The ability of greater sage-grouse to move through the landscape is affected by many factors, including the presence of suitable habitats or topographic features that impede movement (Schulwitz *et al.* 2014, p. 568; Row *et al.* 2015, pp. 1965–1966). An assessment of habitat linkages between greater sage-grouse in Washington and Oregon showed relatively high landscape resistance to greater sage-grouse movements and no modeled linkages between the Columbia Basin and other greater sage-grouse populations (WWHCWG 2010, pp. 57–59). A separate modeling effort evaluating contemporary connectivity among leks (communal breeding centers where males perform courtship displays) spanning the Great Basin and Columbia Basin also showed little to no movement potential between the Columbia Basin and other greater sage-grouse populations (Knick *et al.* 2013, p. 1548).

Analysis of genetic variation across the range of greater sage-grouse is consistent with relatively short-distance dispersal, with gene flow (the transfer of genetic material from one population to another) decreasing as the distance between populations increases (*i.e.,* isolation by distance) (Oyler-McCance *et al.* 2005, p. 1306). Landscape resistance can also influence patterns of gene flow in greater sage-grouse, with broad-scale distribution of low-quality nesting and wintering habitats identified as the most important factors driving patterns of effective dispersal (Row *et al.* 2015, pp. 1963–1964). Landscape-scale analyses of genetic variation show low levels of gene flow between the Columbia Basin and other populations of greater sage-grouse (Oyler-McCance *et al.* 2005, p. 1306). Analysis of allele frequencies in greater sage-grouse on the YTC prior to augmentation efforts showed that these individuals had low genetic diversity and were distinguishable from individuals translocated from Oregon and Nevada (Blankenship *et al.* 2011, pp. 7, 10); a result that is consistent with little to no contemporary gene flow.

Greater sage-grouse have been translocated to the Columbia Basin from Idaho, Oregon, Nevada, and Wyoming (Livingston *et al.* 2006, pp. 2–3; Schroeder *et al.* 2014, pp. 8, 14–15). Moving greater sage-grouse from other areas into the Columbia Basin population means that, while this population is physically discrete from other populations, it has been connected through human intervention. Genetic data collected post-augmentation on the YTC confirms that breeding between endemic individuals and translocated individuals has occurred (Blankenship *et al.* 2011, p. 10). It is unknown if translocated greater sage-grouse released on the Yakama Nation or in Lincoln County are interbreeding with endemic populations of greater sage-grouse. However, at least one bird translocated to Lincoln County is known to have dispersed to the Douglas County population (Schroeder *et al.* 2014, p. 17). In addition, two males released in Lincoln County moved to the Douglas County population for a few days early in the 2015 breeding season, but returned to Lincoln County and were observed strutting on the Lincoln County lek (McPherron, USFWS, pers. comm. 2015).

International Boundaries—Greater sage-grouse occurrences were documented in British Columbia from 1864 to 1918 (Campbell and Ryder 2010, p. 7), in the Okanogan Valley, an area considered part of the Columbia Basin ecosystem. From 1918 to the 1950s, no occurrence records were reported (Campbell and Ryder 2010, entire). Translocations were conducted to reintroduce greater sage-grouse in the late 1950s, but given the lack of occurrence records since the 1960s, the species is considered extirpated from the province (Campbell and Ryder 2010, pp. 7–10). Therefore, greater sage-grouse in the Columbia Basin are not delimited by international governmental boundaries.

Summary for Discreteness—Greater sage-grouse in the Columbia Basin are physically separated from the nearest populations by approximately 250 to 260 km (155 to 162 mi). Information on movement and dispersal ecology, telemetry data, habitat and connectivity modeling, and genetic analyses, when viewed together, suggest that greater sage-grouse are unlikely to move between the Columbia Basin population and other greater sage-grouse populations. Based on this information alone, we could conclude that the Columbia Basin population is discrete based on marked separation from other populations as a consequence of physical and ecological factors. However, ongoing translocation efforts provide a connection that artificially links the Columbia Basin population to other populations of greater sage-grouse. The connectivity provided by human-intervention complicates any conclusions about the Columbia Basin population's discreteness. Therefore, we will assume that the population could be discrete and move on to assess the significance of the population to the taxon.

Significance

If a population segment is considered discrete under one or more of the conditions described in our DPS policy, its biological and ecological significance will be considered in light of Congressional guidance that the authority to list DPSs be used ''sparingly'' (see Senate Report 151, 96th Congress, 1st Session) while encouraging the conservation of genetic diversity. In making this determination, we consider available scientific evidence of the DPS's importance to the taxon to which it belongs. Since precise circumstances are likely to vary considerably from case to case, the DPS policy does not describe all the classes of information that might be used in

determining the biological and ecological importance of a discrete population. However, the DPS policy describes four possible classes of information that provide evidence of a population segment's biological and ecological importance to the taxon to which it belongs. As specified in the DPS policy (61 FR 4722, February 7, 1996), this consideration of the population segment's significance may include, but is not limited to, the following:

(1) Persistence of the population segment in an ecological setting unusual or unique to the taxon;

(2) Evidence that loss of the population segment would result in a significant gap in the range of a taxon;

(3) Evidence that the population segment represents the only surviving natural occurrence of a taxon that may be more abundant elsewhere as an introduced population outside its historical range; or

(4) Evidence that the population segment differs markedly from other populations of the species in its genetic characteristics.

A population segment needs to satisfy only one of these conditions to be considered significant. Furthermore, other information may be used as appropriate to provide evidence for significance.

In our 2001, 12-month finding on the Columbia Basin DPS, we found that the population was significant to the western subspecies because it occurred in a unique ecological setting to the subspecies and because loss of the Columbia Basin would have resulted in a significant gap in the range of the western subspecies (66 FR 22984, May 7, 2001, p. 22992). Below we reevaluate these findings giving consideration to new information and conducting our analysis on the significance of the population segment to the greater sage-grouse species, rather than to the no-longer-recognized western subspecies.

Unusual or Unique Ecological Setting – In our 12-month finding published in 2001, relative to unusual or unique ecological setting, we found that:

(1) The Columbia Basin is a unique ecosystem, whose characteristics were the result of a unique combination of elevation, soil, influences of historical geologic processes, and climatic conditions; as a result, sagebrush habitats in the Columbia Basin could be differentiated from sagebrush habitats outside of the Columbia Basin by a number of floristic characteristics, including the presence of *Juniperus* spp. (juniper) woodlands, salt-desert shrub habitats, and the type and distribution of sagebrush taxa and forb species;

(2) Sage-grouse occupying the Columbia Basin were, ''necessarily,'' differentially exploiting the resources that are available, as compared with sage-grouse in central and southern Oregon; and that these differences in exploitation of resources had bearing on their food and cover preferences, distribution, movements, reproductive fitness, and ultimately, their survival; and

(3) The unique elements of the Columbia Basin held different management implications for western sage-grouse within this ecosystem (66 FR 22984, May 7, 2001).

Below, we reevaluate these findings giving consideration to new information and conducting our analysis on the entire greater sage-grouse range, rather than the no-longer-recognized western subspecies range.

As stated in the DPS Policy, occurrence in an unusual ecological setting may indicate that a population segment represents a significant resource warranting conservation under the Act (61 FR 4722, February 7, 1996). In considering whether the population occupies an ecological setting that is unusual or unique for the taxon, we evaluate whether the habitat includes unique features not used by the taxon elsewhere and whether the habitat shares many features common to the habitats of other populations. We further evaluate whether any of these differences could play an important biological role with respect to the remainder of the taxon, such as by contributing to the taxon's prospects for survival, to a degree that the population warrants conservation under the Act.

The Columbia Basin represents a separate floristic province within the range of the greater sage-grouse and is unique in that none of the ecosystems within the range of the greater sage-grouse are exactly the same with respect to elevation, soil, influences of historical geologic processes, and climatic conditions. As we found in 2001, these differences have resulted in some differences to the types of sagebrush and other vegetative components present in the ecosystem (66 FR 22984, May 7, 2001, pp. 22989–22991). However, simply the occurrence of a species within a definable ecosystem does not, by itself, make it significant to the taxon under the DPS Policy. Sagebrush-dominated plant communities vary considerably across the range of greater sage-grouse (West and Young 2000, pp. 259–267), and specific habitat components used by greater sage-grouse can vary due to biotic and abiotic factors (Connelly *et al.* 2011a, p. 70). Yet, common to all greater sage-grouse is the use of sagebrush and their dependence on this habitat for food and cover during all periods of the year (Connelly *et al.* 2004, pp. 4–1—4–19).

The greater sage-grouse appears to be fairly adaptable to a variety of conditions as it: (1) Occurs throughout a wide variety of sagebrush habitats in western North America; (2) occurs and breeds from less than 610 m (2,000 ft) to more than 3,000 m (9,842 ft) above sea level; (3) spans a variety of climatic conditions from relatively wet montane sagebrush communities to dry sagebrush types; and (4) uses a wide range of understory vegetation during the breeding and brood-rearing periods (Aldridge and Brigham 2002, pp. 440–442; Connelly *et al.* 2004, pp. 4–1—4–19; Schroeder *et al.* 2004, pp. 366–368; Guttery 2011, pp. 20, 50–51). Stated more simply, the species is able to occupy a broad range of sagebrush communities throughout western North America. Therefore, the ability of the Columbia Basin population of greater sage-grouse to exist within a particular amalgamation of habitat features does not necessarily contribute to the survival of the greater sage-grouse species, or otherwise serve an important biological role with respect to the taxon.

The degree to which regional differences in habitat components affect greater sage-grouse distribution, reproductive fitness, and survival is complex (Connelly *et al.* 2011a, pp. 71–83). Greater sage-grouse in the Columbia Basin are comparable to other populations of greater sage-grouse in their date of nest initiation, variation in the date of nest initiation, length of incubation, nest success, lek visitation by females, and fidelity of males to leks (Schroeder 1997, pp. 937–939; Schroeder and Robb 2003, pp. 295–296). Differences reported for the Douglas County population include higher reproductive effort than greater sage-grouse in other regions and lower fidelity to nest sites (Schroeder 1997, p. 939; Schroeder and Robb 2003, p. 296). The degree to which these differences are the result of habitat fragmentation in north-central Washington or other factors is unknown (Schroeder and Robb 2003, p. 297). Nevertheless, greater sage-grouse in the Columbia Basin appear to have reproductive output and survival estimates that are within the range of values observed elsewhere across the range of the species (Stinson *et al.* 2004, p. 6, Connelly *et al.* 2011b, pp. 56–58).

Under the DPS Policy, a determination of significance can be made if a population segment persists in a unique or unusual ecological setting that is significant to the taxon to which it belongs. Although the Columbia Basin differs in some ways from other habitats that the greater sage-grouse inhabits, this is not unusual for the greater sage-grouse rangewide given the diversity of

sagebrush habitats the species utilizes across its range. Further, nothing about the Columbia Basin population's life history or habitat use is unique when compared to other populations across the range. Given that Columbia Basin habitat and birds fall within the natural range of variability for greater sage-grouse across its range, we conclude that the best information available indicates that the Columbia Basin population is not significant to the species as a whole because of persistence in an unusual or unique ecological setting.

Significant Gap in the Range of the Taxon – In our 12-month finding published in 2001, relative to gap in the range, we found that:

(1) Columbia Basin greater sage-grouse represent the extreme northwestern extent of greater sage-grouse range and the northernmost extent of the historical distribution of the western sage-grouse;

(2) The Columbia Basin historically encompassed roughly 55 percent of the entire range of western sage-grouse; and

(3) Due to its potential isolation, greater sage-grouse in the Columbia Basin are likely experiencing increased directional selection due to marginal and varied habitats at the taxon's range periphery, exhibiting genetic consequences of reduced gene flow from other population segments, and responding (and will continue to respond) to the different anthropogenic (human caused) influences in the region (66 FR 22984, May 7, 2001).

Below, we reevaluate these findings giving consideration to new information and conducting our analysis on the entire greater sage-grouse range, rather than the previously designated western subspecies' range.

Greater sage-grouse in the Columbia Basin are the northwestern extent of the sage-grouse range, but greater sage-grouse in Alberta and Saskatchewan and northern Montana make up the northernmost extent of the range. To assess the degree to which being the northwestern extent of the range makes the population significant, we must consider the proportion of individuals in this extent of the range and the amount of habitat available there for greater sage-grouse; being a peripheral population, by itself, does not connote significance to the taxon. Relative to the rest of the range of greater sage-grouse (excluding the bi-State DPS), the Columbia Basin is estimated to contain only 0.6 percent of the rangewide population estimate (Doherty *et al.* 2015, entire), 2.7 percent of the rangewide distribution of sagebrush habitats (Knick 2011, p. 25), and 4 percent of the total occupied range (Knick 2011, p. 25).

In addition, given new information since 2001, we must reevaluate our conclusion relative to the likelihood of directional selection due to the isolation of this peripheral population. The best available population and genetic data suggest that greater sage-grouse in the Columbia Basin have undergone a severe reduction in population size, and are now isolated from other populations (Schroeder *et al.* 2000, pp. 106–109; Oyler-McCance *et al.* 2005, p. 1307). This has resulted in the loss of genetic diversity, and the population now has the lowest levels of genetic diversity, as measured in mitochondrial and nuclear markers, reported for any greater sage-grouse population (Oyler-McCance *et al.* 2005, p. 1307). However, the extent to which this isolation is causing ''selection'' or has resulted in the development of traits in greater sage-grouse that are adapted to the Columbia Basin is not definitive.

Morphological or behavioral differences in greater sage-grouse may be indicators of adaptive traits not revealed through analysis of neutral genetic markers. Comparisons of greater sage-grouse in the Columbia Basin with other greater sage-grouse populations suggest they are heavier than birds in Idaho, Nevada, Oregon, and California, but are similar in mass to greater sage-grouse in northern Colorado to Alberta (Schroeder 2008, pp. 5–9). Although some wing and tail measurements differed between greater sage-grouse from the Columbia Basin and elsewhere, the comparison included only a small number of other populations, measurement bias was unknown, and the conclusion of the author was that the available morphometric data did not illustrate any unique morphological characteristics in the Columbia Basin birds (Schroeder 2008, p. 10). Similarly, an assessment of the available behavioral data did not reveal any substantial differences in greater sage-grouse behavior in the Columbia Basin (Schroeder 2008, pp. 9–10).

In summary, loss of the Columbia Basin population would not result in a significant gap in the range of greater sage-grouse. This area represents less than 1 percent of the rangewide population estimates and less than 3 percent of sagebrush habitat. While loss of this population would reduce the occupied range of the species, it would not remove a habitat type found nowhere else in the range nor would it create a barrier to the movement of birds from other populations. Although the Columbia Basin population is peripheral and isolated, there is no evidence that it has been isolated for long periods of evolutionary time, resulting in significant adaptive traits that might indicate its loss would be significant to the taxon.

Marked Genetic Differences – In our 12-month finding published in 2001, we found that the results from rangewide genetic studies were ''suggestive'' and demonstrated a marked difference between the population segment of greater sage-grouse within the Columbia Basin and the population segment in central and southern Oregon. However, we concluded that these results did not necessarily indicate that genetic differentiation of this population segment is significant to the remainder of the taxon, as we were unsure to what extent the forces of isolation, adaptive change, genetic drift, and/or inbreeding may have influenced the regional profiles of greater sage-grouse (66 FR 22984, May 7, 2001). Below, we reevaluate these findings giving consideration to new information and conducting our analysis on the entire greater sage-grouse range, rather than the previously recognized western subspecies range.

Additional rangewide studies of neutral genetic variation since 2001 support the conclusion that greater sage-grouse in the Columbia Basin segregate from the other populations when evaluated using quantitative measures of genetic diversity (Benedict *et al.* 2003, pp. 308–309; Oyler-McCance *et al.* 2005, pp. 1304–1305). The reason that genetic diversity can be significant to a species is that the presence of novel haplotypes (set of genes inherited from one parent) or alleles (a variant form of a gene) could provide the species with adaptive capacity if faced with deteriorating environmental conditions. However, the quantitative differences in genetics between this population and the species as a whole were largely the result of greater sage-grouse in the Columbia Basin having extremely low levels of genetic diversity (Oyler-McCance *et al.* 2005, p. 1307), rather than a being a function of having a large proportion of novel haplotypes or alleles.

Evaluation of mitochondrial DNA (mtDNA) revealed that approximately 90 percent of the sampled greater sage-grouse in the Columbia Basin had a single mitochondrial DNA haplotype, while only one novel haplotype was present (Oyler-McCance *et al.* 2005, pp. 1298–1300). This novel haplotype (Haplotype DS) was in the same grouping as one of the most common haplotypes observed in greater sage-grouse (Haplotype X) with only a single base-pair difference from this common haplotype (Oyler-McCance *et al.* 2005, pp. 1299, 1301). This indicates that only

a single mutational event was necessary to produce this novel haplotype, which could have occurred over a relatively short amount of evolutionary time. Thus, the available genetic evidence from studies of mtDNA does not lead us to conclude that the populations in Washington are markedly genetically different from other populations of greater sage-grouse found throughout the Great Basin.

Nuclear genetic data evaluated using microsatellite markers showed that populations in the Columbia Basin had the lowest genetic diversity of the 46 populations of greater sage-grouse studied (Oyler-McCance *et al.* 2005, p. 1307). Although genetic distance comparisons showed that the Columbia Basin populations were some of the most differentiated of all greater sage-grouse populations, this finding is largely a reflection of the small number of alleles found there (Oyler-McCance *et al.* 2005, p. 1307). Therefore, while statistically different, these differences cannot be attributed to greater sage-grouse being isolated for a long period of evolutionary time, which might have indicated that they had developed some adaptive traits not found elsewhere in the range of greater sage-grouse.

Summary for Significance – We have considered significance of the Columbia Basin population by evaluating the uniqueness of the ecological setting; the potential for a significant gap in the range of greater sage-grouse if the population was lost; and genetic distinctness from other greater sage-grouse populations. We conclude that the Columbia Basin greater sage-grouse do not occur in a unique ecological setting, and their loss would not result in a significant gap in the range of the greater sage-grouse. While genetic diversity is low, the population is not markedly genetically different from other populations of greater sage-grouse. Based on this information, we find that this population does not meet the definition of significance as defined in our 1996 DPS policy.

Greater Sage-Grouse Listable Entity Summary

In 2010, we determined that the bi-State population qualified as a DPS under the Act. At that time, we deferred any other decisions about potential DPSs, including an assessment of the Columbia Basin population, until this status review. After consideration of the distinctness and significance of the Columbia Basin population, giving consideration to new information, and conducting our analysis on the significance of the population to the greater sage-grouse rangewide instead of to the previously recognized western subspecies, we have determined that it does not meet the criteria for a DPS. Therefore, the Columbia Basin population will be considered together with the other populations in the greater sage-grouse range (hereafter referred to as sage-grouse). Specifically, when we discuss sage-grouse in the Great Basin, we are including Columbia Basin in those discussions. The remainder of this status review will consider all populations and habitat across the range of the species, with the exception of the bi-State DPS.

Distribution

Prior to European settlement of western North America in the 19th century, sage-grouse occurred in an area that today would cover 13 States and 3 Canadian provinces—Arizona, California, Colorado, Idaho, Montana, Nebraska, Nevada, North Dakota, Oregon, South Dakota, Utah, Washington, Wyoming, British Columbia, Alberta, and Saskatchewan (Schroeder *et al.* 2004, p. 369; Figure 1). Sagebrush habitats that potentially supported sage-grouse occurred over approximately 1.2 million square kilometer (km^2) (460,000 square miles (mi^2)) before 1800 (Schroeder *et al.* 2004, p. 366). Currently, sage-grouse occur in 11 States (California, Colorado, Idaho, Montana, Nevada, North Dakota, Oregon, South Dakota, Utah, Washington, Wyoming), and 2 Canadian provinces (Alberta and Saskatchewan), occupying approximately 56 percent of their historical range (Schroeder *et al.* 2004, p. 369; Figure 1). Approximately 2 percent of the total range of sage-grouse occurs in Canada, with the remainder in the United States (Knick 2011, p. 24).

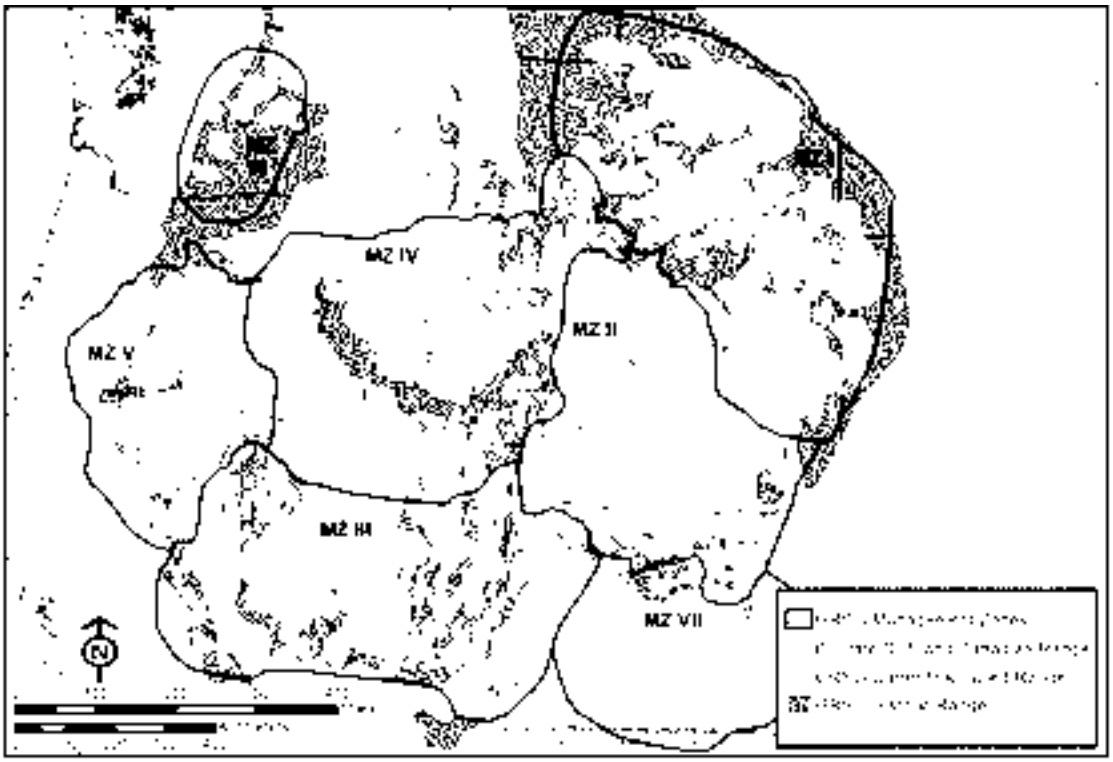

Figure 1 Current occupied and historical range of sage-grouse (derived from Schroeder *et al.* 2004 and updated by the Services) and the WAFWA Sage-Grouse Management Zones (Stiver *et al.* 2006, p. 1–6)

The Western Association of Fish and Wildlife Agencies (WAFWA) Conservation Strategy for Greater Sage-grouse (Stiver *et al.* 2006, p. 1–6) delineated seven sage-grouse Management Zones (MZ; Figure 1) to guide conservation and management. The boundaries of these MZs were delineated based on their ecological and biological attributes (floristic provinces) rather than on political boundaries (Stiver *et al.* 2006, p. 1–6); therefore, vegetation is similar within each MZ, and sage-grouse are likely to respond similarly to environmental factors and management actions. For this reason, we conducted analyses for some potential threats at the MZ-scale. While the Conservation Objectives Team (COT) Report (see *Conservation Objectives Team Report* below for further description) identifies Priority Areas for Conservation (PACs) as the areas needed for the species persistence, not all data used in our potential analyses was available at the PAC scale and the data did not provide a consistent rangewide data set, so PACs were not used as the unit of analysis for the impact analysis.

