASEY DAVIS

Ongoing dialogue with OWEB staff was foundational to this project. The following staff took findings to heart, reflected on their own learning and pushed forward meaningful program changes, even over the course of this study (in alphabetical order):

Lisa Charpilloz Hanson, Executive Director
Ken Fetcho, Effectiveness Monitoring Coordinator
Miriam Forney, Land Acquisitions Coordinator
Eric Hartstein, Board and Legislative Policy Coordinator
Audrey Hatch, Conservation Outcomes Coordinator
Denise Hoffert, Partnership Coordinator
Jillian McCarthy, Partnership Coordinator
Stephanie Page, Deputy Director
Courtney Schaff, Monitoring and Reporting Manager
Eric Williams, Grant Programs Manager

We also honor the late ***Andrew Dutterer,*** former OWEB Partnership Coordinator, who was a champion of OWEB's partnership-focused investments throughout the early years of the program.

The recommendations in this report were refined through collaboration with the Bonneville Environmental Foundation team, including two subconsultants, who collectively have been working with OWEB over the past seven years to support the evolution of the FIP program, including direct support to many of the FIP partnerships:

Robert Warren, Bonneville Environmental Foundation
Lauren Mork, Upper Deschutes Watershed Council and
Ann Moote, Mamut Consulting, LLC

RECIPROCITY CONSULTING

ABOUT RECIPROCITY CONSULTING

Reciprocity Consulting, LLC is a women-owned small business based in Tacoma, Washington that provides customized support to strengthen organizations, engage communities and build resilient, collaborative partnerships emphasizing equity, diversity and inclusion.

Founder Jennifer S. Arnold, Ph.D. has over 20 years of experience in research, facilitation, and training focused on engaging diverse people in collaborative learning and decision-making to have lasting positive impacts in our communities and our environment.

PART THREE

Partnership Learning Project

A THREE-PART REPORT

1 **PART ONE** explores what it takes to initiate or formalize a partnership and work through the growing pains of planning and governance, synthesizing learning from eight partnerships that received P-TA grants.

2 **PART TWO** explores the dynamic nature of partnerships and the resources, support and guidance from funders that can build resiliency and boost impact, synthesizing learning from six partnerships that received FIP grants.

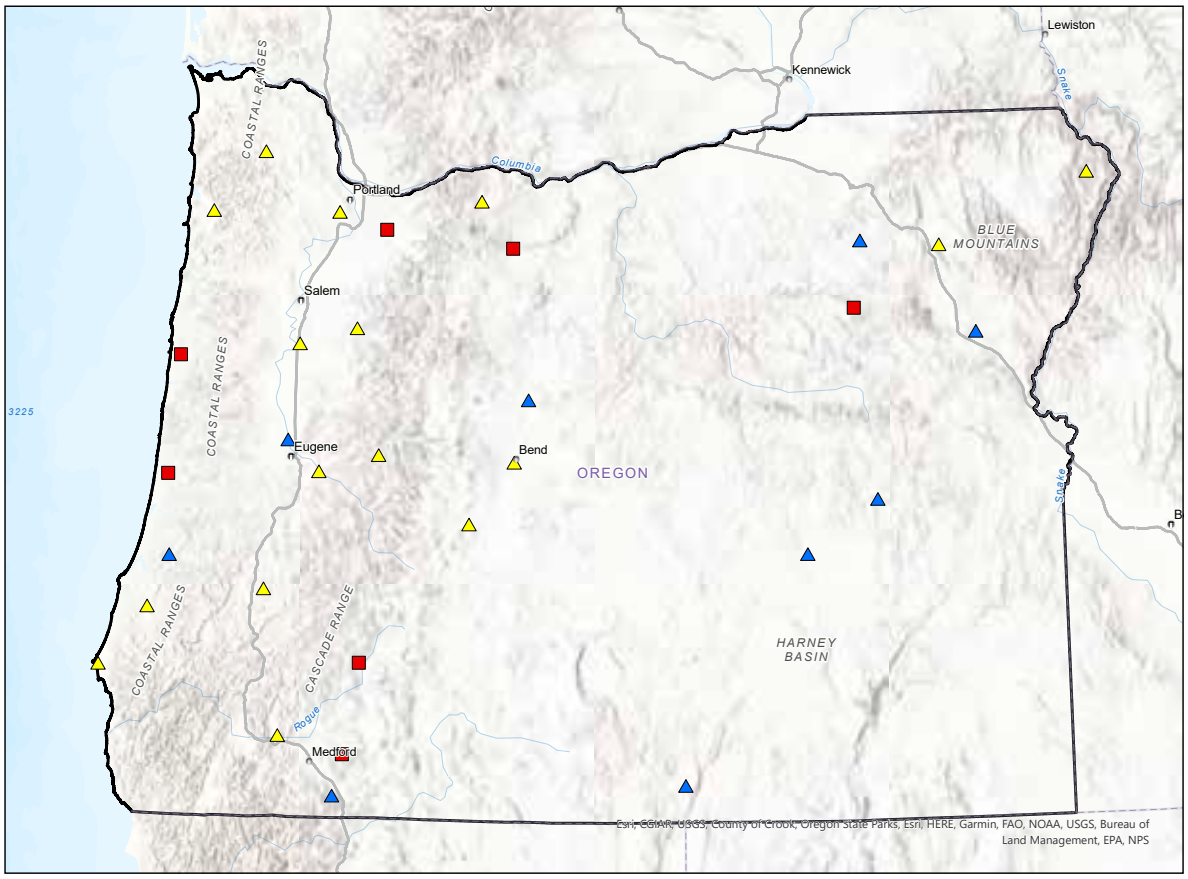
3 **PART THREE** develops a refined framework to understand partnership performance and resilience and examines four specific strategies to enhance performance, synthesizing learning from twenty-four partnerships that received FIP and/or P-TA grants.

Common Terms in OWEB Programs

The Oregon Watershed Enhancement Board (OWEB) is a state agency that provides grants to help Oregonians take care of local streams, rivers, wetlands and natural areas. OWEB grants are funded from the Oregon Lottery, federal dollars, and salmon license plate revenue. The agency is led by a 17-member citizen board drawn from the public at large, tribes, and federal and state natural resource agency boards and commissions.

Focused Investment Partnership (FIP) Grant is a six-year OWEB grant of up to $12 million that is awarded to high-performing partnerships with a strategic action plan and a formalized decision-making process to implement on-the-ground restoration projects addressing ecological priorities, which are defined by the OWEB Board. Although the goal is to allocate all funding within the six-year timeframe, most partnerships will take longer to implement the funded projects.

A FIP Restoration Initiative refers to the work that will be completed with the FIP grant.



Board-identified Priorities for FIP Investments

- Aquatic Habitat for Native Fish Species
- Closed Lakes Basin Wetland Habitat
- Coastal Estuaries
- Coho Habitat and Populations along the Coast
- Dry-Type Forest Habitat
- Oak Woodland and Prairie Habitat
- Sagebrush / Sage-Steppe Habitat

FIP funding categories include partnership coordination, stakeholder engagement, technical assistance, restoration, land and water acquisition and monitoring. Partnerships awarded a FIP grant submit project-level grant applications in these categories at least once a biennium.

For the FIP Project-Level Technical Review, OWEB facilitates a team of technical experts to review project applications with the goal of fine-tuning project design. Because the FIP grants include a list of approved projects for six years, reviewers are not asked to approve or reject projects, but if significant changes are needed, reviewers can ask applicants to make revisions and resubmit.

A Partnership Technical Assistance (P-TA) Grant is an OWEB grant of up to $150,000 for up to three years that is awarded to partnerships to i) develop or update a strategic action plan, ii) strengthen their governance and decision-making and/or iii) support ongoing coordination of a partnership. This was formerly called a Capacity Building FIP grant and a Development FIP grant.

Partnerships awarded P-TA grants and/or FIP grants (2015 - 2022)

- Partnerships awarded a P-TA grant only
- Partnerships awarded a FIP grant only
- Partnerships awarded a P-TA grant, then a FIP grant
- Oregon Boundary

Note: Partnerships work in large geographic areas. The points, shown here in the center of their work area, give a sense for their geographic distribution.

Common Terms Found in this Report

Accountability refers to a shared responsibility to check-in on performance or follow-through with respect to informal or formal agreements.

Capacity refers to the time, energy, resources and/or skills needed to undertake an action or activity. In the context of funders and non-profit organizations, capacity often refers to the funding needed for to pay for people's time to do work.

Expanding the circle refers to the intentional effort of including new people, organizations, government agencies and/or tribes in some aspect of a partnership's work, sometimes with a focus on including new partners.

A partnership refers to two or more organizations voluntarily working together to advance goals that cannot be accomplished independently. Non-voluntary partnerships, created through statute, have different structures and mechanisms of accountability and are not the focus of this study.

Performance refers to the ability of a partnership to achieve their goals and make an impact.

Resilience refers to the capacity of a partnership to withstand stressors and undergo change, while maintaining the integrity of the partnership's vision, identity and focus (adapted for partnerships from Walker et al. 2004).

A theory of change describes the rationale and underlying assumptions for how strategies and actions are expected to lead to short-term, intermediate and long-term goals.

Underrepresented groups refers to demographic groups or types of organizations that are have less involvement or influence than you would expect given their presence in an area. Special considerations are given to groups potentially impacted or able to contribute to an effort. Groups can be underrepresented because of historical patterns that restrict their power and influence – or because their interests do not easily align or overlap with the effort among other reasons.

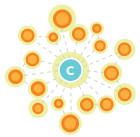
OWEB aims to accelerate the pace and scale of restoration across the state by investing in and supporting **high-performing partnerships.**

A Partnership refers to two or more organizations voluntarily working together to advance goals that cannot be accomplished independently.

OREGON WATERSHED ENHANCEMENT BOARD'S

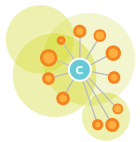
THEORY *of* CHANGE *for* PARTNERSHIP INVESTMENTS

Why partnerships?

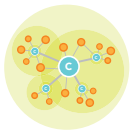


High-performing partnerships bring together the skills, capacities, perspectives and relationships from different organizations and individuals. Partners learn together, plan together and in many contexts act together to advance ecological restoration at larger scales and in more complex landscapes.

Building up Partnerships



Partnerships across Oregon



- Partnerships across the state work together to plan for and implement restoration at different scales, geographies and focus areas.
- Each has a unique structure and function, which may change over time as their work evolves and as they respond to changes in leadership, funding, policies and external events.

(see OWEB's Partnership Types document to learn more)

OWEB Investments in Partnerships

OWEB invests in the following **resources and funding opportunities** to boost partnership performance and resilience alongside ecological and social benefits:

- **Resource Guides**
  Self-guided resources accessible to all partnerships:
  - Strategic Action Planning
  - Monitoring
  - Adaptive Management
  - Partnership Governance
- **Partnership Technical Assistance (P-TA) grants**
  - Competitive grants open to all partnerships across the state
  - Funding to support planning, improved governance and/or coordination of a partnership
- **Focused Investment Partnership (FIP) grants**
  - Highly competitive grants open to partnerships that address ecological priorities identified by the OWEB board *(see list below)*
  - Multi-million dollar funding over a longer time frame to implement projects and accelerate restoration
- **Grantee forums for peer learning, training and networking**

FIP Ecological Priorities

- Aquatic Habitat for Native Fish Species
- Closed Lakes Basin Wetland Habitat
- Coastal Estuaries
- Coho Habitat and Populations along the Coast
- Dry-Type Forest Habitat
- Oak Woodland and Prairie Habitat
- Sagebrush/Sage-Steppe Habitat

Impact of Partnerships

Increased Partnership Performance & Resilience

- With these investments, partnerships will attract new funders, compete well for grants and secure funds over the timescales needed to achieve restoration goals.

We expect partnerships will be:

- Better coordinated, drawing on partners' strengths and reducing duplication
- Better able to engage diverse constituencies
- Better able to work through challenges, including scaling up and working in complex landscapes
- Better able to secure resources
- Better able to incorporate best available science and collective learning, and
- More likely to achieve their goals and sustain their impact.

Ecological & Social Benefits

- High performing partnerships working across the state are able to advance restoration at larger scales and sustain benefits in terms of:
  - Healthy, resilient watersheds *(Ecological)*
  - Healthy people and communities *(Quality of Life)*
  - Knowledge of how to restore watersheds *(Learning)*
  - Broad care and stewardship of watersheds by Oregonians *(Social)*
  - Adaptive capacity of communities to support their watersheds *(Community)*
  - Strengthened economies emerging from healthy watersheds *(Economic)*

Partnerships are dynamic

They take on different forms over time in response to funding, commitment of key partners, external events and how the purpose and scope are defined.

33 Threads of Partnership Resilience

41 A Framework for Understanding High-Performing Partnerships

Executive Summary

When OWEB first started their partnership-focused investments in the 2015-17 biennium, they recognized that they needed to learn more about how partnerships functioned and how OWEB, as a funder, could best support partnership success and the likelihood for impact.

OWEB contracted with independent social scientist Jennifer Arnold, Ph.D. for the Partnership Learning Project Parts 1 and 2 to confidentially hear from grantees and understand what it takes to initiate a partnership and how funders can support performance and resilience. OWEB took those lessons learned to evolve the program. Now five years later, they initiated Part 3 to develop a refined framework for understanding partnership resilience and performance.

Willamette Mainstem Anchor Habitat Working Group – CFWWC Projects Manager repairing Western Bluebird Boxes at Native Oaks Ridge.
PHOTO / COAST FORK WILLAMETTE WATERSHED COUNCIL

OWEB's partnership-focused investments:

P-TA
Partnership Technical Assistance grants[1]
support planning and coordination for up to three years

FIP
Focused Investment Partnership grants[2]
focus on implementing strategic actions to address a Board-identified ecological priority over a six-year timeframe.

[1] *P-TA grants were formerly called Development FIP and Capacity Building FIP grants and originally provided funding for up to two years.*

[2] *Focused Investment Partnership (FIP) grants were formerly called Implementation FIP grants.*

Guiding Questions

Working closely with OWEB, we developed the following guiding questions to more deeply explore partnership structure, resilience and four specific aspects of performance:

Partnership types
What aspects of partnership structure, function and context promote greater understanding and clearer expectations for performance among partners and funders?

Partnership Resilience
What elements of resilience help partnerships withstand changes, such as changes in funding, changes in leadership and other disruptive events?

Partnership Performance
What does high performance look like for partnerships?

Strategies to Enhance Accountability and Performance
How do partnerships maintain accountability and a high level of performance?

Specifically looking at:

1. Trust among partners to work through challenging questions together
2. External technical review at the project level for FIP grantees
3. Expanding the circle of people involved in a partnership's work, and
4. Tracking progress and telling the story of impact.

Methods

In October 2022, Jennifer reached out to 31 funded partnerships inviting participation through confidential interviews, group discussions and an online survey emphasizing that this was a voluntary study and not a requirement or expectation associated with grant funding. Partnerships with at least two people participating received a $250 stipend.

Between October 2022 and June 2023, 72 people representing 24 partnerships participated in the survey, individual interviews and/or group discussions, including 21 partnerships that provided enough detail to estimate their partnership type.

The data were analyzed using a 'grounded theory' approach (Charmaz 2006) to identify patterns relevant to the guiding questions. Findings were further developed with iterative rounds of feedback and opportunities for dialogue with partnerships and separately with OWEB staff. Findings from partnerships are paired alongside insights and reflections from OWEB, shown as green speech bubbles throughout.

Findings

Reflecting on the foundational assumptions of OWEB's partnership-focused investments, this study found many examples of partnerships accomplishing more complex restoration work and at larger scales than would be possible with organizations working independently.

Partnership types as a tool for setting expectations

As people in this study more deeply considered the structure and function of the partnerships they participated in, their reflections informed a revised typology, or description of partnership types. Partnerships embraced the value of this tool for reflection and setting expectations internally and with funders. Some partnerships could clearly trace their evolution from one partnership type to another, while other partnerships described different layers to their partnership's work seeing themselves simultaneously operating as multiple partnership types.

OWEB
affirmed that they would like the FIP and P-TA grants to support a diversity of partnership types. The P-TA grant could be a good fit for any of the partnership types. The FIP grant, with its emphasis on implementing projects together, could be a good fit for all but the least interdependent partnership type, called a learning-oriented partnership.

Partnership resilience

Echoing findings from Part 2, funding was found to be a consistent driver of partnership commitment and performance. When other aspects of performance were going well and partners wanted to work more collaboratively, more funding enabled them to prioritize shared work, solidify their commitments and boost their collective performance. The FIP grant was like "rocket fuel" in the words of one partnership. In that sense, there was consistent evidence that the FIP program boosted partnership resilience, as expected in OWEB's theory of change.

Partnerships that were not able to secure funding to operate their partnership as planned were found to follow a few trajectories:

- Maintain their structure for a period of time with lower levels of activity,
- Shift to a less resource-intensive structure,
- Reorganize as a new partnership with a shifted scope, geography and/or core partners, or
- Dissolve fairly quickly with partners advancing their work independently.

Many partnerships described overcoming severe stressors, most commonly loss of a key leader or coordinator, and emerging with a greater sense of trust and pride in shared accomplishments. In a few cases, the stressors led to instability and a reorganization or dissolution of the partnership.

"Funding has driven change. A lack of funding for a long time meant that we were [only] able to accomplish goals that had funding associated with them, or were directed by funders. Now that the partnership has received a FIP, I'm hopeful that we will be able to properly staff and support the partnership to achieve the lofty goals laid out in our Strategic Action Plan."

Several elements or 'threads' of partnership resilience emerged from this study that individually or collectively contribute to a partnership's ability to withstand stressors and maintain its integrity and focus:

- **Camaraderie** among partners
- **Success** that creates opportunities for more success
- **Formalized commitments** in the form of plans, agreements and governance documents
- **Consistent funding** especially for coordination
- **Organizational anchors** that provide stability for the partnership and mentoring for smaller organizations
- **Shared leadership** that represents the partnership over individual interests
- **Openness** to learning and change, and
- **External relationships** with people and organizations who can introduce new perspectives and resources.

Greater awareness and focus on these elements will help partnerships prepare for and navigate the challenges that come up.

Warner Basin Aquatic Habitat Partnership – A partnership meeting at the Honey Creek Town Diversion. PHOTO / GRACE HASKINS

High-performing partnerships

Considering what it takes to perform well, four categories of performance emerged from the data: 1) Clarity and Direction, 2) Action, 3) Learning and 4) Alignment. Clarity and Direction were important to all partnership types, while the other categories were more or less important for a particular partnership type to perform well overall.

Defining performance in this way relative to partnership types provides a tool for partnerships and funders to have deeper conversations about how a partnership is structured and why – along with realistic expectations for performance and funding associated with a particular structure. These conceptual tools are designed to be used in dialogue to help set expectations together, rather than as a formula for partnerships to follow.

Strategies to enhance performance and accountability

Fundamental to OWEB's theory of change is that the FIP and P-TA programs are structured in ways that boost partnership performance and accountability.

For this study with a focus on continuous improvement, OWEB was particularly interested in:

1. **trust among partners** to ask challenging questions,
2. **external technical review** of FIP projects,
3. **expanding the circle** of people involved in a partnership and
4. **tracking progress** and telling the story of impact.

The survey questions and interview guides (See Appendix) were structured to illicit partnerships' experiences and suggestions for OWEB in these areas. Detailed findings for each of these sections are included in the full report, including steps OWEB is already taking to implement recommendations.

Synthesis - OWEB's Role in Supporting Partnership Performance and Resilience

Partnerships have been eager to participate in the FIP program because the scale of funding over six years allows them to tackle more ambitious projects over larger landscapes. However, there was evidence that this hard push for implementation has sometimes kept them from pausing to check-in on trust, reflect on whether projects are meeting strategic priorities and consider opportunities to expand their circle. Yet, there were also many examples of partnerships effectively scaling up their work, while still dedicating time to reflection and strategic thinking. Overall, there is evidence that the supportive culture within OWEB mitigates for this tension to perform at an accelerated pace and that benefits for performance and resilience outweigh the costs and stressors.

Overall, OWEB's investments in partnership planning, governance, coordination, project implementation and monitoring have been found to be well-positioned to support high performance and resilience. This study finds that the biggest near-term change that OWEB could make to support partnership resilience would be streamlining administrative burdens from the FIP program so that partnerships could dedicate more of their time to the operation of their partnership – specifically, streamlining project applications, technical review, reporting guidelines for monitoring and use of the online application portal and grants database. OWEB is working on integrating some of the recommendations from this study, while others like the database are not possible at this time.

Further investments in institutional support for monitoring, such as near-term investments in peer learning opportunities and training workshops, were also identified as a high priority for investment to support resilience. Monitoring is especially important since partnerships who can learn from their efforts and tell the story of their success have been better positioned for success and additional funding. OWEB holds a gathering for FIP and/or P-TA grantees every biennium, and OWEB staff are interested in more frequent peer learning or peer mentoring opportunities. However, they are considering what is possible given their staff capacity. Over the long-term, support for partnerships to expand their circle, including an emphasis on underrepresented groups, has the potential to boost resilience by tapping into the creative potential of broader constituencies and more diverse funding sources.

OWEB-BEF retreat, January 2023. PHOTO / JENNIFER ARNOLD

Conclusion

Overall, most of the assumptions of OWEB's partnership-focused investments have held true with some fine-tuning of assumptions about performance and resilience. OWEB's effort is striking in its long-term commitment to invest in a breadth of partnerships working in different ecosystems across the state, its openness to learn alongside partners and its commitment to continually evolve the program to have the greatest impact possible.

However, program innovations must fit within the funding OWEB has for staff and infrastructure such as the online application portal and grants database – funding which is decided through the legislative budget process and relatively modest compared with their large funding portfolio. Program innovations must also fit within the statutes that govern the use of lottery funds for the benefit of water quality, watershed function, native fish, wildlife, plants and ecosystems. As OWEB continues to clarify their values and commitment to equity and environmental justice and as they learn from ongoing innovation led by partnerships and tribes, the interpretation of these statutes may play a key role in the future evolution of their partnership-focused investments.

OWEB's focused commitment to learning and adaptation in support of high performing partnerships has yielded many insights and practical tools that will be of use to partnerships and funders working in restoration and across sectors.

Introduction

In the 2015-2017 biennium, the OWEB Board dedicated a portion of their spending plan to invest in restoration work carried out by high-performing partnerships with the belief that partnerships can work at a larger scale and more effectively tackle complex restoration challenges than individual organizations. They created two grant offerings: a multi-million dollar Focused Investment Partnership (FIP) grant focused on implementing their strategic action plan in a specific geography over a six-year grant period and a Partnership Technical Assistance (P-TA)[3] grant for partnerships to develop a strategic action plan or improve their governance.

When the first grants were awarded, OWEB recognized that this was a new area for their grantmaking and they wanted to learn more to inform the evolution of their programs. Their organizational culture is marked by openness to learning, responsiveness to feedback, commitment to continuous improvement and care for the relationships they have with partners and grantees throughout the state. They have an impressive funding portfolio with long-term dedicated funds from Measure 76 state lottery revenue, which gives them financial stability from which to evolve their programs. And yet their staffing and infrastructure is funded through the state legislative budgeting process, which is modest compared with the size of their funding portfolio. The evolution of their grant programs must also fit within the Oregon statutes that define how lottery funds can be spent for the benefit of water quality, watershed function, native fish, wildlife, plants and ecosystems.

[3] *Formerly called a Development FIP grant and a Capacity Building FIP grant.*

Background

In 2017 and 2018, OWEB contracted with independent social scientist Jennifer Arnold, Ph.D. of Reciprocity Consulting, LLC to conduct the Partnership Learning Project Parts I and II with the guiding questions:

- **What do partnerships need to be resilient and maintain a high level of performance?**
- **How can OWEB improve and innovate their partnership-focused investments to support high-performing, resilient partnerships that can make progress toward desired ecological outcomes?**

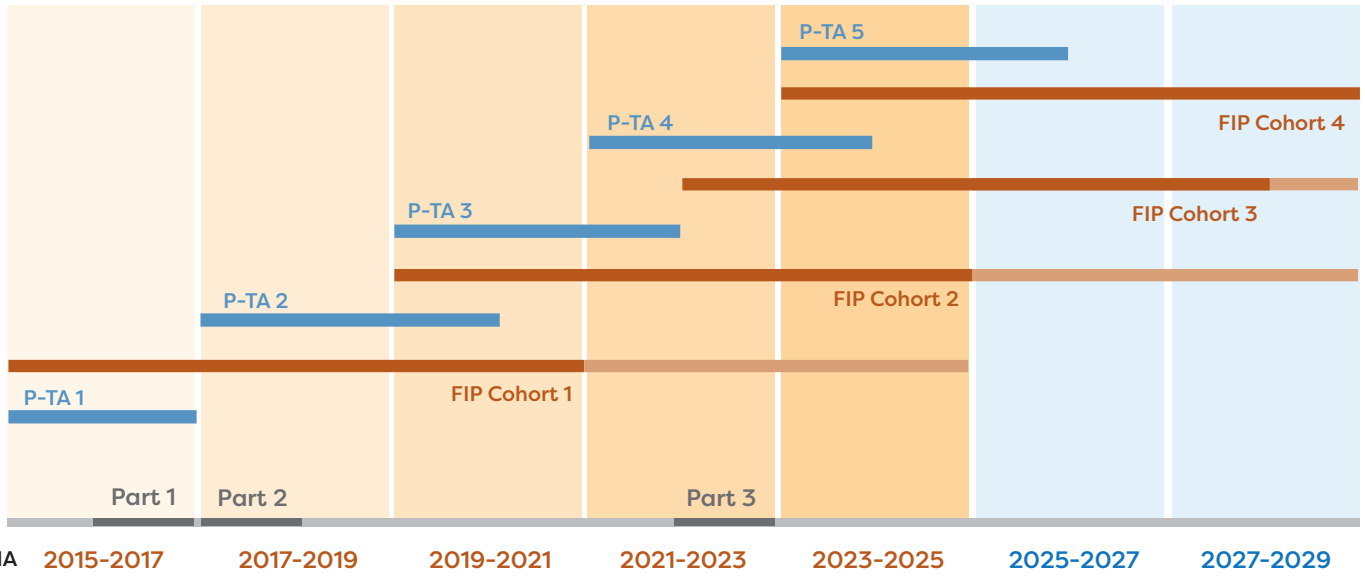
From Fall 2016 to Spring 2018, findings were developed from meetings with 14 funded partnerships, interviews with 47 individual partners and survey responses from 137 partners. Findings helped define the diversity of partnership types and the support they need to establish and evolve. The study also illuminated misconceptions about the two granting programs among other feedback.