Sagebrush occurs in two natural vegetation types that are influenced by elevation, temperature, and patterns of precipitation (Miller *et al.* 2011, pp. 147–148). In general, the Great Basin portion of the range, which encompasses MZs III, IV, V, and VI, is lower in elevation and experiences less precipitation. The Rocky Mountain portion of the range, which encompasses MZs I, II, and VII, generally is higher in elevation and has greater precipitation. Due to the variance in the ecological conditions, the regions have differential susceptibility to potential threats (see Summary of Information Pertaining to the Five Factors, below).

Sage-grouse currently occupy a portion of their historical range and are more concentrated in certain Core Areas. Sage-grouse have been extirpated from Nebraska, British Columbia, and Arizona (Schroeder *et al.* 1999, p. 2; Young *et al.* 2000 p. 445; Schroeder *et al.* 2004, p. 369). Changes from the estimated historical distribution are the result of sagebrush alteration and degradation (Schroeder *et al.* 2004, p. 363; Knick and Connelly 2011, p. 6). The current distribution of sage-grouse is estimated at 703,453 km^2 (271,604 mi^2; USFWS 2015a). Approximately half of the sage-grouse occur in the Rocky Mountain portion of the range and half in the Great Basin portion of the range. Management Zones with the highest relative amounts of birds are MZ II (37.5 percent of the rangewide population estimate) and MZ IV (30.7 percent of the rangewide population estimate). As a result, impacts in these MZs may have greater impact to the species rangewide (see Summary of Information Pertaining to the Five Factors, below).

Habitat

Sage-grouse depend on a variety of shrub-steppe habitats throughout their life cycle and are considered a sagebrush obligate (Patterson 1952, p. 48). Sage-grouse use a variety of sagebrush species such as *Artemisia tridentata wyomingensis* (Wyoming big sagebrush), *A. t. vaseyana* (mountain big sagebrush), *A. t. tridentata* (basin big sagebrush), *A. nova* (black sagebrush),

A. frigida (fringed sagebrush), *A. cana* (silver sagebrush), and *A. arbuscula* (little sagebrush) (Miller *et al.* 2011, pp. 145–151). Sage-grouse distribution is strongly correlated with the distribution of sagebrush vegetation (Schroeder *et al.* 2004, p. 364).

Sagebrush is the most widespread vegetation in the intermountain lowlands in the western United States (West and Young 2000, p. 259). Sagebrush occurs in two natural vegetation types that are delineated by temperature and patterns of precipitation (Miller *et al.* 2011, pp. 147–148). The first, sagebrush-steppe, ranges across the northern portion of sage-grouse occupied range, from British Columbia and the Columbia Basin, through the northern Great Basin, Snake River Plain, and Montana, and into the Wyoming Basin and northern Colorado. Sagebrush is a co-dominant plant, along with perennial bunchgrasses, in sagebrush-steppe. The second vegetation type, Great Basin sagebrush, occurs south of sagebrush-steppe, and extends from the Colorado Plateau westward into Nevada, Utah, and California (Miller *et al.* 2011, pp. 147–148). In the Great Basin sagebrush zone, sagebrush is usually the dominant plant layer accompanied by sparse understories. Other sagebrush types within the sage-grouse occupied range include mixed-desert shrubland in the Bighorn Basin of Wyoming, and grasslands in eastern Montana and Wyoming that also support silver sagebrush and *A. filifolia* (sand sagebrush) (Miller *et al.* 2011 p. 148).

Sagebrush is long-lived, with plants of some species surviving up to 150 years (West 1983, p. 340). Sagebrush is resistant to environmental extremes, with the exception of fire and occasionally defoliating insects (West 1983, p. 341). Natural sagebrush re-colonization depends on the presence of adjacent live plants for a seed source or on the seed bank, if present (Miller and Eddleman 2000, p. 17). Although seed viability and germination are high, seed dispersal is limited (West and Young 2000, p. 260). Additionally, sagebrush seeds typically do not remain viable for more than one growing season, and evidence suggests that seeds do not persist in the soil more than 1 year; however, seeds have higher odds of persisting in the seed bank if they are buried (Wijayratne and Pyke 2012, p. 438). Productivity of plants associated with the sagebrush understory varies widely and is influenced by moisture availability, soil characteristics, climate, and topographic position (Miller *et al.* 2011, pp. 151–154). Forb abundance can be highly variable from year to year and is largely affected by the amount and timing of precipitation.

Sage-grouse depend on large areas of contiguous sagebrush to meet all seasonal habitat requirements (Connelly *et al.* 2011a, pp. 82–83; Wisdom *et al.* 2011, p. 465). Sage-grouse exhibit strong site fidelity (loyalty to a particular area, even when the area no longer provides habitat) to seasonal habitats used for breeding, nesting, brood-rearing, and wintering (Connelly *et al.* 2004, p. 3–1; Connelly *et al.* 2011b, p. 60). Little information is available regarding minimum sagebrush patch sizes required to support populations of sage-grouse. Home range calculations range from 4 to 615 km^2 (1.5 to 237.5 mi^2; Connelly *et al.* 2011b, p. 60), and migratory populations (which are discussed in more detail below) may use areas exceeding 2,700 km^2 (1,042 mi^2, 667,185 acres; Leonard *et al.* 2000, p. 269, Davis *et al.* 2014, p. 713). Large seasonal and annual movements emphasize the landscape nature of the species (Knick *et al.* 2003, p. 624; Connelly *et al.* 2011b, p. 60).

Federal lands encompass the majority of the sage-grouse occupied range, with MZs III, IV, and V being more than 60 percent federally owned (Table 2). Primary Federal land managers within the sage-grouse occupied range include Bureau of Land Management (BLM) and the U.S. Forest Service (USFS), which together manage 51 percent of the sage-grouse occupied range. Other Federal owners include the National Park Service, Department of Defense (DoD), the Service, and Department of Energy (DOE). Private lands comprise approximately 39 percent of the species' occupied range, with the largest proportion of private lands occurring in MZs I and VI. Tribal lands cover approximately 3 percent, and State lands cover approximately 5 percent of the current sage-grouse occupied range.

TABLE 2.—PERCENT OF THE CURRENTLY OCCUPIED SAGE-GROUSE RANGE WITHIN MANAGEMENT ZONES, BY SURFACE MANAGING AGENCY

Management zone	BLM	USFS	Other Federal	Tribal	State	Private
I Great Plains	16	2	1	5	8	69
II Wyoming Basin	49	2	2	3	6	38
III Southern Great Basin	69	14	1	1	2	13
IV Snake River Plain	52	8	3	1	5	30
V Northern Great Basin	62	7	6	1	2	23

VII Colorado Plateau	39	0	0	25	11	25
Rangewide Totals	45	6	2	3	5	39

Life-History Characteristics and Seasonal Habitat Selection

During the breeding season, male sage-grouse gather together to perform courtship displays on areas called leks. These areas are often characterized by having bare soil, shortgrass-steppe, windswept ridges, exposed knolls, or other relatively open sites (Connelly *et al.* 2004, pp. 3–7). Leks are often surrounded by denser shrub-steppe cover used for shelter and to escape predators. Leks can be formed opportunistically at any appropriate site within or adjacent to nesting habitat (Connelly *et al.* 2000a, p. 970), and, therefore, lek habitat availability is not considered to be a limiting factor for sage-grouse (Schroeder *et al.* 1999, p. 4).

After mating, females travel to nesting areas characterized by sagebrush with an understory of native grasses and forbs that provides cover, an insect prey base, and herbaceous forage for pre-laying and nesting females (Connelly *et al.* 2000a, p. 971; Connelly *et al.* 2004, pp. 4–18). Females typically move 1.3 to 5.1 km (0.8 to 3.2 mi) from leks to nest (Connelly *et al.* 2011b, p. 62), although the juxtaposition of habitats, disturbance, and the extent of habitat fragmentation may influence nest location distance from leks (Connelly *et al.* 2011b, p. 62 and references therein).

Sage-grouse clutch size ranges from six to nine eggs with an average of seven eggs (Connelly *et al.* 2011b, p. 62). Males do not participate in incubation of eggs or rearing chicks.

The likelihood of a female nesting in a given year averages 82 percent in the eastern portion of the range and 78 percent in the western portion of the range (Connelly *et al.* 2011b, p. 63). Nest success varies widely, and the average nest success for sage-grouse is 51 percent in non-altered habitats and 37 percent in altered habitats (Connelly *et al.* 2011b, p. 58). Re-nesting occurs only if the original nest is lost (Schroeder *et al.* 1999, p. 11) with an average re-nesting rate of 28.9 percent (Connelly *et al.* 2004, pp. 3–11). Approximately 2.25 chicks per female may be necessary to maintain stable to increasing populations (Connelly *et al.* 2000a, p. 970). Due to low chick survival and limited re-nesting, there is little evidence that populations of sage-grouse produce large annual surpluses (Connelly *et al.* 2011b, p. 67).

Females rear their broods near the nest site for the first 2 to 3 weeks following hatching (Connelly *et al.* 2004, p. 4–8). Forbs and insects are essential nutritional components for chicks (Connelly *et al.* 2004, p. 4–9). Therefore, early brood-rearing habitat must provide adequate cover adjacent to areas rich in forbs and insects to ensure chick survival during this period (Connelly *et al.* 2004, p. 4–9).

Approximately 12 weeks after hatching, sage-grouse gradually move from sagebrush uplands to more mesic (wet) areas during the late brood-rearing period (Peterson 1970, p. 149) as herbaceous vegetation dries during the hot summer (Connelly *et al.* 2000a, p. 971). Summer use areas can include sagebrush habitats as well as riparian areas, wet meadows, and *Medicago* spp. (alfalfa) fields (Schroeder *et al.* 1999, p. 4). These areas provide an abundance of forbs and insects for both females and chicks (Schroeder *et al.* 1999, p. 4; Connelly *et al.* 2000a, p. 971). Males and broodless females will also use more mesic areas in close proximity to sagebrush cover during the late summer, often arriving before females with broods (Connelly *et al.* 2004, p. 4–10).

During the winter, sage-grouse depend almost exclusively on sagebrush for both food and cover (Thacker *et al.* 2012, p. 588). Winter areas are characterized by large expanses of big sagebrush and tall shrubs, predominantly located on relatively gentle south- or west-facing slopes that provide more favorable thermal conditions and above snow forage (Doherty *et al.* 2008, p. 192; Hagen *et al.* 2011, p. 536; Dzialak *et al.* 2013, p. 16). The timing of movement to winter ranges varies considerably, but peaks around mid-October through late November (Schroeder *et al.* 1999, p. 10). Sage-grouse exhibit fidelity to winter sites (Berry and Eng 1985, p. 239); however, some birds shift winter habitat use in response to severe conditions (Smith 2010, p. 8).

The availability of winter habitat is important to sage-grouse persistence. Across the range of sage-grouse, winter habitat comprised from 6.8 to 18 percent of the total landscape used by different populations (Dzialak *et al.* 2013, p. 10; Smith *et al.* 2014, p. 12). Winter habitat availability is reduced during severe winters when heavy snowfall and increasing snow depths further decrease or even eliminate access to sagebrush. During harsh winters, birds become even more concentrated in the few remaining areas of exposed sagebrush (Hupp and Braun 1989, p. 828). As a result, the loss of winter habitats used in harsh winter conditions can have impacts disproportionate to their makeup on the landscape (Swenson *et al.* 1987, p. 128). During the average winter, sage-grouse typically experience low over-winter mortality, estimated at 2 to 4 percent, but could be as high as 15 percent (Connelly *et al.* 2000b, p. 229; Wik 2002, p. 40; Sika 2006, p. 90; Bruce *et al.* 2011, p. 421). During notably severe winters, however, higher mortality rates have been documented (Moynahan *et al.* 2006, p. 1,536; Anthony and Willis 2008, p. 544). In some cases, the locations of these wintering habitats are known, but there is not a consistent data set of this information across the range of the species.

The distances sage-grouse move between seasonal habitats are highly variable across the occupied range (Connelly *et al.* 1988, pp. 119–121). Sage-grouse may migrate between two or three distinct seasonal ranges, or not migrate at all. Non-migratory sage-grouse have seasonal movements of less than 10 km (6.2 mi; Connelly *et al.* 2000a, pp. 968–969), while birds in migratory populations (which are discussed in detail below) may travel well over 100 km (62 mi) (Tack *et al.* 2012, p. 65).

Despite the documentation of extensive seasonal movements in this species (Fedy *et al.* 2012, p. 1066; Tack *et al.* 2012, p. 65; Davis *et al.* 2014, p. 716), the dispersal abilities of sage-grouse are assumed to be low. One study estimated median natal dispersal distances of 8.8 km (5.5 mi) for females and 7.4 km (4.6 mi) for males (Dunn and Braun 1985, p. 622); another study estimated natal dispersal distances of 3.8 km (2.4 mi) for males and 2.7 km (1.7 mi) for females (Thompson 2012, p. 193). Small-scale differences in habitat are not likely to influence sage-grouse dispersal at landscape scales. Rather, the arrangement of habitat quality was more influential on sage-grouse dispersal (Row *et al.* 2015, pp. 1964–1965) than the presence of unsuitable habitats.

Sage-Grouse Connectivity and Landscape Genetics

Habitat-based measures show that maintaining population connectivity is essential for sage-grouse population persistence. Connectivity between sage-grouse populations declined from 1965 to 2007 due to the loss of leks that historically provided connectivity and lower numbers of birds left to disperse (Knick and Hanser 2011, p. 395). As connectivity declined, isolated leks, those leks with low connectivity, were lost first (Knick and Hanser 2011, p. 395), with small decreases in lek connectivity resulting in large increases in probability of lek abandonment (Knick and Hanser 2011, p. 403). This suggests that as connectivity between leks at the edge of the range is lost, the probability these leks will persist is likely to decline (Knick and Hanser 2011, p. 396).

Maintaining sagebrush distribution is the most important factor in maintaining sage-grouse population connectivity (Knick and Hanser 2011, p. 404). Habitat loss decreases the connectivity between seasonal habitats, increasing the potential that a population may be lost (Doherty *et al.* 2008, p. 194). Loss of connectivity can increase population isolation (Knick and Hanser 2011, p. 402 and references therein) and, therefore, lead to a higher probability of loss of genetic diversity and extirpation due to stochastic events. Habitat fragmentation, habitat loss, and altered habitat disturbance regimes (*e.g.,* fire frequency), rather than stochastic events, were identified as the likely primary influences on sage-grouse population trend (Knick and Hanser 2011, p. 403). Large areas of unsuitable habitat, such as mountain ranges, have been found to segregate sage-grouse and restrict genetic mixing (Row *et al.* 2015, p. 1965; Crist *et al.* 2015, p. 16).

Studies of genetic information among populations have revealed patterns of sage-grouse movement and isolation across the landscape. A genetic analysis revealed that the movement of individuals tends to be among neighboring populations and is unlikely to occur over great distances (Oyler-McCance *et al.* 2005, entire; Oyler-

McCance and Quinn 2011, p. 91). Genetic analysis further indicated that sage-grouse in fragmented areas on the periphery of the range in Colorado, Utah, and Washington were not extensively moving between or breeding with other nearby populations (Oyler-McCance and Quinn 2011, p. 92).

A recent analysis shows that core population centers and the habitat between those centers are important for maintaining connectivity (Crist *et al.* 2015, p. 18). This study examined the connectivity of populations across the range of sage-grouse and found that 20 of 188 priority areas contributed the most to range-wide connectivity (Crist et al. 2015, p. 11). These results affirm the conclusion by Knick and Hanser (2011) that relatively large populations in southwestern Wyoming, and straddling the borders between Idaho, Nevada, Oregon, and Utah, were the most highly connected areas within the range of sage-grouse (Crist *et al.* 2015, p. 11) and, therefore, essential to species persistence. However, other priority areas likely contribute to maintaining connections by serving as habitat pathways between and within priority areas, or by maintaining local connectivity in an area (Crist *et al.* 2015, p. 11). Active management will be essential to maintain connectivity between priority areas and to ensure long-term species persistence (Crist *et al.* 2015, p. 16).

Population Abundance and Trends

Estimating population sizes and trends of sage-grouse is difficult due to the large, 11-State range of the species, incomplete sampling, and challenges counting females (Garton *et al.* 2011, pp. 295–296). As a result, sage-grouse population sizes are estimated from counts of male sage-grouse on leks during the breeding season (Garton *et al.* 2011, p. 296). While lek surveys do not provide an accurate estimate of total population, the annual counts of males on leks provide the best indicator of sage-grouse trends (Stiver *et al.* 2006, p. 3–2; WAFWA 2015, p. 2). The relationship of lek survey data to actual population size is unknown (WAFWA 2008, p. 3). When counts are done according to a standardized protocol, these counts can be a useful metric of long-term population trends (Connelly *et al.* 2004, p. 6–6; Johnson and Rowland 2007, p. 20; WAFWA 2008, p. 3, Blomberg *et al.* 2013a, p. 1590, Gregory and Beck 2015, p. 7).

Recent work by MacKenzie and Evans (2015) has indicated the current sampling framework across the range of sage grouse which makes interpreting trend and population data difficult. However, their analysis has indicated that there has been a long-term decline in the number of males per lek which is consistent with other recent trend analyses (Garton *et al.* 2015 and WAFWA 2015). The analysis goes on to indicate that over time and in virtually all management zones the probability of extinction of leks has been relatively stable. Additionally, the probability of recolonization of leks had been decreasing until the mid-1990s but that probability has stabilized to the current point in time. The conclusion of this work indicates that over the last 15 years the rate of extinction of leks and the probability of recolonization of leks has been remarkably stable.

Sage-grouse populations increase and decrease over time, making assessments of population size and short-term trends difficult. The length of these population cycles appears to vary across the range, but most populations have an 8- to 10-year population cycle (Rich 1985, pp. 5–8; Fedy and Doherty 2011, pp. 919–922). The drivers of the cycle are unknown, but may be caused by the amount and timing of precipitation (Rich 1985, p. 14; Fedy and Doherty 2011, p. 921).

In the 2010 finding, we concluded that rangewide, sage-grouse were experiencing a long-term decline in abundance (75 FR 13910, March 23, 2010, pp. 13920–13923). We noted the difficulty in determining the actual rate and magnitude of the declines, but noted that three independent studies had concluded that declines were occurring (Connelly *et al.* 2004, p. 6–71; WAFWA 2008, p. 12; Garton *et al.* 2011, pp. 307–359). In particular, the 2008 WAFWA analysis of lek-count data collected from 1965 to 2007 estimated a long-term decline of 3.1 percent per year during 1965 to 2007 (WAFWA 2008, p. 12). That assessment also found the rate of decline slowed from 1985 to 2007 to an average annual decline of 1.4 percent (Connelly *et al.* 2004, p. 6–71; WAFWA 2008, p. 58). A 2011 study (Garton *et al.* 2011, entire) assessed declining trends similar to the Connelly *et al.* (2004) and WAFWA (2008) analyses. Garton *et al.* (2011, p. 374) also predicted future population declines.

Both Garton *et al.* (2011) and WAFWA (2008) have updated their lek trend analyses to include additional data from 2013 through 2015 (Garton *et al.,* 2015; WAFWA 2015). Garton *et al.* (2015) examined the trend in the years 1965–2013 and reported that the rate of decline has decreased for MZs I, II, and VI when compared to their previous analyses (1965–2007). There was insufficient data from the other MZs to do a similar comparison, but the updated analyses suggest that MZs I–VI have all experienced a long-term abundance decline (Garton *et al.* 2015). Insufficient data in MZ VII prevented a trend analysis in both Garton *et al.* 2011 and Garton *et al.* 2015. The updated WAFWA analyses reported declines in all MZs since 1965, with the exception of MZ III, where a slight increase was noted. In MZ III, the increasing trend was not uniform across the management zone, as peripheral populations are continuing to decline. The rates of decline have increased in MZs I and V in recent years (WAFWA 2015, pp. 17, 26), while the overall rate of decline across the species' range has slowed in recent years. In five MZs, most of the population estimates are primarily trending down at the periphery of the species' range (WAFWA 2015, p. 1), indicating that the denser, interior population areas are more insulated from declining trends. The number of males counted on leks range-wide in 2015 has increased 63 percent since the most recent population trough in 2013 (WAFWA 2015, p. 1).

Analysis of trend data is sensitive to the start and stop dates of the period analyzed due to the cyclic nature of sage-grouse populations. Garton *et al.* (2015) examined data only through 2013, at which time most populations were experiencing a cyclic decline. Lek counts increased in nearly all locations in 2014 and 2015 (WAFWA 2015, p. 1). However, both updated trend analyses are consistent with previous studies showing a long-term rangewide decline of sage-grouse has occurred since 1965 (75 FR 13910, March 23, 2010, p. 13922). The rate of decline lessened during 1985 to 2007, with an average annual decrease of 1.4 percent (Connelly *et al.* 2004, p. 6–71; WAFWA 2008, p. 58). The updated WAFWA analysis reported that, rangewide, rates of declines were less for the past 10 years (2005–2015) than the long-term decline rates (1965–2015) (WAFWA 2015, pp. 10–11).

Abundance and Distribution Models

We developed two models for use in this status assessment: (1) Population Index Model and (2) Occupied Breeding Habitat Distribution Model. These models were developed to evaluate risk to sage-grouse populations and benefits of conservation actions designed to ameliorate those risks. Our models, built with collaboration from WAFWA, are used as metrics for risk analyses and general Geographic Information System (GIS) queries. Full discussions of how the models were created and used are below.