OWEB applied findings from this project to acknowledge that their partnership-focused investments are intended to serve a range of partnership types and that partnerships are not expected to fit just one model of success. OWEB clarified that the P-TA planning grant was not intended to directly lead to a FIP grant. They made the following program changes to differentiate the two grant programs:

- Renamed the planning grant from a Capacity Building FIP grant to a Development FIP grant to a Partnership Technical Assistance grant, now completely removing FIP from the name.
- Moved the P-TA grant administratively to a different program, and
- Expanded eligibility requirements for P-TA applicants so that they do not have to focus on a Board-identified ecological priority, which is a requirement of FIP applicants.

Siuslaw Coho Partnership - Partners gather on Waite Ranch in preparation for implementing a large-scale restoration project. PHOTO / ELIZABETH GOWARD

Oregon Model to Protect Sage-Grouse – Completed juniper and fencing projects. PHOTO / LAKE COUNTY SWCD



In response to the finding that capacity funding to coordinate a partnership was not covered by most funding sources, OWEB also added a new funding category to the P-TA grant offering called "partnership capacity" which could be used to fund a facilitator and/or staff time for coordination. They also allowed partnerships to apply for a P-TA grant for partnership capacity funding only, whereas previously P-TA funding needed to be used for strategic planning and/or strengthening a partnership's governance. OWEB emphasized that partnerships finishing a FIP grant could apply for a P-TA grant for partnership coordination only or to update their strategic action plan and governance documents.

In all, the Partnership Learning Project Parts I and II helped clarify program goals and assumptions, which OWEB used to provide clearer guidance for grantees and prospective applicants.

Now, more than six years after the first grants were awarded and just as the first cohort of FIP grantees are working to complete their final round of funded projects, OWEB initiated the Partnership Learning Project Part 3, again contracting with Jennifer Arnold, Ph.D., to more deeply understand partnership performance and resilience in specific areas defined by the guiding questions below. This research study was implemented with iterative cycles of reflection and feedback throughout to promote collaborative learning and growth for the benefit of both OWEB and the partnerships.

Timeline of OWEB Grant Awards with Partnership Learning Project Parts 1, 2 and 3

The dark orange line indicates the duration of a FIP grant award, but projects can take another 2-4 years after funding is awarded to complete, indicated with the lighter orange line. This means the work of a FIP initiative could extend 8-10 years in total.

Guiding Questions

- *What aspects of partnership structure, function and context are most relevant to the goals of the P-TA and FIP grant offerings?*

  What tools support greater understanding and clarity among partners and funders?

- *How do partnerships build resilience to withstand changes, such as changes in funding, changes in leadership and other disruptive events?*

  Partnership dynamics: *How do partnerships respond to sudden changes in funding or leadership? How do partnerships anticipate their structure, funding or focus may change after the current OWEB grant is complete?*

  Threads of resilience: *What are threads, or elements, that individually or together allow a partnership to more effectively respond to changes and maintain their focus?*

  Barriers to increasing resilience: *What barriers do partnerships face in building resilience? How can the P-TA and FIP grants support greater resilience?*

- *What does high performance look like for partnerships?*

  Are there differences by partnership type?
  What tools support greater understanding among partners and funders?

- *How do partnerships maintain a high level of performance and accountability?*

  1. Trust to ask challenging questions: *How do partnerships build the capacity to ask challenging questions of each other and direct their collective work where it is most likely to have the greatest impact?*
  2. External technical review: *Within the FIP Program, in what ways does OWEB's technical review process add value and support high performance? What are areas for improvement?*
  3. Expanding their circle: *To what extent are partnerships working to expand their circle to enhance their accountability, relevance and ability to implement their theory of change? Expanding the circle refers to including new partners and/or expanding the circle of people who contribute to their work or benefit from it.*
  4. Tracking progress and telling the story of impact: *To what extent are partnerships able to track progress toward their goals by measuring long-term ecological outcomes and tell the story of their impact? What successes and challenges have they experienced? What adaptations or recommendations emerge?*

Methods

To guarantee confidentiality and encourage candid feedback, OWEB contracted with independent social scientist Jennifer Arnold, Ph.D. of Reciprocity Consulting, LLC.

Coordinating with OWEB staff, we sent out an email to the coordinators of 31 partnerships who received either a P-TA grant or a FIP grant. We excluded partnerships in the third cohort of FIP recipients who did not receive a P-TA grant since they had little interaction with the grant programs at the time the study began.

Partnership coordinators were asked to encourage everyone from their partnership to participate in whichever method they preferred: an online survey, a virtual individual conversation and/or a virtual group discussion. OWEB directly communicated with partnerships that participation was not a requirement of their grant and that whatever they shared would be confidential and not linked to their name or their partnership. All partnerships who had at least two people participating received a stipend of $250 to demonstrate appreciation for their time and energy. Reminder emails were sent to encourage participation, including personal outreach to individuals suggested by other participants.

Altogether, 73 people representing 26 partnerships participated with some individuals representing more than one partnership. Twenty one partnerships provided enough detail to understand the structure and function of their partnership and estimate their partnership type, including how it has changed over time and how it relates to their performance and accomplishments.

The data were analyzed using a 'grounded theory' approach (Charmaz 2006) to identify patterns relevant to the guiding questions and develop theories about partnerships inductively from the data. Findings were further developed with iterative rounds of feedback and opportunities for dialogue with partnerships and separately with OWEB staff. Findings from partnerships

Deschutes Basin Partnership - Three Sisters Irrigation District Manager Marc Thalacker oversees canal piping, enabling flow restoration in the Creek.
PHOTO / DESCHUTES RIVER CONSERVANCY

are paired alongside insights and reflections from OWEB relative to these findings, shown as green speech bubbles throughout. OWEB has begun making some improvements even during the course of this study.

Select quotes are shown throughout the text to highlight key findings. They represent individual perspectives that are meaningful to the larger picture, but may not be representative of all partnerships. [Brackets] indicate text added or modified for clarity or to protect confidentiality and ellipses … indicate text omitted for brevity.

Some quantitative survey data are also presented throughout; however, these only represent a subset of the responses. Seven partnerships chose to participate in interviews and groups discussions only, including 29 people total. Their responses are not included in quantitative survey data, but their responses were not markedly different from the survey responses.

Preliminary findings were shared with OWEB at a January 2023 retreat focused on the evolution of the FIP and P-TA Programs in addition to discussions of findings and recommendations monthly throughout the spring and summer. Partnerships and OWEB staff had a chance to review the draft report and provide feedback, which has been incorporated into the final report.

Findings

Reflecting on the foundational assumptions of OWEB's partnership-focused investments, this study found many examples of partnerships accomplishing more complex restoration work and at larger scales than would be possible with individual organizations working independently.

"Our initial hope was that the partnership would result in a much more cost-effective program implementation for our needs. As information evolved on the required costs of implementation, it is difficult to say if cost-effectiveness was an end-result, but we know we are getting a much better product for the community and the environment. And we have program strength in having so many partners committed to the same goals and project successes than if we had gone it alone. For that, it is well worth it and we will be at the table for a long time."

Oregon Model to Protect Sage-Grouse – Landowner collaboration. PHOTO / LAKE COUNTY SWCD

Partnership Types as a Tool for Setting Expectations

A typology, or description, of different partnership types was developed to promote dialogue about realistic expectations for partnership structure and function, not as a prescription for partnerships to follow.

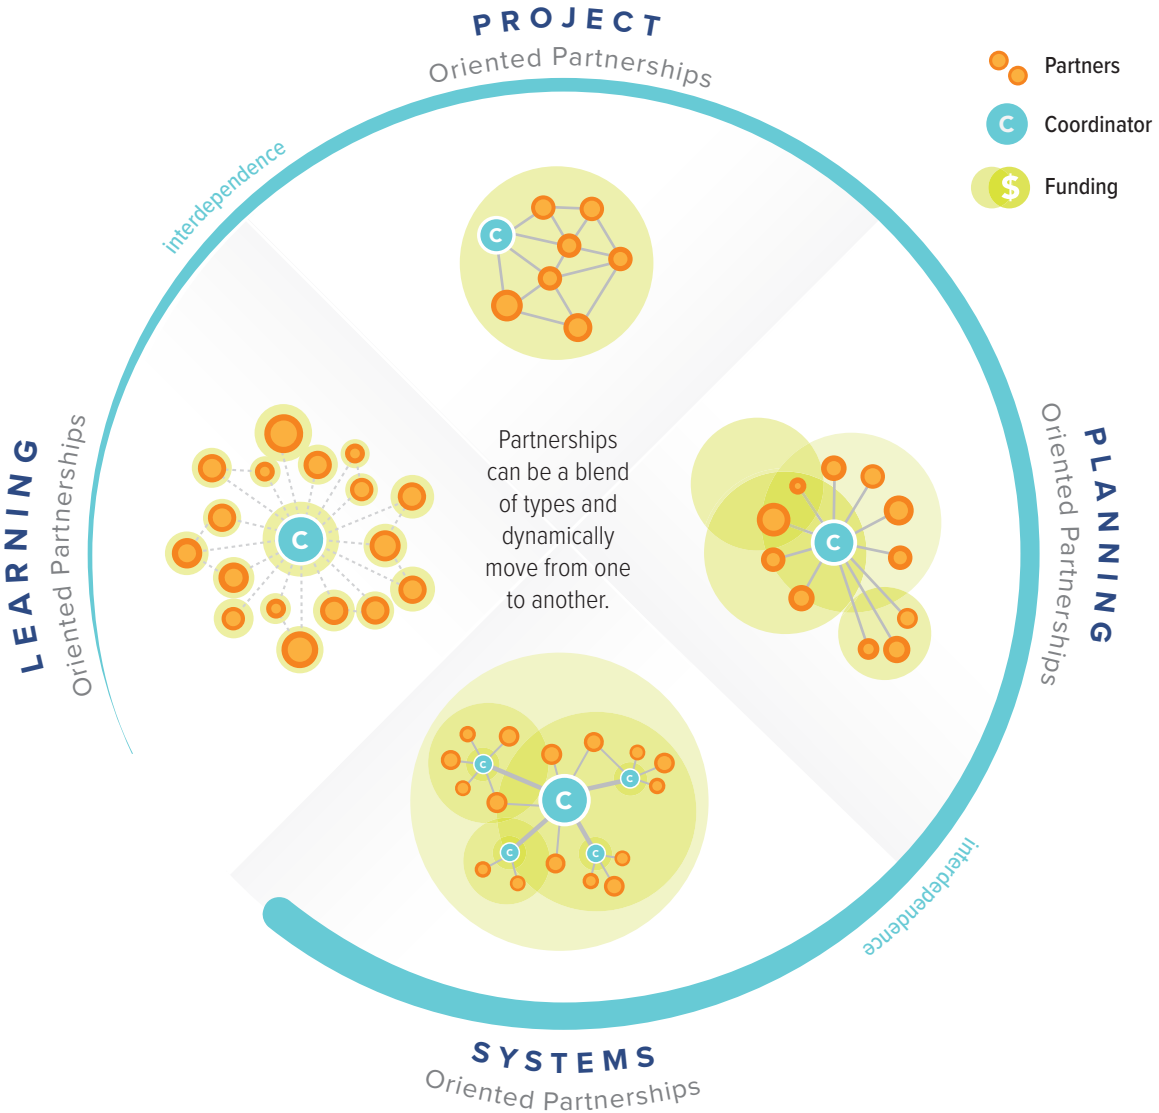
This typology has its origins in the Public Administration literature (Mandel and Steelman 2003; Cigler 1999), but was further developed using a 'grounded theory' analysis of the data from this study. As part of the Partnership Learning Project Parts 1 and 2, a typology of partnerships from the Public Administration literature was used that describes partnership types on a continuum from more autonomous to more interdependent (Mandell and Steelman 2003; Cigler 1999). The relative autonomy or interdependence influences the structure and function of the partnership and the level of funding needed to support operations and performance.

With greater independence and alignment, greater funding is needed to work through differences and hold each other accountable. In the Partnership Learning Project Parts 1 and 2, we developed the continuum adding details that emerged from a comparison of the data, for example describing differences in the partnership's purpose, role of the coordinator and funding needed to sustain specific parts of the structure and function (Arnold 2018).

OWEB said this description of partnership types resonated with them and they used it subsequently to talk with partnerships interested in the FIP and P-TA grants. However, OWEB shared feedback that the continuum, as a linear graphic with greater autonomy on the left and greater independence on the right, gave the impression that grantees should aspire to the partnership type on the right with the highest degree of collaboration and interdependency. However, this is not what they intended. **OWEB wants to support whatever type of partnership is best suited to advance their restoration goals.**

Pure Water Partners - Partners work to replant the Blue River Park as a part of ongoing fire response work in the McKenzie River valley. PHOTO / ELIZABETH GOWARD

Siuslaw Coho Partnership - Restoration Project Managers Kyle Terry (CTCLUSI) and Nathan LeClear (MRT) prepare to break ground at Waite Ranch, July 2023.
PHOTO / ELIZABETH GOWARD



We also received consistent feedback that the partnership type names from the literature were confusing: Cooperative, coordinating and collaborative partnerships were too similar to easily remember. Also, although partnership types were described as a gradient, people often misinterpreted them as discrete types.

Incorporating this feedback, the partnership types are now described as a circular continuum with no assumed endpoint or preferred type. The types were also renamed – learning-oriented partnerships, project-oriented partnerships, planning-oriented partnerships and systems-oriented partnerships – to emphasize the focus of the collaborative work, which is correlated with the level of interdependence. Partnerships can still do various types of work, but they are named for the focus of their collaborative energy. For example, all partnership types may implement projects. A project-oriented partnership will focus their collaborative energy on coordinating and implementing projects, while a planning-oriented partnership will focus their collaborative energy achieving the goals of a long-term strategic action plan, which would include project implementation but also collaboration in fundraising, monitoring and ongoing updates to their plan. A project-oriented partnership typically engages in planning at the beginning of their collaborative work together as they define priority actions and secure funding, but partners might not be committed to working together on an ongoing basis to reach long term goals.

To maintain confidentiality and minimize the influence on any future funding decisions, partnership types are not described with reference to specific partnerships, but rather fictionalized descriptions of each type were created by merging details from different partnerships that best fit each type. Some of the details from these descriptions may not match a particular partnership, even if it fits well within that type, because there is natural variation in how partnerships operate, even within a given type.

It is important to note that some partnerships may be a blend of different partnership types and others may not fit well into any partnership type if they do not have a well-defined focus or structure or if they are struggling to operate as intended.

The partnership types below are defined by the relative autonomy or interdependence of partners. This originates from the Public Administration literature (Mandell and Steelman 2003; Cigler 1999) and was further developed inductively through 'grounded theory' analysis of data from the partnerships in this study.

OWEB's Partnership Technical Assistance grants would be suitable for any partnership type. OWEB's Focused Investment Partnership grants, with their focus on implementation, would be suitable for project-oriented, planning-oriented or systems-oriented partnerships.

A TYPOLOGY OF

Partnership Types

$ Funding for Coordination Interdependence among partners

Learning-Oriented

*Partners are **fully autonomous** with **little interdependence.***

Partners come together to tackle shared questions to improve strategies, practices or policies. Partners independently apply their learning. A coordinator serves as convenor.

Project-Oriented

*Partners are **mostly autonomous** with **some interdependence.***

Partners go through an initial period of collaborative planning and commit to a set of shared actions. Their main focus is coordinating implementation, often with each partner leading their own projects. After projects are complete, the partnership may dissolve or reorganize around a new focus. A coordinator serves as a project manager, a role which may be rotated among partners.

Planning-Oriented

*Partners are **moderately interdependent.***

Partners engage in iterative cycles of collaborative long-term planning and work together to implement shared priorities. Individual partner organizations may have to shift how they operate to align with the partnership overall. A coordinator serves as a facilitator, planning coach and project manager, a role which is usually held by a partner organization who may also contract with an independent facilitator.

Systems-Oriented

*Partners are **greatly interdependent.***

Partners engage in iterative cycles of collaborative long-term planning and establish shared standards, practices and systems to hold each other accountable to systems change. They work through differences, achieve alignment and coordinate for implementation. A coordinator serves as collaborative leader, facilitator and project manager, a role which may be held by a partner or host organization who may also contract with independent facilitators.

©2023 Reciprocity Consulting, LLC

Learning-oriented partnerships

Partners are fully autonomous. They come together to tackle shared questions to improve strategies, practice or policies. Partners independently apply their learning, or in some cases collaborate with one or a few other partners. A coordinator serves as an a convener. A partner organization may serve this role.

A hypothetical learning-oriented partnership

- **Initiation** – A partnership forms around the desire to learn together and improve the use of a particular restoration treatment.

- **Structure** – The convenor and leadership team frame up the issues, develop a schedule for regular meetings and organize workshops, conferences or trainings that may include experts and peer learning. They secure funding for the gatherings, communicate with partners about opportunities to participate and disseminate new learning.

- **High performance** – The partnership performs well when partners ask hard questions, integrate the latest science and engage in dialogue. When learning is salient to their work, individual partners apply what they learn to their individual projects. If the learning is salient to a broader policy context, partners might coordinate to share their findings with policymakers or advocacy organizations, individually advocating for a policy change that they developed collaboratively.

- **Potential evolution** – If a subset of partners find synergies in how they want to apply their learning, they might develop a project together, secure funding and implement it together, forming a project-oriented partnership within the larger partnership.

- **Potential evolution** – If partners want to work more closely together over a longer timeframe and they develop enough interest from funders and/or political officials, the partnership can secure funding to transition to a structure with greater interdependence, potentially any one of the other three partnership types.

- **Low performance** – A learning-oriented partnership that is not performing well might be reduced to a series of meetings where partners report what they are doing, which typically does not provide enough value to stimulate learning or improvement. Learning-oriented partnerships that are not effective lag in participation and dissolve or pause until there is new energy and direction.

John Day Basin Partnership PHOTO / HERB WINTERS

Project-oriented partnerships

Partners are somewhat interdependent. They go through an initial period of collaborative planning and commit to a set of shared goals and actions. Their main focus is coordinating implementation to maximize impact and efficiency, often with each partner leading their own projects. After projects are complete, the partnership may go through another period of planning to secure funding to work together again, they may dissolve, or they may reorganize around a new focus. A coordinator serves as a project manager, a role which may be rotated among partners.

A hypothetical project-oriented partnership

- **Initiation** – A group of partners starts with a regional restoration plan to identify a set of actions and a theory of change that they are well positioned to implement. They draw from the regional plan to develop a strategic action plan and work plan, agree on the terms of their partnership, secure funding and implement the work plan together.

- **Structure** – The partnership meets regularly to coordinate and streamline implementation. They work together to develop a database to track implementation.

- **High performance** – They trust each other that each partner is following through on the tasks they agree to. They address questions as they come up. If problems arise, they work to quickly resolve the issue, typically through compromise, so they can resume their focus on implementation.

- **Potential evolution** – After they complete their funded projects, they might seek out additional funding to continue working together or they might transition to focus on implementing projects individually. If they do not find funding to implement projects together, they are unlikely to stay together. However, they may find value in maintaining relationships and informally sharing updates.

- **Low performance** – If project partners do not communicate openly about their activities and progress with implementation, they may start to form negative judgments about each other's performance. Once mistrust flares up, partners are less likely to share information or ask questions as issues come up, which leads to more problems with implementation and coordination. The ability for the partnership to deliver on their work plan can suffer overall even though some partners are still performing well individually. With low performance, partners tend to stay together to satisfy the terms of their funded work and then part ways.

Planning-oriented partnerships

Partners are moderately interdependent. They engage in iterative cycles of collaborative long-term planning and establish work together to implement shared priorities. Individual partner organizations may have to shift how they operate to align with the partnership overall. A coordinator typically serves as facilitator, planning coach and project manager, roles which may be shared among partners or covered by a team of staff from a sponsoring organization, sometimes also contracting with independent consultants.

A hypothetical planning-oriented partnership

- **Initiation** – A group of partners come together to systematically work through a planning process, create a partnership structure and launch fundraising efforts to implement their plan. Partners identify key questions and uncertainties and a monitoring plan to track progress of the initiative overall.

- **Structure** – They establish a partnership structure, including some kind of steering committee with representatives who are asked to make decisions in the partnership's best interest, not the interest of their individual organizations. Steering committee members rotate every few years. They raise funds to hire staff, such as a partnership coordinator, a communications lead and a monitoring coordinator.

- **High performance** – Different partners take the lead on securing funds to implement different parts of the plan, and they coordinate to ensure that work from different funding sources is aligned with the plan they collaboratively developed. Partners periodically reflect on their progress overall and what they are learning from implementation and monitoring so that they can update their plan and adjust their priority actions.

- **Potential evolution** – Their work typically spans more than a decade so they develop their partnership structure and governance practices to be resilient in the face of staff turnover, changes in funding and new learning. Their structure shifts over the years, but they can continue to operate in a similar form for many years.

- **Low performance** – A planning-oriented partnership that is not able to secure funding may stay together with low level activity implementing the plan they developed together. People's commitment may lag, and it may be difficult to follow the governance practices and maintain the structure. It may be difficult to convene partners to regroup and adjust.

John Day Basin Partnership PHOTO / HERB WINTERS

PHOTO / HERB WINTERS

Systems-oriented partnerships

Partners are highly interdependent. Partners engage in iterative cycles of collaborative, long-term planning and establish shared standards, practices and systems to hold each other accountable to long-term change. They work through differences, achieve alignment and coordinate for implementation. The complexity of their work may require committees. A coordinator typically serves as a collaborative leader, facilitator, planning coach and project manager. A partner organization may take on these roles, often hiring staff and contracting with facilitators.

A hypothetical systems-oriented partnership

- **Initiation** – A group of partners is highly motivated by the potential for coordinated learning, action and systems change. They have the support of funders and/or elected officials that gives them confidence that they can invest in the infrastructure to support a more interdependent model of collaboration over a longer time frame.

- **Initiation** – As they collaboratively develop a strategic action plan, partners consolidate the latest science and best practices and develop standardized protocols and procedures for all partners to follow. They also frame up key questions and uncertainties, which they use to develop a monitoring plan to track progress.

- **Structure** – The partnership is governed by a steering committee that includes representatives from partner organizations and external members including tribes and neighboring communities. They have various committees that oversee implementation of different parts of their work, but all of the committees gather and engage in learning together once to twice a year.

- **Structure** – The partnership has centralized staff housed in one of the partner organizations that includes a partnership coordinator, a tribal liaison, a community outreach coordinator, a monitoring coordinator and part-time leads for each of the committees that serve as project managers for that section of the work plan.

- **High performance** – Centralized staff work with restoration leads, monitoring leads and researchers to track progress, tell the story of their cumulative impact and apply findings to adaptively manage their future approaches and actions.

- **Potential evolution** – As the partnership evolves, their initial investment in the partnership infrastructure pays off in terms of well-coordinated implementation of complex projects across a large geography. They build relationships with university and agency researchers to focus research on high priority questions. They secure long-term consistent funding, including congressional appropriations and/or a local bond.

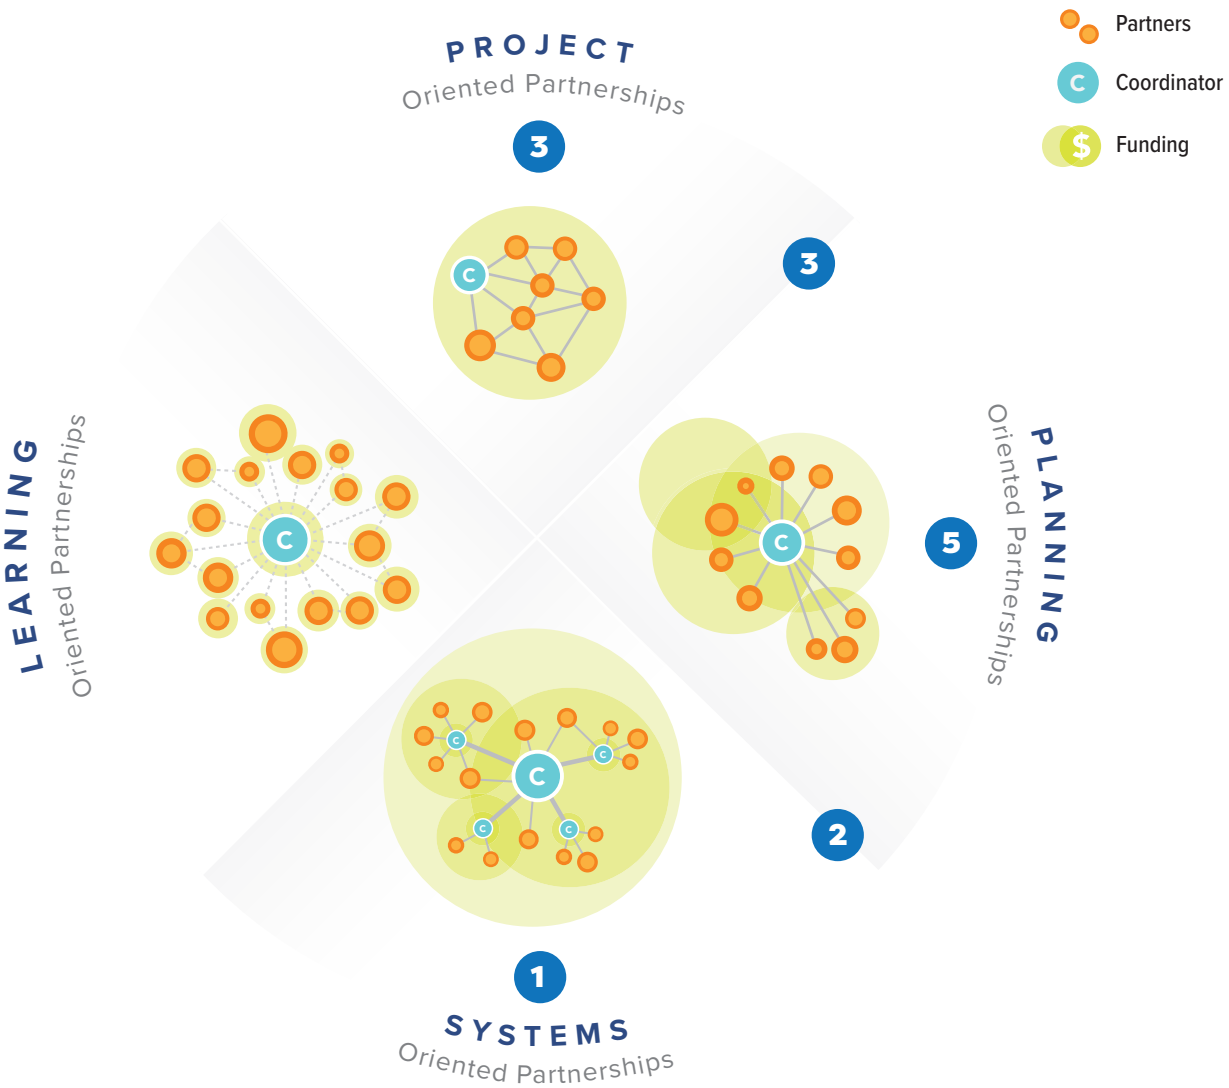
- **Low performance** – Despite high initial investment in partnership infrastructure, if a partnership is overly ambitious with their goals or the complexity of their work, they may not be able to show progress with implementation fast enough to secure enough additional funding to keep the partnership operating. Because it is so expensive to operate a highly interdependent partnership, it is likely that partners will not be able to maintain the structure or processes they built. The partnership is likely to dissolve or refocus on less complex projects at a smaller scale.

Partnership focus and context

To clarify, all partnership types may implement projects or focus on learning, but the type is determined based on where the primary focus of collaborative work lies, which is closely correlated with the degree of autonomy or interdependence partners have as they work together. If a partnership's primary focus is learning, the structure, function and level of interdependence among partners will be very different from a partnership who holds annual meetings for reflection and learning but whose primary focus is working together on strategies to reach their long-term vision of restoration.

Partnership type is influenced by who is motivated and invited to join, how partners define their vision, the leadership style of core partners and the level of commitment and resources partners are willing to dedicate.

The context of a partnership's work can also shape the partnership type and what performance looks like. Partnerships working in social-ecological systems that are well-understood with well-established best practices are more often structured as project- or planning-oriented partnerships with more focus on the efficiency and coordination of actions. Partnerships working in social-ecological systems with many unknowns and little to no research to draw from require a focus on learning, which means they are more often structured as learning-oriented or systems-oriented partnerships, sometimes planning-oriented partnerships if there is a moderate level of understanding of the system.



In situations when the system is not well-understood but funders or political leaders put great importance on the issue or problem, a partnership is more likely to attract the funding and commitment needed for a systems-oriented partnership to focus resources on learning alongside action and systems of accountability. However, there is greater risk for individual partners in these situations that it may take substantial time to build the learning and capacity to determine the best course of action and then more time before results are seen. If funders or political leaders do not see progress quickly enough and reduce funding prematurely, the value in ramping up the infrastructure needed for a systems-oriented partnership may be lost if they need to transition to a lower level of commitment and infrastructure, such as a project- or learning-oriented partnership.

Estimation of partnership types for funded partnerships

Based on the 14 FIP partnerships that provided enough detail to estimate partnership type, FIP partnerships were mostly in the range of project-oriented to planning-oriented partnerships with a few leaning toward systems-oriented partnerships. None of the FIP partnerships fully operated as a systems-oriented partnership, and none were structured as a learning-oriented partnership.

Numbers above indicate the number of FIP partnerships associated with each partnership type or the gradient between types.

Looking at all 21 partnerships that received a FIP and/or P-TA grant and provided enough detail to estimate partnership type, they followed a similar pattern. None of the partnerships who responded are currently structured as a learning network, but several clearly had been functioning that way in the past, including two learning-oriented partnerships who later became FIP grantees operating in the range of planning-oriented to systems-oriented partnerships.

Numbers above indicate the number of FIP and/or P-TA partnerships associated with each partnership type or the gradient between types.

Reflections on partnership types

During this study, partnerships were asked to reflect which partnership type best describes how their partnership operates now, in the past and where they would like to be in the future. Many partnerships felt that this reflective exercise was helpful, especially as a group reflection.

When discussed as a group, new partners expressed how helpful and interesting it was to hear more senior members describe their partnership's history and current context. Some partners shared it with new colleagues to orient them to their partnership's context. This type of reflective activity, in which partners collectively reflect on their past, present and future, is a well-established practice for building group cohesion and revisiting governance practices (Arnold and Bartels 2014). Incorporating this tool into a reflective exercise can help support clarity in structure, function and expectations among partners and funders.

Many people responded that they could see themselves in multiple partnership types depending on which projects or activities were going on. For example, if they had a series of learning-focused meetings, a few large project-focused grants and ongoing work with their strategic action plan, they wanted to respond that they were a learning-oriented, project-oriented and planning-oriented partnership. However, with encouragement to identify which one was the focus of their collaborative energy, people were able to choose one type or a blend of different types.

"[The partnership types] were really helpful and eye opening for describing and thinking about our partnership.

I think this partnership will never be a systems partnership. I mean there are just too many distinctly different missions of the various partner organizations, which gives it huge strength. A huge part of the strength of the partnership is that it is so diverse [and] able to accomplish so much, [plus] the fact that the trust has been built and we have [farmers] involved so strongly."

"Initially, when I looked at this, I jumped right to the project-oriented partnership... [since] for the most part, we're all kind of working off that one funding pool, and individually, we all kind of have our own different opportunities for funding as well.

But the more I looked into this, I would agree that I think we're a systems-oriented partnership with a little bit of all these other partnership types tied in. There's a learning-oriented piece to our partnership with our [annual meetings, which is a] big effort to merge research and management and revisit [our strategic action plan] as information comes in.... So yeah, we've got an interesting dynamic with our partnership. Half of our programs are supported in a large way by [a couple of funding programs] and then the other half of our partnership is funded through other avenues – but what really brings us together are our common goals and objectives. That is kind of an interesting dynamic."

"I think the partners have gotten more committed over the years as the [partnership] has achieved a track record of success in securing funding and project implementation. There were initially some doubts from local partners about whether to join in the effort, or whether it would impact their own strategic priorities and funding opportunities."

A few findings emerged from people's reflections on partnership types:

- Project-oriented partnerships described going through an intensive period of collaborative planning after which they remained fairly autonomous, coordinating and tracking progress in an agreed upon format as they independently implemented projects described in their plan.

- Any partnership type may have a subgroup of partners who form a smaller project-oriented partnership, typically in response to a funding opportunity with specific tasks and timelines that are consistent with and nested within the larger partnership structure and focus.

- All partnership types may have peripheral partners who are tracking but not directly participating in partnership activities. These peripheral partners may have a very different view of the function and structure of the partnership from core partners, who are in a better position to understand and accurately describe how their partnership operates. If core partners do not see the partnership similarly, then this is an area that likely could use improvement for greater clarity and cohesion.

- As partnerships evolved toward increased interdependency, several described perceptions of increased risk and the opportunity costs associated with greater commitment. Perceptions of risk and benefits go into the internal calculations for each partner's desired level of commitment and collective negotiations to decide the structure and function of the partnership.

As an example of what this risk might look like, one partnership, during a group interview, described a somewhat intense negotiation process among partners. They were deciding which grant proposals would lead with the branding and logo of the partnership instead of a collection of logos from different partners, which had been their usual practice. One partner pointedly talked about the risk that this posed to their organization.

"We are many organizations [that make up this] partnership. As a non-profit organization, I'll speak [from my organization's] point of view, and this comes from a lot of experience. [Our organization] works in partnership with just about everything we do. It's very rare that we've got something that isn't involving some other organization or agency. We've got decades of experience with that. It is always a risk when you are working in a partnership that starts to take on its own identity, its own branding, that you suddenly get lost. As a nonprofit, who's trying to survive in this world and raise funds and be recognized, that's a risk. That can be detrimental.

For example, when people in [this area], which is the heart of our home, don't start recognizing [our organization, but] they recognize [the partnership instead], what does that mean for us? That's something that we have to constantly make sure that we're keeping in balance as we move forward in partnership."

The acute pinch-point described here was most clearly felt by partnerships with a high degree of interdependence leaning toward a systems-oriented partnership type. However, these tensions may be felt for any partnership type. Some partners from different project-oriented partnerships described tensions when one or more partners shifted the energy and focus of the partnership in seemingly subtle ways that ended up causing a shift in outcomes and a reduction in the predicted benefits for one or more partners. In these situations, when these tensions were openly discussed and negotiated, the partnership maintained high levels of trust and buy-in. When the affected partners had relatively less influence within the partnership and were not able to have open conversations about their concerns and the direction of the partnership, those partners described lingering mistrust, even resentment when questions raised had no response. This type of mistrust can build up over time and impact the cohesiveness of a partnership.

Reflecting on these findings, **OWEB** felt this was an accurate description of the breadth of partnership types. They also felt that any partnership type except for the learning-oriented partnership should be eligible for the FIP grant and all partnership types should be eligible for the P-TA grant.

Currently, partnerships must have a strategic action plan or be developing one to be eligible for a P-TA grant. However, reflecting on the partnership types, **OWEB** wondered if perhaps a learning-oriented partnership did not need a fully developed strategic action plan and would be better served by some other type of planning document more appropriate to their focus and low level of interdependence.

OWEB also reflected that perhaps some of their expectations for FIP grantees may be based on unconscious assumptions that they should be operating as systems-oriented partnerships. **However, OWEB affirmed that they would like the FIP and P-TA grants to support a diversity of partnership types.** They will continue to consider these findings relative to their expectations of grantees and applicants.

Partnership Resilience to Withstand Stressors and Change

Resilience refers to the capacity of a partnership to withstand stressors and undergo change, while maintaining the integrity of the partnership's vision, identity and focus (adapted for partnerships from Walker et al. 2004). While there are many types of stressors, funding has a strong influence on the commitment of core partners and the ability to maintain the integrity of the partnership, referring to the integrity of the vision and scope even if the structure changes.

Resilience in the context of OWEB's theory of change

Referring back to OWEB's theory of change for partnership-focused investments, OWEB expected that P-TA grants would boost partnership performance and resilience by developing clarity around a partnership's theory of change, priority actions and governance to coordinate implementation. They expected some P-TA grantees would go on to become FIP grantees, but that most P-TA grantees, now highly competitive with their strategic action plans and strengthened governance, would find funding for implementation elsewhere, including OWEB's Open Solicitation program and other state, federal and private sources. To ensure that P-TA grantees got the most from this opportunity and developed strong plans and governance, OWEB developed resource guides on Strategic Action Planning, Monitoring, Adaptive Management and Partnership Governance, also publicly available for any partnership (referenced in OWEB's theory of change).

Most partnerships who received P-TA grants did describe this grant opportunity as a way to increase their readiness to do more complex work and position themselves to secure competitive funding.

"Our partners are invested in [our shared] goal, and it is helpful that one organization is coordinating the effort. The track record of success has built momentum, and partner commitments are likely to keep things moving. The [P-TA] funding from OWEB that enabled us to develop our [charter], strategic action plan, financial plan and communications plan has been important in building resilience. The process, though sometimes a bit painful, helped resolve many lingering disagreements or issues and got everyone on the same page. Now we have those documents to refer to and guide us."

- Quote from a P-TA grantee

As for the FIP grants, OWEB expected that dedicated implementation funding for six years would boost the performance of grantees accelerating progress toward their restoration goals, while also showcasing their successes making them highly competitive for other funding sources. OWEB never intended to fund individual partnerships on a long-term basis, but rather to invest in their performance for six years with the expectation that FIP grants would be a catalyst for greater investment and impact beyond that timeframe. Funding partnerships for six years also allows OWEB to fund different types of partnerships over time, focused on different ecological priorities in different parts of the state.

Partnerships consistently described the value of the FIP grant in terms of boosting performance like 'rocket fuel' and supporting resilience.

Several partnerships that received the FIP grant were explicit that the FIP grant didn't make or break them, but accelerated the work they were already doing. While other partnerships identified the FIP grant, and in some cases even the P-TA grant, as a primary driver of their forward momentum.

OWEB reflected that providing funding for more than six years would stretch partnerships to try to propose on-the-ground projects beyond a realistic planning horizon. Costs beyond that timeframe are also difficult to predict due to fluctuating material and labor costs, which have been especially challenging in the last few years. In OWEB's experience, some FIP partnerships struggled to put together strong project proposals in their last biennium of funding due to changing conditions and new information since they developed their FIP application. They also found it can take partnerships 2-4 years to implement projects, which means up to 8-10 years to complete all funded projects.

"The FIP funding has been a wonderful come-alongside for our partnership; our partnership does not exist because of it."

"[After the FIP funding,] we may just go our different ways unless we find another funder to keep it going."

"When our partnership was first founded, we were trying to grapple with all of the threats to [the species] and their habitat and figure out how pooling our knowledge, resources and projects could move the needle. After a number of discussions, we realized we needed a formalized [strategic action plan], which two very smart partners authored for the group. We next explored how to take action on [the plan], and one of our partners encouraged the group to apply for a FIP grant. We tried it, and I don't know how to describe what a tremendous difference it has made for our partnership to be able to fund the work we knew needed to be done – and utilize FIP grant funds to leverage other funds, expand impact with other projects, and encourage private landowners to get involved. It was like adding rocket fuel to our plan.

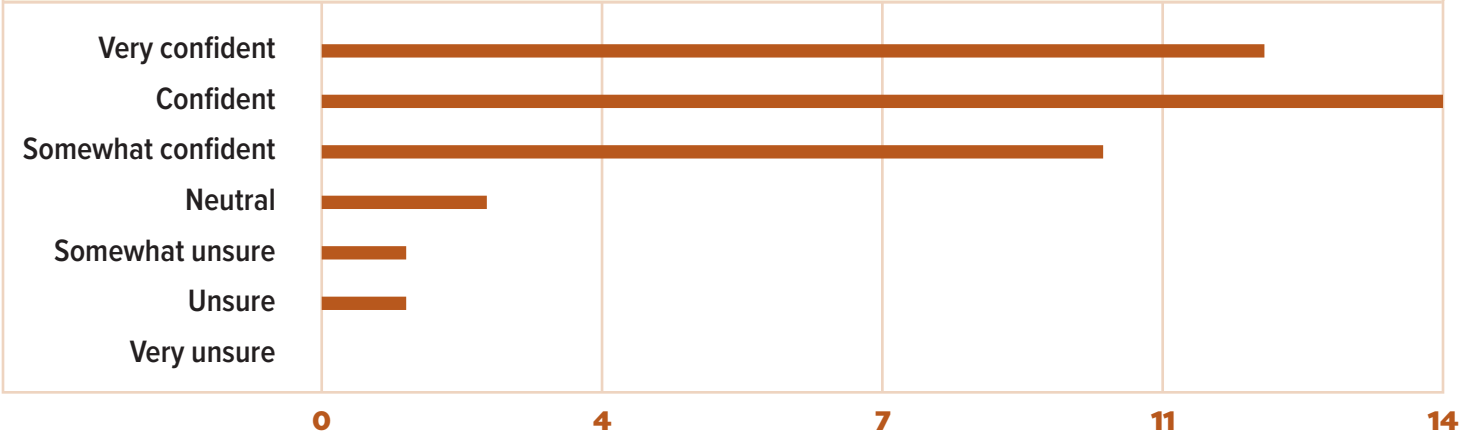
In all, our partnership structure, function and partner composition hasn't changed much over time, but our impact has grown so much farther than we could have done without OWEB coming alongside our vision. The funding through OWEB has allowed us to address many urgencies, and we are in place as a partnership where we are able to step back and start thinking more deeply about our next steps in order maximize investment of time and resources on a scale we couldn't imagine being at prior to the FIP grant."

Partnership dynamics after the end of a P-TA or FIP grant

As of 2022, seven out of 25 P-TA grantees went on to receive a FIP award. These partnerships reflected on the power of receiving both grants, one after another.

OWEB-BEF retreat, January 2023. PHOTO / JENNIFER ARNOLD

"In [our watershed], partnerships have been occurring for 10-20 years, but on a smaller scale than today. Once [this partnership was] formally created, the group was awarded a [P-TA grant] that led to the creation of [governance documents] and a steering committee, [which] were critical to our success. Then the hard work began to develop a strategic action plan that brought everyone to the table to start looking at the long-term planning and prioritization in the basin. [We created our plan, which] remains the backbone of the partnership's vision. A successful FIP proposal shifted the focus to project implementation with a smaller focus on planning. … There have been small hiccups along the way, but generally, the partnership has remained cohesive and highly functioning. Some key steering committee members with institutional knowledge of the effort have moved on, but these positions were quickly filled with ambitious individuals that kept the momentum going. Recently, the steering committee has begun discussing more long-term initiatives, but this is still being evaluated."



Several other P-TA grantees, who applied for a FIP but were not selected, also reported that they have been highly successful securing other funds, including OWEB's Open Solicitation grant, state, federal and local funding sources. One partnership reported that they have been so successful in raising funds that they recently declined a large federal award that had too many administrative strings attached. They were able to make this choice because they had other large grants.

When asked about their future outlook, many partnerships felt confident that they would be able to sustain their partnership's work as different funding opportunities come and go. Several partnerships expressed confidence based on their history of securing tens of millions of dollars in federal funds and/or hundreds of thousands of dollars in private funds. Two partnerships developed a steady source of funding from rate-payer fees to balance out the ups and downs of funding from grants.

Resilience to Funding Changes

To what extent do you feel confident that your partnership will be resilient and sustain its work as different funding opportunities come and go?

Note: This reflects survey responses only and not responses from interviews or group discussions.

A few of the FIP grantees anticipated that they might have to scale back their work after the FIP was over and/or rely more on federal resources, while a few considered potentially restructuring the partnership, merging with another or splitting off to focus on a different issue or geography, potentially applying for another P-TA or FIP grant. A few other partners anticipated a state of flux and uncertainty after their FIP or P-TA grants.

Oregon Model to Protect Sage-Grouse - Installing sage grouse fence markers.
PHOTO / LAKE COUNTY SWCD

"We have a diverse funding pool at this time. However, the funding commitments are linked to the timeframe of the FIP – 6 years. [We are] uncertain if funders will continue to invest after that timeframe."

"I'm confident in our [partnership] and the existing OWEB FIP support. What might come next for [us] after the FIP funding is over? I suspect that partners will lean heavily on funded government agencies to continue the work with limited and less formal wider collaboration."

However, not all P-TA grantees went on to implement the strategic action plans they developed with their P-TA funding. After the end of the P-TA grant, three partnerships described their partnership as somewhat or completely dormant until they can secure additional funds and/or re-energize a potentially new configuration of partners, which likely would also require an updated planning effort. Those partnerships that have been able to hang on until more funding is secured often rely on one or more partners who are fiscally and organizationally well-established and/or private funding sources to keep at least a minimum of communication and coordination. One partnership described a series of work groups within the partnership that "dissolved overnight" as soon as private funding for the work group coordinators ended.

One partnership described a process of dissolving a previous partnership structure and reorganizing around a new focus, after which they described being ready to respond to emergent funding opportunities. This newly structured partnership quickly launched into implementation with a sudden large funding opportunity, gaining new energy and momentum.

"[Our partnership] began largely as a group of organizations with similar goals and overlapping geography to prioritize planning and actions that worked in tandem and leveraged one another. As we worked together, we coalesced around the notion of a [partnership fund] through which partners would pool resources and facilitate partner-approved projects and priorities. As we further developed [governance documents] for working together, we focused more on the roles and strengths that each organization brings to the table in terms of Coordinator, Funder, Implementer, etc. The partnership framework paid dividends in being nimble and ready to respond to [needs that emerged suddenly in the region] and to best execute the various landowner, implementation, and oversight [tasks required with the large amounts of funding available]."

Partnership dynamics in response to other stressors

Besides changes in funding, another prominent stressor that was mentioned by at least 12 of the 26 partnerships we heard from was the loss of a coordinator and/or key leaders in the partnership. Several partnerships described the process as challenging but ultimately rewarding and positive as partners pitched in during the transition and onboarding process. Several FIP grantees reflected that it can be hard to retain a highly skilled coordinator or leader as they may be actively seeking opportunities to advance their career before the end of a big grant. This may be especially true in rural areas as hiring and retaining employees and board members overall is a challenge given smaller local populations to recruit from and limited housing for people moving to the area.

"Turnover among leaders at participating organizations has both delayed some actions and changed the nature of conversations as well as the focus – or what is considered the work that needs attention."

"Following the emergency response phase, the partnership is now trying to transition away from a task force incident command operation with its top down decision-making to collaborative system-oriented decision making – while we are still working at a pace that is not sustainable (we have not slowed down and are still running as if we are in emergency in some respects), and we are trying to scale up. [There are] a lot of inefficiencies due to growth of organizations (onboarding new people quickly), expansion of the type of work we are doing, and scaling up work with the influx of funding."

Oregon Model to Protect Sage-Grouse – Spring development trough with wildlife ramp. PHOTO / LAKE COUNTY SWCD

One partnership also discussed a natural disaster in their area as a stressor that ended up reshaping the partnership and refining their theory of change, integrating a focus on human health and wellbeing. In this case, the stressor ended up bringing more resources and activating the partnership more than ever. However, the stressor also created a partnership structure modeled after a hierarchical emergency response incident command system, and now after the emergency has passed, the partnership has had to work through tensions associated with that structure to evolve to be more transparent and collaborative. The pressures they describe from quickly ramping up their pace and scale alongside the need to take care of staff and evolve their partnership is perhaps not as intensely felt in other partnerships, but definitely a common theme when large amounts of implementation funding are suddenly available.

Threads or elements of resilience

Throughout as partners reflected on what helped get them through various stressors, several threads or elements of resilience emerged as important across partnerships and partnership types. The analogy of thread is used with the idea that each thread helps hold the integrity and focus of a partnership, and together multiple threads reinforce each other, as in strands of twine, for even greater resilience.

1 Camaraderie – People like each other and are willing to go above and beyond to help each other when there is a need or crisis, which develops a sense of pride and care for each other. They enjoy their time together and feel energized working on shared passions and interests. This was frequently highlighted by partners when asked what inspired them to invest their time and energy into the partnership.

2 Success – Success breeds more success. Demonstrated success leads to a feeling of pride and shared accomplishment which then leads to more confidence and often more opportunities and more success. Referring specifically to success with funding, several people used a variation of a common phrase: Funding begets more funding. However, people also referred to smaller successes such as an inspiring meeting that catalyzed deeper engagement and commitment.