In the 2010 finding, we assessed impacts to sage-grouse and their habitat based on the portion of occupied range where a disturbance occurred. This approach was based on the best available GIS data at that time, but may have overestimated some impacts, because all lands within the occupied range were assumed to provide habitat. We used this analysis in 2010 because current information available to us about the occupied sage-grouse range was developed at a very broad scale and included large areas of non-habitat. The Occupied Breeding Habitat Distribution Model was developed to more accurately portray the breeding areas that are important to sage-grouse. The Occupied Breeding Habitat Distribution Model uses sage-grouse lek data as a proxy for landscapes important to breeding sage-grouse, because leks are central to the breeding ecology of sage-grouse. We developed a model that statistically links habitat characteristics around known lek locations to habitat features such as the amount of sagebrush or tree cover within a 6.4-km (4-mi) radius. The output of the model is a prediction of the probability that each 120-m^2 (393-ft^2) area within a sage-grouse management zone provides habitat to support a breeding population of sage-grouse (Figure 2). These spatial predictions of occupied breeding habitat are then able to be linked with spatially explicit risk models to better understand how potential impacts to sage-grouse overlap with breeding habitat. A consistent data set for other important seasonal habitat is not available, so while the model may not specifically include other seasonal habitats, it is the best available information for predicting impacts to the species consistently across the range. This model was the primary tool used to assess how the location and scope of potential threats may impact the species currently and into the future (see Summary of Information Pertaining to the Five Factors, below).

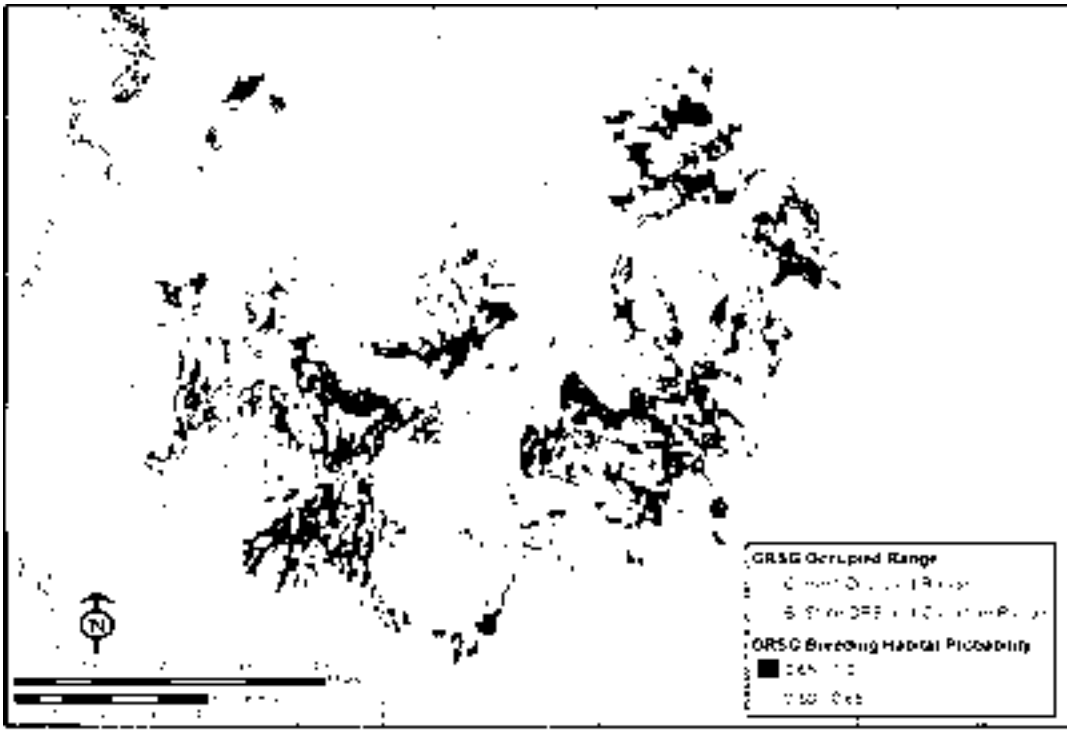

Figure 2 Modeled distribution of occupied sage-grouse breeding habitat

We developed the Population Index Model to spatially identify Core Areas on the landscape that contain population centers of sage-grouse (Figure 3). We did this because sage-grouse populations are highly clumped, and relatively small areas can contain a disproportionate amount of sage-grouse. To create our Population Index Model, we used lek data to identify hotspots using standard statistical methods. We used the Occupied Breeding Habitat Distribution Model to develop our final Population Index Model. The model results are grids that represent an index to the relative amount of breeding birds for each 120 m^2 (393 ft^2) within management zones. Similar to our Occupied Breeding Habitat Distribution Model, our Population Index Model can be linked with other spatially explicit risk models or conservation actions to understand spatial overlap with sage-grouse populations. We would expect high levels of future impacts to occur if current sage-grouse population centers overlap areas with high probabilities of future land use activities. Conversely, we would expect future impacts to be low, if current sage-grouse population centers do not overlap areas with high probabilities of future land use activities. The Population Index Model was used to assess potential impacts from Nonrenewable Energy and Agricultural Conversion (see Summary of Information Pertaining to the Five Factors, below).

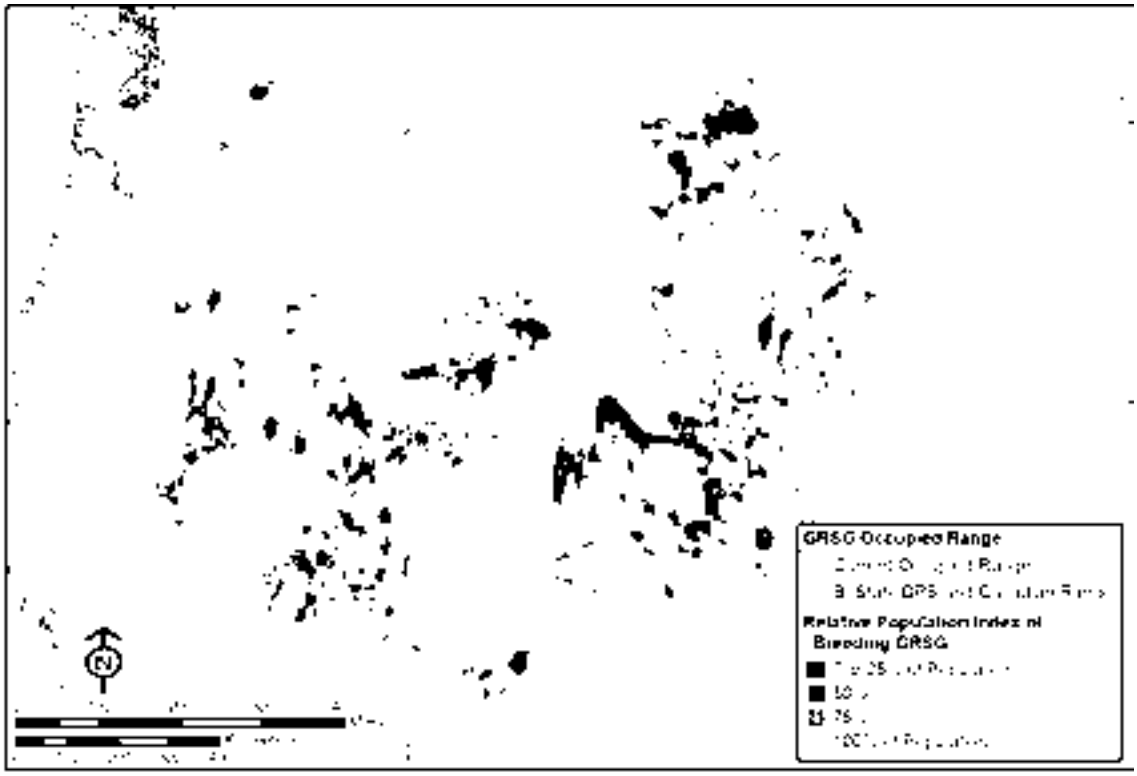

Figure 3 Population Index of breeding sage-grouse Darker areas illustrate the highest densities of breeding sage-grouse

Unfortunately we did not receive population or habitat data from the two Canadian provinces within the species range and, therefore, could not include these areas in our modeling efforts. The abundance of sage-grouse is low in both Canadian provinces (Alberta Environment and Sustainable Resource Development 2013, p. 8). Due to the low number of birds remaining in Canada, coupled with the limited amount of existing habitat in Canada, we do not anticipate that the exclusion of these areas affects the outcome of this range-wide model.

Population Abundance and Trends Summary

Estimating sage-grouse abundance is difficult due to changes in seasonal distributions, the cryptic coloration, and behavior of females and their offspring, and the lack of a systematic survey protocol and sampling scheme across the range of the species (WAFWA 2015, pp. 44–46). Lek counts do not provide a precise estimate of population size; however, these counts provide a useful index to the population size that detects population changes over time (Johnson and Rowland 2007, p. 20). Although an imperfect measure, peak counts of males on leks are the best available information about the number of sage-grouse in an area (Johnson and Rowland 2007, p. 20) and are the accepted method to assess sage-grouse abundance trends (WAFWA 2015, p. 2; Garton *et al.* 2015, entire).

Information reviewed for the 2010 finding indicated a long-term decline of sage-grouse abundance since lek count surveys were initiated in the 1960s. New information since 2010 confirms that long-term declines have occurred from 1965 to 2014 across all MZs where sufficient data exist to make inferences (Garton *et al.* 2011, 2015, entire; WAFWA 2008, 2015, entire). While models agree about downward abundance trends since the 1960s, the actual rates of decline differ among MZs and studies. Our confidence in these rates of decline is limited due to a variety of statistical sampling issues associated with counting peak males on leks (see Johnson and Rowland 2007, pp. 17–20), as well as the cyclic nature of sage-grouse populations. Regardless, the best information available indicates that the rangewide population of sage-grouse is declining.

Changes Since the 2010 Finding

The landscape of the western United States has undergone significant changes since the onset of European settlement, including the dramatic alteration of key sage-grouse habitats. Despite human population growth and accompanying development, sagebrush habitats persist on millions of acres across 11 States in the west. Sage-grouse numbers have declined since pre-European settlement, but sage-grouse distribution (Figure 3) has remained relatively unchanged since our first status review in 2005 (70 FR 2244, January 12, 2005). In other words, despite historical and current population declines, sage-grouse are still distributed throughout their range.

The 2005 status review found that, despite a growing number of serious threats, large numbers of birds continued to be distributed across the range (70 FR 2244, January 12, 2005, p. 2279). At that time, 92 percent of the known active leks occurred in 8 of 41 populations; 5 of those populations were so large and expansive that they were subdivided into 24 subpopulations to facilitate analysis (Connelly *et al.* 2004, p. 13–4). We subsequently

determined that the species did not warrant listing, but emphasized the need for ongoing sage-grouse and sagebrush conservation efforts to moderate the rate and extent of habitat loss for the species in the future (70 FR 2244, January 12, 2005, p. 2279). Following the 2005 finding, the Western Association of Fish and Wildlife Agencies (WAFWA) released a rangewide conservation strategy for sage-grouse, which established an overarching goal of maintaining and enhancing populations and distribution of sage-grouse ''by protecting and improving sagebrush habitats and ecosystems that sustain these populations'' (Stiver *et al.* 2006, p. i). The WAFWA conservation strategy included actions such as increasing capabilities in habitat restoration, habitat conservation, research, and improving regulatory mechanisms. The WAFWA conservation strategy also identified quantifiable conservation goals (Stiver *et al.* 2006, pp. 1–8).

In 2010, we conducted a second status review for sage-grouse (75 FR 13910, March 23, 2010, entire). Although the species remained widely distributed across the landscape, we found it warranted for listing under the Act due to continued loss and fragmentation of habitat exacerbated by a lack of adequate regulatory mechanisms to address habitat loss. The primary drivers of habitat fragmentation identified were renewable and nonrenewable energy development in prime sage-grouse habitats, continued expansion of supporting infrastructure, the spread of invasive annual grasses and associated changes in wildfire regimes, and the lack of adequate regulatory structures to address these impacts. In addition, trend data showed a continuation of population declines identified in 2005. Without regulatory mechanisms in place to control continued habitat loss and fragmentation, we determined the sage-grouse was at risk of extinction in the foreseeable future and, therefore, warranted protection under the Act. However, due to the workload of managing higher priority species, we designated the sage-grouse a ''candidate'' species, assigning it a listing priority number of 8 to indicate the moderate magnitude of imminent threats. Species with lower listing priority numbers are addressed before those with higher priority numbers.

We also concluded that the extinction risk was not imminent. As noted in the 2010 finding when determining its listing priority status: ''We consider the threats that the sage-grouse faces to be moderate in magnitude because the threats do not occur everywhere across the range . . . and where they are occurring they are not of uniform intensity or of such magnitude that the species requires listing immediately to ensure its continued existence. While sage-grouse habitat has been lost or altered in many portions of the species' range, substantial habitat still remains to support the species in many areas of its range. We believe the ability of these population centers to maintain high densities in the presence of several threat factors is an indication that the magnitude of threats is moderate overall'' (75 FR 13910, March 23, 2010, pp. 14008–14009). The 2010 finding has galvanized a rangewide conservation effort that includes new management plans developed by Federal and State agencies to establish regulatory mechanisms adequate to address identified threats.

New Scientific Information

Since 2010, the already voluminous scientific literature on sage-grouse has been augmented by extensive, newly published research on sage-grouse biology, sagebrush habitat, and impacts to both. We collected this information for our status review through a direct request to our conservation partners and through general literature reviews. We have used this data to inform our understanding of the current status of sage-grouse and how its status has changed since 2010. All relevant published resources, as well as unpublished data, were considered in our status review. Not all of this new information is cited in this document, as it either did not provide additional information on impacts to the species or response to conservation, or was repetitive of other studies already cited in our assessment. In addition, we considered all new scientific information presented to us in response to our data call for this status review, information received during our previous annual Candidate Notice of Review data calls, data entered into the Conservation Efforts Database (CED), and recently published articles. Several articles providing new information since 2010 are summarized below.

New population trend analyses incorporating up to 7 years of additional data have been completed (Garton *et al.* 2015, WAFWA 2015) and provide greater insight into population cycling and species status. We recognize the difficulty in detecting short-term trends for a species with decadal cycles; longer term trends show a small, but detectable decline since the 1960s. For more information, see Population Abundance and Trends section, above.

An evolving appreciation of mechanisms that affect sage-grouse and sagebrush habitats assisted in the development of new applied science for conservation efforts, including wildfire and invasive management (Chambers *et al.* 2014a, entire), conifer removal (Miller *et al.* 2014, entire), and energy development (Patricelli *et al.* 2013, entire; Drouin 2014). These important, applied conservation tools have been essential in assessing species and habitat persistence and aiding the minimization of impacts to the species and its habitat. Specifically, the resilience and resistance matrix developed by WAFWA and published in 2014 provided a new applied science framework to better understand the likelihood of habitats to ability to resist *Bromus tectorum* (cheatgrass) invasion and recover following wildfire (Chambers *et al.* 2014a, entire). Conservation actions designed to minimize risk have also been furthered by application of new scientific information and tools. For example, the Natural Resources Conservation Service (NRCS) Sage Grouse Initiative (SGI) has incorporated new scientific research on impacts to guide the development of grazing plans, conifer removal, fence marking, and other conservation actions on private lands to benefit sage-grouse and its habitat (NRCS 2015a, entire).

The U.S. Geological Survey (USGS) compiled the findings of published scientific literature evaluating the influence of human activities and infrastructure on sage-grouse (Manier *et al.* 2013, entire). An additional report (Manier *et al.* 2014, entire) provided information on biologically relevant buffer distances around sage-grouse habitats to help reduce habitat avoidance caused by human disturbance and infrastructure. The revised and amended BLM and USFS Federal Plans adopted and incorporated the recommendations in the Manier *et al.* report (2014), as discussed below in the *Sagebrush Landscape Conservation Planning* section. These new analyses and tools, plus all the other information we considered, are addressed throughout this document and our administrative record.

Many partners across the range of the sage-grouse are working to conserve sage-grouse habitat. In 2014, we developed the CED, a spatially explicit, online platform for efficiently collecting data from conservation partners about their sage-grouse conservation efforts. More than 100 partners across the range of the species entered information about 6,200 projects into the CED. Of these projects, 44 percent (2,700 projects) cover more than 1.2 million ha (3

million ac) and were deemed complete and effective at addressing the primary threats identified in the Conservation Objectives Team (COT) Report (See *Sagebrush Landscape Conservation Planning* section below for a description of this report) (USFWS 2013, entire). Examples of these projects include conservation easements, conifer removal, and treatments to remove or reduce invasive weeds and annual grasses. The other 3,500 projects (56 percent), as reported in the CED, were of more limited scope and scale; and some did not contain enough information for us to reliably assess their effectiveness or implementation even on a local scale. Thus, while these efforts will continue to be helpful in conserving sage-grouse and its habitat now and into the future, we took a conservative approach and did not rely on these efforts in this finding.

Sagebrush Landscape Conservation Planning

The expansive range of sagebrush habitat has compelled managers to take a landscape approach to conservation efforts, with sage-grouse assuming the focus of these efforts for the past decade. In 2006, WAFWA developed a comprehensive strategy for conserving habitat for the benefit of this species. The strategy outlined the need to develop partnerships among local, State, Provincial, Tribal, and Federal agencies, non-governmental organizations, and private landowners to design and implement cooperative actions to support robust populations of sage-grouse and the landscapes and habitats upon which they depend (Stiver *et al.* 2006, p. i). This was the first of several documents to outline the conservation needs of the species and its habitat.

In 2011, the BLM assembled a National Technical Team (NTT) of sage-grouse and sagebrush habitat experts to identify the best available science-based information to guide the development of Federal land management plans for the greater sage-grouse (BLM 2011a, entire). The NTT Report proposed conservation measures based on habitat requirements and other life-history aspects of the species. The NTT Report also described the scientific basis for some of the conservation measures proposed within each of the Federal land planning program areas. These conservation measures included actions such as development of sage-grouse specific habitat objectives relative to domestic livestock management, criteria to inform leasing decisions in sage-grouse habitats, and monitoring of sage-grouse and their habitats (BLM 2011a, entire).

Conservation Objectives Team Report

In 2013, we, together with the States, chartered a team of sage-grouse and habitat experts to identify the conservation goals for the species. The Conservation Objectives Team (COT) Report was a ground-breaking, collaborative approach to develop rangewide conservation objectives for the sage-grouse, both to inform this finding and to inform the collective conservation efforts of the many partners working to conserve the species (USFWS 2013, entire). The highest level objective identified in the COT Report is minimization of habitat threats to the species so as to meet the objective of the 2006 WAFWA Greater Sage-grouse Comprehensive Conservation Strategy: Reversing negative population trends and achieving a neutral or positive population trend.

The conservation principles of redundancy, representation, and resilience guided the development of the conservation goals, priority areas for conservation, conservation objectives, and measures included in the COT Report (USFWS 2013, p. 12). The COT Report found that satisfying these conservation principles for sage-grouse meant having multiple, geographically distributed populations across the species' range (USFWS 2013, p. 12). The COT Report further stated, ''By conserving well distributed sage-grouse populations across geographic and ecological gradients, species adaptive traits can be preserved, and populations can be maintained at levels that make sage-grouse more resilient in the face of catastrophes or environmental change'' (USFWS 2013, pp. 12–13).

In particular, the COT Report, using State information, identified the habitats most critical for the conservation of the species, which were described as Priority Areas for Conservation (PAC, Figure 4) (USFWS 2013, entire). Priority Areas for Conservation are ''. . . the most important areas needed for maintaining sage-grouse representation, redundancy and resilience across the landscape'' (USFWS 2013, p. 13). Identifying PACs ensured that conservation partners direct their efforts to the highest priority habitats. Since the completion of the COT Report, improved habitat mapping and further discussions with the States has resulted in changes to the PAC map in Nevada, Montana, and Utah. For the purposes of this document, we refer to those areas that were added as Important Priority Areas.

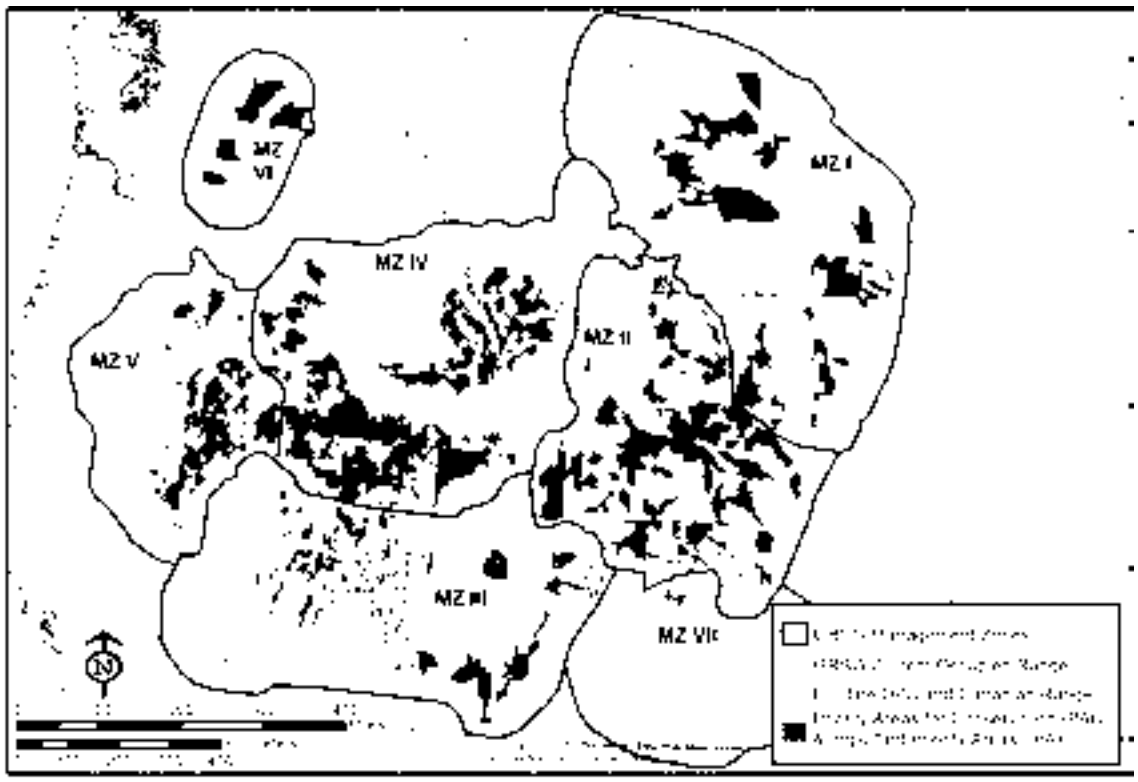

Figure 4 Sage-grouse Priority Areas for Conservation (PACs) including modifications to incorporate Important Priority Areas

Federal and State Planning Efforts

As discussed above, in 2010 we concluded that sage-grouse populations were well-distributed across the occupied range, but without the habitat protections provided by adequate regulatory mechanisms, populations were likely to become smaller, fewer, and separated by fragmentation, placing the species at risk of extinction in the future (75 FR 13910, March 23, 2010, p. 13986). Because the 2010 finding indicated that adequate regulatory protections could prevent the need to list sage-grouse, numerous Federal and State agencies undertook planning efforts to improve regulatory mechanisms and conserve sage-grouse into the future. A centerpiece of all of the conservation efforts is the protection of the most important habitats for sage-grouse that are necessary to maintain redundant, representative, and resilient populations (*i.e.,* PACs). These important habitats for conservation were identified in conservation planning efforts (Figure 4) as the places where large, undisturbed expanses of sagebrush habitat were supporting leks and the highest density of breeding birds (USFWS 2013, p. 15). These important habitats for conservation also correspond with the population centers referred to in the 2010 finding. The maintenance of these areas and the birds that use them would provide a network of resilient and connected populations across the landscape that would provide for long-term species viability.