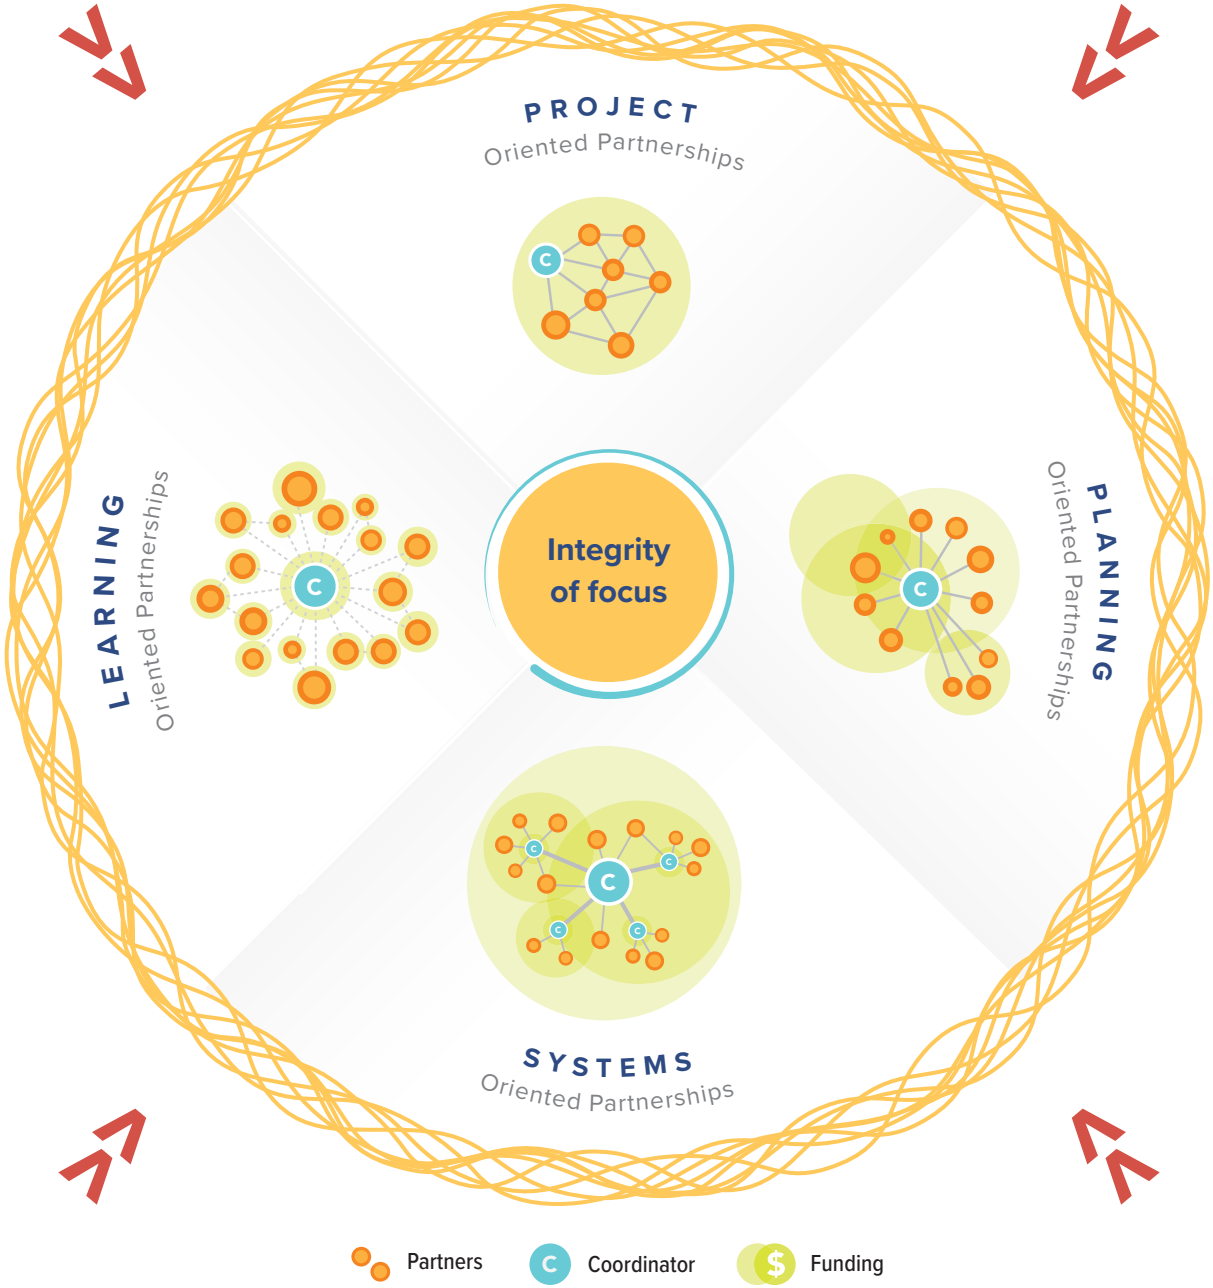
3 Formalized Commitment – Partners document agreements and plans. Partners unite around a common vision, partnership structure and a set of strategies and practices to get there, which is collaboratively developed. They formalized it into a plan and charter with partners as signatories. The level of commitment, complexity of the partnership structure and detail needed in the plan are dependent on the partnership type and the focus and context of their work.

4 Consistent Funding – Partnership coordination is consistently funded. Dedicated, consistent, flexible funding or in-kind support helps fulfill critical needs for coordination and also grant writing that keep partners together. Consistent flexible funding can also take care of unexpected needs. Even a small amount of consistent flexible funding can contribute greatly to resilience.

Rogue Basin Partnership – First annual Network of Networks gathering, May 2023.

5 Shared leadership – Partners work together to share responsibilities and decision-making to shape the vision and direction of the partnership. When shared leadership is a part of a partnership's culture and institutionalized in their structure and processes, they are better able to transition through staff changes, promote innovation and draw on the diverse strengths of partners to respond to challenges.

6 Openness – Leaders and partners are open to learning and change. They are able to reflect on the whys behind strong opinions, consider other views and recognize unknowns in the work. This gives them space to incorporate new learning and bring in people who have different perspectives.



7 Organizational anchors – Fiscally strong partner organizations add stability and capacity. Partners draw from the leadership, stability and in-kind support of financially strong organizational partners to get through challenges. Strong organizational partners may lend particular expertise and experience that open up new opportunities and promote innovation. When strong organizational partners mentor and support other partners to build skills and capacity, the overall partnership becomes stronger and more resilient.

8 External Relationships – Partners have relationships with people and organizations external to the partnership who may introduce new perspectives, serve as a sounding board or help secure resources to extend the capacity, relevance and influence of a partnership.

As partnerships experience stressors, they may change from one partnership type to another while maintaining their clarity of purpose and core members - or they may dissolve, merge with another partnership or shift in purpose, scope and structure to form a new partnership.

Examples of stressors:

>> Loss of a coordinator and/or key leaders
>> Catastrophic events like fire or drought
>> Loss or gain of substantial funding
>> Inaccurate assumptions in the theory of change
>> Strong critiques and/or opposition

THREADS OF

Partnership Resilience

Resilience refers to the ability to withstand changes and stressors and still maintain the integrity of a partnership.

The following threads, or elements, contribute to a partnership's resilience with multiple threads reinforcing each other.

- **Camaraderie**
  Partners like each other and pitch in to help
- **Success**
  Success creates more opportunities for success
- **Formalized commitments**
  Partners document agreements and plans
- **Consistent funding**
  Partnership coordination is consistently funded
- **Organizational anchors**
  Fiscally strong partner organizations add stability and capacity
- **Shared leadership**
  Leadership is shared among partners, both structurally and in the culture of how partners work together.
- **Openness**
  Leaders and partners are open to learning and change
- **External relationships**
  Partners connect with individuals and organizations who can be a source for new ideas and resources

Quotes describing threads of resilience

Camaraderie and organizational anchor

"It feels like a family at this point, and seeing the scale of projects increase significantly is particularly rewarding. The additional security added to the smaller organizations in the partnership is also appreciated."

Camaraderie

"When we face difficulties, we face them as a team instead of pointing fingers. I think we were all worried when our coordinator left, but members, myself included, were happy to take on the tasks to ensure that the [partnership] continued to operate smoothly until the position could be filled. Our new coordinator hit the ground running through the support/assistance of members and [the outgoing coordinator] and the transition has been relatively smooth. Our group is made up of individuals who want to get things done and are happy to help others (even if is outside of their duties) when needed in order to get something done."

Shared leadership

"The relationships that have developed over time have made our partnership more resilient to changes in funding. The steering committee, outreach committee, and fundraising committee have established the structure to find additional funding through long-range planning."

Shared leadership, formalized commitment, success and openness

"I feel [our partnership] has always focused on creating diversified funding sources that are more stable and predictable, moving away from living grant to grant. … I think once we complete our transition … to collaborative governance with the tools built to support the larger more complex partnership [goals and functions from operations to prioritization and equity to database upgrade, monitoring and reporting], the collaborative will become highly functioning and will attract funding over time…plus current large funding is over 5 years. We have seen that success breeds more investment and success. Adaptive management has been the cornerstone of [our partnership] over the last 2-3 years."

Formalized commitment and consistent funding

"Our partnership built relationships over time with stable funding sources. The structure and agreements in place provide stability from several sustainable sources. … The partner composition includes sources with large funding reserves dedicated to the partnership."

Consistent funding

"What's helped with the resilience for our partnership? Funding. Just even the $10,000 level of regular, consistent, very flexible funding has been instrumental."

Openness

"In the short time I have been working with these partners, I do believe we have something different here. Along with increased community engagement, the understanding of the ecological science of [this region and ecosystem] continues to grow. I have held past positions where collaboration was not a part of the problem solving process. And because of that, projects lost momentum, partners lost their passion and frustrations grew amongst colleagues. Progress stalled. I came to [this partnership] because I wanted something different and to be a part of something that can make a difference."

Openness

"I'm incredibly proud to be part of a group who is motivated and optimistic over the years. We don't dwell on failures, instead we try to learn from them and move on in a productive manner. We celebrate our achievements, but always realize there's more to do. We continually communicate and ask questions to make sure we are moving forward in the best way possible and assessing any mistakes we may have made. It's an honest group where egos and emotions get checked at the door. It's allowed us to focus on what needs to be done and we are lucky enough to have accomplished quite a bit because of that."

Organizational anchors

"Individual organizational financial strength is a big one. Financially stronger organizations frequently carry the day on partnership work. Individual leadership abilities and availability (time) also play a role."

Organizational anchors

"Commitment to the outcome. Our partnership came together and began the work with no external resources (just what our collective agencies already had) and we will continue to do the work we can ,as we can, regardless of how the partnership is funded. Obviously, we will get much more done with funding, but the partnership will not dissolve without it."

Organizational anchors

"There has been a lot of turn over at the local levels. One watershed council has completely disbanded with no staff for about five years. [Another] watershed council is on its fourth coordinator since the inception of this partnership. The [partnership] has also had complete turnover with four staff having left over time, and all of the current staff are brand new to the watershed. [One organizational partner] has been the single binding thread at the local level to maintain continuity. Having their national program strength and expertise has been very important, and they've expanded to having two staff, now potentially moving to three. However, the imminent departure of their coordinator will be a big setback to keeping momentum. More structurally sound local capacity and a stronger local central coordinating body are big missing pieces for long-term success for restoration in general in this basin."

Grande Ronde Restoration Partnership - Dry Creek Aiwohi Restoration Project Complete, 2022. PHOTO / GRANDE RONDE MODEL WATERSHED

Relationships, success and openness

"I think having a long history of working in a basin, building trust with community members and consistently performing good work while adapting and incorporating new findings, all help to add to our resilience. Our board members are a big part of providing credibility to the work we do within the community and supporting our staff. Our reputation helps us leverage and strengthen partnerships and apply to funding sources."

External relationships

"Having these relationships just really helps move the needle forward on all of our projects. I guess you could say we all know who to pick up the phone and call for what issue and what geography because we have this partnership. And it definitely helps us just strengthen our abilities across the board."

External relationships

"The breadth of the partnership provides many avenues to funding from federal, state and private funding."

Rogue Basin Partnership – First annual Network of Networks gathering, May 2023.

"Funding for partnership coordination or facilitation is very important, as the coordinator can be the 'glue' that keeps things cohesive."

Partnerships completing their FIP appreciated the opportunity to apply for a P-TA grant to support ongoing partnership coordination and/or refine their strategic action plan.

"Aside from the large consistent funding [from the FIP], I think what OWEB has done with providing some smaller grant opportunities to bridge the gap [after a FIP is very helpful]. It allows a bit of an update to our restoration plan and [for us to] spend some time really thinking about what we've accomplished and where our next highest priorities are in the basin. Having some of those other smaller funding opportunities allows the partnership to go through those cycles, while we still continue to implement a bunch of projects. Yeah, that's been really helpful, and hopefully our partnership can get there."

Barriers and gaps to increasing partnership resilience

Considering their resilience and long term outlook, partnerships reflected on barriers or gaps that OWEB and other funders could potentially address.

Not surprisingly given the focus of this study, a strong theme was the need for long-term consistent funding that includes partnership coordination, capacity funding for partners, implementation funding and notably also funding for monitoring, including coordination of monitoring efforts. Some people suggested that partnership coordination funding as part of the P-TA grant should be extended to five or ten years.

Salmon SuperHwy – This new bridge on Peterson Creek restored access to over 6.2 miles of upstream habitat to ESA listed Coho Salmon as well as Chinook Salmon, Chum Salmon, Steelhead, and Cutthroat Trout. Fish were documented spawning upstream of the bridge within weeks of project completion. PHOTO / JUSTIN BAILIE

Partnerships awarded FIPs frequently commented that the time needed to administer their grants was considerable and aspects of the program were described as time-consuming, repetitive, clunky and frustrating that took energy away from their partnership operations and project implementation. In contrast, partnerships awarded P-TA grants regularly appreciated the flexibility, support and efficient administration of P-TA grants. There were many specific suggestions for ways to streamline the FIP programs, described in the recommendations below. *(See also Findings: External Technical Review, Findings: Tracking Progress and Telling the Story)*

"In my experience with the [P-TA] grants, OWEB was very flexible. It felt like there was trust and professional credibility, and the administration of those grants was efficient and straightforward. That was all really appreciated. With other grant programs in OWEB [including FIP], people have had different experiences, and it can be a burden – to the point that we have some partners who just won't apply for OWEB funding."

Partnerships emphasized that monitoring was central to their resilience since it helped them both understand the effectiveness of their actions and tell the story of their progress to secure funding for ongoing implementation. Several partnerships also suggested that it would be helpful if OWEB can help communicate the value of a partnership approach to restoration to amplify their own communications efforts.

As funding was identified as a prominent driver of commitment and performance, partnerships had several suggestions for how OWEB could support, including looking for opportunities for greater alignment among funders and directly linking partnerships to funders.

Partnerships applauded OWEB for the FIP and P-TA programs, which in many ways addressed the gaps they identified, while also making suggestions for further ways that OWEB can support their resilience.

"Courtney [administered our P-TA grant, and she] is a great touchstone person [for all our partners.] There have been moments [in our planning process when we] just called her up and said, "Oh, my gosh, what is going on?" ... Because [OWEB is] so dialed in with all of the other groups throughout the state, for me anyway, it really provided this sense of perspective, kind of like, "You're not alone. It's okay. Other folks are dealing with it. [Your partnership] is doing amazing work, and your reputation is still fine. This is normal." And I could go back and put one foot in front of the other again. [That support has been] important!"

Salmon SuperHwy – A new bridge over Clear Creek, a tributary to the Nestucca River, and streambed reconstruction opened the watershed up for native fish use and natural stream function. Salmon were observed upstream of the bridge weeks after project completion. PHOTO / BRETT ROSS

Recommendations for OWEB to continue

- **A culture of openness and flexibility in grant administration** where grantees feel supported to share questions, challenges and new learning.
- **FIP grants with funding for six years of implementation**, including a breadth of funding categories that can be flexibly used: partnership coordination, stakeholder engagement, restoration, land and water acquisition, monitoring and technical assistance.
- **P-TA grants with up to three years of funding** for strategic action planning, strengthening governance and/or partnership coordination, including the streamlined and flexible administration of these grants.
- **Capacity funding for partnership coordination** as part of the P-TA and FIP grants, including the option for partnerships to apply for a P-TA grant after completing a FIP.
- **Clarify that capacity funding can be used for a monitoring coordinator position,** not to collect data, but for the coordination, synthesis and flow of information, including facilitation to interpret monitoring results together.
- **Learning opportunities for FIP and P-TA grantees** to support skill-building, peer learning and networking, especially in the areas of: monitoring, tribal relations, equity and inclusion, partnership coordination, fundraising and restoration strategies.

Recommendations for OWEB for further support

- **A clearer articulation of what OWEB considers successful performance**, especially with the FIP program.
- **More streamlined FIP grant administration** to minimize the time spent on administrative tasks so that more time can be dedicated to the partnership and its work, specifically in the areas of:
    - **Clear expectations of what is required with the FIP grant** explaining everything that OWEB will ask for over the course of the grant so partnerships can plan for the staff time needed,
    - **Shorter, more concise FIP project applications and ideally ways to reduce the number of project applications** to reduce redundancy with information explained in the strategic action plan and reduce time spent managing so many separate grants,
    - **More user-friendly online application portal and grants database** to to reduce the time spent with a clunky application and reporting interface (See Findings: External Technical Review)
    - **Clearer guidance for partnerships and technical reviewers** to address the concern that some revisions are time-consuming and do not change project design or outcomes (See Findings: External Technical Review), and
    - **Clearer expectations for reporting on monitoring projects** to reduce time spent with revisions. (See Findings: Tracking Progress)
- **Introducing partnerships to other funders** in federal and state agencies to minimize the time for each partnership to track down contacts for each funding program and potentially create a mechanism to share funding opportunities.
- **Alignment among funders,** especially around goals, timing, grant requirements and reporting, for example with the Oregon Water Resources Department's Place-Based Planning Grants, but also coordinating with other state agencies to collectively lobby for federal funding and make a strong business case for increased investment, for example with the Infrastructure Investment and Jobs Act.
- **Communicating the value and uniqueness of this partnership approach** to increase the visibility of partnership work across the state, which partnerships can use to amplify their own messages.

South Coast. PHOTO / OWEB

Understanding High-Performing Partnerships

One of the goals OWEB had for this study was to develop a framework for understand high-performing partnerships and better articulate what success looks like in the FIP and P-TA programs.

Performance refers to the ability of a partnership to achieve their goals and make progress toward their vision and desired impact.

"This partnership took a 'good idea' that was extremely ambitious and turned it into an on the ground, verifiable, actual success. What this partnership has achieved, at halfway to our goal, has been monumental."

Comparing across partnerships and inductively looking for patterns, it became clear that high performance looked different for different partnership types. Several categories of partnership performance emerged - **Clarity and Direction, Action, Learning** and **Alignment.**

Clarity and Direction, which included strengths related to mobilizing people and resources and securing commitment to advance the work, was needed for all partnership types to perform well. Performance in the categories of **Action, Learning** and **Alignment** were more or less important depending on the partnership type. Performance overall for a particular partnership type was driven by one or more categories of performance. Other categories could be beneficial but were not necessary for high performance.

If the partnership type is not considered when evaluating performance, the performance of learning-oriented or project-oriented partnerships may be underestimated due widely-held assumptions that more collaboration is better (Christen and Inzeo 2015).

The categories of performance are show on the next page and described in some detail here.

Clarity and direction

Leadership, dedicated partners and funding

Leaders mobilize knowledgeable people and organizational partners with diverse skills and perspectives who understand the issues and can advance the work. Partners have good relationships with each other and people outside of the partnership that can make things happen. Together, they secure funding that crystalizes people's commitment of time and energy toward a common purpose.

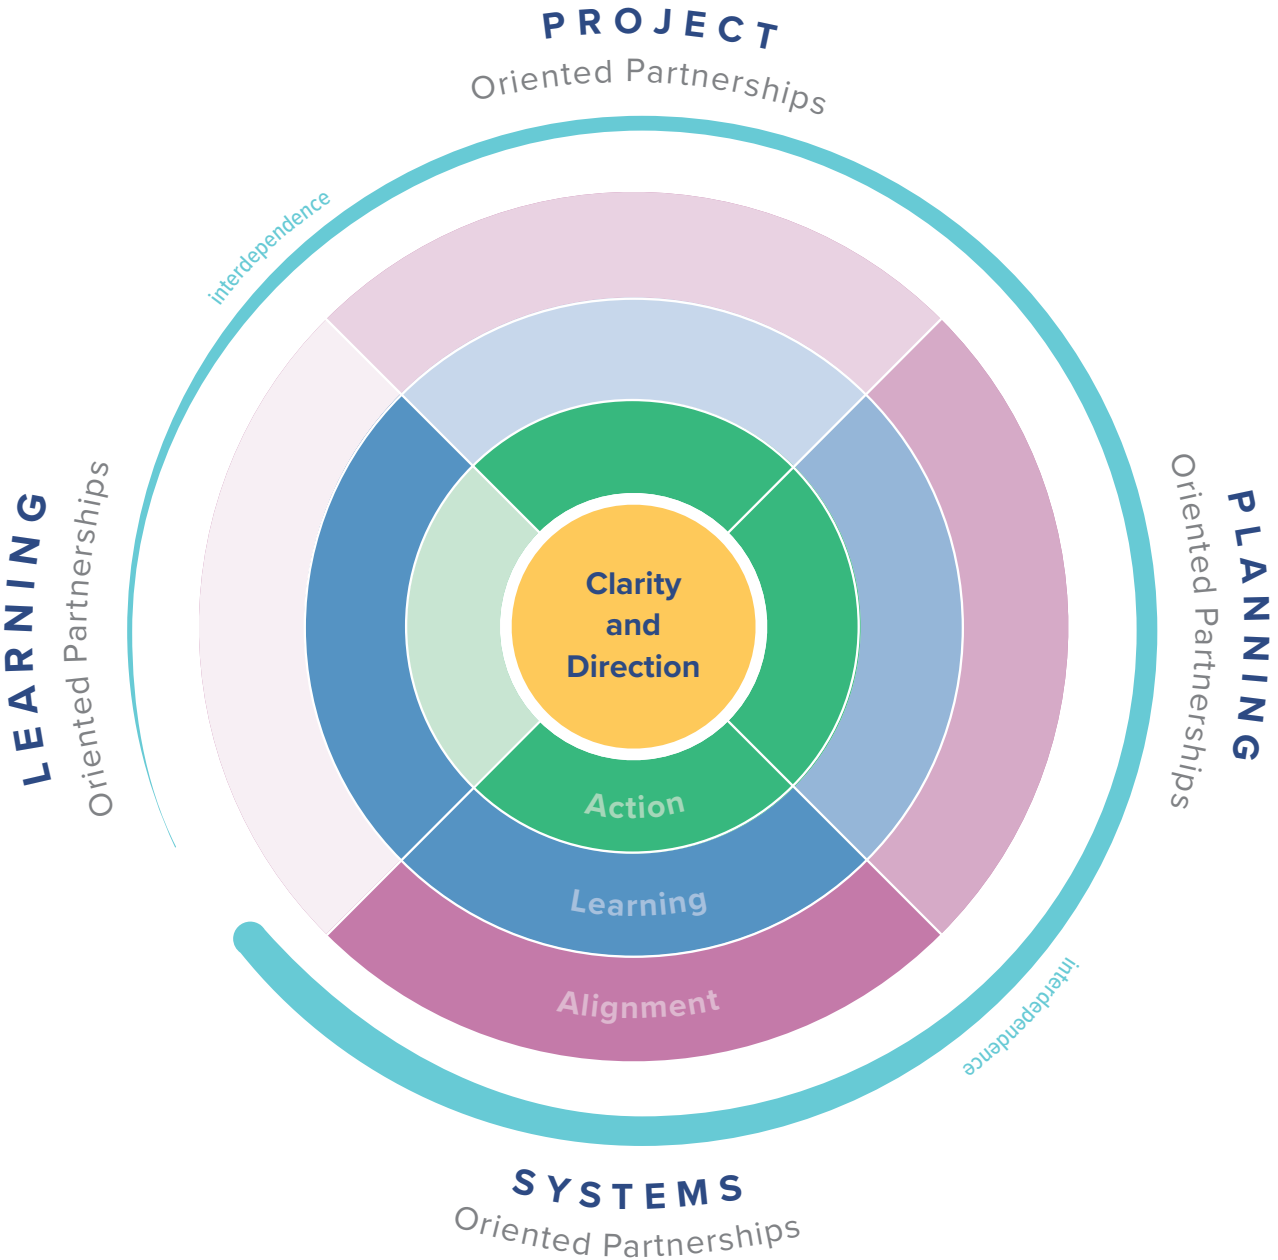
Clear purpose and scope

Partners are clear about the reason they are coming together, including the scope and focus of their work, which is realistic given the people and resources they have dedicated to the work.

Clear roles and decision-making

Partners clearly understand the roles and responsibilities of themselves and others, including how someone can join the partnership, if applicable. The structure of any steering committees or technical work groups is clear, including how people are chosen for those roles. For planning-oriented or systems-oriented partnerships, partners in leadership positions make the best decisions for the partnership and not necessarily their organization. Decision-making rules are clearly written, openly discussed and shared with everyone, including attention to the details that matter most to partners.

Effective communication and coordination



Partners share information with each other and engage in dialogue and problem-solving to build the understanding and relationships needed to advance the work. They coordinate so that their individual contributions effectively contribute to the overall goals and vision, avoid unnecessary duplication and minimize conflicts and inefficiencies. Partners who represent an organization maintain two-way communication between their organization and the partnership so that their organization's leadership is engaged and authentically supportive.

"[Our] partnership has significantly increased communication and collaboration among our local restoration partners. Due to this increased communication conveyed via email or during monthly meetings and/or site visits hosted by the lead coordinator, there has been more efficient evaluation, ranking, and prioritization of projects, as well as overall information dissemination and partner collaboration since 2016."

LOW HIGH

Performance refers to the ability of a partnership to achieve their goals and make an impact.

High performance looks different for different partnership types. Greater color intensity below denotes categories of performance that are highly important for overall performance for each partnership type.

UNDERSTANDING

High-Performing Partnerships

The following categories of performance were inductively developed from the data.

Clarity and Direction
- Leadership, dedicated partners, and funding
- Clear purpose and scope
- Clear roles and decision-making
- Effective communication and coordination

Action
- Strategic plan with prioritized actions
- Well-executed actions
- Ability to track progress and make improvements

Learning
- Trust to work through hard questions
- Incorporation of new learning and latest science
- Dissemination of learning

Alignment
- Standardized practices and norms
- Systems for feedback and accountability
- Ability to tell the story of learning and impact

Clarity and Direction are important for all partnership types to perform well, while other categories may be more or less important for overall performance depending on the partnership type (See Partnership Types). Partnerships can be a blend of different types and dynamically move from one to another.

Action

A strategic action plan with prioritized actions

Partnership actions are directed by a strategic action plan that explains the partnership's vision, long-term goals and context alongside strategies and prioritized actions. They have a clear theory of change that explains how their work is expected to lead to desired impacts over a specified timeframe.

- Project-oriented partnerships: Emphasis on prioritizing actions in a specific geography and timeframe after an initial planning effort, often based on an existing regional plan
- Planning-oriented partnerships: Emphasis on collaboratively developing a strategic action plan and prioritized actions and updating it together periodically
- Systems-oriented partnerships: Emphasis on identifying questions and uncertainties together as the strategic action plan is developed, implementing actions to test questions, reflecting on outcomes and incorporating learning into plan updates

Well-executed actions

Partnerships have a track record of well-executed actions with evidence that outcomes will be reached in time.

- Project-oriented partnerships: Emphasis on efficiency, scaling up and/or proof of concept
- Planning-oriented partnerships: Emphasis on implementation of a sequence of actions that together will yield a cumulative impact greater than individual actions
- Systems-oriented partnerships: Emphasis on learning so that well-executed actions lead to improved understanding of the system and standardization of strategies and practices that have the greatest likelihood for impact

Ability to track progress and make improvements

Partners have a framework for tracking progress based on their theory of change. They are able to collect data or evidence to learn from mistakes and improve as they plan future projects.

- Project-oriented partnerships: Often increasing the efficiency or effectiveness of projects
- Planning-oriented partnerships: Often increasing efficiency or effectiveness and/or re-prioritizing actions as conditions change or new learning emerges to have a greater chance of impact
- Systems-oriented partnerships: Often increasing efficiency or effectiveness and developing best practices, reprioritizing actions and/or revising the theory of change, sometimes restructuring the partnership with new committees to address new learning

Learning

Trust to work through hard questions

Partners bring up questions or suggestions that could increase the likelihood for impact, even when it may include uncomfortable or surprising feedback for others. Partners demonstrate respect for each other and work through discomfort to promote learning and improvement. Partnerships using skilled facilitation are able to discern which hard questions or topics will move them toward their goals and which may be distracting or unhelpful.

Incorporation of new learning and latest science

Partners create forums to deepen learning, share latest science and help people incorporate it into their work.

Dissemination of learning

Partners find creative ways to articulate what they are learning and share it with others.

PHOTO / ROBERT WARREN

Alignment

Standardized practices and norms

Partners work together to standardize best practices and norms, for example related to partnership culture, conservation practices, landowner outreach and engagement, monitoring and commitments to diversity, equity and inclusion. Systems-oriented partnerships may also align themselves in fundraising approaches, for example using the partnership's branding rather than individual branding.

Systems for feedback and accountability

Partnerships institutionalize processes and structures for feedback and accountability, for example technical review, post-implementation field site review and more formally adaptive management. These processes and structures create time and space for partners to ask questions of each other, reflect on progress, invite constructive criticism and commit to changes that have a greater likelihood for impact. Systems-oriented partnerships tend to be able to justify more detailed, time-intensive processes like formal adaptive management and more explicit mechanisms for accountability among partners.

Ability to tell the story of learning and impact

Partners are able to take all the project-level success stories and tell the larger story of what they are learning together and the cumulative impact of their work over time.

"We have a circular image of our process as a feedback loop. It basically has our prioritization in one corner, our implementation in another corner and then the other half is research, monitoring and evaluation, and then we have a shortcut in the middle, and that's [our annual meeting to look at the most recent science and data], [which leads to] ultimately adaptive management.

And [at our annual meeting] this past week, we hit that diagram on the head. It was awesome, and the reason why is because, better than we have ever before, we really looked at the data that we have and the data that was new, and we asked ourselves, "How does this change what we are going to do?" and we documented it."

PHOTO / ROBERT WARREN

Four Strategies to Enhance Performance and Accountability

OWEB wanted to better understand several specific dimensions of performance and accountability with respect to what they can expect from partners and how they can best support, focusing on the following four topics with findings described in the following sections:

1. **Trust among partners to ask challenging questions** to maximize the likelihood for impact, for example during the development of budgets, prioritization of projects, internal technical review or implementation
2. **External technical review of FIP projects**
3. **Expanding the circle** of people involved either as core partners or some other role, including consideration of underrepresented groups, and
4. **Tracking progress** toward goals by measuring ecological outcomes and telling the story of impact

PHOTO / ROBERT WARREN

Performance within any organization or team is linked to systems of accountability or checks and balances. People with relevant knowledge, expertise or perspectives are positioned to review work, provide feedback, ask questions, and provide support for resolution or improvement where needed.

Voluntary partnerships like those in this study, which do not have formal lines of authority typical of of hierarchical organizations, must rely on trust to develop and enforce internal processes of accountability. External accountability in this context is shaped by funders, technical reviewers and broader constituencies.

Many FIP grantees expressed recognition that with greater investment comes a greater sense of responsibility to use the resources well and have the greatest impact.

"As [we] build all this momentum, I want to make sure it is in service to conservation outcomes and we remain responsive to partner interests and needs. It just feels like with more investment, we have got to make this matter."

"The process that we went through in the development of the FIP grant was super helpful. There was sort of this desire to see success in delivering the best possible proposal that we knew how, and in doing that it meant asking hard questions of all of our projects – and to me that's a fantastic learning benefit of the partnership."

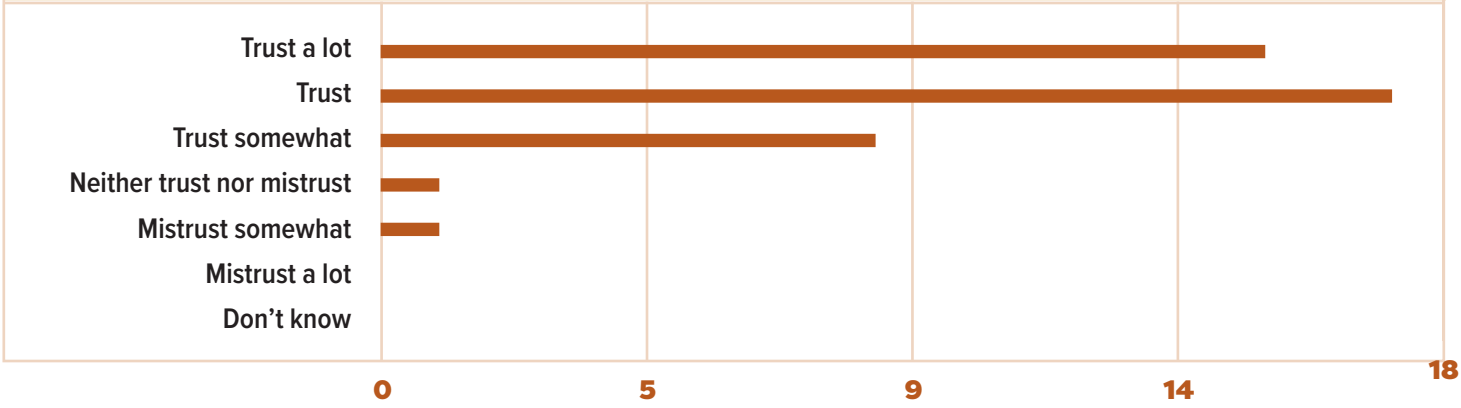
1 Trust among partners to ask challenging questions

From Part 2 of this study, many partnerships felt that relationships were somewhat fragile. Some people described how their partners tip-toed or shied away from bringing up challenging questions about performance and how to best target their efforts for the most impact. Partnerships emphasized that building trust at this level requires substantial investment in relationships along with skilled facilitation to create the space to listen to each other and make decisions together. Some partners felt that they had the facilitation capacity and relationships to do this, while others could see what they were lacking, often without knowing how to improve. In some cases, they requested more training and support for facilitation and consensus building.

In this study, partnerships again echoed the importance of relationship building, and many partnerships described success in regularly working through challenging discussions.

With the FIP and P-TA grant programs, **OWEB** has emphasized the value of governance documents and planning tools to structure collaborative work in ways that can support trust among partners. However, they also recognize that investments in relationships building, such as spending time together at site visits, are vital to working through challenging questions and directing work toward the greatest likelihood for impact.

"I think the challenging questions are asked at every single internal project review meeting, and there are no hard feelings when the group is split on a decision to fund. The partners have made really great changes and clarifications to their project in response to the group's questions and sometimes criticisms of the project. The group is always careful to make it about the project, not the presenter, which helps keep trust high."



Oregon Central Coast Estuary Collaborative – Field trip, September 2023.
PHOTO / MIDCOAST WATERSHEDS COUNCIL

Current Trust Levels

To what extent do you currently trust your partnership to ask hard questions of each other so that collective decisions and actions have the greatest chance for impact?

Note: This reflects survey responses only and not responses from interviews or group discussions.

The literature on trust describes different sources of trust: i) dispositional trust, which refers to innate tendencies to trust that are shaped by a person's disposition, life history, cultural norms and social context, ii) relational trust, which refers to the investment in relationship building where people get to know and appreciate each other's strengths, weaknesses and unique characteristics, iii) rational trust, which refers to an intentional process of creating a clear track record showing follow-through on commitments and responsiveness to feedback, and iv) systems-based trust, which refers to setting up systems, procedures or rules for accountability (Robbins 2016; Stern and Baird 2015). Additionally, historical and sociopolitical forces that privilege some groups over others influence the potential for trust and power dynamics among partners (Wollenberg et al. 2005; Brouwer et al 2015). The context and these different sources of trust together shape what is possible within a partnership.

PHOTO / ROBERT WARREN

"Our partnership has been one of the highest functioning teams I've ever had the pleasure of being a part of, and I believe that is due to a high personal and organizational commitment to [restoration goals] in our specific area."

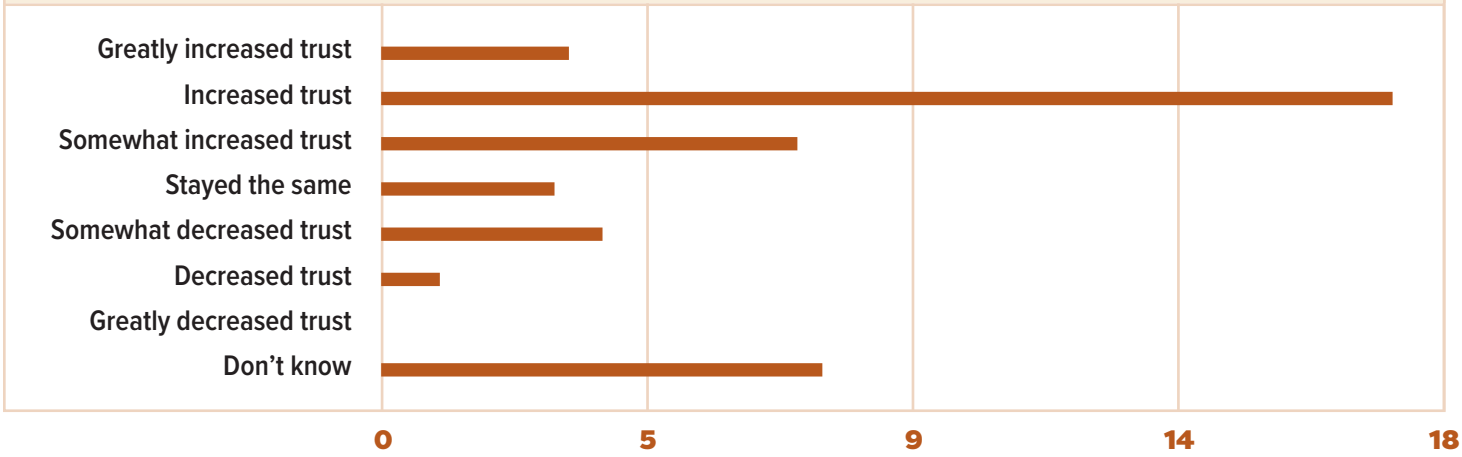
"The collective trust has increased through time, as the partnership has had lots of stability and chances for many partners to support each other through key processes."

Generally Increasing Trust

Reflecting on years of working together, most partners expressed trust in their current partnership and growing trust over time, which was often linked to collective pride in their accomplishments. Pride was described in terms of what they accomplished with their P-TA and/or FIP grants and in getting through difficult situations, for example partners going beyond their normal duties to collaboratively respond to leadership changes or natural disasters.

Sources of Trust

People from many partnerships expressed liking the people in their partnership and being inspired by their work together addressing issues they are passionate about.



Several partnerships specifically referenced aspects of their governance, such as regular check-ins, an internal review process and a steering committee with representatives from different partnerships, that contributed to greater trust and performance.

Spending time together was highlighted frequently. One partnership reflected that sharing an office built foundational relationships that made deeper collaboration possible.

Changes in Trust

To what extent do you think that trust among partners has changed over the years, thinking about the trust needed to ask hard questions and make planning and budget decisions together to hold the bar high for performance and impact?

Note: This reflects survey responses only and not responses from interviews or group discussions.

Grande Ronde Restoration Partnership, Hall Ranch OSU Visit, 2015.
PHOTO / GRANDE RONDE MODEL WATERSHED

People from some of the rural partnerships reflected on how intertwined their professional and personal lives are. Several other partnerships reflected on the value of field trips for building trust, allowing people to talk about questions naturally as they come up and see connections between different projects.

People newer to a partnership with less understanding of its history tended to be trusting and optimistic about partnership performance. At the same time, many long-time partners who had personally experienced the ups and downs were also very trusting of their partners and some of the biggest champions of the value of their partnership.

One partnership directly referenced their culture of openness as a strength that has contributed to trust – for example openly discussing assumptions from their theory of change and recognizing when they were wrong about initial assumptions. They also appreciated that they could talk openly and honestly about their learning with OWEB, which reinforced trust in their approach.

> *"I think that's one of the strengths of what we've all learned together – admitting [when we got something wrong]. Celebrating successes also, but [admitting] maybe we should do it another way."*

OWEB has long been recognized by grantees for their open, supportive and responsive culture. Specifically, partnerships expressed gratitude to Courtney Schaff, Andrew Dutterer, Ken Fetcho, former OWEB Director Meta Loftsgaarden and former Deputy Director Renée Davis.

> *"Yeah, it's kind of fun to look back and joke with [each other] that we used to snorkel together all the time. Yeah, there are handful of us that have been around. And because we are rural and a smaller community, the connections outside of work are big. We connect on many, many levels, which is a good thing."*

Challenges related to trust

While trust is a good thing for partnerships, sometimes high levels of trust can create a sense of inflated confidence, where partners assume things will go well and place less attention on tracking each other's performance. Several partnerships described this pattern, including some which had been operating as a planning-oriented partnership but evolved into a project-oriented partnership, which makes sense since they are structured to allow each partner autonomy to accomplish their tasks with less investment in centralized processes for accountability. One partner, who shared a long list of accomplishments and examples of pulling through difficulties together, reflected that people in their partnership trust each other so much that they haven't set up a mechanism to check-in with each other. The partnership realized that regular check-ins would have been helpful when one partner experienced challenges with monitoring and it took a while for other partners to find out and offer support.

Strong opinions can also create challenges in a partnership and lead to reduced trust to ask questions for fear of strong responses. Two partnerships described experiences where key people with strong opinions closed down opportunities to work through challenging questions together. They found this inhibited trust and affected performance, where people avoided speaking up for fear of being attacked or blamed. In both cases, the strong opinions and division among partners reflected larger patterns of political divisions in the region. In both situations, things improved after the person with strong opinions left and partners made an intentional effort to improve communication and relationships. In one situation, the partnership structure remained intact, while in the other, relationships remained strained and partners openly talked about restructuring.

Lack of time and energy dedicated to reflection and open discussion was a common theme among partnerships who felt that trust has eroded somewhat, particularly those partnerships focused on implementation with ambitious goals and work plans. One partner reflected that despite all that they have accomplished as a partnership, some partners still do not share data freely, even when asked. Another partnership reflected that they used to have big heated discussions that everyone contributed to, but now over time, there are so many different funded projects that each person is more focused on their own and not as engaged in other projects or the big picture. With both of these partnerships, they described their current meetings as update round tables with little discussion.

Suggestions for partnerships

Even when performance is strong and trust is high, it is still recommended to put at least simple accountability measures in place to regularly check-in on performance. Reflective time to check-in on strategic direction is also recommended periodically to maintain partnership performance and resilience.

Recommendations for OWEB on trust

- **Continue to nurture a culture of learning,** where partnerships are encouraged to ask questions, work through challenges and celebrate new learning with each other and OWEB.
- **Encourage partnerships to use their funds for professional facilitation and/or build their own facilitation skills** to work through challenging topics, for example facilitating consensus, team building and agenda design.
- **If partners with strong opinions are impacting trust, encourage partnerships to seek professional facilitation or mediation support** to better understand and mitigate the situation.

"Larger projects have brought a much greater pressure and doubling down on getting the work done with less time to reflect and discuss. With several organizations involved in the same kind of work, there are more meetings, responsibilities and tracking responsibilities."

Grande Ronde Restoration Partnership, Sheep Creek culvert before bridge construction, May 2018. PHOTO / GRANDE RONDE MODEL WATERSHED

2 External technical review of FIP projects

FIP applicants go through an initiative level technical review as part of the selection and award process. When a partnership is awarded a FIP grant, they technically have an approved list of projects for the next six years; however, each project still needs to go through a more detailed project review to ensure that public funds are spent on well designed projects with the likelihood for impact. OWEB conducts external technical review at the project-level for FIP grantees at least once a biennium.

With this study, **OWEB** prioritized this topic to inform ongoing improvements in FIP project-level technical review. Their goal is to encourage challenging questions that keep the bar high for strong projects, while also respecting that projects have already been vetted through the FIP selection process and with some partnerships an internal technical review process.

Strengths

Overall, most partnerships felt that the FIP project-level technical review process plays an important role in developing good projects, recognizing project strengths and weaknesses and supporting stronger partnerships. Even partnerships who had their own internal technical review valued the added layer of OWEB's external technical review.

> *"I would say the presence of the technical review has been important. We've built more robust proposals because we knew they weren't just going to be taken carte blanche. It is important to have that technical review there as a motivator. And they do ask good questions."*

Partnerships consistently valued technical review for two reasons:

- Good questions that led to stronger projects and
- Transparency in how public funds are spent.

> *"I think the value is partly to improve outcomes but it also has value because it provides transparency and understanding among stakeholders."*

Important design features

Overall, partnerships consistently mentioned two important design features that made the review process meaningful:

- Local reviewers who understand local geography, local issues, project proponents and the partnership's history and track record, and
- The opportunity to discuss proposals with reviewers, in some cases even visiting field sites together.

"I appreciate that [the FIP technical review process] is more of a back and forth meeting to get questions answered, less formality. I also appreciate that we can suggest technical experts for the review. [It is] still kind of clunky but much better than how it started."

Several partnerships reflected that the FIP technical review is a stark contrast to OWEB's Open Solicitation technical review process, where regional reviewers are often not familiar with local issues and where there is no opportunity to interact. One partnership described their transition from the FIP program back into the Open Solicitation review process and noted a drastic contrast in reviewers' understanding of the context of their proposals. With the FIP project-level technical review, reviewers asked better questions because they understood the context of the strategic action plan and connections to other projects.

Siuslaw Coho Partnership - Partners gather on Waite Ranch in preparation for implementing a large-scale restoration project, 2022.
PHOTO / ELIZABETH GOWARD

Areas for improvement

The most commonly discussed area for improvement was the tedious work of filling out long project applications with repetitive questions to prepare for project-level technical review. A few people from different partnerships expressed frustration that FIP reviewers didn't always review their materials or understand the context, which they felt was related to the length of application materials. Many partnerships suggested that OWEB could do more to streamline application materials and be clearer with reviewers about their expectations. One partnership perceived that FIP staff were inconsistent in their guidance for what could and could not be included in a project application based on conversations with another FIP partnership.

Some partnerships were frustrated with the time it took to respond to minor questions that didn't change the projects or potential outcomes. Several partnerships commented that the online application portal was clunky and difficult to use. One partnership found it tedious to edit a project application to incorporate changes from multiple partners as part of the technical review process. (Currently, only one person can edit a project application at a time, and they asked OWEB if the online application portal can be changed to allow for multiple editors.)

OWEB responded that they know there are challenges associated with the online application portal and are working to streamline and update it as resources allow. They recommended that partnerships download the application template into a program that allows group editing and then, when ready, insert those responses into the online application.

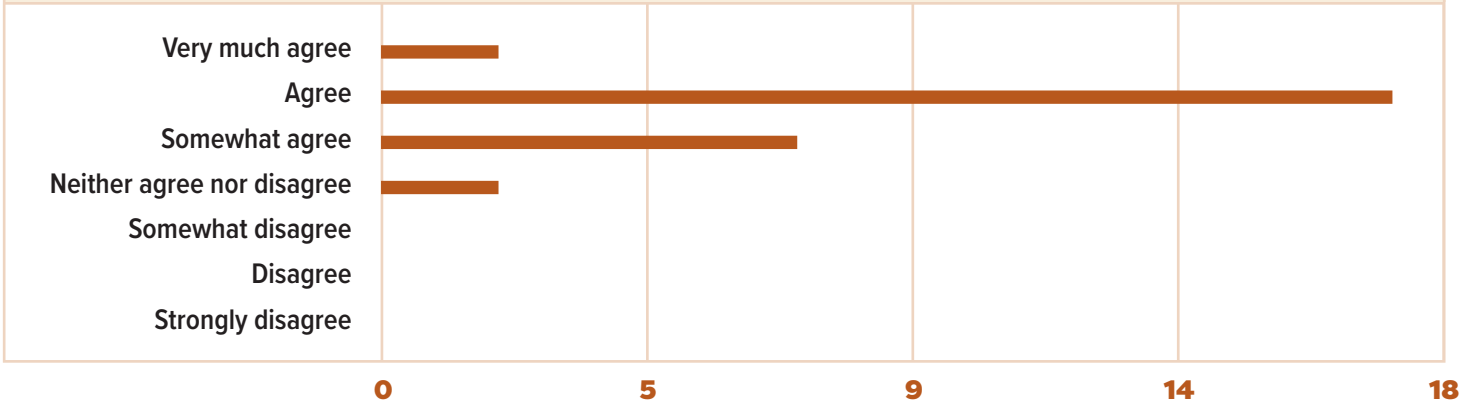
Two people from one partnership described their challenges as a new OWEB grantee trying to navigate complicated rules for each of the FIP funding categories and prepare their applications with the appropriate level of detail for technical review. They described struggling to figure out what OWEB and external reviewers were

looking for. They strongly suggested that OWEB provide orientation to new FIP grantees – or even FIP applicants – so they would know what to expect twith project applications and project review. They strongly encouraged new FIP applicants to read through the detailed rules for each grant type to inform how partnerships put together the projects in their FIP application. Although these challenges were more prominently felt and openly expressed by this new FIP grantee, other FIP partnerships expressed similar comments that it took them time to figure out how to fit their work into project applications and the appropriate level of detail needed.

Another theme from the data was the emotional nature of some technical review discussions. A couple of individuals from different partnerships expressed concern that some reviewers' comments reflected personal bias or preference more than science, requesting that OWEB could play a role more effectively facilitating these situations so that reviewers explain the reasons for their concerns.

Several partnerships discussed the potential value of moving OWEB's technical review earlier in the design process – or using a two-phased review – so reviewers could comment on preliminary design ideas and have more of a chance to influence the final design. Otherwise, if significant changes were needed and only discovered later in the design process, applicants would have to make changes and resubmit in the next review cycle.

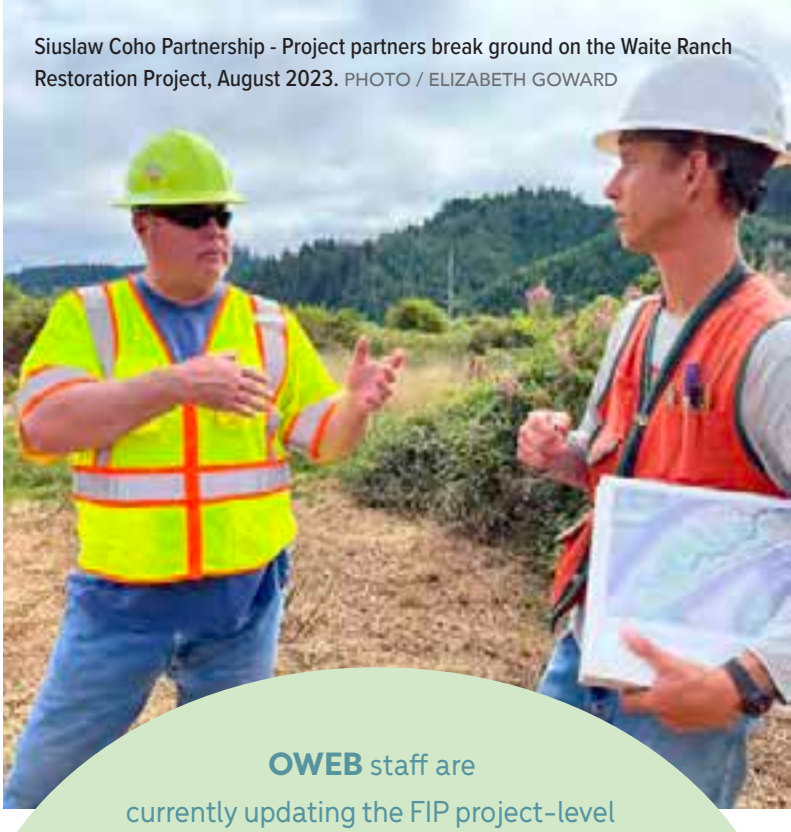
There were a few people who were skeptical about the value of the FIP project-level technical review process because they already had their own internal review process. One person felt it was sufficient that projects were already vetted through the FIP initiative level review process as part of the FIP selection process. However, the number of partnerships who valued OWEB's FIP technical review process far outweighed the few people who doubted its value.



There were also concerns from two partners who valued the process and wanted it to be more comprehensive. Two people from different partnerships expressed disappointment that they felt their internal project-level review was not comprehensive enough. They wanted a strategic review to evaluate project proposals against the partnership's strategic action plan, theory of change and priority actions so that they could draw attention to projects that aren't being proposed. They expressed a desire for the OWEB's project-level technical review to make up for this strategic review that they felt was lacking in their partnership.

OWEB reflected that this more comprehensive strategic review is something that they would hope high-performing partnerships are doing. Once a FIP is awarded with its list of prioritized projects, their due diligence is clearly focused on technical review to ensure those projects, or alternates, are well-designed and likely to have the desired impact.

Value of OWEB's Technical Review



To what extent do you think OWEB's role in technical review has led to a better outcome for implementation and greater likelihood for impact?

Note: This reflects survey responses only and not responses from interviews or group discussions.

Recommendations for OWEB's technical review

- **Retain the FIP project-level technical review,** including two important design features: local reviewers and opportunities for reviewers and partners to discuss proposals.
- **Revise guidance for the FIP project-level technical review and provide an orientation for FIP grantees** to include clear explanations of roles, responsibilities and expectations for OWEB, reviewers, project applicants and the partnership as a whole. Include expectations that:
    - o Partnerships will work together to consider the technical design of each project and how well proposed projects collectively compare with the theory of change and prioritized actions before submitting it for OWEB's technical review,
    - o OWEB will facilitate a fair process where people ask challenging questions, listen to each other and consider the breadth of science and best practices above personal preference or biases, and
    - o Reviewers will read materials and come prepared to ask questions, listen and provide justification for any changes requested.
- **Provide the option, if time allows, for earlier review or a two-step review process.**
- **Continue dialogue and coordination among OWEB staff** to ensure consistency in how they advise partnerships to prepare project applications and how they facilitate technical review team meetings.
- **Strengthen the facilitation skills** and toolkit of OWEB staff facilitating technical review.