Using the recommendations provided in the COT Report (USFWS 2013, entire) and the NTT Report (BLM 2011a, entire), the Federal agencies developed conservation strategies to protect the important habitats for conservation. These strategies focus not only on the most important habitats for conservation, but also on conservation objectives to address the greatest threats to the species, as identified in the COT Report (USFWS 2013, pp. 31–52).

While 10 of the 11 States in the range of the sage-grouse updated their State plans to conserve the species by incorporating new information, which is a testimony to their concern and commitment to protect the grouse and its habitats, not all of these plans have been implemented or are regulatory in scope. We will specifically highlight the regulatory conservation actions mandated by the State plans in Wyoming, Montana, and Oregon because they provide the greatest degree of regulatory certainty in addressing potential threats on State and private lands not under the jurisdiction of Federal plans. We appreciate the work that each State has completed, but not all planning efforts met a level of certainty for implementation and effectiveness. We acknowledge that sage-grouse conservation plans have been developed for Colorado, Idaho, Nevada, North Dakota, South Dakota, and Utah that could provide long-term benefits to sage-grouse. For example, the Idaho Plan includes the following measures: Technical and monetary assistance for fire rehabilitation and restoration efforts in areas where wildfire has impacted both State and Federal lands; assistance with implementation of Federal landscape fuels management projects on lands adjacent to Federal lands (such as the extension of fuel break projects onto State lands); development, coordination, and training for Rangeland Fire Protection Associations (RFPAs); and adoption of a general strategy to reduce Idaho Plan ownership of key habitat within Core Habitat Areas through land exchanges with BLM. We encourage all of the States to fully implement their

sage-grouse plans as they will further contribute to the long-term conservation of the sage-grouse.

In this section, we provide a summary of the various conservation programs and efforts put in place at the Federal, State, and local levels that are most important to our analysis of regulatory mechanisms in addressing potential threats to sage-grouse: The Federal plans, State plans in Wyoming, Montana, and Oregon; and the voluntary conservation efforts on private lands provided by SGI and Candidate Conservation Agreements with Assurances (CCAAs). The Wyoming Plan is analyzed based on its 7-year track record of implementation, and SGI is also analyzed based on its accomplishments to date.

The sections below provide an analysis of the implementation and effectiveness of the Federal plans, Montana program, Oregon efforts, and Secretarial Order 3336 pursuant to our Policy for Evaluation of Conservation Efforts (PECE) (68 FR 15100, March 28, 2003). The purpose of PECE is to ensure consistent and adequate evaluation of recently formalized conservation efforts when making listing decisions. The policy provides guidance on how to evaluate conservation efforts that have not yet been implemented or have not yet demonstrated effectiveness. The evaluation focuses on the certainty that the conservation efforts will be implemented and the effectiveness of the conservation efforts to contribute to make listing a species unnecessary. In this finding, we evaluated the certainty that the Federal Plans, and the Montana and Oregon Plans will be implemented into the future and the certainty that they will be effective in addressing threats, based on the best available science and professional recommendations provided in the COT and other scientific literature and reports. We also evaluated the Secretarial Order using PECE, which is discussed below in the *Wildfire and Invasive Plants* section.

The Federal plans and three State Plans provide protective, regulatory mechanisms for the majority of the most important habitat for sage-grouse. The Federal Plans divide habitat into two habitat management area categories—Priority Habitat Management Areas (PHMAs) and General Habitat Management Areas (GHMAs). Priority Habitat Management Areas largely correspond to PACs (USFWS 2013, p. 13) and State-identified Core Areas (BLM and USFS 2015, entire). The PHMAs are the highest priority for conservation because they contain large, undisturbed expanses of breeding habitat and the highest densities of sage-grouse. The most restrictive conservation measures, such as excluding certain activities and requiring avoidance and minimization measures, apply to 64 percent of the species' breeding habitat designated as PHMAs (USFWS 2015a). The Federal and three State plans protect an additional 26 percent of breeding habitat in GHMAs (USFWS 2015a) that contain fewer leks and sage-grouse than PHMAs, but provide habitat and connectivity between populations. As discussed above in Sage-Grouse Connectivity and Landscape Genetics, connectivity between core population areas has been identified as an important strategy to ensure long-term sage-grouse persistence (Crist *et al.* 2015, p. 17). The required conservation measures in GHMAs are less restrictive than in PHMAs and provide greater land-use flexibility, but still deliver measures that minimize potential impacts. To assess the effectiveness of the Federal Plan, we completed a geospatial analysis of how much the areas designated as PHMAs and GHMAs overlapped with areas modeled as breeding habitat. Collectively, the regulatory mechanisms provided by the Federal plans and three State plans reduce potential impacts to approximately 90 percent of the sage-grouse breeding habitat rangewide (USFWS 2015a). Later in this document, we will discuss how all of these conservation efforts are expected to address adverse effects from potential threats, and lastly, we will assess the adequacy of these efforts as regulatory mechanisms (See *Regulatory Mechanisms,* below).

Federal Plans

The BLM and USFS sage-grouse planning effort was unprecedented in scope and scale, and represents a significant shift from management focused within administrative boundaries to managing at a landscape scale. This effort also represented a concerted effort by the agencies to balance their multiple-use mandates with conservation objectives. The BLM and USFS completed this effort by issuing amendments or revisions to 98 land management plans governing over half of the occupied range. These land management plans are the principal regulatory documents for the activities allowed on BLM and USFS lands, are grounded in the agencies' organic statutes (*e.g.,* Federal Land Management and Policy Act, National Forest Management Act), and are at the core of the agencies' National Sage-Grouse Conservation Strategy outlined in their plan revisions and amendments. We were a key partner working closely with BLM and USFS throughout the process to develop and complete the Federal Plans. In this section, we will discuss the Federal plans across the 11-State range of sage-grouse, except for the plans in Wyoming. For Wyoming, because the Federal and State plans work together to conserve sage-grouse on all lands, they will be discussed together in a separate section below.

The BLM and USFS have broad authorities to manage the lands and resources within their jurisdiction. The Federal Land Policy and Management Act of 1976 (FLPMA) (43 U.S.C. 1701 *et seq.*) is the primary Federal law governing most land uses on BLM-administered lands and directs development and implementation of Resource Management Plans, which direct management at a local level. Resource Management Plans are the basis for all actions and authorizations involving BLM-administered lands and resources. Management of activities on National Forest System lands is guided principally by the National Forest Management Act (NFMA) (16 U.S.C. 1600–1614, August 17, 1974, as amended). The NFMA specifies that the USFS must have a Land and Resource Management Plan (16 U.S.C. 1600) to guide and set standards for all natural resource management activities on each National Forest or National Grassland. For the purposes of this document, Resource Management Plans and Land and Resource Management Plans are collectively referred to as Federal Plans.

Under FLPMA, the BLM is required to establish Resource Management Plans for the management and use of public lands in accordance with the principles of multiple-use and sustained-yield. Similarly, pursuant to the NFMA, the USFS is required to establish plans for the management and use of National Forest System lands in accordance with the principles of multiple-use and sustained-yield. The Federal Plans are the basis for on-the-ground actions that the BLM and USFS undertake and authorize. Decisions in Federal Plans guide future land management actions and subsequent site-specific implementation decisions. Land use plan decisions establish goals and objectives for resource management (desired outcomes) and the measures needed to achieve these goals and objectives (land use allocations for the BLM; Standards and Guidelines for the USFS).

These Federal Plans are regulatory mechanisms. The Federal Plans establish goals and objectives and measures to address the potential

threats to sage-grouse and sage-grouse habitat. The Federal Plans establish mandatory constraints and were established after notice and comment and review under the National Environmental Policy Act (NEPA). Therefore, changes to the Federal Plans would require additional notice and comment and further analysis under NEPA. All future management authorizations and actions undertaken within the planning area must conform to the Federal Plans, thereby providing reasonable certainty that the plans will be implemented. The BLM has already made substantial financial commitments to ensure success of actions identified in their Plans, including allocating more than 10 million dollars to support fire management (DOI 2015a, entire). In 2015, BLM directed resources to fund monitoring crews, and funded activities, like data management, to ensure successful implementation of the monitoring commitments; and BLM's fiscal year 2016 budget request included an additional 8 million dollars to directly support monitoring the implementation and effectiveness of the land use plans (Lueders, BLM, 2015, pers. comm.). The Department of the Interior identified additional high-priority actions that the BLM will complete in the next 5 years including prioritizing control of invasive plants and removal of free-roaming equids from high-priority sage-grouse habitat (DOI 2015a, entire). Based upon past Federal land planning efforts, we expect these plans to be implemented for the next 20–30 years. The BLM and USFS have committed to full funding and implementation of these plans, and have included monitoring and adaptive management to ensure their long-term effectiveness.

The Federal Plans represent a paradigm shift in western Federal lands management in their focus on maintaining large expanses of the sagebrush ecosystem for the benefit of sage-grouse and many other species. Federal Plans are structured around a layered management approach that aims to preclude or minimize additional surface disturbance in priority conservation habitats, while providing some management flexibility in sage-grouse habitat areas that are less critical for conservation. In addition to these land use allocations and associated conservation actions, the Federal Plans include direction for wildfire and invasive species management, minimization measures, mitigation strategies, monitoring, and adaptive management that provide further conservation benefits for sage-grouse, as discussed below. There are differences across 98 plans as necessary to address differing ecological conditions; however, the general regulatory framework is consistent amongst all the plans. Because of the commitments from the Federal Government to implement these plans and because of the Plans' consistency with the COT Report recommendation for measures to reduce threats, these Federal Plans provide substantial conservation benefits to sage-grouse, now and in the future

Land Management – The Federal Plans adopt a tiered land use allocation regime that provides the greatest level of protection for the most important habitats. We, together with State agencies, helped the BLM and USFS designate priority habitat areas using the best available scientific data to identify the location of the highest quality habitat with the greatest number of breeding sage-grouse. These areas largely coincide with the PACs identified in the COT Report (USFWS 2013, p. 14) and were designated by BLM and USFS in the Federal Plans as Priority Habitat Management Areas (PHMAs) (BLM and USFS 2015, entire). Based on our recommendation to further protect sage-grouse population centers that have been identified in the scientific literature as critically important for the species and areas identified through our analysis as important for conservation, BLM and USFS designated areas as Sagebrush Focal Areas (SFA) and added protections that would further limit new, human-caused surface disturbance in SFAs. Lastly, BLM and USFS designated General Habitat Management Areas (GHMAs) that represent areas with fewer leks and lower densities of breeding birds where disturbance is limited, while providing greater flexibility for land use activities.

Federal Plans mapped approximately 27 million ha (67 million ac) of sage-grouse habitat, of which 14 million ha (35 million ac) were designated as PHMAs, 4.5 million ha (11 million ac) were designated as SFAs (and overlap generally with PHMAs), and 13 million ha (32 million ac) were designated as GHMAs (no habitat was mapped in Washington, as minimal habitat occurs on BLM and USFS land in that State). The Federal Plans authorize and establish allowable resource uses for each of these Management Area designations. The Federal Plans also establish stipulations for certain authorizations to protect resources. Land use allocations of specific activities are generally categorized as:

- Exclusion/Closed: Areas that are not available for development or use of particular resources; or
- Avoidance: Areas to be avoided but may be available for development or use of particular resources with special stipulations; or
- Open: Areas open to development or use of particular resources, although use may be restricted by stipulations.

Using this targeted and tiered approach to habitat conservation, the Federal Plans have a number of components for conserving sage-grouse and their habitats. The primary components of the Federal Plans are a combination of: (1) Land use allocations; (2) human-caused disturbance caps and density limitations; (3) lek buffers; (4) monitoring; (5) adaptive management; (6) mitigation; and (7) a landscape-scale strategy for addressing the threat of fire and invasive grasses.

The BLM, USFS, and other partners recognize the variability in habitat value across sage-grouse habitat, both in terms of habitat characteristics and habitat quality. Priority sage-grouse habitats are areas that have the highest conservation value to maintaining or increasing sage-grouse populations. These areas include breeding, late brood-rearing, winter concentration areas, and where known, migration or connectivity corridors (BLM 2011a, p. 7). The BLM developed a rangewide Breeding Bird Density Map to highlight locations where the highest densities of breeding males were found on leks (Doherty *et al.* 2010a). Using this information and additional State agency expertise, BLM highlighted seasonal habitats needed for the sage-grouse (BLM 2011a, p. 7). In those instances where the BLM State offices did not complete this delineation, BLM relied upon the Breeding Bird Density maps (Doherty *et al.* 2010a, entire; BLM 2011b, entire). An Instructional Memorandum (IM; IM 2012–043) established two habitat categories. Preliminary Priority Habitat forms the basis for PHMA in the final plans and represents the habitat designated to maintain distribution and sustainable sage-grouse populations (BLM 2011b, entire). The second category was Preliminary General Habitat, the precursor to GHMA, which represents areas with fewer leks and lower densities of breeding birds where disturbance is limited, while providing greater flexibility for land use activities. Many of these areas were already impacted by human activities or wildfire. General sage-grouse habitat is described as occupied (seasonal or year-round) habitat outside of priority habitat (BLM 2011a, p. 9).

The Federal Plans focus on land use management within these two management areas (Figure 5). The discussion below analyzes PHMA and GHMA separately to distinguish the different management considerations in the most important habitats (PHMA) and the measures provided in other occupied habitats (GHMA).

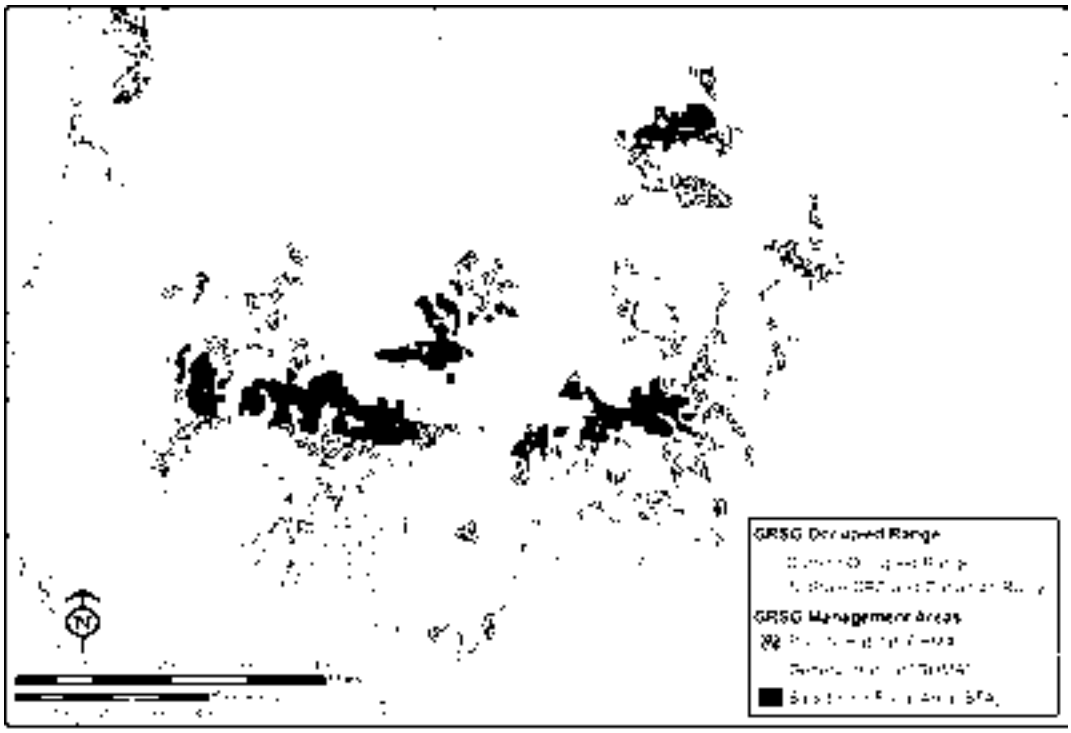

Figure 5 Federal Plan management areas and focal areas

Priority Habitat Management Areas—The BLM and USFS evaluated the occupied habitat within their jurisdiction and designated the areas with the best habitat and the majority of the leks as PHMAs. Approximately 14 million ha (35 million ac) were designated as PHMA (Figure 5), corresponding with approximately 64 percent of breeding habitat. The PHMA consists of the most important habitat on Federal lands occupied by the species. Because this is the most important habitat on Federal lands within the range of the species, the land use allocations and other measures are more restrictive in these habitats. Below we analyze the land use allocations and other measures in the revised and amended Federal Plans to conserve and maintain these important habitat areas on Federal lands. The Federal Plans in Wyoming are discussed separately below with the Wyoming State strategy as they collectively address all lands in Wyoming in a coordinated effort.

Fluid Minerals (Including Oil, Gas, and Geothermal): Under the revised or amended Federal Plans, PHMAs are closed to new leasing or subject to leasing with No Surface Occupancy (NSO). No surface occupancy areas are open to leasing, but human-caused surface-disturbing activities, such as development of well pads, cannot be conducted on the surface of the land. Access to oil and gas deposits would require directional drilling from outside the boundaries of the NSO areas. There will be no waivers, exceptions, or modifications, unless the following condition is met: ''A lease exception may be considered where a portion of the proposed lease is determined to be in non-habitat, the area is not used by sage-grouse, nor would it have direct, indirect or cumulative effects to sage-grouse or its habitat. The determination would be made by a team of agency sage-grouse experts, including an expert from the state wildlife agency, the Service, and BLM/USFS. All exceptions must be approved by the State Director.'' Further, priority will be given to leasing and development of fluid mineral resources, including geothermal, outside of sage-grouse habitat. The implementation of these priorities will be subject to valid existing rights and any applicable law or regulation, including, but not limited to, 30 U.S.C. 226(p) and 43 CFR 3162.3–1(h).''

On existing leases, the BLM will work with the lessees, operators, or other project proponents to avoid, reduce and mitigate adverse impacts to the extent compatible with lessees' rights to drill and produce fluid mineral resources. The BLM will work with the lessee, operator, or project proponent in developing for the lease an application for a permit to drill to avoid and minimize impacts to sage-grouse or its habitat and will ensure that the best information about the sage-grouse and its habitat informs and helps to guide development of such Federal leases. See the *Nonrenewable Energy* section below for a further discussion of valid existing rights.

Fluid minerals land use allocation decisions are more complex than the typical open, avoidance, and closed/exclusion decisions. Allocative decisions within the Federal Plans for fluid minerals can be one of the following:

- Open: These areas are open to leasing with minor to no constraints, subject to existing laws and regulations, and formal orders, as well as any standard terms and conditions.

- Open with moderate constraints: These are areas where it has been determined that moderately restrictive lease stipulations may be required to mitigate impacts. These stipulations include timing limitations and controlled surface uses.
- Open with major constraints: These are areas where it has been determined that highly restrictive lease stipulations are required to mitigate impacts.
- No Surface Occupancy (NSO): These areas are open to leasing, but surface-disturbing activities are precluded. Access to oil and gas deposits would require directional drilling from outside the boundaries of the NSO areas. The NSO areas are also avoidance areas for Rights-of-Way (ROWs); no ROWs would be granted in NSO areas unless there are no feasible alternatives.
- Closed: These are areas where it has been determined that other land uses or resource values cannot be adequately protected with even the most restrictive lease stipulations and appropriate protection can be ensured only by closing the lands to leasing.

In 2010, there were few habitat restrictions specific for sage-grouse for fluid mineral leasing on Federal lands within the range of the species. The new land use allocations in the Federal Plans designating PHMAs as either closed or open with NSO restrictions represent an unprecedented change in the management of areas important for sage-grouse (PHMAs) with fluid mineral potential. These land use allocations are consistent with the COT Report (USFWS 2013, p. 43) recommendations to reduce and eliminate disturbance in PACs. Closing areas to development and requiring NSO with only very limited exceptions, substantially reduces the potential for future disturbance in PHMAs. Considered together, these measures avoid or minimize impacts to fluid mineral development in priority habitat for conservation; this signifies a substantial improvement in the effectiveness of regulatory mechanisms since the 2010 finding.

Non-Energy Leasable Minerals: Under the Federal Plans, PHMAs are closed to new permits for non-energy leasable minerals (*e.g.,* phosphate, sodium, potassium), but expansion of existing operations could be considered, subject to specific conditions outlined in the plans. This provision reduces the potential impacts from non-energy leasable mineral development. The BLM leases certain solid minerals on public and other Federal lands. When mineral rights owned by the Federal Government underlie privately owned surface lands, the BLM can also lease these minerals. The restrictions in PHMAs reduce the likelihood that future development to non-energy leasable minerals will occur in these areas. Closing areas is an effective measure to reduce disturbance.

Mineral Materials: Since July 23, 1955, common varieties of sand, gravel, stone, pumice, pumicite, and cinders were removed from the General Mining Law and placed under the Materials Act of 1947, as amended. Use of salable minerals requires either a sales contract or a free-use permit (free permit for personal, noncommercial use). Under the Federal Plans, PHMAs are closed to new mineral material sale with limited exceptions for free use permits (described below) and the expansion of existing active pits, subject to compensatory mitigation and disturbance caps. Required design features (RDF) will be applied to all free use permits to minimize any potential impacts. As with other mineral development, disturbance in important habitat areas will be minimized through disturbance caps, lek buffers, and other measures. The closure of PHMAs to the sale of mineral materials effectively eliminates new impacts from this activity in PHMAs providing effective conservation in the most important habitats for the species.