Siuslaw Coho Partnership - Project partners break ground on the Waite Ranch Restoration Project, August 2023. PHOTO / ELIZABETH GOWARD

OWEB staff are currently updating the FIP project-level technical review process and orientation for the next cohort of FIPs integrating many of the above recommendations. The project application is the same for FIP and Open Solicitation, and OWEB is streamlining some of the questions so they are not as repetitive. They are also considering to possibly create an even more simplified project application for FIP considering that all the background and context is described in their SAP.

Responding to interest in moving the technical review earlier in the design process, **OWEB** is working on an option to hold site visits with partners and technical reviewers early in the design process to discuss project proposals, well in advance of writing project applications so that reviewers have more of a chance to influence designs. OWEB still needs reviewers to evaluate project applications later in the design process, but that can be a shorter meeting, even held virtually, as a follow-up to an earlier site visit.

3 Expanding the circle

Expanding the circle refers to the intentional effort of including new people, organizations and/or tribes in some aspect of a partnership's work.

- Sometimes efforts to expand the circle are directed at recruiting new partners.
- Sometimes the focus is to be more inclusive of underrepresented groups who are impacted by a partnership's work but may not have any connection to the partnership or means to participate.
- Often, but not always, efforts to expand the circle overlap with a partnership's commitments to diversity[4], equity[5], inclusion[6], and justice[7], especially when working with underrepresented or historically marginalized groups.

Some of these terms can be polarizing so care was taken in this study to encourage people to interpret this topic 'expanding the circle' as they liked and share their views freely.

Some aspects of OWEB's grant programs relate to people's ability to access grant funding, for example offering individual consultations to anyone interested in a FIP and advertising this widely. Referred to as equitable grantmaking, OWEB has contracted two studies examining their grantmaking practices with an equity lens, one specifically looking at impacts to tribes (Miller 2021) and another broader analysis (ECONorthwest in progress). They have also developed new climate-related evaluation criteria, applicable to all grants, that include an environmental justice component for "Local Communities Disproportionately Impacted by Climate Change." Some of the findings and recommendations in the Synthesis section of this report also relate to this topic.

Other aspects of OWEB grant programs relate to the rules and programs that shape what funded partnerships work on and how they work together, which influences their ability to expand their circle. OWEB provides a lot of flexibility in their rules and guidance for partnerships to decide what is right for their context and needs, for example flexibility in planning frameworks, governance structures and monitoring plans. OWEB also emphasizes dialogue with grantees, partners and tribes and is responsive to feedback, which are all core tenets of equity, and yet particular details in grant rules and programs can still have a significant impact on grantees and their extended networks. The findings and recommendations in this section provide context for these types of changes that OWEB may want to consider.

OWEB identified this topic to include in the study because they have been undergoing their own process of learning and engagement to articulate their values around diversity, inclusion, equity and environmental justice, for example through the development of the Board's equity statement.

Because of the timing of this study, **OWEB** saw this as an opportunity to listen and learn from partnerships about their approaches and experiences with expanding the circle.

[4] ***Diversity*** *is the breadth of differences in a group, in this context most often referring to differences in race, culture, language, economic stability and age.*

[5] ***Equity*** *is an approach that recognizes some groups have been systematically disadvantaged and works to mitigate those disadvantages by engaging people impacted to design systems and practices for everyone to thrive.*

[6] ***Inclusion*** *is the intentional practice of welcoming diverse people to participate meaningfully and nurturing a sense of belonging among everyone.*

[7] ***Justice*** *refers to making amends for wrongdoings and creating a fair system that provides opportunity for everyone.*

A range of perspectives

Partnerships expressed a range of perspectives on expanding their circle. Most partnerships felt it was important to expand their circle in some way to achieve their goals, while a few partnerships felt they have just the right circle of partners and participants to advance their vision without the need to expand.

When describing who they wanted to better include, partnerships often named tribes, landowners and farmers, sometimes also researchers. A few partnerships described a clear focus on engaging low-income residents, Spanish-speaking residents and/or Spanish-speaking restoration workers.

PHOTO / COAST FORK WILLAMETTE WATERSHED COUNCIL

Belief that Expanding Your Circle Will Help Achieve Your Goals

To what degree do you feel that expanding your circle of partners and/or building relationships with underrepresented groups in your watershed will help you achieve your goals?

Note: This reflects survey responses only and not responses from interviews or group discussions.

The breadth of views among grantees about expanding their circle is not surprising since the P-TA and FIP grant offerings provide partnerships a lot of flexibility to define their partnership on their own terms, widely considered a strength of the program. OWEB does not provide specific guidance or expectations associated with expanding the circle, except that:

- Partnerships need to develop a stakeholder engagement strategy and consider tribal engagement,
- Partnerships are expected to communicate effectively with all partners, and
- Partnerships should not exclude any organization who works on the same issues and geography and wants to become a partner.

Perspectives from across the state

A few people openly talked about the politics that can come up when discussing equity and underrepresented groups, especially in the context of funding and sometimes influenced by cultural differences between urban and rural areas. They urged OWEB to think carefully about how they use these words and concepts as their words carry a lot of weight with the potential to be misunderstood or misrepresented.

East Cascade Oak Partnership. PHOTO / PALOMA AYOLA

Considering power and representation

Power refers to access to resources, opportunities, knowledge and social networks that allow a person or entity to have influence over decisions and ultimately achieve their goals.

Some groups historically have not had power and have been disproportionately impacted by environmental burdens. For example, low-income immigrants who speak limited English and live in flood-prone areas are typically underrepresented in decisions about flood risk and mitigation.

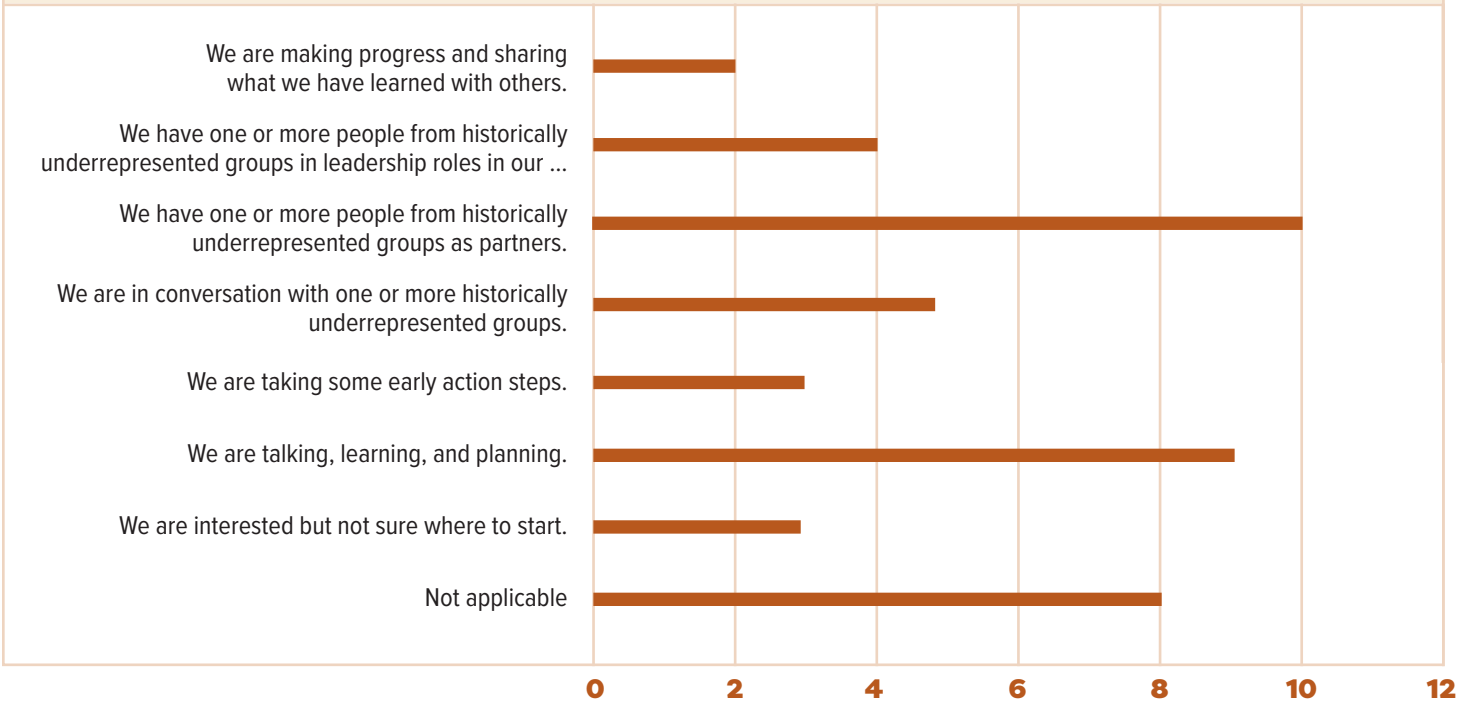
Other groups may be underrepresented because their perspectives or goals are very different from the leadership and/or direction of a partnership. For example, the goals of farmers or academic researchers may not necessarily align well with the goals of a restoration initiative – or may require listening and dialogue to develop alignment.

It is also important to consider how power has changed over time. Some groups who have had more power and influence historically than they do today may be considered underrepresented, even though they may still have power and influence.

Understanding power and representation is nuanced and not straightforward. These are a few considerations that provide context for what is meant by expanding the circle to include underrepresented groups.

As an example, a couple of people from one rural partnership felt that buzzwords like equity, inclusion and underrepresented groups were applicable in urban areas with more diverse populations but not in rural areas. They were nervous that funders like OWEB would use these terms in ways that would reduce their chances for funding. And yet separately, someone from the same partnership described their ongoing work to engage tribes, which indicates awareness of this issue within the partnership alongside nervousness about what funders expect of them.

To put this comment in context and summarize responses from across the state, partnerships in both urban and rural areas working in different ecosystems have been engaged in thinking about expanding their circle in terms of diversity, equity and inclusion and integrating it into their work. Many are focused on learning, while a few have transformed the way they work by integrating new voices and perspectives into their partnership. A few haven't discussed expanding their circle as a partnership recently or at all with partners, in many cases admitting everyone is too busy implementing projects to discuss it. Some partnerships felt they have the partners and relationships already in place to confidently implement their work. For example, some partnerships already have more landowner interest than they have capacity to work with. In a few partnerships in both Eastern and Western Oregon, tribal partners are in leadership positions and integral to the momentum and direction of the partnership. One partnership in Eastern Oregon noted that a majority of their partners are female in a professional field that has been dominated by males.



Efforts to expand the circle

Considering those that want to expand their circle, many partnerships described themselves still in the learning stages, not sure where to start or taking early action steps to expand their circle, while several other partnerships have been actively taking strides and providing a model for others.

Work to Expand Your Circle

To what degree are you working on expanding your circle of partners to include underrepresented groups?

Note: This reflects survey responses only and not responses from interviews or group discussions.

Partners described learning and early action steps to expand the circle.

"It is tough at [my agency] to work on this topic because of our mission, funding and culture, but we are thinking, learning and trying to develop plans and actions that are realistic and meaningful."

"The coast is largely white, working class folk. We have been really successful in working with our tribal partners, however there is much more work we can do in properly engaging, learning from, and being led by tribal members."

"[Our basin], as a whole, inherently lacks diversity, and the partnership has recognized this and is looking into ways to expand our circle of partners. Many [partners] have recently taken DEI training. ... This is something we could use help with."

"Our partners are working to fund tribal liaison positions to better coordinate collaborative efforts and ease the time burden on tribes to participate in conservation/restoration planning."

As partnerships engaged in deeper learning, one partner reflected on patterns of structural inequality[8] that can feel overwhelming.

South Coast. PHOTO / OWEB

"Expanding the diversity of voices heard is a difficult task in rural coastal communities, not because we haven't tried, but because the diversity is tribal and socioeconomic and the priorities of these diverse groups are different. Tribal engagement is critically important, but people available within the tribes to participate are extremely limited. Poverty issues related to housing and medical care continue to plague the small coastal towns. Bringing a range of voices to the table on restoration, conservation and natural resource issues likely feels like a 'nice to do' to most who are struggling day to day."

Addressing structural inequality is possible, but requires creative energy for relationship building and often reframing of a partnership's goals to open up new possibilities for broader engagement. As part of that reframing, several partnerships discussed the distribution of costs and benefits from restoration projects, a cornerstone of environmental justice work, observing that if this question is not considered, economic benefits will often be highest for wealthier residents who own riparian areas or large upland properties.

Oregon Central Coast Estuary Collaborative Field Trip, September 2023.
PHOTO / MIDCOAST WATERSHEDS COUNCIL

Several partnerships described how the process of reframing their goals, vision and work together took place in tandem with new partners taking leadership positions. They also discussed how their governance structures, roles and/or decision-making processes evolved through this process.

- One partner described how tribes have become pivotal partners and taken on a leadership role in several projects as the partnership has deepened their commitment to tribal interests – transforming their planning processes with benefits including protection of culturally important resources.

- Two other partnerships described how local government agency partners with missions that emphasized public health and economic stability helped shift the partnership's work to minimize or mitigate environmental burdens to low-income residents and increase benefits, for example when deciding which projects to implement first and investing in workforce development.

[8] ***Structural inequality*** *refers to a society where different groups have vastly different life outcomes and opportunities. It occurs when bias is embedded in the policies and practices of organizations and governments across sectors, such as housing, education, economic development, health care, clean water infrastructure, etc. People who experience disadvantages in one area are more likely to experience disadvantages in another, and vice versa, people experiencing advantages in one area are more likely to experience advantages in another, which structurally reinforces disparities over time.*

While leaders have a clear role to play in expanding the circle and introducing new ways of thinking, the diversity of perspectives among staff and participating partners can also be transformative in the evolution of a partnership. Several partnerships described the value of having diverse perspectives both at the leadership level and also embedded throughout the general partnership and partner organizations. One partner, who is a citizen of a tribal nation, reflected that having more people with indigenous perspectives embedded within their organization has influenced the thinking, conversations and direction of their organization and the partnership overall with transformative results.

East Cascade Oak Partnership, Wildflower Walk. PHOTO / COLUMBIA LAND TRUST

Another partnership shared how they are continually investing in conversations with tribal partners and looking for ways to create more touchpoints, knowing that it takes time to build trust and understanding, which can then lead to deeper engagement.

"Equity is layered into how we operate. We don't have a formal tribal representative on the board, but I am in a leadership role with [my organization] and a citizen of [a tribal nation.] One person on staff is a citizen of [another tribal nation.] While we are not officially representing the tribes, we bring indigenous perspectives to our work. When I bring up issues, I guess yes, I feel like my voice is being heard. A bunch of collaboration is happening with tribes and other partners also. The tribes are collaborating in ways they didn't before. This engagement is changing projects in the watershed and how we look at watershed restoration overall. Maybe not with landowners yet, but definitely within the partnership."

"Through [funded projects] and our monitoring work, we're having a lot of conversations [with our tribal partners]. I just talked with three tribal members last night about our shortages for monitoring consultants, and they said, 'Well, we have these crews that are busy for three quarters of the year, and then don't have anything to do for another quarter of the year.' There might be some opportunity for us to train them up and hire them to implement some of our monitoring for us. And you know seasonally, it might not be ideal, but it might be from an equity perspective to more deeply engage tribal members in the work that we're doing and for us to learn more from them about the things they're seeing in the landscape and the lens that they view this work through."

In addition to reframing the work, one partnership highlighted compensation for people to participate in meetings who otherwise wouldn't be able to attend – as a way to reduce barriers for engagement. OWEB provides flexibility within the P-TA and FIP grants to pay people to participate meetings, so partnerships are allowed to use this funding to reduce barriers for historically marginalized groups that otherwise couldn't attend. Some partnerships described using this funding to ensure that grant-based organizations, and especially small watershed councils, could dedicate their time, but no one spoke of specific examples where partnerships are using this funding with historically underrepresented groups.

Challenges to expanding the circle

A challenge expressed by several partnerships focused on implementation is lack of time to slow down and discuss questions like who to involve, why and how. One partner expressed frustration that there was never time on the agenda to discuss opportunities to bring in new partners who could help shape ideas for long-term planning. A lack of time or focus for these types of discussions is exacerbated even more when there is turnover among leadership or staff. Some partnerships that have been successful managing the power dynamics and interests within their existing circle were hesitant to think about including new partners because of the uncertainty and risk that it would slow them down.

"I can see problems in certain watersheds, where adding too many groups could result in less restoration. If it takes too much time to come to consensus or if certain groups do not get along, that might be more problematic than reducing the number [of groups involved] to get good restoration projects done in an effective manner."

In some partnerships, progress working with underrepresented groups has been led by one or a few partners that have many years of experience integrating equity into their programs and operations. Some examples include workforce development that includes

Grande Ronde Restoration Partnership, Hall Ranch OSU Visit, 2015.
PHOTO / GRANDE RONDE MODEL WATERSHED

recruiting from Native and Latino communities, labor representation at the highest level of the organization and healthcare benefits for restoration workers. In one or two partnerships, it appears that the partnership as a whole has been less engaged in expanding their circle because one partner has been making strides that benefit the whole partnership.

It takes a concentrated effort for people who are relatively comfortable in a given context to understand the forces that marginalize others or even see that people are marginalized at all. Several partners felt fairly confident they had the right people involved, but then emphasized that they would gladly expand their circle if it turns out they are missing anyone. Several partnerships emphasized that this is an area where learning and support are needed and that they want to be thoughtful and intentional when bringing in new partners and attempting to expand their circle.

This was a common theme that it takes time for partnerships to consider whether to expand their circle, how and why, then time to make decisions together and take steps to follow through. This is challenging for many partnerships who have a heavy workload and other complications such as turnover among leadership and staff. It is very humbling work that requires trust and openness recognizing that there is no single right way and everyone will make mistakes.

Expanding the circle in the context of OWEB grant programs

As OWEB continues to clarify their own internal values related to equity, diversity, inclusion and environmental justice, there likely will be aspects of their grant programs that they will want to clarify, change or further develop. Two examples below – land transactions and planning frameworks – illustrate how seemingly small details in program guidance can influence whether potential partners feel included or not.

Willamette Mainsteam Anchor Habitat Working Group - Public tour of project work at Snag Boat Bend, June 2017. PHOTO / LONG TOM WATERSHED COUNCIL

Land transactions – an example

The example of OWEB's land transactions and the conservation easements they include is used here to better describe how program rules – and perceptions about what is allowed or not - can restrict a partnership's efforts to expand their circle. A few partnerships expressed concern that OWEB-funded land transactions exclude tribal harvest of culturally important plants, which is a high priority issue for tribes.

In the words of one tribal partner, who urged OWEB to change their policy, OWEB's restrictions on land transactions make tribes not want to participate, which can negatively affect the momentum and direction of a partnership overall.

"The significance of restrictions on land transactions is heavy. If OWEB doesn't change the restrictions in ways that recognize and respect tribal uses and needs, tribes will struggle with land acquisitions. Tribes may prefer not to have them. I would want OWEB to add language to conservation easements that 'When this land is returned to tribes, this easement will be dissolved.' It is a recognition of tribal sovereignty."

"Stewardship for us as indigenous people is about going out on the land, using resources, observing, talking about what you see, involving young people. When we take care of the land, we harvest and gather foods, medicines and materials for baskets and other culturally important purposes. We may want a simple structure to protect us from the weather as we process materials. Sometimes we may want to have a community space to hold a ceremony before we harvest. Our elders might need parking, maybe a bathroom to make it possible to be there with us. When we are observing, protecting and teaching about our resources across the generations, we are active stewards.

OWEB needs to change this policy - for tribes that are ready, it can bring about healing."

OWEB's response to concerns about land acquisition from Tribes

When this concern was brought up to OWEB, their response was that tribal harvest of culturally important plants is allowed on lands acquired with OWEB funds as long as the harvest is consistent with the protection of conservation values for that property and is described in the management plan required by OWEB.

OWEB staff explained that the language in the conservation easement template for fee simple transactions says that vegetation removal is not allowed until either a management plan is developed that includes vegetation removal or OWEB approves vegetation removal separately in writing. From the comments received in this study and similar comments expressed directly to OWEB, it seems that this nuance has not been understood. OWEB staff also shared they have approved one management plan that includes the harvest of culturally important plants, so there is more flexibility than what people are perceiving.

OWEB's land acquisitions staff and regional staff work together to review proposed management plans for newly acquired property interests and management plan updates for prior transactions, in what they describe as a fairly straightforward process.

Land acquisitions staff emphasized they hope people pick up the phone and call if they have questions. They would be more than willing to work with tribes to include harvest of culturally important plants in OWEB-required management plans.

The question about other improvements such as a simple structure to protect people from the weather, parking, bathrooms and other infrastructure would need further discussion and would depend on the specific context of each property to determine what would be consistent with the protection of the property's conservation values. For example, some acquired properties are old farms so there might be an existing turn-around for a few cars to park and an easy spot to put a temporary port-a-potty with little risk of negative impacts. If there was a desire to have more extensive infrastructure like permanent bathrooms and shelters, or regularly host lots of people, other funding sources that align with community use of the property would be a better fit.

With respect to transferring **OWEB** -funded properties over to tribes, OWEB staff described a property that was purchased by a land trust and then transferred to the Confederated Tribes of Siletz Indians. They emphasized that OWEB uses conservation easements in all transactions including transfers because Oregon statues require that properties acquired with OWEB funds are managed in perpetuity for the conservation purposes of the grant and give the Board certain authorities regarding the sale or transfer of the property. Changing this requirement would necessitate changing the statutes, which tribes could advocate for.

Recognizing the need for more clarity on this issue, **OWEB** is already beginning to reach out to tribes to discuss concerns associated with the land acquisition grant program. They want to listen to better to understand tribal perspectives and ways they can address concerns.

Planning frameworks – an example

As another example, at least one partnership felt strongly that the Open Standards for Conservation Planning framework referenced in OWEB's Strategic Action Planning Guide with its emphasis on 'threat reduction' did not align with their values and approach. They explained that an emphasis on 'threat reduction' positions people as causing threats that need to be managed instead of partners who work together to develop a vision and plan of action.

"We approached our strategic planning a little bit differently than [other] partnerships who start with the ecological outcomes that they want to see and then threats and then figure out strategies to address those threats. We rejected the concept of 'threats' out of the box. Instead, we wanted to talk about impacts both positive and negative that people's behaviors have on ecological systems, just recognizing that we're all a part of them."

Instead, this partnership created a modified planning framework that fit their values and approach. Their planning included broad outreach interviewing more than 60 people outside of the partnership to expand the ideas and perspectives that went into development of their results chain beyond their circle of partners.

While OWEB allows partnerships flexibility to choose their own planning frameworks and tools, which is widely celebrated as a strength including in this example, their planning guidance is largely shaped by the Open Standards approach, which caused friction in this case and has been critiqued more broadly for similar reasons (Arnold and Wilson 2021). This example provides a reminder of how values are embedded in planning tools and grant guidance, which may have unintended consequences for who feels included or not in the work.

Recommendations for OWEB for expanding the circle

- Use terms such as diversity, equity, inclusion and underrepresented groups very intentionally, clearly articulating their definitions and why they are being used considering how this will be understood by different audiences.

- Continue proactively analyzing grantmaking practices and program rules to identify and eliminate barriers and increase accessibility to OWEB grant programs, especially inviting feedback from new applicants, new grantees and grantees working to include underrepresented groups.

- Consider how and when to integrate concepts of equity and environmental justice into grant programs and rules considering OWEB's strategic plan and equity statement, in development, alongside existing laws, policies and capacity to implement changes.

- Continue to provide resources and tools to grantees to support greater awareness of tribal issues, including sovereignty, treaty rights and the specific issues and cultural practices relevant to tribes in Oregon.

- Consider training or peer learning opportunities to raise awareness and share innovations related to engagement, equity, inclusion and environmental justice as they relate to restoration, for example how asking about the distribution of costs and benefits may help identify new groups to involve and/or new approaches.

- Invest in opening communication and building trust with tribes around concerns that OWEB-funded land acquisitions are not inclusive of tribal approaches to stewardship – clarify that harvest of culturally important plants is allowed and potentially other activities – and stay open to suggestions that may emerge from further dialogue.

- Confirm with grantees that they can use P-TA or FIP funds to compensate people for participating in meetings, which may reduce barriers for some underrepresented groups.

OWEB identified tracking progress and telling the story of impact as a priority topic aligned with their ongoing efforts to understand the real challenges of monitoring and tracking progress so that they can support grantees to be as successful as possible (Boulay 2021; OWEB 2018). Tracking progress is valued as a means to understand the effectiveness of actions and adaptively manage future actions to increase the likelihood for impact. Tracking progress is also valuable for showing the impacts of a partnership's work to gain public support and increase competitiveness for funding.

Since the start of the FIP Program, **OWEB** Board, staff and partnerships have shifted their thinking and expectations. They now recognize that while six years of funding is longer than most grants, the work needed to see ecological and social outcomes will take much longer. With this part of the study, OWEB hopes to elevate common challenges experienced by partnerships and any innovative strategies that all partnerships may benefit from.

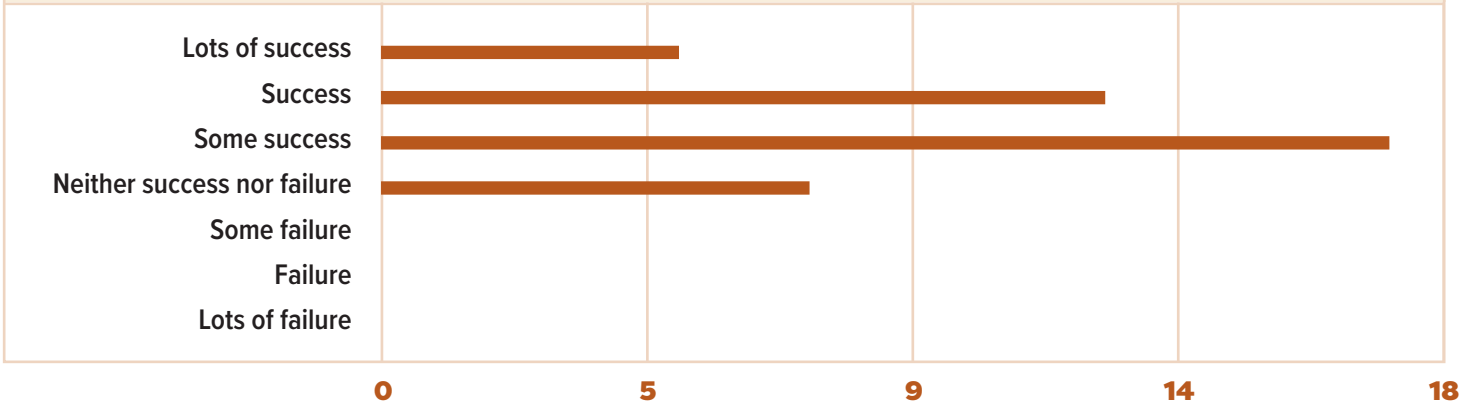
4 Tracking progress and telling the story of impact

Success alongside common challenges

Overall partnerships expressed pride and confidence in their ability to track outputs and demonstrate progress toward meeting their strategic action plan's goals and objectives. Many partnerships relied on their theory of change to infer progress toward outcomes based on tracking of near-term indicators. In some cases, partnerships conducted effectiveness monitoring at the project level. However, landscape-level effectiveness and telling the larger story of impact was much more challenging.

One partner described having a thoughtful, science-based discussion within their partnership, where they determined it was neither feasible, financially or economically, nor a good use of the partnership's time and attention to focus on landscape-level ecological trends.

Another partner noting the substantial cost and complexity of monitoring change at the landscape level, encouraged creativity in telling the story of impact, for example integrating anecdotes, storytelling, traditional knowledge and observations at the ecosystem level.



"We have a lot of project level success stories to tell…. We can't link our work directly to anything at the population level, and we struggle at the landscape level as well. But at the project level, we have a lot of good data. …

One of the landowners, when we started a project, was like, 'Hey, there's no trout in my river!' And then we built this project, and he went out and had a 20-fish morning! His response was, 'I never knew how important large pools were.' It's learning you can touch."

Success Tracking Progress

To what extent have you had success tracking progress toward your long-term goals?

Note: This reflects survey responses only and not responses from interviews or group discussions.

Common monitoring challenges

OWEB initiated this study by recognizing common challenges partnerships face with monitoring short- and long-term ecological and social outcomes:

- External changes, such as extreme flooding, catastrophic fire, economic recession, climate change, etc.
- Shifting understanding of how systems work and what we should be tracking to measure change
- Managing large complex data sets with multiple partners
- Funding for monitoring over the timeframe needed for outcomes to emerge, and
- Linking your work to the changes observed when there are other influences and unknowns.

Partnerships heartily agreed with this list – sharing examples of facing many of them at once.

Partnerships also added several more challenges to monitoring short- and long-term outcomes:

- Selecting the most relevant metrics out of all of those that interest partners and funders
- Lack of regionally standardized protocols
- Complexities of monitoring ecological and social outcomes, especially when integrating goals around diversity, equity, inclusion and justice
- Lack of historical data to establish trends
- Limited personnel with the capacity and expertise to develop monitoring plans and conduct analysis
- The time and expense to meet funders' monitoring and reporting requirements that may not align with the partnership's goals or available funding
- Limited time to turn around results and discuss together what they mean, and
- Trust to ask hard questions so what is learned from monitoring can improve future work.

"Funding opportunities for monitoring habitat at the project scale are rare or may not be practical. Monitoring that is occurring at the population level is not detecting change, likely from the lack of habitat restored compared to what has been degraded over time. Remote sensing has provided another tool for monitoring projects that may be more cost effective, however, time scales and costs could prevent timely nature of effectiveness monitoring that can be applied."

East Cascade Oak Partnership, USFS Prescription Fire Tour with Roland Rose. PHOTO / COLUMBIA LAND TRUST

Again, partnerships described experiencing many of these challenges all at once. One partnership recommended that it would be more practical to develop regionally standardized protocols that would be implemented by highly trained and funded regional monitoring crews rather than expect that each partnership or organization lead their own monitoring.

A shared need for increased monitoring infrastructure

Many partnerships expressed wanting to assess the effectiveness of their actions at a larger scale and over a longer timeframe – and yet an overwhelming theme was that more institutional support and monitoring infrastructure are needed to do so. Partnerships with monitoring expertise emphasized this point.

"With only two staff dedicated to restoration work [from our organization], we simply do not have the time, funding, training, or capacity to track/monitor short and long-term outcomes on all of our projects.

Another challenge is that even if we did have the ability 'in-house' to do so, there is generally a lack of regionally standardized protocols established to track/monitor these various projects.

If there were in fact regionally standardized protocols, it would be most efficient to have a highly trained and funded regional or perhaps county-wide monitoring crew(s) dedicated to collecting and analyzing data to determine if short and long-term goals are being met.

This would be an extremely useful form of support to the partnership."

"We all are monitoring on our own, including an incredibly robust program [that one partner is leading]. Everyone is doing a portion. All of us are putting in some of the ingredients, but the cake never actually gets baked. We are always just bringing our individual part. If you ask us, how did you change x, we can give you that answer. But telling you the whole story, that is what's hard.

[We are waiting] for that moment when you actually have the final product that everyone can look at and say, 'Okay! This is everything that we have done, and this is what's been achieved.' And we finally getting to eat the cake! I want that moment where I get to see all of it. It would be good to have a well-baked cake."

Grande Ronde Restoration Partnership, Hall Ranch OSU Visit, 2015. PHOTO / GRANDE RONDE MODEL WATERSHED

Many partnerships, including both FIP and P-TA grantees, expressed specific needs for institutional support for monitoring. Partnerships with much less capacity and expertise required more support, for example the earlier suggestion for monitoring conducted with standardized protocols and regional monitoring teams. The priority needs highlighted here were commonly identified as critical gaps by partnerships, both FIP and P-TA grantees, who have relatively high capacity and expertise in monitoring.

***Priority** needs for institutional monitoring support:*

- Systems to manage and share data,
- Expertise for analysis, especially addressing multi-scale data, and
- Support to interpret results to tell the story of progress and inform adaptive management.

Possible types of institutional support:

- An institute within the university system supported by federal funds, similar to the Southwest Ecological Restoration Institutes,
- Greater leadership by state and federal agencies,
- Contracts with private consultants, and
- Peer learning through conferences and workshops.

A prominent theme in these suggestions was the desire for more monitoring workshops or peer learning opportunities with at least seven partnerships expressing a strong interest. Some partners expressed preference toward in-person sessions that provide more targeted, directly useful guidance over written materials or virtual sessions.

> *"A widely known scientific challenge is analyzing multi-scale data. I think a watershed restoration monitoring workshop would be very helpful so that we could all learn from each other on things like: monitoring different parameters, monitoring effectiveness of different types of restoration projects, writing monitoring plans for watersheds, funding for monitoring personnel and equipment, managing monitoring data, etc."*

Several partnerships noted their disappointment that the universities haven't played a bigger role in providing expertise and capacity for training, analyses and interpretation.

Suggestions for ways to fund additional monitoring infrastructure and institutional support included partnerships:
- Lobbying state and federal agencies for funding and/or
- Advocating for a statewide bond.

> *"Looking forward, I think that OWEB and the state and federal agencies may need to look toward a high-level longer lasting institutional support [for monitoring and restoration] and lobby for the creation of something like the Ecological Restoration Institutes at Northern Arizona University, Colorado State University, and New Mexico Highlands University. This type of organization would support FIPs with science, monitoring, coordinated outreach and improved engagement by local partners." (Link to SWERI and federal authorizing legislation)*

Suggestion for partnerships

Convene partnerships to explore a unified strategy to advocate for funding from state and federal agencies and/or some kind of bond measure.

OWEB reflected that these comments could help to reinvigorate the vision from the Oregon Plan, where the responsibility for landscape level monitoring is shared among state and federal agencies. This approach integrates two priorities from OWEB's 2018 Strategic Plan – the need to define monitoring priorities and working with agencies and private foundations to align funding for those priorities.

Feedback for OWEB on monitoring

Overall, OWEB monitoring staff were consistently recognized for their ability to understand the real challenges partnerships faced and provide meaningful, individualized support.

However, two partnerships felt that OWEB could do better providing clear guidelines or expectations for monitoring reports at the beginning of the FIP grant, especially given the limited timeframe and the complexity of the work. One partnership in particular was frustrated by the different metrics required by different funding sources that were not apparent at the beginning of the grant. OWEB responded that this issue was flagged in a 2021 assessment of granting practices (Miller 2021) and that they have been coordinating with the staff responsible for reporting on Pacific Coastal Salmon Recovery Funds to prevent this from happening again.

Partnerships consistently expressed appreciation for FIP funding that could be used to hire a monitoring coordinator and fund monitoring projects. FIP grantees further along in their workplan recommended to newer FIP partnerships that they reserve funding in the second and third biennia for monitoring since the need would grow as projects were completed. Partnerships emphasized grant writing should also be included in the second and third biennia.

Suggestion for partnerships

For FIP grantees, reserve funding in the second and third biennia for monitoring and grant writing.

Partnerships also realized that even though all grant funds would be awarded in six years, many projects might take one to four years or more to complete after the award. One partnership emphasized the value of the supplemental effectiveness monitoring funds that OWEB provided, in addition to their FIP funding, which was critical in responding to concerns by an oversight agency early in the project. The additional monitoring grant allowed them to show progress and gain the support needed to move forward with the project.

PHOTO / HARNEY BASIN WETLANDS COLLABORATIVE

"That first round of restoration was a little messier than people were used to. … And we really had to pause for several years and do monitoring and tell that story. Having that extra funding and that space to be able to tell that story [was an added] boost. We've restarted [the work] now, and it's going much better. It helped us continue with that restoration effort overall. Having the funding and space to do that was really critical."

Grande Ronde Restoration Partnership, Longley Meadows Post Construction, June 2022. PHOTO / GRANDE RONDE MODEL WATERSHED

Several partners pointed out that ongoing capacity for monitoring will be needed well beyond the FIP grant to tell the story of progress – and that they felt OWEB still has unrealistic expectations of how long it will take to observe ecological outcomes.

"It takes decades to do this work to the extent we want to do it."

"Post FIP, we will need to find a way to continue monitoring, which increases with each new project. If we are not able to find funding, it will be difficult to meet the monitoring requirements. I think that it would be helpful to have long-term funding associated with FIPs that covers monitoring expenses post-FIP."

"We're talking decades of monitoring. One brood year is 4 or 5 years out in terms of fish return. And then we need multiple generations coming back to be able to look at any trends. And then we have decadal oscillations in ocean productivity. Right now, if you look at our nice graph, we are at the bottom of yet another decadal oscillation. That's the temporal scale that we need [consistently funded] monitoring programs guaranteed. The data doesn't tell you a lot because you have to look at 50 years of data."

OWEB's grants database was another area for improvement. FIP grantees are required to describe 'lessons learned' when they enter their grant reports in OWEB's database. One partner highlighted that these lessons learned could be a source for peer learning across similar project types, except that this field in the grants database is not searchable. They recommended that OWEB update this function of the grants database or provide some type of annual summary of lessons learned by project type.

OWEB's learning around monitoring and tracking progress

OWEB recognizes the inherent challenges in monitoring and tracking progress in complex systems, and they also understand the desire for grantees to have more clarity about what they are looking for in terms of monitoring. With this in mind, OWEB staff met with the third cohort of FIP grantees individually at the start of their grant to clarify monitoring expectations. They said they expect FIP grantees to conduct some type of monitoring that can be used to track progress towards meeting ecological outcomes and inform adaptive management, as described in their theory of change.

OWEB staff emphasized that they can provide tools, resources and guidance on general principles, but the partnerships are the ones that need to decide what is most important for them to monitor relative to their goals and theory of change, ideally involving the breadth of partners in these decisions.

As for changes to the grants database, there are not funds or capacity to do so at this time, but **OWEB** emphasized that it is good to document this request for future consideration and it echoes feedback they have heard previously.

OWEB has also learned the importance of flexible resources to respond to emerging monitoring needs, for example the supplemental effectiveness monitoring grants that were available to the first two cohorts of FIP grantees. OWEB is considering ways to set aside funding for similar sorts of emerging monitoring needs in the future.

While recognizing the need for consistent, long-term funding for monitoring, OWEB clarified that the FIP program is not the vehicle to address this need. In the near term, OWEB is very interested in having partnerships report on all they accomplished with their FIP grants. They acknowledge that there were not resources budgeted for this step and that reporting at this scale requires time and collaboration among partners. With this in mind, OWEB is piloting a post-FIP reporting project with a FIP grantee from the first cohort. The purpose is to synthesize and communicate information collected during the FIP, not to collect any new data. They are looking to use what they learn from this pilot to better define post-FIP reporting.

OWEB does aim to share lessons learned across partnerships, for example sharing Project Completion Reports with a partnership's permission. They also suggested that lessons learned can be found in a FIP grantee's Progress Tracking Reports, especially in the adaptive management section.

Salmon SuperHwy - Bridge construction on Peterson Creek to allow fish passage. PHOTO / TRAV WILLIAMS

Recommendations for OWEB for tracking progress

- Clarify expectations for monitoring and reporting requirements at the start of each FIP grant in an individualized manner.
- Continue to allow flexibility in monitoring and reporting so that grantees don't have to invest energy into metrics or reporting that may be outside of the partnership's main focus.
- Invest in workshops, trainings and/or conferences to encourage peer learning and learning from experts and guest consultants, for example working through the challenges of multi-scale data including monitoring different parameters, monitoring effectiveness of different types of restoration projects, writing monitoring plans for watersheds, funding for monitoring personnel and equipment, managing monitoring data, cultural considerations, etc.
- Work with state and federal agencies to explore ways to increase investment in monitoring infrastructure, for example a restoration research institute or regional monitoring teams supported with legislative funding or a bond.
- Continue offering supplemental effectiveness monitoring grants to allow flexibility to support overarching monitoring needs identified by each partnership.
- Consider long-term funding for a monitoring coordinator through the P-TA grant.
- Given the long-term need to track progress beyond the six-year FIP grant, consider offering funding to all FIP partnerships for post-FIP reporting.
- Update OWEB's grants database to be able to search completed projects for lessons learned – or consider how to compile lessons learned and distribute to partnerships.

Synthesis – Partnership Types, Performance and Resilience

Partnerships are often fragile arrangements built on a delicate calculation that the individual roles and responsibilities that partners are willing and able to commit to add up to the collected effort needed to advance their shared vision. Ambitious work in complex systems that are not well-understood puts additional pressure on the partnership since uncertainties in the work make it harder to accurately estimate roles and responsibilities and puts a greater emphasis on learning. Resilience is centrally important in these contexts.

"Money drives commitment in a big way. However, not all project concepts evolve the way they were initially thought of, so commitments have to also evolve."

Compromise *refers to a quick resolution of differences with the goal of at least partly giving each party what they want.*

Collaboration *refers to a deeper exploration of differences, engaging in dialogue to understand the 'whys' behind what each party wants with the goal of developing more creative and inclusive solutions that address common interests and overarching goals.*

Partnerships that engaged in more straightforward work in relatively well-understood systems may experience fewer stressors and be able to perform well with less emphasis on resilience.

For many partnerships, especially project-oriented partnerships, that calculation is negotiated as the partnership is formed so that each partner, or a subset of core partners, will get some portion of the budget and will be afforded the trust that they have the professional skills and judgment to carry out high quality work. These financial expectations may be spelled out in a charter or grant agreement, but more often, they are an implicit premise that keeps everyone showing up and is foundational to the stability of the partnership. If one partner falters in their performance, the threads of resilience can help a partnership stabilize, for example camaraderie and openness to talk about problems and pitch in to resolve them, plus shared leadership to keep the overall focus on the partnership's work, rather than individual interests.

East Cascade Oak Partnership, Grass Identification.
PHOTO / COLUMBIA LAND TRUST

In the context of this delicate calculation, many partnerships are set up to compromise when issues arise about overall performance or accountability, for example which actions are most likely to have a positive impact or which partner is best suited to take on specific roles. In the ideal sense, collaboration may seem like a better approach to boost performance, where partners engage in deeper dialogue for mutual understanding and problem-solving.

However, if partnerships have a solid understanding of their socio-ecological systems, if there are best practices to address their resource concerns and if partners have the capacity and expertise to advance the work, then they may be able to operate at a high level of performance relying on compromise without the need to have deeper conversations about performance and accountability. In fact, they may be able to maximize their efficiency and performance by relying on compromise.

Further, most partnerships are not structured for this level of higher level of interdependence and accountability. Even if their intent is to be structured in this way, they may not have enough stability or resilience to do this well, in terms of that negotiated division of labor and budget that keeps everyone showing up. This may be especially true when individual partners depend on the partnership for their financial stability or reputation. If funders push partnerships too hard expecting them to hold each other accountable with performance issues and the stability and resilience isn't there, performance could suffer. For example, tensions caused by the attempt to talk about performance issues could close down communication making it harder to address concerns. Partnerships that have more threads of resilience, for example camaraderie, success, organizational anchors, shared leadership and openness, are better able to withstand the destabilizing forces of working through these types of challenging questions.

A focus on compromise instead of collaboration is common for project-oriented partnerships and to some extent planning-oriented partnerships. Compromise and 'splitting the pie,' for example splitting budgets evenly among partners, may contribute well to performance in relatively well-understood systems with straightforward work plans, especially if a number of actions are considered equally important and the roles align well to split the work.

However, **OWEB** has expressed that they do expect a higher level of collective attention on prioritizing projects and preparing projects for technical review. They explained that the FIP program provides a unique opportunity for partnerships to work together to strategically focus on actions that have the greatest potential benefit relative to their restoration goals. Splitting the budget evenly among partners could be a strategic approach to keeping partners at the table and sharing the workload, but not necessarily strategically focused on the highest priority restoration activities. OWEB believes partnerships who split the budget evenly would be a better fit in the Open Solicitation Program.

"We don't want partnerships to form and apply for the FIP simply so they each have access to a larger pot of money for projects. We want to fund partnerships that utilize their collective expertise to implement the most meaningful, priority projects in their geographies."
OWEB

Compromise may also be more common when partners work in separate geographies, for example with multiple watershed councils or Soil and Water Conservation Districts, which by definition only implement projects in their geographies respecting the territory and autonomy of their neighboring districts and councils. However, there were clear examples of partnerships with multiple watershed councils and Soil and Water Conservation Districts organized as a planning-oriented partnership where they were structured to work collectively to fund the best projects, rather than just 'split the pie.' Planning-oriented partnerships tend to emphasize shared leadership, as in a steering committee that includes representatives from different partners organizations that keeps the focus on what is best for the partnership. Partnerships that have their own internal review process often also rely on a steering committee to weigh in on proposed projects.

Systems-oriented partnerships are structured to have even greater accountability, where they collaboratively develop standards and expectations along with mechanisms to raise questions and a process to work through them to meet standards. Developing this level of infrastructure is resource intensive and requires a greater emphasis on resilience although none of the partnerships in this study were fully built out systems-oriented partnerships. Partnerships are better able to mobilize funding for this level of infrastructure when their work commands high interest and there is the potential for dedicated long-term funding. Several partnerships leaning towards a systems-oriented partnership were able to use the FIP grant as a catalyst to start to build that level of long-term funding, but the findings from this study caution not to expect such a high level of commitment without long-term consistent funding.

In contrast, learning-oriented partnerships are structured to ask challenging questions, since learning is the focus and what brings value to partners. However, they are structured to work independently, not to plan or implement projects together, and so the consequences of asking hard questions are not as destabilizing to partner reputations or finances in most cases. Each partner is responsible for securing funding to do their own work, and so the partnership can withstand partners coming and going, for example if there is a change in focus to improve performance that some partners dislike, with less risk to the partnership as a whole.

OWEB shared that they will continue to reflect on these findings to more clearly understand and articulate their vision of how successful FIP partnerships function.

East Cascade Oak Partnership, Wildflower Phenology Walk. PHOTO / COLUMBIA LAND TRUST

Synthesis – OWEB's Role in Supporting Partnership Performance and Resilience

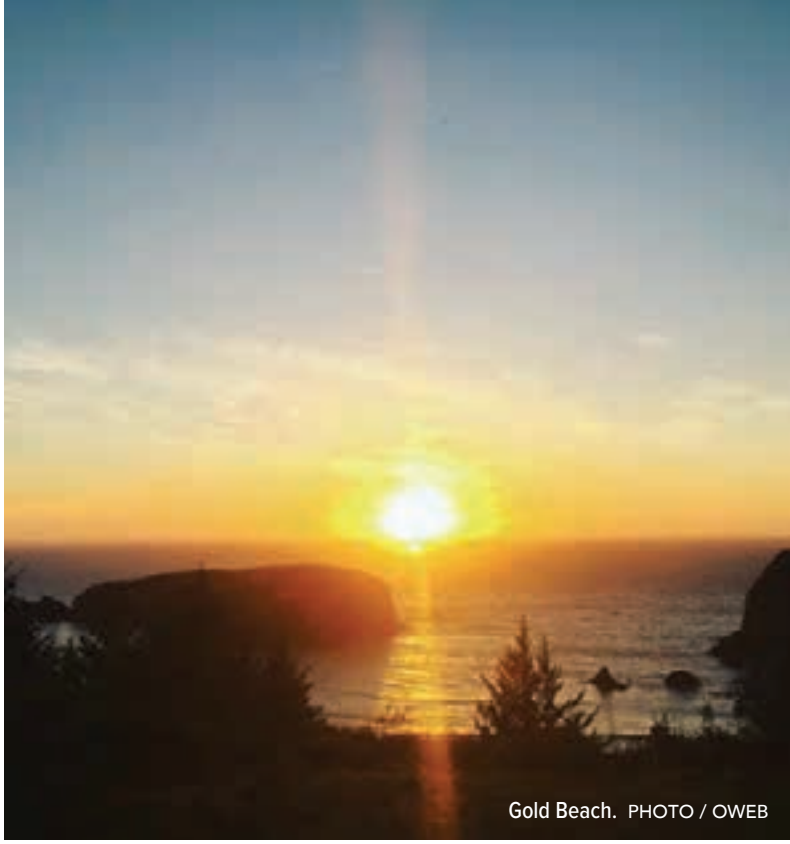
Partnerships have been eager to participate in the FIP program because the scale of funding over six years allows them to tackle more ambitious projects over larger landscapes. However, there was evidence that this hard push for implementation has sometimes kept them from pausing to check-in on trust, reflect on whether projects are meeting strategic priorities and consider opportunities to expand their circle. Yet, there were also many examples of partnerships effectively scaling up their work, while still dedicating time to reflection, expanding their circle, and strategic thinking. **Overall, there is evidence that the supportive culture within OWEB mitigates for this tension to perform at an accelerated pace and that the benefits of the FIP and P-TA grants related to performance and resilience outweigh the costs and stressors.**

Overall, OWEB's investments in partnership planning, governance, coordination, project implementation and monitoring have been found to be well-positioned to support high performance and resilience.

"OWEB had a gathering a few years ago of funded partnerships to come and share at the Menucha Retreat Center. I thought that kind of thing is pretty helpful and would like the opportunity to do that again, to talk with other partnerships informally and get ideas. It was really useful, really great hearing [from others]. I just assumed OWEB wanted to see a perfect partnership, and I remember sitting with [another partnership] and hearing them talk about some of their [struggles]. It was just great to be like, 'Oh, good! Okay. So you can still be successful and have issues and are working through it.' And then just hearing and seeing what other people were doing, it was very reassuring for me. Yeah that was good." - *P-TA Grantee*

This study finds that the biggest near-term change that OWEB could make to support partnership resilience would be streamlining administrative burdens from the FIP program so that partnerships could dedicate more of their time to the operation of their partnership – specifically, streamlining project applications, technical review, reporting guidelines for monitoring and use of the online application portal and grants database. Some of these OWEB is working on, integrating recommendations from this study, while others like the database are not possible due to current capacity.

Further investments in institutional support for monitoring, such as near-term investments in peer learning opportunities and training workshops, were also identified as a high priority for investment to support resilience. OWEB holds a gathering for FIP and/or P-TA grantees every biennium, and OWEB staff are interested in more frequent peer learning or peer mentoring opportunities. They are considering what is possible given their staff capacity. Monitoring is especially important as partnerships who were able to learn from their efforts and tell the story of their success have been better positioned to be effective and secure ongoing funding. If OWEB can help introduce grantees to other funders, this would also contribute to resilience in terms of greater opportunity to secure ongoing funding. Over the long-term, support to help interested partnerships integrate equity into their vision and approach, including an emphasis on underrepresented groups, has the potential to boost resilience by tapping into the creative potential of broader constituencies and more diverse funding sources.



Conclusion

This in-depth, qualitative study found many examples of partnerships accomplishing more complex work at a larger scale than any one organization could do alone. Most of the assumptions from OWEB's theory of change have held up with some fine-tuning related to performance and resilience.

Partnerships emphatically described the value that the P-TA and FIP grants had to their performance, growth and resilience, including the cumulative value of these programs for partnerships that received both. FIP grants were described like 'rocket fuel' that launched partnerships into a higher level of performance, which also supported their resilience and competitiveness for future funding from other sources. P-TA grants created an opportunity for partnerships to formalize their focus, commitment and governance structure, which for most partnerships created momentum to then take advantage of large funding opportunities, including partnerships that were not selected for FIP grants. On the other hand, partnerships who weren't able to secure funding for the partnership to implement projects anticipated operating at a lower level until new funding was available, implementing the work individually or restructuring around a new focus and funding opportunity.