Solar/Wind: The Federal Plans generally exclude new utility scale and commercial solar and wind developments from PHMAs. Limited exceptions must be based on an explicit rationale that biological impacts to sage-grouse will be avoided. Rights-of-way are required for wind testing, associated development structures, or solar energy development projects implemented on public lands. In Nevada, California, Utah, and Colorado, the Solar Energy Development Programmatic EIS (BLM 2012, entire) excludes development of utility-scale solar facilities outside the Solar Energy Zones and variance areas (variance areas are potentially available for utility-scale solar energy development, subject to additional environmental review), protecting a majority of the sage-grouse habitat in these States. Exclusion is an effective tool to reduce disturbance and minimize impacts in the most important habitats for conservation on federally managed lands because the activity will not be allowed in important habitats.

Rights-of-way: Under the Federal Plans, PHMAs are either avoidance or exclusion areas for both major and minor rights of way with limited exceptions, which must be based on an explicit rationale that biological impacts to sage-grouse are being avoided. Existing designated corridors for major transmission lines and pipelines will remain open. Federal Plans designate existing and potential ROW corridors to minimize adverse environmental impacts and the proliferation of separate ROWs (43 CFR part 2806). Any new disturbance within these corridors would count towards the disturbance cap. All new, modified, or deleted corridors will require a land use plan amendment (including NEPA analysis and notice and comment), thereby limiting new or expanded corridors in priority habitats for conservation in the future.

Livestock Grazing: The Federal Plans have not substantively changed livestock land use allocations; however, the BLM and USFS have committed to implementation of vegetative standards and habitat objectives specifically for sage-grouse based on local ecological conditions and prioritization of monitoring in PHMAs to determine if they are meeting sage-grouse habitat objectives consistent with site-specific guidelines or ecological site descriptions. The Federal Plans call for grazing to benefit or be neutral to sage-grouse, including in times of drought. Specifically, the BLM and USFS have committed to implementing the following measures in the Federal Plans:

- The habitat assessment framework (Stiver *et al.* 2010, entire) will be used to monitor progress at achieving rangeland health objectives at multiple spatial scales.
- The BLM and USFS will prioritize the following first in SFAs followed by PHMAs outside of the SFAs: (1) The review of grazing permits/leases, in particular to determine if modification is necessary prior to renewal, and (2) the processing of grazing permits/leases. In setting workload priorities, precedence will be given to existing permits/leases in these areas not meeting Land Health Standards, with focus on those containing riparian areas, including wet meadows. The BLM may use other criteria for prioritization to respond to urgent natural resource concerns (*e.g.,* fire) and legal obligations.
- The NEPA analysis for renewals and modifications of livestock grazing permits/leases that include lands within PHMAs will include specific management thresholds based on sage-grouse Habitat Objectives Table and Land Health Standards (43 CFR 4180.2) and defined responses that will allow the authorizing officer to make adjustments to livestock grazing without conducting additional NEPA analysis.
- Allotments within SFAs, followed by those within PHMAs, and focusing on those containing riparian areas, including wet meadows, will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision.
- At the time a permittee or lessee voluntarily relinquishes a permit or lease, the BLM and USFS will consider whether the public lands where that permitted use was authorized should remain available for livestock grazing or be used for other resource management objectives.
- Structural range improvements will be managed to benefit or not adversely affect sage-grouse by restricting locations of ranch

facilities (*e.g.,* fences, windmills, and corrals) around leks, marking or removing fences, and controlling invasive plants.

Prioritizing the onsite monitoring to the most important areas for sage-grouse consistent with the rangewide monitoring plan, the certainty of implementation is improved because monitoring and management changes will occur in the most important areas for sage-grouse first. The vegetative objectives in the Federal Plans were developed using the best available scientific information, taking into consideration ecological differences across the range of the species. The Federal Plans specifically cite to the literature relied upon to develop these objectives. The Federal Plans commit to implementation of any habitat enhancement projects and other activities to meet these objectives. The monitoring framework is designed to add consistency to this effort and will, with adaptive management, provide additional certainty that measures will be implemented to meet habitat objectives. These changes represent a significant change from having virtually no or only general land health standards for sage-grouse to a system that establishes specific standards for sage-grouse, prioritizes the most important habitats, and targets monitoring to ensure compliance. This framework represents an effective suite of measures that reduces the impacts from improper grazing.

Sagebrush Focal Areas—Sagebrush Focal Areas (SFAs) are the areas that the Federal Plans manage as the highest priority lands in PHMAs for sage-grouse conservation (Figure 5). The BLM requested input from us about additional conservation opportunities, and we provided a memo that identified ''strongholds'' for sage-grouse (USFWS 2014a, entire). These ''strongholds'' represented areas identified in the scientific literature as essential for the persistence of the species. Some of the important characteristics of these areas include large, contiguous blocks of Federal lands; high population connectivity; and high densities of breeding birds (USFWS 2014a, entire). Our recommendations directly informed the BLM and USFS development of SFAs, important conservation units within which land managers will apply the most conservative strategies to protect sage-grouse and habitat. Sagebrush Focal Areas encompass 4.5 million ha (11 million ac) of federally administered lands in PHMAs (BLM and USFS 2015, entire). All of the measures listed above in PHMAs also apply in SFAs; in addition, the following more restrictive measures also apply in SFAs.

Locatable Minerals: The General Mining Law of 1872, as amended, opened the public lands of the U.S. to mineral acquisition by the location and maintenance of mining claims. Mineral deposits subject to acquisition in this manner are generally referred to as locatable minerals. Locatable minerals include metallic minerals (*e.g.,* gold, silver, lead, copper, zinc, and nickel), nonmetallic minerals (*e.g.,* fluorspar, mica, gypsum, tantalum, heavy minerals in placer form, and gemstones), and certain uncommon variety minerals. Under the Federal Plans, the BLM and FS have recommended that lands in SFAs be withdrawn from location and entry under the Mining Law, subject to valid existing rights. (BLM and USFS 2015). Under FLPMA, the first step of the withdrawal process implementing that recommendation is for the Secretary (or Deputy or Assistant Secretary) to ''propose'' a withdrawal. 43 U.S.C. 1714(b). Upon publication of such a proposal in the **Federal Register**, the lands are immediately segregated from location and entry under the Mining Law as specified in the notice for a period of two years. That segregation temporarily has essentially the same effect as a withdrawal; that is, it closes the lands to location and entry under the Mining Law, subject to valid existing rights. Although the Secretary is free to make a final decision prior to or after its expiration, the segregation is intended to allow time for public input and allow time for her to make a final decision as to whether to withdraw the lands. The Assistant Secretary took this first step and proposed withdrawal of the SFAs on September 16, 2015. The BLM will publish notice of the proposal concurrent with the announcement of the BLM Records of Decision, which will segregate the lands. After public involvement and preparation of various reports, including a NEPA analysis, the Secretary will make a final decision as to whether to withdraw the lands. 43 CFR 2310.3–2, 3. A withdrawal aggregating more than 5,000 acres is limited by law to a term of 20 years (subject to renewals) and is subject to Congressional notification. 43 U.S.C. 1714(c).

Fluid Minerals (Including Oil, Gas, and Geothermal): The Federal Plans manage SFAs as NSO, without waiver, exception, or modification, for fluid mineral leasing (with the exception of plans in Wyoming, as discussed below). No Surface Occupancy is where areas are open to leasing but surface-disturbing activities associated with development of the lease cannot be conducted on the surface of the land. Access to oil and gas deposits would require horizontal/directional drilling from outside the boundaries of the NSO areas. This is the most restrictive designation that allows for development of resources and protects habitat.

Habitat Management: BLM and USFS will prioritize management and conservation actions in SFAs, including, but not limited to, review of livestock grazing permits/leases, free-roaming equid gathers, fire management projects, and sagebrush restoration projects. Ensuring these areas are analyzed first provides certainty that, if degraded habitat conditions occur in the most important areas for the species, management actions will be taken and possible restoration will occur.

The actions identified for implementation in the SFAs are more restrictive versions of the measures described above for PHMAs. As such, the measures implemented within SFAs are more effective at reducing threats within these important areas. These measures have been determined to be effective because they eliminate or reduce the impacts from new development or improper grazing on Federal lands in SFAs.

General Habitat Management Areas—The Federal Plans designate approximately 12.5 million ha (31 million ac) as GHMA (Figure 5), which corresponds with approximately 27 percent of breeding habitat rangewide. The GHMAs represent habitats that contain fewer leks and sage-grouse than PHMAs. The designation as GHMAs provide sage-grouse conservation by protecting habitat and connectivity between populations and potential refugia in the event of catastrophic events such as wildfire. While the amelioration of threats in GHMAs will likely be less than in PHMAs due to less stringent required conservation measures, GHMAs do have restrictions that benefit sage-grouse conservation.

Specifically, the Federal Plans contain the following measures that apply in GHMAs:

Fluid minerals (Including Oil, Gas, and Geothermal): General Habitat Management Areas are open with constraints. Areas with standard constraints may be open to mineral leasing with no specific management decisions defined in the Federal Plans; however, these areas are subject to lease terms and conditions. Terms and conditions may include but not be limited to concentrating development, moving or supporting infrastructure, or reducing project footprints, thereby reducing habitat impacts. Moderate constraints include controlled surface

use, which can reduce habitat impacts and timing limitations which reduce human activities during the times sage-grouse are most sensitive to their presence.

Non-Energy Leasable Minerals: General Habitat Management Areas are open to non-energy leasable mineral development, subject to stipulations. In GHMA, development, including mineral exploration, is subject to lek buffers to protect breeding birds, timing restrictions to reduce human activities in important seasonal habitats while sage-grouse are present, mitigation requirements, and other protective measures discussed throughout this section, thereby reducing and minimizing the impacts to the species and its habitat.

Rights-of-Way: For major transmission lines and pipelines, GHMAs are either avoidance or exclusion areas, and may be available for installation of pipeline and transmission lines/ROWs within existing infrastructure corridors. Protective stipulations such as limiting road use (to minimize disturbance to birds) or eliminating perching areas (to reduce predation) will be incorporated into the ROW grants to protect sage-grouse and its habitat. For minor ROWs (*e.g.,* roads), GHMAs are open and subject to stipulations that will protect sage-grouse and its habitat, such as lek buffers and seasonal restrictions (BLM and USFS 2015, entire). For solar and wind energy rights of way, GHMAs are either designated avoidance or exclusion areas with limited exceptions and available for location of new utility scale and/or commercial development ROWs only with special stipulations that minimize the impact to sage-grouse.

Mineral Materials: General Habitat Management Areas can be open to new mineral material sales and free use permits subject to mitigation requirements and application of RDFs that will protect sage-grouse and its habitat.

Livestock Grazing: Federal Plans call for grazing to benefit or be neutral to sage-grouse in GHMAs and PHMAs. However, GHMAs will be the lower priority for monitoring as they comprise habitat with fewer leks and sage-grouse.

Measures Applicable in Both PHMA and GHMA—In addition to specific land use allocations described above, the new Federal Plans include other protective measures that will further limit disturbance and impacts to sage-grouse and their habitats. Additionally the plans include monitoring and adaptive management to help ensure that implementation of the allocative decisions and limitations on disturbance are effective at conserving sage-grouse and their habitats, and mitigation provisions where disturbance cannot be avoided. These measures apply regardless of the habitat designation (PHMA, SFA, or GHMA).

Land Tenure: The land tenure land use allocation refers to whether the BLM or USFS intend to dispose of, or retain, Federal lands. A land use allocation of retain means that the agencies will seek to retain the land in Federal ownership, with limited exceptions. An allocation of dispose means that the agencies may transfer the land out of Federal ownership. Under the Federal Plans, PHMAs and GHMAs will be retained in Federal management, with limited exceptions. Those limited exceptions may occur when: (1) The agency can demonstrate that disposal of lands will provide a net conservation gain to the sage-grouse; or (2) the agency can demonstrate that the disposal of lands will have no direct or indirect adverse impact on conservation of sage-grouse. The land tenure allocation ensures that BLM and USFS lands within PHMAs and GHMAs will be managed for sage-grouse into the future.

Trails and Travel Management: Travel management regulations require BLM and USFS to establish lands as open, limited, or closed to off-road vehicle use. In open areas all types of vehicle use is permitted at all times, anywhere in the area. Limited areas are restricted at certain times, in certain areas, and/or to certain vehicular use. Closed areas are those that are closed to all types of vehicle use and include units of the National Wilderness Preservation System. Areas that have not been designated in one of these categories are undesignated and have no restrictions on motorized access.

In PHMA and GHMA, temporary closures will be considered in accordance with several regulations, including Closures and Restrictions (43 CFR subpart 8364); Designated National Area (43 CFR subpart 8351); Use of Wilderness Areas, Prohibited Acts, and Penalties (43 CFR subpart 6302); and Conditions of Use (43 CFR subpart 8341). These regulations help control access to sensitive areas and have been employed strategically in the past to minimize access and disturbance during critical time periods such as spring breeding. These measures ensure that travel management decisions in PHMA and GHMA are made with consideration of sage-grouse conservation needs. These measures help to address concerns with potential disturbance due to travel on Federal lands and will continue to be used by the agencies as needed.

Disturbance Caps and Density Limitations – Each Federal Plan includes a disturbance cap that will serve as an upper limit (the maximum disturbance permitted). Anthropogenic disturbance has been identified as a key impact to sage-grouse. To limit new anthropogenic disturbance within sage-grouse habitats, the Federal Plans establish disturbance caps, above which no new development is permitted (subject to applicable laws and regulations; *e.g.,* General Mining Law of 1872, and valid existing rights). This cap acts as a backstop to ensure that any implementation decisions made under the Federal Plans will not permit substantial amounts of new disturbance within the distribution of sage-grouse on BLM and USFS lands.

For all States, except Wyoming and Montana, the BLM and USFS have established a 3 percent disturbance cap at two spatial scales – the Biologically Significant Unit (BSU) and at the project scale within PHMAs (BLM and USFS 2015, entire). The BSU is a geographical/spatial area, defined in conjunction with the States, within sage-grouse habitat that contains habitats supporting several interconnected populations. The disturbance cap calculation includes all anthropogenic disturbances in PHMAs at the project scale regardless of land ownership. If 3 percent disturbance is reached at the project level scale, no further anthropogenic disturbances will be permitted by BLM or USFS within PHMAs in the analysis area until the disturbance has been reduced to less than the cap. For BSUs the disturbance calculations will include anthropogenic disturbances in all habitat designations. Those disturbance calculations will be completed on an annual basis by the BLM's National Operation Center. If 3 percent disturbance is reached, the Federal land management agencies will examine all activities under their authority to determine if adaptive management is necessary (depending on the spatial scale at which the 3 percent cap is hit). In Montana, the same disturbance cap approach is used, but disturbance is limited to 5 percent, due to more detailed mapping and disturbance calculations. Wyoming uses a different approach to limiting disturbance in Core Areas, as discussed in Wyoming State and Federal Plans, below. As previously stated, sage-grouse are sensitive to disturbance, and small amounts of development within sage-grouse habitats can negatively affect sage-grouse population viability (Knick and Connelly 2011, p. 1). Thus, limiting future disturbances in sage-grouse

habitats is an essential component of reducing or eliminating effects related to disturbance, as recommended in the COT Report (USFWS 2013, p. 13).

In addition to the percent disturbance cap at the BSU and project scales, the BLM and USFS will use a density cap related to the density of energy and mining facilities during project-scale authorizations. If the disturbance density is greater than an average of 1/259 ha (1/640 ac) in PHMA, the project will either be deferred or co-located in an existing disturbed area (subject to applicable laws and regulations, such as the General Mining Law of 1872, valid existing rights, etc.).

Lek Buffers – Sage-grouse leks are communal breeding centers that are representative of the breeding and nesting habitats. Conservation of these areas is crucial to maintaining sage-grouse populations. Protective buffers around leks conserve these important habitats (Manier *et al.* 2014, pp. 1–2).

To develop ''biologically relevant and socioeconomically practical'' lek buffer distances for use in the Federal Plans, the DOI commissioned the USGS to review the scientific information on conservation buffer distances for sage-grouse. The result was the publication of a USGS Open-File Report, entitled *Conservation Buffer Distance Estimates for Greater Sage-Grouse – A Review,* in 2014 (Manier *et al.* 2014, entire). In addition to the land use allocations described in this section, the BLM and USFS will apply the lek buffer distances specified as the lower end of the interpreted range in PHMAs as described in the report unless justifiable departures are determined to be appropriate (see below). The lower end of the interpreted range of the lek buffer distances are presented in Table 3. Note that for many potential activities in PHMAs, the Federal Plans land use allocations result in no or few activities allowed in these important areas (*e.g.,* no surface occupancy restrictions). Thus, for those types of projects, buffers are unnecessary in PHMAs because the activity is already restricted.

TABLE 3—LEK BUFFER DISTANCES IN FEDERAL PLANS

Disturbance	Lek buffer
Linear Features (*e.g.*, roads).	5 km (3.1 mi).
Infrastructure related to energy development.	5 km (3.1 mi).
Tall structures (communication or transmission towers, transmission lines).	2 km (1.2 mi).
Low structures (*e.g.*, fences, rangeland structures).	2 km (1.2 mi).
Surface disturbance (human activities that alter or remove natural vegetation).	5 km (3.1 mi).
Noise and related disruptive activities.	0.4 km (0.25 mi).

The BLM and USFS may approve actions in PHMAs that are within the applicable lek buffer distance identified above only if the BLM or USFS determine that a buffer distance other than the distance identified above offers the same or greater level of protection to sage-grouse and its habitat. The BLM or USFS will make this determination based on best available science, landscape features, and other existing protections, with input from the local State fish and wildlife agency. The BLM or USFS will explain its justification for determining that the approved buffer distances meet these conditions in its project decision.

For actions in GHMAs, the BLM and USFS will apply the lek buffer distances in Table 3 as required conservation measures to fully address any impacts to sage-grouse identified during the project-specific NEPA analysis. However, if it is not possible to locate or relocate the project outside of the applicable lek buffer distance(s) identified above, the BLM or USFS may approve the project only if: (1) Based on best available science, landscape features, and other existing protections, (*e.g.,* land use allocations, State regulations), the BLM or USFS determine that a lek buffer distance other than the applicable distance identified above offers the same or a greater level of protection to sage-grouse and its habitat, including conservation of seasonal habitat outside of the analyzed buffer area; or (2) the BLM or USFS determines that impacts to sage-grouse and its habitat are minimized such that the project will cause minor or no new disturbance (*e.g.,* co-location with existing authorizations); and (3) any residual impacts within the lek buffer distances are addressed through compensatory mitigation measures sufficient to ensure a net conservation gain, as outlined in the Mitigation Strategy (see below). By applying lek buffers in addition to other measures, the Federal Plans provide an additional layer of protection to the habitat in closest proximity to leks and the areas documented in the literature to be the most important for breeding and nest success (Manier *et al.* 2014, entire).

Required Design Features – Required Design Features (RDFs) are best management practices to reduce potential effects to sage-grouse for certain project-level features. The RDFs establish the minimum specifications for certain activities to help mitigate adverse impacts. Because of site-specific circumstances, some RDFs may not apply to some projects (*e.g.,* a resource is not present on a given site) and/or may require slight variations (*e.g.,* a larger or smaller protective area). The need to apply RDFs to a project or to modify RDFs to address any concerns unique to a project is determined during the project-specific planning and environmental assessment. All variations in RDFs would require that at least one of the following be demonstrated in the NEPA analysis associated with the project/activity:

- A specific RDF is documented to be not applicable to the site-specific conditions of the project/activity (*e.g.,* due to site limitations or engineering considerations). Economic considerations, such as increased costs, do not necessarily require that an RDF be varied or rendered inapplicable;
- An alternative RDF is determined to provide equal or better protection for greater sage-grouse or its habitat;
- A specific RDF will provide no additional protection to sage-grouse or its habitat.

While the applicability and overall effectiveness of each RDF cannot be fully assessed until the project level when the project location and design are known, the Federal Plans include the requirement to implement appropriate RDFs and these RDFs are expected to further minimize impact to the species and its habitat. These RDFs were developed based on the COT and NTT conservation objectives and the best professional judgment of BLM and USFS wildlife biologists. For example, any project that includes the development of a pond or similar water feature would require RDFs that direct the design, construction, and maintenance of the pond so that it would not provide habitat for mosquitos that could carry West Nile virus (WNv).

Monitoring—While monitoring does not in and of itself reduce impacts, it is an integral component of any conservation program's long-term success. We take into consideration monitoring when evaluating the overall adequacy and effectiveness of a conservation strategy. The regulations for the BLM (43 CFR 1610.4–9) and the USFS (36 CFR part 209, published July

1, 2010) require that Federal Plans establish intervals and standards, as appropriate, for monitoring and evaluations based on the sensitivity of the resource to the decisions involved. Pursuant to these regulations, an interagency team developed *The Greater Sage-grouse Monitoring Framework* that describes the methods to be used to collect monitoring data and to evaluate implementation and effectiveness of the sage-grouse planning strategy and the conservation measures contained in the Federal Plans (BLM and USFS 2014, entire).

To ensure that the BLM and the USFS are able to make consistent assessments about sage-grouse habitats across the range of the species, this framework lays out the methodology—at multiple scales (broad, mid, fine, and site scales)—for monitoring of implementation and disturbance and for evaluating the effectiveness of the BLM and USFS actions to conserve the species and its habitat. Monitoring efforts will include data for measurable quantitative indicators of sagebrush availability, anthropogenic disturbance levels, and habitat conditions. Implementation monitoring results will allow the BLM and the USFS to evaluate the extent that decisions from their Federal Plans to conserve sage-grouse and their habitat have been implemented. State fish and wildlife agencies will continue to collect population monitoring information, which will be incorporated into effectiveness monitoring as it is made available.

Managing and monitoring sage-grouse habitats are complicated by the differences in habitat selection across the range and habitat use by individual birds within a given season. Therefore, the monitoring framework evaluates multiple habitat suitability indicators to evaluate plan effectiveness. Descriptions of these habitat suitability indicators for each scale are provided in the ''*Sage-Grouse Habitat Assessment Framework: Multiscale Habitat Assessment Tool''* (Stiver *et al.* 2010, entire).

Results from monitoring data will define when habitat objectives are not being achieved, disturbance caps have been breached, and adaptive management triggers have been met (see below). Having a consistent framework for all management units will allow the agencies to track information and trends across management units, which has not been possible in the past. The BLM and USFS have and committed to increased monitoring, and we expect the results to give the agencies valuable data to assist and improve implementation and improve the overall effectiveness of the BLM and USFS plans.