Thoughtful reflection on the function and structure of partnerships led to development of a series of conceptual tools describing:

- Partnership types defined by relative interdependence among partners,
- A framework for understanding high performance including categories of performance common to all partnership types and others that vary by partnership type, and
- Threads of resilience that maintain the integrity of a partnership despite stressors and change.

Gold Beach. PHOTO / OWEB

OWEB's efforts have been striking in their long-term commitment to invest in a breadth of partnerships working in different ecosystems across the state, their openness to learn alongside partners and their commitment to continually evolve the program to have the greatest impact possible.

However, program innovations must fit within the funding OWEB has for staff and infrastructure such as the online application portal and grants database – funding which is decided through the legislative budget process and relatively modest compared with their large funding portfolio. Program innovations must also fit within the statutes that govern the use of lottery funds for the benefit of water quality, watershed function, native fish, wildlife, plants and ecosystems. As OWEB continues to clarify their values and commitment to equity and environmental justice and as they learn from ongoing innovation led by partnerships and tribes, the interpretation of these statutes may play a key role in the future evolution of their partnership-focused investments.

OWEB's focused commitment to learning and adaptation in support of high performing partnerships has yielded many insights and practical tools that will be of use to partnerships and funders working in restoration and across sectors.

Appendix A

Partnerships awarded a FIP and/or P-TA grant: 2015-2022

The following partnerships were invited to participate in this study, except those with an asterisk who had only recently received funding when the study started. **Partnerships shown in bold participated in this study.** All of these partnerships are included on the map at the beginning of this report.

Partnerships awarded a FIP grant only: 2015-2022

Ashland Forest All-Lands Restoration
Baker Sage-grouse Local Implementation Team
*Coos Basin Coho Partnership
Deschutes Basin Partnership
Grande Ronde Model Watershed
Harney Basin Wetland Collaborative
Oregon Model to Protect Sage-Grouse All Counties
Warner Basin Aquatic Habitat
Willamette Mainstem Anchor Habitat Working Group

Partnerships awarded a P-TA grant only: 2015-2022

Umpqua Basin Partnership
Siskiyou Coast Estuaries Partnership, formerly Wild Rivers Coast Estuaries
Wallowa Fish Habitat Restoration Partnership
Rogue Basin Partnership
Willamette Valley Oak Prairie Collaborative
Hood River Basin Partnership
Intertwine Alliance Oak Prairie Working Group
Salmon Super Highway
Pure Water Partners
Upper Grande Ronde River Watershed Partnership
Partners of the North Santiam
Upper Deschutes Partnership
*Deschutes Basin Water Collaborative Partnership
*Nehalem Basin Partnership
*Coquille Coho Partnership
Upper Willamette Stewardship Network

Partnerships awarded a FIP grant and P-TA grant: 2015-2022

Clackamas Partnership Restoration for Native Fish Habitat
John Day Basin Fish Habitat Initiative
Rogue Forest Partners
Oregon Central Coast Estuary Collaborative
Siuslaw Coho Partnership
East Cascades Oak Partnership
Klamath Siskiyou Oak Network

Ashland Forest All-Lands Restoration Project

OWEB's Partnership Learning Project– Partnership Survey

Thank you for your willingness to participate!

Your thoughtful comments will contribute to a greater understanding of how partnerships grow and evolve under different circumstances. We hope this will benefit your partnership and others, while also directly informing the evolution of OWEB's Focused Investment Partnership (FIP) Program and Partnership Technical Assistance (P-TA) grants.

It is possible to complete the required questions in this survey in about 20-30 minutes. (Required questions are marked with an asterisk.) If you have more time to add comments and examples, it will contribute to a deeper understanding of partnerships and potentially more creative recommendations for OWEB.

Your responses for each page will be saved automatically each time you click on the 'next page' button. If you close your browser and have cookies enabled, you can open the survey link in the same browser and return to your responses to make changes or complete the survey.

If you would prefer an interview by phone or Zoom to share your thoughts instead of taking this survey, please reach out to the email below.

As a gesture of appreciation, each partnership that has at least two people complete the survey or participate in an interview will receive a check for $250 - which could be spent on meeting refreshments to celebrate your good work or whatever your partnership chooses.

All of your responses will be confidential and only seen by the research lead, Jennifer Arnold, Ph.D. of Reciprocity Consulting, LLC. Only aggregated summaries or anonymous quotes will be shared after all personally identifiable information is removed.

Findings will be presented to OWEB staff and board and if all goes well, we'll also develop an academic publication for a broader audience. We will recognize all of the organizations that participate.

If you include your email address, you will receive a copy of preliminary findings and be invited to share your feedback, likely sometime in early 2023. In the meantime, please reach out with any questions.

Thank you for the work you put in every day - and the opportunity to learn alongside with you!

Jennifer Arnold, Ph.D., Reciprocity Consulting, LLC
jennifer@reciprocityconsulting.com 520-990-6922
reciprocityconsulting.com

Partnership Survey

A Few Questions about You and Your Partnership

The following questions will help track patterns in responses across partnerships and allow for individual follow-up if questions come up during analysis.

1 Which partnership(s) are you a part of? Please mark all that apply.

- ◯ Ashland Forest All-Lands
- ◯ Baker Sage-grouse Local Implementation Team
- ◯ Clackamas Basin Partnership
- ◯ Deschutes Partnership
- ◯ East Cascades Oak Partnership
- ◯ Grande Ronde Restoration Partnership
- ◯ Harney Basin Wetlands Collaborative
- ◯ Hood River Watershed
- ◯ Intertwine Alliance Oak Prairie Working Group
- ◯ John Day Basin Fish Habitat Initiative
- ◯ Klamath Siskiyou Oak Network
- ◯ McKenzie Collaborative
- ◯ Millicoma Forks Coastal Coho Restoration Partnership
- ◯ Oregon All Counties Sage Grouse
- ◯ Oregon Central Coast Estuary Collaborative
- ◯ Partners of the North Santiam Watershed
- ◯ Pure Water Partners
- ◯ Rogue Basin Partnership - Little Butte Creek Watershed TRIB Initiative
- ◯ Rogue Forest Partners
- ◯ Salmon Super Highway
- ◯ Sandy River Basin Partners
- ◯ Siuslaw Coho Partnership
- ◯ Umpqua Basin Partnership
- ◯ Upper Grande Ronde River Watershed Partnership
- ◯ Upper Willamette
- ◯ Wallowa County Annual Invasive Grass Partnership
- ◯ Wallowa Fish Habitat Restoration Partnership
- ◯ Warner Basin Aquatic Habitat
- ◯ Wild Rivers Coast Estuaries
- ◯ Willamette Mainstem Anchor Habitat Working Group
- ◯ Willamette Valley Oak Prairie Cooperative

2 If you marked more than one partnership, which one are you most involved with?

Please answer the survey questions with this one partnership in mind. In the open comment boxes throughout the survey, you are also welcome to share reflections about other partnerships you have experience with.

3 Your Name

Your name is strongly preferred but not required. None of your responses will be linked to your name, organization or partnership. Research lead, Jennifer Arnold, will be the only person who will see personally identifiable information.

4 Your Email

If you provide your email, I will share preliminary findings for your review and feedback.

5 Your Organization

6 Your position in your organization and your role within the partnership, if you have a specific role.

7 Are you interested in being contacted for a follow-up conversational interview?
I am looking to talk to people from different types of partnerships to hear more about the questions in this survey.

- ○ Yes, I would like to have a conversation.
- ○ Maybe
- ○ No

8 Do you think your partnership might be interested in participating in a facilitated discussion?
If there is interest, I can virtually attend one of your partnership meetings to listen and/or facilitate a group discussion about some of the questions from this survey.

- ○ Yes
- ○ Maybe
- ○ No

Questions or comments?

9 How long has your partnership been operating in one form or another?

- ○ 0-2 years
- ○ 3-5 years
- ○ 5-10 years ago
- ○ 10-20 years
- ○ 20+ years
- ○ Don't know
- ○ No longer operating

10 How long has your partnership been operating in one form or another?

- ○ 0-2 years
- ○ 3-5 years
- ○ 5-10 years ago
- ○ 10-20 years
- ○ 20+ years

Comments?

11 Which OWEB grant has your partnership applied for?

- ○ Partnership Technical Assistance (P-TA) grant, formerly called Development FIP and Capacity Building FIP
- ○ Focused Investment Partnership (FIP) grant

12 Which OWEB grant has your partnership received?

- ○ Partnership Technical Assistance (P-TA) grant, formerly called Development FIP and Capacity Building FIP
- ○ Focused Investment Partnership (FIP) grant
- ○ None of the above

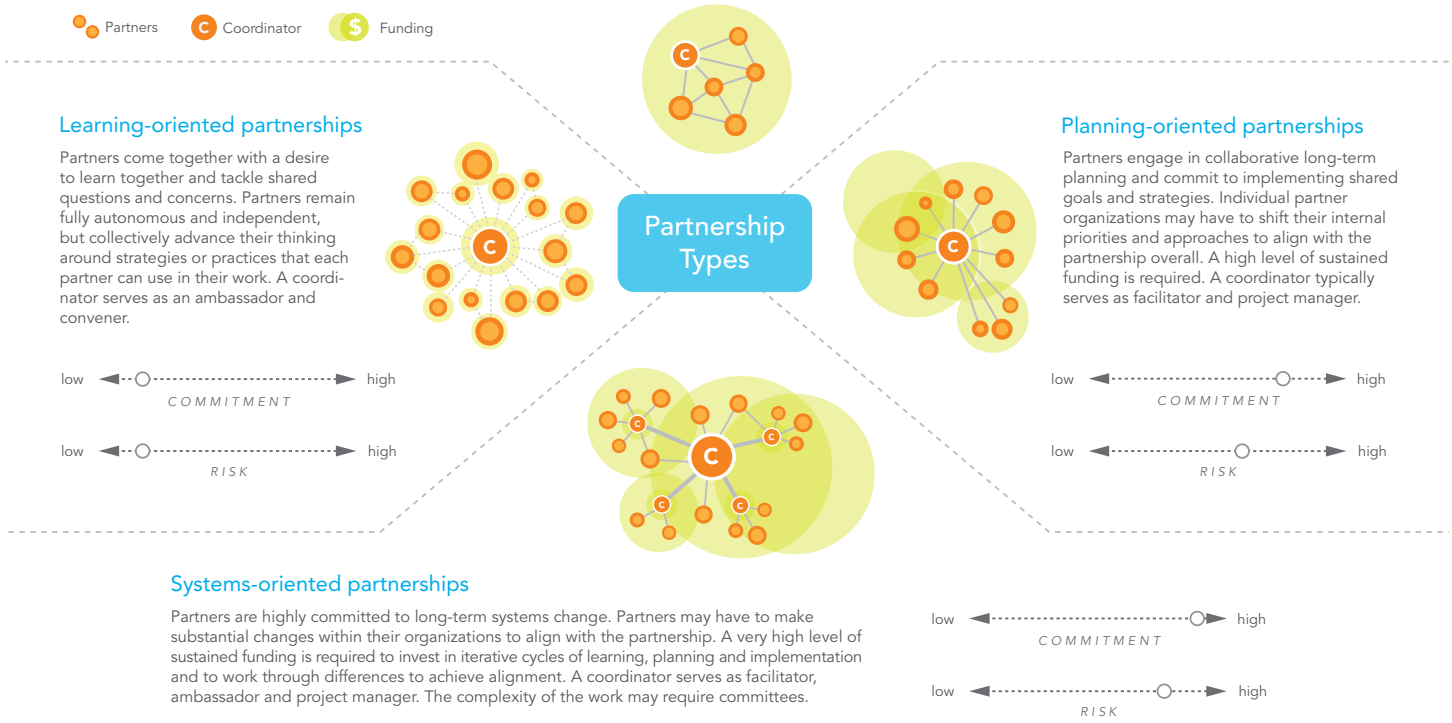
PARTNERSHIP TYPES

Partnerships work at different scales, geographies and focus areas. Each has a unique structure, function and focus, whichmay change over time as the work evolves and in response to changes in leadership, new partners, funding, policies, external events, etc.

The next few questions will ask you to refl ect on yourpartnership with respect to the four partnership types described below, where partners have differing levels ofrelative autonomy or interdependency. The four types are also described in the questions below, but this graphic is provided for more detail. Each of these types can be high-performing and generate impact.

Partnership Types

Partnerships work at different scales and in different geographies and contexts. Each has a unique structure, function and focus, which may change over time as the work evolves and in response to changes in leadership, new partners, funding, policies, external events, etc.



The partnership types below differ with respect to interdependency. In reality, this is a gradient, not discrete types. With more ambitious goals and greater interdependency, partners take on greater risk to meet shared commitments.

Project-oriented partnerships

Partners remain relatively autonomous and independent, but commit to a set of shared priorities and tasks, typically in response to funding opportunities. Usually there is a small number of partners. A coordinator serves as a project manager, a role which may be rotated among partners.

COMMITMENT

low ◄------► high
RISK

Systems-oriented partnerships

Partners are highly committed to long-term systems change. Partners may have to make substantial changes within their organizations to align with the partnership. A very high level of sustained funding is required to invest in iterative cycles of learning, planning and implementation and to work through differences to achieve alignment. A coordinator serves as facilitator, ambassador and project manager. The complexity of the work may require committees.

Draft - 2022 revised graphic based on partnership continuum from OWEB's Partnership Learning Project, 2018 - Feedback welcome **jennifer@reciprocityconsulting.com**

1 Which partnership type best describes how your partnership is currently structured?

- ○ **Learning-oriented partnership** – partners remain fully autonomous andindependent, but collectively advance their thinking
- ○ **Project-oriented partnership** - partners remain relatively autonomous andindependent, but commit to shared priorities and tasks
- ○ **Planning-oriented partnership** – partners engage in collaborative long-term planning andimplementation which may require individual partners to shift their internal priorities
- ○ **System-oriented partnership** - Partners are highly committed to long-term systems change and may have to make substantial changes within their organizations to achieve alignment
- ○ **Don't know**

2 Which partnership type best describes how your partnership has functioned in the past? *Mark all that apply.*

- ○ **Learning-oriented partnership** – partners remain fully autonomous andindependent, but collectively advance their thinking
- ○ **Project-oriented partnership** - partners remain relatively autonomous andindependent, but commit to shared priorities and tasks
- ○ **Planning-oriented partnership** – partners engage in collaborative long-term planning andimplementation which may require individual partners to shift their internal priorities
- ○ **System-oriented partnership** - Partners are highly committed to long-term systems change and may have to make substantial changes within their organizations to achieve alignment
- ○ **Don't know**

Comments?

3 Which partnership type best describes how you wouldlike your partnership to function in the future? *Mark all that apply.*

- ○ **Learning-oriented partnership** – partners remain fully autonomous andindependent, but collectively advance their thinking
- ○ **Project-oriented partnership** - partners remain relatively autonomous andindependent, but commit to shared priorities and tasks
- ○ **Planning-oriented partnership** – partners engage in collaborative long-term planning andimplementation which may require individual partners to shift their internal priorities
- ○ **System-oriented partnership** - Partners are highly committed to long-term systems change and may have to make substantial changes within theirorganizations to achieve alignment
- ○ **Don't know**

Comments?

4 Describe how your partnership has changed over the years – and share from your perspective, what are some of the influences that have driven those changes? *Consider partnership structure, function, partner composition and/or focus of your work.*

EXPANDING YOUR CIRCLE

OWEB believes that healthy watersheds are supported by people who reflect the diversity of their communities.

Increasingly, people are acknowledging that segments of the population have not been engaged in restoration efforts – and that the support and creativity from the breadth ofpeople in a watershed is important, or even necessary, forrestoring watersheds and realizing the full potential for socialand ecological benefits.

1 To what degree do you feel that expanding your circle of partners and/or building relationships with underrepresented groups in your watershed will help you achieve your goals?

- ○ Strongly agree
- ○ Agree
- ○ Somewhat agree
- ○ Neither agree nor disagree
- ○ Somewhat disagree
- ○ Disagree
- ○ Strongly disagree
- ○ Don't know

★ Please explain or provide examples.

2 To what degree are you working on expanding yourcircle of partners to include underrepresented groups? *Mark all that apply. Your name or partnership will not be linked to your answers.*

- ○ Not applicable
- ○ We are interested but not sure where to start.
- ○ We are talking, learning and planning.
- ○ We are taking some early action steps.
- ○ We are in conversation with one or more historically underrepresented groups.
- ○ We have one or more people from historically underrepresented groups aspartners.
- ○ We have one or more people from historically underrepresented groups in leadership roles in our partnership.
- ○ We are making progress and sharing what we have learned with others.

Please explain or provide examples. *If you are working to expand your circle, please share which groups or constituencies you are working with.*

PARTNERSHIP TRUST & ACCOUNTABILITY

When we spoke to OWEB-funded partnerships five years ago,some partnerships noted that trust was fragile and partners were hesitant to ask challenging questions of each otherduring project prioritization and technical review.

They recognized that holding each other accountable requires leadership and substantial investment in relationships and trust building. They also reflected that governance documents, a skilled facilitator and planning tools help too.

They wondered if it would become easier to ask challenging questions of each other over time as relationships and trust were built.

1 **To what extent do you currently trust your partnershipto ask hard questions of each other so that collective decisions and actions have the greatest chance for impact?** Your name and partnership will not be linked withyour response.

- ○ Trust a lot
- ○ Trust
- ○ Trust somewhat
- ○ Neither trust nor mistrust
- ○ Mistrust somewhat
- ○ Mistrust
- ○ Mistrust a lot
- ○ Don't know

Comments?

2 To what extent do you think that trust among partners has changed over the years, thinking about the trust needed to ask hard questions and make planning and budget decisions together to hold the bar high for performance and impact?.

- ○ Greatly increased trust
- ○ Increased trust
- ○ Somewhat increased trust
- ○ Stayed the same
- ○ Somewhat decreased trust
- ○ Decreased trust
- ○ Greatly decreased trust
- ○ Don't know

Comments?

3 If you can, please share an example of when partners asked challenging questions of each other to increase their chance for greater impact.

ACCOUNTABILITY IN THE TECHNICAL REVIEW PROCESS

Note: Only FIP grantees were asked the questions in this section.

OWEB works with partnerships in the technical review process to keep the bar high for performance and likelihood of impact. However, OWEB also appreciates each partnership's autonomy and investment in strategic planning and internal governance that was the basis for the FIP grant award.

1 To what extent do you think OWEB's role in technical review has led to a better outcome for implementation and greater likelihood for impact?

- ○ Very much agree
- ○ Agree
- ○ Somewhat agree
- ○ Neither agree nor disagree
- ○ Somewhat disagree
- ○ Disagree
- ○ Strongly disagree

2 What do you appreciate about OWEB's role in technical review and what could be improved?

TRACKING PROGRESS AND IMPACT

High performing partnerships are often very good at tracking progress with respect to implementation and outputs, such as miles of stream restored or acres of forest treated.

However, it is much more challenging to track short and long-term ecological and social outcomes, such as changes insalmon populations, the resilience of forests to extreme fi reevents or economic and human health benefits from healthy watersheds.

1 To what extent have you had success tracking progress toward your long-term goals?

- ○ Lots of success
- ○ Success
- ○ Some success
- ○ Neither success nor failure
- ○ Some failure
- ○ Failure
- ○ Lots of failure

★ Please explain and share examples.

2 The following are some examples of why it is challenging to track short and long-term ecological and social outcomes. Please mark all those that you've experienced and describe any others below.

- ○ External changes, such as extreme flooding, catastrophic fire, economic recession, climate change, etc.
- ○ Shifting understanding of how systems work and what we should be tracking to measure change
- ○ Managing large complex data sets with multiple partners
- ○ Funding for monitoring over the timeframe needed for outcomes to emerge
- ○ Linking your work to the changes observed when there are other influences and unknowns

3 Please share examples of your biggest challenges withtracking short and long-term outcomes. How have you navigated these challenges, which might include changes in staffing, technology, training, etc.? What support would be useful from OWEB or other funders?

PARTNERSHIP RESILIENCE AND FUNDING

Partnership resilience refers to the ability of partnerships towithstand stressors and changing circumstances and stilladvance their vision and goals. A partnership may change instructure, function, composition or focus over time, but it is resilient if it continues to advance its vision and goals. A partnership may face many different kinds of stressors, but inthis study, we are specifi cally looking at how partnerships respond to changes in funding.

1 To what extent do you feel confident that your partnership will be resilient and sustain its work as different funding opportunities come and go?

- ○ Very confident
- ○ Confident
- ○ Somewhat confident
- ○ Neutral
- ○ Somewhat unsure
- ○ Unsure
- ○ Very unsure

Comments?

2 From your perspective, what makes your partnership more or less resilient to changes in funding? Consider your partnership structure, governance, history, partner composition, community context, access to funders, etc.

3 Are there ways funders can better support partnership resilience, short of continuous long-term funding commitments?

4 What are you most proud of with respect to fundraising for the partnership? *Include any significant or impactful grants that you have received, not including OWEB, with amounts and funders, for example NRCS, Oregon Department of Water Resources, private foundations, etc. We would like this information to understand the range of funding sources across partnerships and get a sense for the diversification of sources. We appreciate that this is sensitive information, and these details will not be shared. If you include private foundations, please share the name of the foundation.*

FINAL THOUGHTS

1 What inspires you to continue investing your time and energy in this partnership?

2 Do you have any other comments, feedback or questions to share?

Thank you so very much for your time! Please reach out with any questions.

OREGON WATERSHED ENHANCEMENT BOARD

Agenda Item K

PacifiCorp Interim Measure 11

Board Meeting October 23-25, 2023

Tina Kotek, Governor

OREGON WATERSHED ENHANCEMENT BOARD

775 Summer Street NE, Suite 360
Salem OR 97301-1290
www.oregon.gov/oweb
(503) 986-0178

Agenda Item K supports OWEB's Strategic Plan priority #3: Community capacity and strategic partnerships achieve healthy watersheds; Strategic Plan priority #4: Watershed organizations have access to a diverse and stable funding portfolio; and Strategic Plan priority 7: Bold and innovative actions to achieve health in Oregon's watersheds.

MEMORANDUM

TO: Oregon Watershed Enhancement Board

FROM: Renee Davis, Acquisitions and Special Programs Manager
Heidi Hartman, Drought Program Specialist
Greg Ciannella, Region 4 Program Representative

SUBJECT: Agenda Item K – Approval of Receipt of PacifiCorp Interim Measure 11 Funding
October 23-25, 2023, Board Meeting

I. Introduction

This report requests the board approve receipt of $6,433,500 in grant funding from PacifiCorp for nutrient reduction projects in the Klamath Basin to provide water quality improvements in the mainstem Klamath River, as described in the amended Klamath Hydroelectric Settlement Agreement (KHSA).

II. Background

The amended KHSA includes Water Quality Improvements under Interim Measure 11 which is intended to address water quality needs in the Klamath River through restoration and conservation actions in the Klamath Basin. The emphasis of Interim Measure 11 (IM 11) is nutrient reduction projects. PacifiCorp, in consultation with the Interim Measures Implementation Committee, developed a Priority List of Projects (PLP) to be implemented to fulfill the objective of amended agreement. The priority categories include: natural wetlands restoration; riparian fencing and grazing management; irrigation efficiency and water management projects; and diffuse source treatment wetlands. Projects in these categories are intended to be implemented in strategic locations achieve water quality benefits. The amended KHSA, funding agreement for PLP implementation will be provided by PacifiCorp upon the Klamath River Renewal Corporation (KRRC)'s acceptance of the Federal Energy Regulatory Commission (FERC) license surrender order for the four hydroelectric dams operated by PacifiCorp on the Klamath River. This process is documented in the 2018 Phase 2 Final Report of the Interim Measures Implementation Committee.

In 2019, PacifiCorp and the Committee selected OWEB as the fiscal agent for the water quality improvement funding.

III. PacifiCorp Funding and IM 11 Grant Program Development

Now that the FERC license surrender order has been accepted by KRRC, grant funding in the amount of $6,433,500 for implementation of water quality improvements (including a modest amount for inflation) has been provided by PacifiCorp to OWEB. This funding, formally referred to as the KHSA Water Quality Improvements Fund, will be administered by OWEB as the designated fiscal agent. The Oregon Department of Environmental Quality (DEQ) is responsible for convening and facilitating a Steering Committee (Committee) to oversee grant-making for water quality improvements. An interagency agreement is in place between OWEB and DEQ that outlines roles and responsibilities for both agencies.

The Committee is comprised of members with relevant technical expertise in the Klamath Basin and tasked with oversight of the PLP implementation process. The Committee, led by DEQ as outlined in the 2018 Committee report, will review and approve both the grant solicitation process to be developed by OWEB and all projects that will be selected to receive available funding through this grant-making. DEQ and the Committee will provide oversight for OWEB's work as the fiscal agent and review reporting to be provided by grantees via OWEB. OWEB's role is to administer a defined process by which the Committee will select projects to receive grant awards made with the PacifiCorp funding.

Based on the grant solicitation process, local partners will develop project proposals within the Oregon portion of the Klamath Basin for submission to OWEB. The Committee will use evaluation criteria previously established in the 2018 report to review and prioritize projects for funding. Currently, it is not possible to predict how many grant cycles will be needed to fully allocate the funding. This timeframe will depend on the number of qualified projects proposed and the outcome of the review processes.

As of the writing of this staff report, DEQ has convened the Steering Committee twice, with discussions focused on development of the grant program structure and timeline.

IV. Recommendation

Staff recommend the board approve receipt of $6,433,500 in grant funding from PacifiCorp for water quality improvement projects in the Oregon portion of the Klamath Basin, and delegate authority to the Executive Director to distribute funds through the appropriate agreements with an effective date of October 25, 2023.