Adaptive Management – Like monitoring, adaptive management is a key element of complex long-term conservation strategies, particularly where there is uncertainty. Adaptive management is a decision process that promotes flexible resource management decision-making that can be adjusted in the face of uncertainties as outcomes from management actions and other events become better understood. This flexibility is critical for ensuring long-term conservation of sage-grouse into the future, as it will allow the Federal Plans to adjust to changed conditions or new science that cannot be foreseen at this time. Careful monitoring of these outcomes both advances scientific understanding and helps with adjusting resource management directions as part of an iterative learning process. Adaptive management also recognizes the importance of natural variability in contributing to ecological resilience and productivity. An effective adaptive management program will ultimately improve the overall effectiveness of the conservation program through time.

Adaptive management will help ensure that sage-grouse conservation measures in the Federal Plans are effective, and if they are not effective, that corrective actions will be implemented. Each planning area (with the exception of the Lander and North Dakota Plans) has identified adaptive management soft and hard triggers and responses. Soft triggers represent an intermediate threshold indicating that management changes are needed at the project/implementation level to address habitat and population losses. If a soft trigger is met, the BLM will apply more conservative or restrictive implementation conservation measures to mitigate for the specific causal factor in the decline of populations and/or habitats, with consideration of local knowledge and conditions. These types of adjustments will be made to preclude meeting a hard trigger (which signals more severe habitat loss or population declines). Hard triggers represent a threshold indicating that immediate action is necessary to stop a deviation from sage-grouse conservation objectives as set forth in the Federal Plans. Tripping a hard trigger will result in BLM or USFS switching to a more restrictive alternative from the Final Environmental Impact Statement either in whole or in part to address the causal factors (*e.g.,* immediate cessation of authorizing land use authorizations within the area). After the hard-trigger is tripped, the BLM or USFS will determine the causal factor and develop and implement a corrective strategy. While adaptive management is not a land use allocation decision, the Federal Plans have developed species and habitat triggers and tied them to appropriate management actions in the Federal Plans, providing an additional certainty that action will be taken if the species or habitat objectives are not being met.

Mitigation – All of the Federal Plans require that impacts to sage-grouse habitats are mitigated and that compensatory mitigation provides a net conservation gain to the species. All mitigation will be achieved by avoiding, minimizing, and compensating for impacts following the regulations from the White House Council on Environmental Quality (CEQ) (40 CFR 1508.20; *e.g.,* avoid, minimize, and compensate), hereafter referred to as the mitigation hierarchy. If impacts from BLM/USFS management actions and authorized third party actions that result in habitat loss and degradation remain after applying avoidance and minimization measures (*i.e.,* residual impacts), then compensatory mitigation projects will be used to provide a net conservation gain to the species. Any compensatory mitigation will be durable, timely, and in addition to that which would have resulted without the compensatory mitigation.

The Federal Plans will establish a Management Zone Greater Sage-Grouse Conservation Team (hereafter, Team) to help guide the conservation of sage-grouse, within 90 days of the issuance of the Record of Decision. This Team will develop a Management Zone Regional Mitigation Strategy using the BLM's Regional Mitigation Manual as a framework. The Team will also compile and report on monitoring data (including data on habitat condition, population trends, and mitigation effectiveness) from States across the MZs and will use these data to either modify the appropriate Regional Mitigation Strategy or recommend adaptive management actions. Requiring mitigation for residual impacts provides additional certainty that, while impacts will continue at reduced levels on Federal lands, those impacts will be offset to a net conservation gain standard.

Fire and Invasives Assessment Tool (FIAT) – The Federal Plans recognize that fire and invasive plants are the primary impact to sage-grouse habitat in the Great Basin. The BLM and USFS convened an interagency team to develop a rangewide assessment and step-down approach to address these impacts (*i.e.,* FIAT). The result was the ''*Greater Sage-Grouse Wildfire, Invasive Annual Grasses and Conifer Expansion*

Assessment'' report (BLM 2014, entire). The FIAT assessments are incorporated in the Federal Plans. The assessments identify the habitats most resistant and resilient to wildfire and invasive plants to target fire management and ecosystem restoration activities (BLM and USFS 2015, entire). The FIAT Assessments ensure that wildfire and invasive plant management and restoration resources are deployed in the landscapes where they will be most effective in reducing this potential threat.

As part of the assessment process, Instructional Memorandum (IM) 2014–134 was released August 28, 2014. This IM, in part, provided guidance for the BLM field offices to cooperate with interagency partners to complete FIAT assessments at local scales for five priority landscapes in sage-grouse habitat, which roughly corresponded to PACs in the Great Basin as identified in the COT Report (USFWS 2013, p. 14) (*i.e.,* Central Oregon, Northern Great Basin, Snake/Salmon/Beaverhead, Southern Great Basin, Western Great Basin/Warm Springs Valley). For each priority landscape, regional findings were stepped down to describe local conditions by Project Planning Area (PPA) and associated treatment needs and management priorities. Each PPA contained emphasis areas, *i.e.,* portions of a PAC with important habitat characteristics and sage-grouse populations that are impacted by wildfire, invasives, and conifer encroachment. The assessments were included in the Federal Plans. The FIAT Assessments are described in more detail in the *Wildfire and Invasive Plants* section, below.

Federal Plans Summary

The Federal Plans provide major new regulatory mechanisms to protect sage-grouse from land use activities on more than half of the occupied range. In 2010, the Federal land management plans did not contain, for the most part, sage-grouse specific measures, and areas important to the species were open to land uses that could disturb habitat (75 FR 13910, March 23, 2010, p. 13982). Since then, the BLM and USFS have amended or revised 98 plans to address threats to the species (BLM and USFS 2015, entire). The Federal Plans exclude or reduce habitat-disturbing activities in PHMAs that contain the most important habitats for conservation. General Habitat Management Areas are still being managed for the benefit of sage-grouse, but BLM and USFS have flexibility to site development or leasing in GHMAs to keep priority areas intact. While some disturbance can occur in the GHMAs, as they contain fewer sage-grouse when compared to PHMAs, protective measures for activities in those areas minimize impacts and require mitigation. The combination of restrictive PHMAs and less restrictive GHMAs provide conservation for sage-grouse on approximately 27 million ha (67 million ac) while still enabling the multiple uses that are part of the BLM and USFS missions. While there are impacts associated with on-going activities, the Federal Plans provide adequate mechanisms to reduce and minimize new disturbance in the most important areas for the species. By following COT Report and NTT guidance and restricting impacts in the most important habitat, the Federal Plans ensure that high-quality sage-grouse lands with substantial populations are minimally disturbed and sage-grouse within this habitat remain protected.

Wyoming State and Federal Plans

Approximately 37 percent of estimated sage-grouse abundance occurs in Wyoming (Doherty *et al.* 2010a, p. 21). The Wyoming Basin, the majority of which occurs within the State of Wyoming, has been identified as one of two areas with the highest population connectivity (Knick and Hanser 2011, p. 391). Therefore, conservation of this area is essential to the persistence of sage-grouse into the future. We have also identified this area as a stronghold for the species (USFWS 2014a).

The Wyoming Plan relies on the protection of important sage-grouse habitats in the State using a suite of avoidance and minimization measures. Important habitats (Core Areas) were identified by the highest densities of males attending leks, and added associated habitats through a scientific process engaging State wildlife experts and local working groups. Core Areas encompass approximately 83 percent of the breeding population of sage-grouse in Wyoming on approximately 24 percent of the total land surface of the State (Budd, Wyoming Wildlife and Natural Resource Trust, pers. comm. 2015). Additional connectivity areas were identified for protection to ensure population movements. Protective measures associated with the Wyoming Plan (described below) do not extend to lands located outside the identified Core Areas but that are still within occupied sage-grouse habitat. In non-Core Areas, the minimization measures are implemented to maintain habitat conditions such that there is a 50 percent likelihood that leks will persist over time (Wyoming Game and Fish Department 2009, pp. 30–35). While impacts to sage-grouse are possible in non-core habitats, the majority of primary habitats necessary for long-term conservation of sage-grouse in Wyoming are included in the identified Core Areas. Core Area maps are reviewed and adjusted every 5 years to allow for the incorporation of new data that ensures the most important areas for sage-grouse receive protections. For example, the State of Wyoming reviewed the Plan in 2015 and added 58,191 ha (143,794 ac) to the Core Areas.

The key component of the Wyoming Plan is the application of State regulatory measures associated with the Wyoming Plan on all lands in Wyoming (6 million ha (15 million ac)) as any project requiring a State permit must meet the conditions of the strategy regardless of land ownership. Specifically, the Wyoming Plan applies to all activities that require permits from Wyoming's Industrial Siting Council (ISC) (Wyoming E.O. 2015–4, entire). The Federal Plans in the State incorporate the Wyoming strategy, thereby ensuring implementation of the strategy on Federal land surfaces and subsurface regardless of the need for a State permit (see further discussion below). The completion of the Federal plans also facilitates greater coordination between the State and Federal agencies in implementing and monitoring the Wyoming Plan. This addition to the Wyoming Plan further increases the value of this effort in conserving sage-grouse by covering all lands in the State with a single regulatory framework to reduce affects to sage-grouse in the most important habitats in the State. Therefore, the strategy conserves sage-grouse through an effective regulatory mechanism for conservation.

The Wyoming Plan first encourages projects to be re-located outside of Core Areas by reducing restrictions in non-Core Areas for development activities. Where projects cannot be relocated, the Plan requires a combination of restricted development densities, development disturbance caps, seasonal restrictions, and lek buffers to minimize habitat disturbance within Core Areas. Surface disturbance is limited to 5 percent within Core Areas reducing fragmentation and degradation of habitat (Wyoming E.O. 2015–4, Attachment A, p. 6; Wyoming E.O. 2015–4, Attachment B, p. 5). While 5 percent is greater than the 3 percent used in other States, habitat disturbance monitoring in Wyoming is conducted at a much finer scale and is, therefore, more inclusive in the number and extent of disturbances measured. Additionally, Wyoming includes natural disturbances, such as wildfire, in the

disturbance measure, which is not included in any other State. Therefore, the higher disturbance cap permitted in Wyoming is not more permissive as a simple comparison of the numbers suggests. Limiting development to one site per 259 ha (640 ac) on average reduces the disturbance footprint to a level where impacts to sage-grouse are minimal, if nonexistent (Holloran 2005, p. 58; Taylor *et al.* 2012a, p. 31; Holloran *et al.* 2010, p. 71). Development is not permitted if either of these criteria (development density or disturbance caps) is exceeded. Incentives to consolidate disturbance further reduce development impacts by minimizing habitat loss and degradation within large landscapes. Where development cannot be moved away from breeding habitats, an NSO buffer of 1 km (0.6 mi) of a lek is required, as well as a seasonal restriction on project development. Activity within 6.4 km (4 mi) of a lek is also restricted from March 15 through June 30. These restrictions reduce impacts to the sage-grouse by avoiding disturbance during breeding season (Wyoming E.O. 2015–4, Attachment B pp. 2–6; Fedy *et al.* 2012, p. 1063; Doherty *et al.* 2010a, entire).

Disturbance (including all anthropogenic and natural disturbances) is tracked via a geospatial database (measuring disturbance at 1 m (3.3 ft). Including all disturbances with such precision ensures that all potential impacts to sage-grouse, regardless of source, are being considered prior to authorizing new development. Additional conservation is gained through the enforcement of noise restrictions at the perimeter of leks, which minimizes disturbance to birds visiting the leks (Wyoming E.O. 2015–4, Attachment B, p. 8; Patricelli *et al. 2013*, p. 241; Blickley and Patricelli 2012, p. 33; Blickley *et al.* 2012, p. 470).

Outside of core-habitat, there are NSO restrictions within 0.4 km (0.25 mi) of leks to minimize impacts to sage-grouse (E.O. 2015–4, Attachment B, p. 6), and activities within 3.2 km (2 mi) of a lek are restricted during the breeding season. These relaxed stipulations encourage development to move outside of Core Areas, while still providing some protections to birds in non-Core Areas. While impacts to birds and their habitats may occur outside of Core Areas, only about 17 percent of the sage-grouse bird density occurs in those areas (Budd, Wyoming Wildlife and Natural Resources Trust, pers. comm. 2015), minimizing impacts to sage-grouse and allowing for the continuation of the economies that support the State.

In 2010, we analyzed the Wyoming Plan and noted that it included measures that if fully implemented could ameliorate threats to sage-grouse (75 FR 13910, March 23, 2010, pp. 13974–13975). We now have data that shows how implementation has avoided and minimized impacts in core habitats. Since 2012, the majority of the 600 projects proposed in Core Areas and reviewed by the State complied with the criteria of the Wyoming Plan. Projects that added additional surface disturbance within Core Areas were minimized or co-located with existing disturbance. Less than 8 ha (20 ac) of new disturbance has occurred within Core Areas since 2012 (USFWS 2014b). Other applications were denied that would negatively affect sage-grouse, including a wind lease application on State trust lands (USFWS 2014b). The number of oil and gas wells permitted in Core Areas has also declined as industry seeks to avoid conflict with sage-grouse. Between 2006 and 2012, vertically drilled single well permits declined 65 percent, while directionally and horizontally drilled wells, from outside the Core Areas, increased by 66 and 1,337 percent, respectively (USFWS 2014b). This change in the number and nature of oil and gas well permits further demonstrates the efficacy of the Wyoming Plan. Other industries, such as mining, have initiated restoration efforts to remove existing disturbance and improve habitat for sage-grouse. These data demonstrate the efficacy of the Wyoming Plan in removing and reducing impacts to sage-grouse from development activities.

The Federal Plans in Wyoming have incorporated the Wyoming Plan Core Area strategy. Core habitats designated by the State have been identified as PHMA on BLM and USFS lands, while non-core habitats are designated as GHMA. Both the BLM and USFS have adopted the more precise disturbance measurements developed by the State at 5 percent. With the exception of the fluid and non-energy leasable mineral programs, the Federal Plans in Wyoming are the same as with other States. However, these modifications were made to expand the protections already implemented by the State to Federally managed lands.

The fluid mineral designation in the Federal Plans in Wyoming is different than in the other Federal Plans throughout the range, which was necessary to adopt the Wyoming Plan. For fluid minerals in Wyoming, PHMAs are designated Controlled Surface Use, which means these areas are open to leasing, but would require proposals for surface-disturbing activities only be authorized in accordance with the controls or constraints specified in the Wyoming Plan. For non-energy leasable minerals, PHMAs are open to non-energy leasable minerals, but are subject to measures intended to minimize impact in important (core) areas pursuant to the Wyoming Plan.

A recent analysis of the Wyoming Plan predicted that 83 percent of the landscape within core area boundaries supports increasing or stable populations of sage-grouse (Burkhalter *et al.* 2015, p. 20) due to the conservation of high-quality intact sagebrush habitats. Seventeen percent of the landscape within Core Areas may have declining populations as those areas occur around the edges of Core Areas and, therefore, are subject to disturbances outside these protected areas (Burkhalter *et al.* 2015, p. 20). The factors identified in this report as essential for conservation, such as maintaining connected landscapes in sagebrush cover, and minimizing oil and gas development, are all key components of the Wyoming Plan. The recent completion of the BLM and USFS Federal Plans should reduce disturbance around the edge of Core Areas, thereby increasing the efficacy of the strategy. The Wyoming Plan was renewed in July 2015 ensuring that the protections will continue until at least 2022 (Wyoming E.O. 2015–4, p. 6).

The Wyoming Plan has been in place for 8 years, and has demonstrated its conservation value by protecting areas identified as important to sage-grouse conservation. As described above, development has been removed or minimized in Core Areas, protecting intact habitats from fragmentation and degradation. Carefully controlled development within Core Areas has had minimal to no impact to the sage-grouse as demonstrated by the increasing populations within Core Areas (Burkhalter *et al.* 2015, p. 20). Protections outside the Core Areas also provide additional conservation to habitats and birds by maintaining connectivity between Core Areas. The adoption of the Wyoming Plan into Federal land plans provides additional assurances that protections of Core Areas will be achieved on all lands, regardless of land ownership.

Montana and Oregon Conservation Efforts

State and Private lands account for 42 percent of the sage-grouse occupied range. Plans developed by States for sage-grouse vary widely in the nature of the protective measures, with some measures being regulatory and some being voluntary. State Plans in three States—Wyoming, Montana, and Oregon—contain regulatory measures

that effectively address threats on State or private lands. Wyoming is addressed separately above because of its integration with the Federal Plans in that State (See *Wyoming* section above).

Since 2010, all States within the range of the species, except for California, have drafted, finalized, or implemented conservation plans for the sage-grouse. These plans take different approaches, but, in general, they identify important conservation objectives for sage-grouse, and provide mechanisms to incentivize conservation. While 10 of the 11 States in the range of the sage-grouse updated plans to conserve the species by incorporating new information, which is a testimony to their concern and commitment to protect the grouse and its habitats, not all of these plans have been fully implemented or regulatory in scope. As discussed above, we will assess the conservation actions mandated by the State plans in Wyoming, Montana, and Oregon because they provide the greatest degree of regulatory certainty in addressing potential threats on State and private lands not under the jurisdiction of Federal Plans. We appreciate the work that each State has completed, but we could not include all planning efforts in other States in our analysis because they did not meet a level of certainty for implementation and effectiveness. Regardless of the nature of State conservation efforts, we reviewed and considered the conservation efforts developed and implemented by the States consistent with the Act (16 U.S.C. 1533(b)(1)(A)). A description of the other applicable State laws is included below in *Regulatory Mechanisms* and *Other Conservation Plans.*

Montana—The Montana Sage-Grouse Habitat Conservation Program (Montana Plan) is similar to the Wyoming Plan in that it is a regulatory mechanism that applies to Core Areas across the State. In 2014, the Governor signed an Executive Order that provides sage-grouse conservation directives for activities on State and private lands where approximately 70 percent of sage-grouse habitat in Montana occurs (Montana E.O. 10–2014, entire). The Governor of Montana issued a second Executive Order putting into effect the Montana Sage Grouse Habitat Conservation Program and giving it full regulatory authority (Montana E.O. 12–2015, entire). This second Executive Order included a full review of State regulatory authority over activities in sage-grouse habitat in Montana. The Montana Plan is regulatory on State lands and on any private lands where State permits or authorizations are required; it requires that State agencies adhere to the requirements and stipulations of the Program. The Montana Executive Order created the Montana Sage-Grouse Oversight Team (Montana Oversight Team) composed of State Agency Directors to oversee administration of the Montana Plan. Additional staffing of the Montana Plan includes a Program Manager, GIS Manager and technician, biologists, and support for seasonal work. The Montana Plan and supporting documents clearly identify under what regulatory authority the State and private entities are required to act in accordance with the Executive Order.

In the previous section, we describe in detail how the Wyoming Plan addresses the issues of habitat loss and fragmentation and disturbance to sage-grouse. The Montana Plan closely follows the structure of the Wyoming Plan and, similarly, uses information and guidance from the COT Report to identify and reduce impacts associated with threats to sage-grouse in Montana. The Montana Executive Order also identifies scientifically valid performance standards based upon number of males at leks to ensure that the Montana Plan actions are effective; monitoring protocols are also included. The Montana Plan specifies adaptive management strategies in response to this monitoring information. Implementation of the Montana Plan will occur immediately in response to future and additional actions that occur in sage-grouse habitat; full implementation of the Montana Plan is expected by January 2016.

The Montana Plan includes similar requirements as those identified in the Wyoming Plan including the following: Use of a 5 percent disturbance cap in Core Areas; allowance of only one disturbance (well pad, grouped impacts) per section (259 ha (640 ac)) for oil and gas and mining; prohibition of sagebrush eradication or conversion; and lek buffers and disturbance buffers in both Core Areas and general habitats. For a complete discussion of why these methods are effective in supporting viable sage-grouse populations, please see the previous discussion of the Wyoming State and Federal Plan, above.

The Montana State Legislature recently passed, and the Governor signed, the Montana Sage-Grouse Protection Act during the 2015 legislative session. This Act ensures that critical funding and support are available for necessary sage-grouse conservation efforts in the future. This Act funds staff resources to implement the conservation program, and includes a revolving conservation fund with an initial balance of 10 million dollars. This funding authorization is directly tied to the implementation of the E.O. and provides certainty of implementation. The Governor also signed the Montana Greater Sage-Grouse Stewardship Act, which establishes the Montana Sage-Grouse Oversight Team and provides grant-based funding for voluntary sage-grouse conservation efforts. Unless specifically excluded, all State actions (including those prescribed for sage-grouse conservation) require review under the Montana Environmental Policy Act, which is analogous to the National Environmental Policy Act at the State level. Given this commitment from the State, there is certainty that the Montana Plan will be implemented and effective.

In addition to the Montana Plan, private landowners in Montana have worked with Montana Fish, Wildlife, and Parks to enroll nearly 80,000 ha (200,000 ac) in 30-year sagebrush leases. Montana Fish, Wildlife, and Parks provided 1.2 million dollars for these leases where landowners agreed not to eliminate sagebrush on the enrolled acres (Wightman, Montana Fish, Wildlife, and Parks, 2015, pers. comm.).

Oregon—The Oregon Sage-Grouse Action Plan (Oregon Plan) ensures regulatory protection and enhancement of sage-grouse and their habitat on State and private lands in Oregon. This Plan is backed by two new rules in the Oregon Legislature and an Executive Order. The Oregon Plan includes explicit habitat and population goals with incremental completion dates and prioritizes avoidance with standards for mitigation of impacts if necessary. The Oregon Plan builds on the core area strategies utilized by Wyoming and Montana to address all sage-grouse habitats. The Oregon Plan applies to more than 6 million ha (approximately 15 million ac) of all landownership types and includes regulatory mechanisms, such as disturbance caps and adaptive management triggers, to reduce impacts to sage-grouse in the State.

The Oregon Plan includes similar provisions to those identified in the Wyoming Plan and Montana Plan. Based upon the nature and extent of threats to sage-grouse in Oregon and information in the 2010 Finding and COT Report, the Oregon Plan includes limitations on disturbance in Core Areas through disturbance caps and an avoidance and minimization strategy. Actions permitted through county actions (such as a new subdivision or county road) as well as actions permitted through State agencies (such as a new large-scale energy or utility project) are both subject to the Plan as

outlined in the two Rules (Oregon OAR 635–140–0025, entire; and Oregon OAR 660–023–0115, entire; OR E.O. 2015). For specific discussions of why these stipulations are effective, please see the Wyoming State and Federal Plan discussion. The Oregon Plan identifies fire management measures, such as funding and logistical support for Rural Fire Protection Areas. Wildfire and the fire/invasives cycle can impact large areas of sage-grouse habitat in very short periods of time, making prevention of wildfire important for minimizing effects. This commitment improves the likelihood that wildfires will be effectively controlled to reduce the potential negative effects to sage-grouse habitat. Further, the Oregon Plan includes a State-administered compensatory mitigation program designed to synchronize with BLM mitigation processes. The Oregon Plan has identified an overall population goal of 30,000 birds with interim performance measures and corresponding monitoring protocol to ensure progress towards the larger goal. The Oregon Plan commits to adaptively manage for sage-grouse in response to this monitoring data.

Many of the Oregon Plan measures are similar or complementary to those included in the Federal Plans. This aligned framework of tools, rules, and protocols across local, State, and Federal processes will ensure that coordinated mitigation and voluntary actions conserve the species across all land ownerships in Oregon. It also creates the transparency and credibility necessary for public support of the State's strategy.

The Oregon Plan identifies several State agencies as well as specific staffing and funding requirements necessary for full implementation of the Oregon Plan. In addition to gaining public support and identifying necessary staffing, financial support has been secured through the Oregon Watershed Enhancement Board, which has committed 10 million dollars over the next 10 years. These funds are used to implement aspects of the Oregon Plan that manage impacts from fire and invasive species. In addition, 3.34 million dollars of new funding for sage-grouse conservation was appropriated by the Oregon Legislature for the 2015 through 2017 funding cycle. These commitments ensure that the Oregon Plan will be successfully implemented for the conservation of the species.

Sage Grouse Initiative

The Sage Grouse Initiative (SGI) works with landowners and other partners to design and deliver voluntary conservation practices, including grazing systems and conservation easements, on private lands to ameliorate impacts to sage-grouse while improving the sustainability of working ranches. Private lands account for 39 percent of sage-grouse occupied range. Habitat under private ownership may be at greater risk of conversion through development than neighboring Federal land. The Sage Grouse Initiative's past, present, and future contributions are considerable because, while private lands are less than half of the sage-grouse occupied range, the potential biological value of those lands for various phases of the species' life history is high, as is their potential conservation value. The NRCS carries out conservation through a variety of authorities and tools. We have identified specific activities that are directly benefiting sage-grouse under SGI (Table 4).

TABLE 4—CONSERVATION COMPLETED BY SGI FOR 2010 TO 2014

[From NRCS 2015a, p. 38]

MZ	Grazing systems		Easements		Conifer removal		Seeding		Fence modification	
	ha	ac	ha	ac	ha	ac	ha	ac	km	mi
I	554,529	1,370,269	26,661	65,881	73	181	3,074	7,597	182	113
II	216,285	534,450	95,186	235,210	1,437	3,551	1,023	2,527	37	23
III	15,199	37,557	4,529	11,191	7,630	18,855	2,240	5,534	16	10
IV	127,448	314,930	39,727	98,167	83,405	206,099	12,035	29,740	153	95
V	35,736	88,306	11,684	28,871	71,061	175,595	439	1,085	129	80
VI	33,619	83,073	1,768	4,369	0	0	274	677	47	29
VII	3,667	9,061	3,316	8,193	389	962	388	960	2	1
Total	986,482	2,437,646	182,870	451,882	163,996	405,243	19,474	48,120	565	351

Grazing Management – The objective of SGI's Prescribed Grazing protocol is to ensure that rangelands are managed sustainably and support functional sagebrush ecosystems (NRCS 2015a, p. 23). Since 2010, SGI has improved rangeland health through rotational grazing systems, re-vegetating with sagebrush and perennial grasses, and controlling invasive species (NRCS 2015a, p. 23). The techniques employed by SGI to improve and/or maintain habitat suitability for sage-grouse are consistent with the recommendations provided in the COT Report (USFWS 2013, pp. 45–46).

Easements – The SGI has enrolled 182,109 ha (450,000 ac) in conservation easements; 80 percent of these occur inside occupied sage-grouse habitat, and 94 percent provide permanent protection (NRCS 2015a, p. 1). Under these easements, habitat cannot be subdivided or converted to agriculture, thus protecting sage-grouse habitat from development. By maintaining these lands in sagebrush habitat, these easements support existing sage-grouse populations and decrease likelihood of fragmentation.

Restoration – The SGI ameliorates impacts through restoration of disturbed and degraded habitat. The SGI has reclaimed 163,995 ha (405,241 ac) of otherwise suitable habitat by direct removal of conifers encroaching on sagebrush habitat. Removal of early-stage conifers should improve and expand sage-grouse habitats by precluding ecological type conversion to an otherwise unsuitable habitat (Johnson and Miller 2006, p. 8; Casazza *et al.* 2011, p. 163; Knick *et al.* 2013, p. 1544). Through monitoring data, SGI is working to assess how birds use areas with recent conifer removal. Anecdotal reports suggest that sage-grouse have responded positively to these efforts. Moreover, SGI and others are developing conifer maps in MZs III, VI, V, and VII (NRCS 2015a, p. 19). The SGI will use this new information to target efforts where removal will have the greatest value for sage-grouse (NRCS 2015a, p. 19 and NRCS 2015b, p. 10).

Fence modification is another aspect of SGI restoration. Marking and

removing fences can reduce direct mortality to sage-grouse by reducing fence strikes. NRCS estimates that SGI fence marking prevents 2,600 collisions annually (NRCS 2015a, p. 22).

The SGI uses direct seeding to restore habitat through the addition of native species. Through grazing systems, re-vegetating former rangeland with sagebrush and perennial grasses and controlling invasive weeds, SGI has enhanced rangeland health inside PACs (NRCS 2015a, p. 2).

Monitoring and Adaptive Management – The NRCS has continued to improve conservation of sagebrush habitat through new information and new scientific methods (NRCS 2015a, entire; NRCS 2015b, entire). They employ habitat suitability models to target conservation easements and address conifer encroachment in the early stages of development to improve the benefit of their treatments. By monitoring and tracking the effectiveness of their efforts and their willingness to incorporate this information into their management, SGI has ensured the long-term implementation of their program will achieve conservation for sage-grouse on private lands.

Since 2010, the NRCS, through the SGI, has invested approximately 425.5 million dollars, with 76 percent of investments occurring within PACs (Table 4). To date, 1,129 ranches have participated in the SGI, across all 11 States in the species' range (NRCS 2015a, p. 1). Through the 2014 Farm Bill, NRCS will continue and accelerate its efforts, ensuring a durable and increasingly targeted conservation effort on private lands in sage-grouse country (NRCS 2015a, p. 29; NRCS 2015b, p. 6). Starting in 2015, NRCS will add 198 million dollars to continue sage-grouse conservation on private lands in the future (NRCS 2015a, p. 29; NRCS 2015b, p. 6).

Where they have been implemented, these conservation efforts have addressed certain potential threats to sage-grouse, such as urban and exurban development, infrastructure, and improper grazing (defined for the purposes of this analysis as grazing at an intensity or in ways that impair ecosystem functions of the sagebrush ecosystem) [See *Grazing and Rangeland Management,* below]. The nature of those potential threats and the impact of SGI's conservation in ameliorating some potential threats are discussed in further detail below (see Summary of Information Pertaining to the Five Factors). Given the history of success of this program, the level of local and national support, NRCS' application of adaptive management, demonstrated partnerships, and the recent reauthorization and dedicated resources through the 2014 Farm Bill, we expect that SGI will continue to provide valuable on-the-ground conservation to sage-grouse and its habitat into the future.

Candidate Conservation Agreements

Over the past 2 years, we have prioritized Candidate Conservation Agreements with Assurances (CCAAs) to focus conservation on non-Federal lands for the benefit of sage-grouse. Candidate Conservation Agreements with Assurances provide assurances to both landowners and the Service that conservation will continue into the future without resulting in a regulatory burden on the landowners involved. Through these agreements, landowners agree to avoid certain activities that may be harmful to sage-grouse, or to undertake activities on their property that benefit sage-grouse (*e.g.,* restore degraded habitat, create new habitat, augment existing populations, and restore historical populations). In Oregon, more than 575,000 ha (1.4 million ac) of rangeland have been effectively conserved for sage-grouse through enrollment in a CCAA. In Wyoming, 36 CCAAs have been completed, with more than 180,000 ha (445,000 ac) enrolled. In addition to CCAAs, we also employ Candidate Conservation Agreements; these agreements can exist between the Service and private landowners, local governments, States, and Federal agencies.

Candidate Conservation Agreements operate through tailored conservation strategies that specify required activities that will benefit sage-grouse. Although individual agreements vary, the focus is always on improving sage-grouse habitat or populations. Through CCAAs, landowners may restore existing degraded sagebrush to provide habitat for sage-grouse. They may also create new habitat or simply, as with conservation easements, protect existing habitat for the benefit of the species. As an example, landowners enrolled in the Oregon CCAA have agreed to maintain contiguous habitat by avoiding further fragmentation. The objective for this required conservation measure is for no net loss in: (1) Habitat quantity (as measured in acres) and (2) habitat quality (as determined by the ecological state). Additionally, every enrolled landowner must have at least one conservation measure in place to address each threat identified during the baseline assessment of individual properties.

Candidate Conservation Agreements are voluntary agreements. As such, it is possible for landowners to terminate these agreements. However, based on previous experiences with existing CCAAs for a variety of other species (Anderson and Moore, USFWS, 2015, pers. comm.), we have found that landowners generally do not withdraw from these agreements. Of the 34 CCAAs the Service has finalized nationwide for a variety of species, 32 are still in effect and 2 expired based on the term of the agreement, indicating that landowners continue to implement CCAAs following finalization of the agreements (Anderson and Moore, USFWS, 2015, pers. comm.). Landowners commit to beneficial actions that they are willing to implement to receive the assurances of no further regulatory requirements if the species would become listed. In addition to CCAAs, we work with private landowners through the Partners for Fish and Wildlife Program through Private Landowner Agreements to benefit species and their habitats. A past study on the retention of restored wetlands found that the vast majority of landowners continued to implement the practices from their agreements well after the agreement ended (Fairchild 2004, entire). Further, over the last decade, in an 8-State area roughly equivalent to the Rocky Mountain sage-grouse range, the majority of landowners completed their agreements and continued practices after the agreements were completed (Johnson, USFWS, 2015, pers. comm.). Habitat loss and degradation were identified as threats to the species in 2010; through efforts such as these, sage-grouse habitat remains available to the species. Given the ongoing fidelity these efforts to conserve sage-grouse and its habitat, along with our previous experiences with other species, we conclude that there is sufficient certainty that existing CCAAs will continue to be implemented into the future.

Secretarial Order 3336

On January 5, 2015, the Secretary of the Interior signed Secretarial Order 3336, Rangeland Fire Prevention, Management, and Restoration (Secretarial Order), that provides guidance on wildfire management in the sagebrush ecosystem (Department of the Interior (DOI) 2015b, entire). The Secretarial Order places a priority on ''protecting, conserving, and restoring the health of the sagebrush ecosystem and, in particular, sage-grouse habitat, while maintaining safe and efficient operations,'' and allocates fire resources and assets associated with wildfire to reflect that priority. The Secretarial

Order established a Rangeland Fire Task Force (Task Force) to prepare and oversee an Implementation Plan for accomplishing the objectives of the Secretarial Order. The Task Force completed an ''Initial Report'' outlining actions that can be undertaken during the 2015 western wildfire season and that plan is being implemented (DOI 2015c, entire). The Task Force also prepared a ''Final Report'' that identifies long-term activities, beyond the 2015 fire season, that can be implemented to further address the effects of wildfire in the Great Basin (DOI 2015d, entire). A full discussion of the Secretarial Order, the Initial and Final Reports, and how they address the effects from wildfire and invasive species is provided below (see Wildfire and Invasive Plants).

Summary of New Information Since 2010

Since 2010, there have been several major changes in the regulatory mechanisms that minimize impacts to sage-grouse and their habitats. Foremost among these are the adoption of new Federal Plans specifically tailored to conserving sage-grouse over more than half of its occupied range. These Federal Plans now include substantial provisions for addressing activities that occur in sage-grouse habitats and affect the species, including those threats identified in 2010 as having inadequate regulatory measures. Aside from addressing specific activities, the Federal Plans include provisions for monitoring, adaptive management, mitigation, and limitations on anthropogenic disturbance to reduce impacts authorized in sage-grouse habitats. The Federal Plans are the foundation of land-use management on BLM and USFS managed lands. We are confident that these Federal Plans will be implemented and that the new changes, which are based on the scientific literature, will effectively reduce and minimize impacts to the species and its habitat.

In addition to the Federal Plans, the BLM and USFS have provided new policy guidance and management direction for the management of wildfire and invasive plant in the sagebrush ecosystems. The Secretarial Order establishes new, overarching policy direction for DOI and its wildfire prevention and suppression efforts by prioritizing ''protecting, conserving, and restoring the health of the sagebrush ecosystem and, in particular, sage-grouse habitat, while maintaining safe and efficient operations.'' The Secretarial Order also requires that DOI allocate its wildfire resources and assets in ways that fulfill the priority of protecting, conserving, and restoring the health of the sagebrush ecosystem. The Secretarial Order aims to reduce the size, severity, and cost of suppressing wildfire in sage-grouse habitats by reducing the spread of invasive plants and prioritizing resources to ensure that suppression efforts are effective.

Further, 10 of the 11 States within the occupied range of the sage-grouse have revised and adopted sage-grouse conservation plans. State sage-grouse conservation plans in Wyoming, Montana, and Oregon contain regulatory mechanisms that minimize impacts to the species and its habitat. Most notably, the Wyoming Plan has been in place since 2008 and has effectively minimized impacts within core habitats, protecting the highest density areas for the species within the State. The Montana and Oregon State Plans use proven conservation measures including disturbance caps, density restrictions, and lek buffers to minimize disturbance to important habitats. In combination, the Federal and three State plans cover 90 percent of the sage-grouse breeding habitat where they provide regulatory mechanisms that reduce potential adverse effects to sage-grouse. These State and Federal Plans, together with the private lands conservation provided by SGI and CCAAs, represent a substantial increase in sage-grouse conservation since 2010. These Plans and private land efforts provide conservation for sage-grouse now and into the future and ensure that the most important habitats will remain distributed across the landscape to support the populations identified as critical to the long-term conservation of the species.

Summary of Information Pertaining to the Five Factors

Section 4 of the Act (16 U.S.C. 1533) and implementing regulations (50 CFR 424) set forth procedures for adding species to the Federal Lists of Endangered and Threatened Wildlife and Plants. The Act defines an ''endangered'' species as ''any species which is in danger of extinction throughout all or a significant portion of its range,'' and a ''threatened'' species as one ''which is likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range'' (16 U.S.C. 1532(6), (20)). Under section 4(a)(1) of the Act, we may determine a species warrants listing as endangered or threatened based on any of the following five factors:

(A) The present or threatened destruction, modification, or curtailment of its habitat or range;

(B) Overutilization for commercial, recreational, scientific, or educational purposes;

(C) Disease or predation;

(D) The inadequacy of existing regulatory mechanisms; or

(E) Other natural or manmade factors affecting its continued existence.

In making this finding, we discuss below information regarding the status and potential threats to the sage-grouse in relation to the five statutory factors provided in section 4(a)(1) of the Act. Our evaluation of potential threats is based on information provided in the relevant petitions, information available in our files, and other sources considered to be the best scientific and commercial information available, including published and unpublished studies and reports. In considering what factors might constitute threats to the species, we must look beyond the mere exposure of the species to the factor to determine whether the species responds to the factor in a way that causes actual impacts to the species. If there is exposure to a factor, but no response, or only a positive response, that factor is not a threat. If there is exposure and the species responds negatively, the factor may be a threat to the species and we then attempt to determine if that factor rises to the level of a threat, meaning that it may drive or contribute to the risk of extinction of the species such that the species warrants listing as an endangered or threatened species as those terms are defined by the Act. This does not necessarily require empirical proof of a threat. The combination of exposure and some corroborating evidence of how the species is likely impacted could suffice. The mere identification of factors that could impact a species negatively is not sufficient to compel a finding that listing is warranted; we require evidence that the threats, either alone or when combined, are significant, in that they act on the species to the point that the species meets the definition of an ''endangered species'' or ''threatened species'' under the Act.

Habitat Fragmentation

In the 2010 finding, we determined that the greatest threat to the species was habitat loss and fragmentation (Factor A) due to a variety of causes, including but not limited to, energy development, infrastructure, invasive species, and wildfire (75 FR 13910, March 23, 2010, p. 13986). Sagebrush habitats were becoming increasingly degraded and fragmented due to the impacts of multiple threats, including direct conversion, urbanization, infrastructure such as roads and power

lines built in support of several activities, wildfire and the change in wildfire frequency, incursion of invasive plants, improper grazing, and nonrenewable and renewable energy development. Many of these threats were found to be exacerbated by the effects of climate change, which could influence long-term habitat trends.

As noted in 2010, fundamental characteristics of sagebrush landscapes have changed since Euro-American settlement (Knick and Connelly 2011, p. 7). Very little of the extant sagebrush is undisturbed, with up to 50 to 60 percent having altered understories or having been lost to direct conversion (Knick *et al.* 2003, p. 612). Conversion to cropland and other land uses has reduced the quantity of area that is dominated by sagebrush land cover. The composition of sagebrush communities has changed with the expansion of junipers and *Pinus* spp. (pinyon) woodlands (Miller and Rose 1999, p. 556) and the invasion of nonnative species such cheatgrass (West and Young 2000, p. 262). Habitat suitability has also been affected by the presence of anthropogenic structures such as communication towers and power lines (Connelly *et al.* 2000a, p. 974; Beck *et al.* 2006, p. 1070). Lastly, the configuration of sagebrush mosaics across the species' range has changed, resulting in the risk of increased population isolation, exposure to predators in areas of edge habitat, and invasive plants (Saunders *et al.* 1991, pp. 22–24; Gelbard and Belnap 2003, p. 424; Knick and Connelly 2011, pp. 7–14).

The biology of sagebrush and the ecology of the sagebrush ecosystem makes restoration of disturbed areas very difficult and processes to restore sagebrush habitat are relatively unproven (Knick *et al.* 2003, p. 620). Active restoration activities are often limited by financial and logistical resources (Knick *et al.* 2003, p. 620; Miller *et al.* 2011, p. 147; Pyke 2011, p. 544) and may require decades or centuries to be effective (Knick *et al.* 2003, p. 620). Meaningful restoration for sage-grouse requires action on a landscape, watershed, or eco-regional scale rather than individual, unconnected efforts (Knick *et al.* 2003, p. 623; Wisdom *et al.* 2011, p. 469). Recently, investigations have focused on ascertaining where and how sagebrush habitat restoration is likely to be more effective (Pyke 2011, pp. 531–548; Miller *et al.* 2014, pp. 468–481; Chambers *et al.* 2014b, pp. 440–454). Because loss and fragmentation of habitats due to invasives and wildfire is one of the biggest impacts to sage-grouse, particularly in the Great Basin, it is important that these investigations continue and that management actions continue to focus on effective wildfire suppression and habitat restoration.

Because of the challenges with sagebrush restoration, management efforts in sagebrush ecosystems are usually focused on habitat maintenance (Miller *et al.* 2011, p. 183; Wisdom *et al.* 2011, pp. 470, 472). This goal has primarily been achieved through the management of activities that can result in habitat loss and fragmentations such as non-renewable energy development, agricultural conversion, wildfire, and invasive plants, consistent with the recommendations in the COT Report (USFWS 2013, pp. 40–52). Each of the activities that can cause habitat fragmentation will be discussed further below, as well as any conservation efforts that have been implemented to address those impacts.

Nonrenewable Energy Development

In 2010, we evaluated the effect of nonrenewable energy development on sage-grouse and concluded that the development and related infrastructure were substantial contributors to habitat loss and fragmentation in the past, and that it would continue into the future, particularly in the Rocky Mountain portion of the species' range. We also found that regulations addressing nonrenewable energy development were inadequate at that time to address this threat. It was the lack of regulatory mechanisms that led us to conclude this nonrenewable energy development would continue at rates similar to or greater than historical rates of development. The 2010 finding concluded that habitat fragmentation, caused in part by nonrenewable energy development, and inadequate regulatory mechanisms were significant threats to the species, then and into the foreseeable future, such that listing was warranted under the Act (75 FR 13910, March 23, 2010, pp. 13986–13988).

Nonrenewable energy development includes the exploration, construction, and drilling of wells and installation of supporting infrastructure needed to extract and transport oil, natural gas, coal, coal-bed natural gas, coal-bed methane, and other types of gas. Nonrenewable energy development begins with exploratory surveys and the construction of access roads and well pads, followed by drilling, extracting, and transporting the energy reserves along roads and pipelines. Additional infrastructure needed for nonrenewable energy development often includes compressor stations, pumping stations, electrical generators, and power lines (Connelly *et al.* 2004, p. 7–39; BLM 2007, pp. 2–110).

Nonrenewable energy development has occurred in sage-grouse habitats since the late 1800s (Connelly *et al.* 2004, p. 7–28), with wells historically concentrated in MZs I, II, VII, and the eastern portion of MZ III (IHS Incorporated 2014, entire). Specifically, nonrenewable energy development is concentrated above four geologic basins across the sage-grouse range: The Powder River Basin (MZ I); the Williston Basin (MZ I); the Southwestern Wyoming Basin (MZ II); and the Uinta-Piceance Basin (MZs II, III, and VII). These four basins overlap with the highest density of sage-grouse, and the largest number of leks in the Rocky Mountain portion of the occupied range (Doherty *et al.* 2015, entire). Approximately 10 percent of the species' overall occupied range has been directly or indirectly affected by nonrenewable energy development, with approximately 20 percent affected in MZ I, 20 percent affected in MZ II, and 29 percent affected in MZ VII (Knick *et al.* 2011, p. 240). The existing development and infrastructure has already affected the species distribution (Naugle *et al.* 2011, pp. 489–491). Nonrenewable energy development is expected to continue in the occupied range of the sage-grouse based on the estimates of available energy reserves and projected trends in development rates (Copeland *et al.* 2009, p. 5; Knick and Hanser 2011, p. 394; Wisdom *et al.* 2011, p. 467).

Nonrenewable energy development can remove and fragment sagebrush habitats (Factor A). Well pads vary in size from 0.10 ha (0.25 ac) for coal-bed natural gas wells to greater than 7 ha (17.3 ac) for deep gas wells and multi-well pads (Connelly *et al.* 2004, p. 7–39; BLM 2007, pp. 2–123). Pads for compressor stations typically occupy 5 to 7 ha (12.4 to 17.3 ac) (Connelly *et al.* 2004, p. 7–39). However, where geology permits the use of new horizontal and directional drilling technologies, multiple wells can be placed on one pad, thereby reducing the amount of surface disturbance associated with wells, roads, power lines, and pipelines (Applegate and Owens 2014, p. 288).

The reduction and fragmentation of sagebrush habitats can decrease sage-grouse abundance and reduce the distribution of sage-grouse across the landscape (Knick *et al.*, 2011, pp. 247–250; Leu and Hanser 2011, p. 270). Male sage-grouse may avoid leks if there are five or more wells within 3.0 km (1.9 mi), and sage-grouse are less likely to occupy habitats with wells spaced at 32 ha (80 ac) (Doherty *et al.* 2008, p. 193).

Well densities on Federal lands have typically ranged from 1 well per 16 ha to 32 ha (40 ac to 80 ac), although densities as high as 1 well per 4 ha (10 ac) do occur (BLM 2006, pp. 2–5; Naugle *et al.* 2011, p. 497). Impacts from nonrenewable energy extend beyond the physical footprints of wells and may include indirect effects such as the physical and behavioral changes, increased mortality, and reduced reproductive success (Lyon and Anderson 2003, p. 459; Walker *et al.* 2007a, p. 2651; Holloran *et al.* 2010, p. 70; Knick *et al.* 2011, p. 240).

Sage-grouse avoid habitats near nonrenewable energy developments, including important wintering habitats and leks (Dzialak *et al.* 2013, p. 16; Smith *et al.* 2014, p. 15). Sage-grouse have lower nest initiation and nest success rates near nonrenewable energy development (Aldridge and Boyce 2007, p. 517; Webb *et al.* 2012, p. 9), and reduced survival rates (Holloran *et al.* 2010, p. 70; Kirol 2012, p. 15). Due to the strong habitat fidelity exhibited by adult sage-grouse, declining population trends may take up to 10 years to detect following the onset of nonrenewable energy development. (Doherty *et al.* 2010a, p. 5; Harju *et al.* 2010, pp. 441–445; Taylor *et al.* 2012a, p. 8; Gregory and Beck 2014, p. e97132). This delay poses challenges to detecting population-level impacts resulting from development, and may prevent timely implementation of measures to eliminate, reduce, or mitigate those impacts. As a single conservation tool, mitigation measures (such as habitat restoration and seasonal or timing restrictions) to reduce impacts may not be sufficient to prevent sage-grouse declines due to nonrenewable energy development (Walker *et al.* 2007a, p. 2651; Doherty *et al.* 2008, p. 192; Harju *et al.* 2010, p. 445), as the associated infrastructure persists on the landscape for several generations of sage-grouse. However, as part of a larger tool set that includes avoidance and minimization, mitigation can serve as a helpful conservation measure (USFWS 2014c).

Nonrenewable energy resources are the largest source of energy worldwide, and demand for these resources could increase by up to 1.3 percent annually in the United States and 50 percent worldwide by the year 2030 (National Petroleum Council 2007, p. 46; Naugle *et al.* 2011, p. 490). Nonrenewable energy resources will likely be in demand and used in the United States through the year 2030, although energy forms and extraction techniques may change in the future (EIA 2009, entire). Market conditions and extraction technologies influence the rates of nonrenewable energy development in North America (Applegate and Owens 2014, p. 287); the Energy Policy and Conservation Act (Pub. L. 109–58) and its amendments mandate that the United States increase its domestic energy development. Therefore, nonrenewable energy development is likely to continue throughout the sage-grouse range into the future, although its form and extent across the landscape may change.

In 2010, we assessed impacts to sage-grouse and their habitat based on the portion of occupied range where a nonrenewable energy project was occurring and where there was increased potential for future development (75 FR March 1310, March 23, 2010, pp. 13942–13948). This approach was based on the best available GIS data at that time but may have overestimated some effects, because we had less precise information regarding areas of high oil and gas development potential and we measured impacts against all lands within the occupied range.

For this status review, we used peer-reviewed and published methodologies (Copeland *et al.* 2009, entire) to model the probability of future oil and gas development impacting sage-grouse. The model focused on assessing the risk of nonrenewable energy in MZs I and II, the two areas with the highest potential for future nonrenewable energy development (Figure 2) (Juliusson and Doherty 2015). Although nonrenewable energy development potential exists and will continue in the Uinta-Piceance Basin (MZ VII), we did not apply the model to MZ VII because the relative proportion of potential development was low, even under the highest development scenario. The model used geological information about potentially available oil and gas resources to map areas of likely future development (Juliusson and Doherty 2015). We also used Oil & Gas Resource Assessments developed by the USGS to incorporate future maximum potential development scenarios into the analysis (Juliusson and Doherty 2015). The analysis quantified potential effects to sage-grouse by calculating the percent of the Population Index and breeding habitat distribution potentially exposed to future nonrenewable energy development based on the availability of oil and gas resources. The potential effects from nonrenewable energy development were assessed with and without regulatory mechanisms contained in the Federal Plans, the Wyoming Plan, and the Montana Plan (see Conservation Efforts, below). The estimate of potential non-renewable energy effects without conservation planning efforts is roughly equivalent to what was evaluated in 2010.

Our analysis indicates that the Federal Plans, the Wyoming Plan, and the Montana Plan are reducing the exposure of the sage-grouse to nonrenewable energy, as measured by the portions of the Population Index and breeding habitat, in MZs I and II, the two MZs at greatest risk of future nonrenewable energy development (Table 5). Without the regulatory mechanisms in MZ I, 28 percent of the Population Index and 21 percent of the breeding habitat could be affected by nonrenewable energy development. Without regulatory mechanisms in MZ II, 27 percent of the Population Index and 25 percent of the breeding habitat could be affected (Table 5). However, with the regulatory mechanisms provided by the State and Federal plans, the risk of nonrenewable energy development decreases. With regulatory mechanisms, 17 percent of the Population Index and 14 percent of the breeding habitat could be exposed to nonrenewable energy development in MZ I, and 8 percent of the Population Index and 9 percent of the breeding habitat could be exposed to nonrenewable energy development in MZ II. Our analysis shows that the State and Federal regulatory mechanisms reduce the risk of nonrenewable energy exposure to the Population Index and breeding habitat by more than 35 percent in MZ I and more than 60 percent in MZ II.

TABLE 5—POTENTIAL EXPOSURE TO SAGE-GROUSE POPULATIONS AND BREEDING HABITAT FROM NONRENEWABLE ENERGY DEVELOPMENT IN MZS I AND II, WITH AND WITHOUT THE REGULATORY MECHANISMS, AT THE HIGHEST DEVELOPMENT SCENARIO

Management zone	Without regulatory mechanisms		With regulatory mechanisms	
	% of the population index exposed	% of the breeding habitat exposed	% of the population index exposed	% of the breeding habitat exposed
I	28	21	17	14
II	27	25	8	9

To summarize, our analysis quantifies that without regulation a high proportion of the Population Index and breeding habitat in MZs I and II could be exposed to and potentially negatively affected by nonrenewable energy development. However, with the regulatory mechanisms enacted since 2010, the potential risk from nonrenewable energy development is substantially reduced in MZs I and II (Table 5). Future impacts to sage-grouse from new development could vary based on other factors, such as economic markets, technologies, densities, proximity to existing development, and the location of new development; however, our results show that the Federal and State regulatory mechanisms in MZs I and II reduce habitat loss and fragmentation due to nonrenewable energy development. The next section will discuss these conservation efforts, including those regulatory mechanisms designed to address the effects of nonrenewable energy development and how they ameliorate this potential threat.

Conservation Efforts

Since 2010, State and Federal agencies have worked collaboratively to develop regulatory mechanisms, that is, legally binding and enforceable sage-grouse conservation measures, as well as other nonregulatory conservation efforts, to reduce or eliminate the potential threat of new nonrenewable energy development to sage-grouse and its habitat. Those efforts are discussed in detail below.

State Plans—Three States where nonrenewable energy development has historically been concentrated have implemented regulatory mechanisms to address this potential threat. As described below, Wyoming and Montana Plans provide regulatory mechanisms to address habitat loss, habitat fragmentation, and disturbance associated with nonrenewable-energy development on applicable lands in their States. In addition, the Utah Executive Order contains a regulatory mechanism for potential nonrenewable energy development that is discussed below.

The Wyoming Plan provides regulatory mechanisms to reduce impacts associated with energy development on all lands within Core Areas. The Wyoming Plan features development stipulations to guide and regulate development within the Core Population Areas to avoid as much as possible, but, if avoidance is not possible, to minimize and mitigate, impacts to sage-grouse and its habitat (See *Regulatory Mechanisms* section below; Wyoming E.O. 2015–4, entire). Specific measures include controlled surface use, density of development restrictions, seasonal and noise restrictions, and lek buffers. Since implementation of the plan began in 2008, the number of new nonrenewable energy wells in sage-grouse habitats declined by 80 percent and permits for potential new development of single wells has declined by 65 percent (USFWS 2014b). At the same time, applications for directional and horizontal drilling permits, which congregate disturbance from multiple wells into one area, increased by 66 and 65 percent respectively, representing a decrease in sage-grouse habitat lost to nonrenewable energy development (USFWS 2014b). The BLM analyzed existing lease information and found that only 14 percent of PHMA in Wyoming is already leased (Carmen, BLM, 2015, pers. com.). The Wyoming Plan recognizes valid existing rights. ''Activities existing or permitted in Core Populations Areas prior to August 1, 2008, will not be required to be managed under Core Population Area Stipulations'' (Wyoming E.O. 2015–4, p. 4). Our risk analysis described above confirms that the Wyoming Plan, together with the Federal Plans, reduces the potential exposure of nonrenewable energy development to the Population Index by more than 35 percent in MZ I and 60 percent in MZ II (Table 5) where nonrenewable energy development has historically been concentrated. Results were similar for breeding habitat. Risk of exposure, however, is a measure of areas where regulatory mechanisms would allow development and does not equate to a forecast of where actual impacts will occur; actual energy development and potential impacts are likely to be much lower than the risk analysis. While some development will occur in the future, the Wyoming Plan directs projects to areas that will avoid impacts, includes stipulations to minimize indirect effects, and if necessary, requires mitigation to benefit the species.

The Montana Plan also provides regulatory mechanisms very similar to those described above for Wyoming that reduce impacts from nonrenewable-energy development. Montana's State plan includes controlled surface use, restrictions on density of development, seasonal and noise restrictions, and lek buffers. Similar to the Wyoming Plan, it is designed to reduce impacts associated with energy development in Core Areas on State lands and private lands where a State authorization is required (Montana E.O. 10–2014, entire; see *Conservation Efforts* section above). The Montana Plan includes a controlled surface use, density of development restrictions, seasonal and noise restrictions, and lek buffers.

The Utah Executive Order requires that the Utah Division of Oil Gas and Mining coordinate with the Utah Division of Wildlife Resources prior to issuing energy development permits. Further, the Plan directs the Utah Division of Oil, Gas, and Mining to implement recommendations provided during that coordination that require avoidance and minimization measures on State and private lands consistent with the conservation plan. These measures are subject to the statutory requirements to protect rights on private property and avoid waste of the mineral resource.

To summarize, since the 2010 finding, States have undertaken considerable effort to reduce the impact of nonrenewable energy development on sage-grouse and efforts are consistent with the recommendations in the COT Report (USFWS 2013, pp. 43–44). State Plans in Wyoming and Montana provide regulatory mechanisms that direct

development out of Core Areas and minimize indirect effects, effectively reducing the risk of habitat loss and fragmentation in MZs I and II. In addition, the Utah Executive Order contains a regulatory mechanism that requires consultation with the State Division of Wildlife Resources and implementation of its recommendations to avoid and minimize sage-grouse impacts. The State Plans work together with the Federal Plans, as discussed below, to reduce nonrenewable energy effects to sage-grouse habitat across the range, and particularly in MZs I and II, where the potential for development is the greatest.

Federal Plans – Since 2010, BLM and USFS have completed plan amendments or revisions conserving sage-grouse on more than half its occupied range. Approximately 80 percent of the BLM and USFS lands with high to medium potential for nonrenewable energy development are located outside federally managed PHMAs (Quamen, BLM, 2015, pers. comm.). The Federal Plans in Wyoming adopt the Wyoming Plan, which, as described in the *Regulatory Mechanisms* section above, reduces impacts to sage-grouse from nonrenewable energy development. The Federal Plans include NSO restrictions in 14 million ha (35 million ac) of PHMA, with either no or very limited waivers or modifications. Exceptions to this restriction could occur only if it is determined that the project would not affect sage-grouse or would be beneficial compared to other options. The Federal Plans prioritize the future leasing and development of nonrenewable-energy resources outside of sage-grouse habitats. The plans require disturbance caps, surface occupancy restrictions, seasonal restrictions, and lek buffers to effectively reduce habitat loss, habitat fragmentation, and disturbance to sage-grouse from nonrenewable energy development. Calculation of the percentage of disturbed surface under the disturbance caps incorporates both existing and new authorized disturbances to limit habitat loss and fragmentation from new nonrenewable energy development (See *Sagebrush Landscape Conservation Planning* above).

The Federal Plans recognize valid existing subsurface rights to nonrenewable energy resources, but still reduce impacts to sage-grouse by requiring the agencies to work with lessees, operators, and project proponents to follow an avoidance, minimization, and mitigation approach subject to applicable laws (30 U.S.C. 226(p) and 43 CFR 3162.3). The BLM estimates that approximately 10 percent of all habitat is currently leased rangewide (Carmen, BLM, 2015, pers. comm.). According to BLM's analysis, varying proportions of PHMA are leased across the range of the species: 20 percent in North Dakota; 17 percent in Colorado; 14 percent in Wyoming; 4 percent in Utah; and 2 percent in Montana (Carmen, BLM, 2015, pers. comm.). The Federal Plans provide coordinated monitoring strategies of disturbance caps. In response to monitoring, development allowed under the Federal Plans may be adjusted based on adaptive management criteria to provide an immediate, corrective response to any identified triggers for population or habitat declines. While the development of some valid existing rights may continue, these provisions provide a backstop for other disturbance if adaptive management triggers are exceeded.

In summary, the Federal and three State Plans include closure or NSO restrictions for all PHMAs (except in Wyoming), and limit exceptions to instances where the activity will have no direct, indirect, or cumulative effect on sage-grouse or sage-grouse habitats, or is an alternative action for activities on a nearby parcel and would provide a clear conservation gain to sage-grouse. In GHMAs, Federal Plans dictate that project proponents avoid, minimize, and mitigate impacts from nonrenewable energy development (see *Sagebrush Landscape Conservation Planning* above). The Federal Plans are also consistent with the recommendations in the COT Report (USFWS 2013, pp. 43–44). Together, these measures reduce effects from nonrenewable energy development on approximately 90 percent of the breeding habitat across the range.

Nonrenewable Energy Summary

In the 2010 Finding, we determined that nonrenewable development was a threat to sage-grouse due to the habitat loss and fragmentation it caused. Current information indicates that the global demand for nonrenewable energy resources will continue and will likely increase in sage-grouse habitats through the year 2030. Nonrenewable energy development can negatively affect sage-grouse individuals and populations by reducing and fragmenting sagebrush habitats and by disturbing individual sage-grouse through increased noise and behavioral avoidance of infrastructure and human activity. Nonrenewable energy development could also act cumulatively with other potential threats to increase habitat loss and fragmentation caused by invasive plants, and may increase predation or disease. Our analysis indicates that regulatory mechanisms reduce the risk of nonrenewable energy exposure to the Population Index and breeding habitat by more than 35 percent in MZ I and more than 60 percent in MZ II, the areas with the greatest potential for nonrenewable energy development. State and Federal Plans emphasize protection of the most important habitats from habitat loss, habitat fragmentation, and disturbance, ensuring that large, contiguous expanses of habitat will remain to support sage-grouse populations. Rangewide, the Federal Plans, Wyoming Plan, and Montana Plan reduce impacts from nonrenewable energy development on approximately 90 percent of the modeled breeding habitat (see *Sagebrush Landscape Conservation Planning* for a detailed discussion of conservation measure implementation and effectiveness).

Infrastructure

In 2010, we evaluated the effect of infrastructure (including roads, railroads, power lines, communication towers, and fences) on sage-grouse and concluded that it was a substantial contributor to habitat fragmentation throughout the species' range and that fragmentation from this source would increase in the future. We also found that infrastructure causes direct mortality from collisions and provides perches for predators. We further found that the regulations governing the location and installation of infrastructure were inadequate to address these threats. The 2010 finding concluded that habitat fragmentation, caused in part by infrastructure, and inadequate regulatory mechanisms to address the negative effects of infrastructure were significant threats to the species and likely to continue or increase into the future such that listing was warranted under the Act (75 FR 13910, March 23, 2010, pp. 13986–13988).

The increasing expansion of human settlement into the western United States has led to an increase in demand for natural resources and the necessary infrastructure to support human development. Development of roads, railroads, power lines, communication towers, and fences can result in habitat loss and fragmentation, and can cause sage-grouse habitat avoidance. These types of infrastructure can also provide sources for the introduction and propagation of invasive plants, increase fire risk, and increase concentrations of predators.

The physical footprint of existing infrastructure has directly impacted

approximately 218,535 ha (540,013 ac) of breeding habitat rangewide (Factor A) (Table 6). In addition, infrastructure can influence a larger ecological footprint by negatively affecting sage-grouse use of otherwise suitable habitats through indirect effects from noise disturbance, increased perches for predators, and pathways for invasive species (Manier *et al.* 2013, p. 31; Blickley and Patricelli 2012, p. 26). For infrastructure that has been in place for a number of years, these impacts have likely already been realized. The greatest impact from existing infrastructure has occurred in the Columbia Basin (MZ VI) where approximately 2.9 percent of sage-grouse breeding habitat has been affected. Current infrastructure associated with power lines accounts for the greatest direct disturbance (117,004 ha; 289,125 ac) across the range. Fences occur across the landscape; however, the amount of fencing is unknown (75 FR 13910, March 23, 2010, p. 13929).

TABLE 6—SAGE-GROUSE BREEDING HABITAT DIRECTLY IMPACTED BY EXISTING INFRASTRUCTURE

		Management zone							
		I	II	III	IV	V	VI	VII	Total
Roads [1]	ha	18,344	28,798	17,604	21,210	7,289	4,871	601	98,717

[1] Includes interstates, State and Federal highways, and secondary roads.
[2] Includes existing, large (>115 kV) transmission lines. Does not include distribution lines.
[3] Includes meteorological towers, communication towers, and wind turbines.

The primary impact of infrastructure is habitat loss and fragmentation (Factor A). Other impacts associated with infrastructure are direct mortality from strikes (Beck *et al.* 2006, p. 1075), spread of invasives (Connelly *et al.* 2004, p. 7–25), wildfire ignition (Havlina *et al.* 2015, p. 2), and increased predator occurrence (Manier *et al.*2013, p. 31; Howe *et al.* 2014, p. 43). Additionally, sage-grouse may avoid infrastructure because of noise or visual disturbance (Blickley and Patricelli 2012, p. 26). However, fences may be beneficial if used to protect areas used by sage-grouse (USFWS 2013, p. 52), such as fencing livestock and free-roaming equids out of mesic areas used as late brood-rearing habitat. The best available information does not forecast where or how much additional infrastructure could be installed across the species' range. However, as discussed in the next section, regulatory mechanisms provided by the Federal and State Plans will exclude or minimize new infrastructure in approximately 90 percent of sage-grouse breeding habitats.

Conservation Efforts

Since 2010, a number of landscape-scale efforts have been undertaken to reduce impacts from existing and future infrastructure to sage-grouse across the range that are consistent with the recommendations in the COT Report (USFWS 2013, pp. 51–52). Those efforts include Federal Plan amendments, State Plans, SGI projects, and CCAs.

Federal Plans – The Federal Plans limit new infrastructure primarily through land use allocations, lek buffers, and disturbance caps (BLM and USFS 2015, entire). In PHMA, these measures are designed to avoid or minimize infrastructure development, with limited exceptions for new ROWs. Any exceptions must include the explicit rationale that biological impacts to sage-grouse are being avoided. Existing designated corridors for future major transmission lines and pipelines remain open. Any impacts from new infrastructure require mitigation and are counted toward the 3 percent disturbance cap, except in Wyoming and Montana where a 5 percent cap exists. The Federal Plans also include seasonal timing restrictions, noise restrictions, buffer distances from leks, and required design features to minimize infrastructure impacts on sage-grouse. Further, in response to monitoring, development allowable under the Federal Plans may be adjusted based on adaptive management criteria to provide an immediate, corrective response to any triggers for population or habitat declines. These provisions provide a backstop to prevent additional disturbance. As a result of these measures, approximately 14 million ha (35 million ac) of PHMA are protected from ROWs. Based on past planning processes, we expect the measures to be implemented for at least the next 20 to 30 years. For additional details about the implementation and effectiveness of Federal Plans, see *Federal Plans* section, above.

State Plans – State Plans in Wyoming, Montana, and Oregon contain regulatory measures to minimize impacts from infrastructure on State lands and, in some instances, on private lands. The Wyoming Plan imposes the following restrictions on all lands in Wyoming: Structure-density limits, timing stipulations, buffers, habitat-disturbance caps, and project-specific reviews for any project subject to State permitting requirements permitted after August 1, 2008, on all lands in Wyoming (Wyoming E.O. 2015–4, entire). Oregon's Plan regulations require avoidance, minimization, and compensatory mitigation actions for development actions in sage-grouse habitat on State and private land and, in conjunction with BLM's Federal Plan, cap the amount of disturbance on sage-grouse core habitat to 3 percent (Oregon OAR 635–140–0025, entire; and Oregon OAR 660–023–0115, entire), while the

Wyoming and Montana Plans cap the amount of disturbance on sage-grouse core habitat to 5 percent (Wyoming E.O. 2015–4, p. 6; Montana E.O. 10–2014, p. 14). For additional details about the implementation and effectiveness of State plans, see the *Wyoming State and Federal Plans* and *Montana and Oregon Conservation Efforts* sections, above.

Sage Grouse Initiative – Marking fences with permanent flagging improves their visibility and reduces fence collisions and was recommended by the COT Report (USFWS 2013, p. 52). The Sage Grouse Initiative has worked with ranchers to implement voluntary conservation projects in sage-grouse habitat, including the marking of fences. To date, NRCS has marked or removed 563 km (350 mi) of high-risk fence to reduce collisions (NRCS 2015a, p. 6). Conservative estimates indicate that fence-marking prevents 2,600 collisions annually (NRCS 2015a, p. 22). Another study found that marking fences reduced collisions by 83 percent over unmarked fences in Idaho during the breeding season (Stevens *et al.* 2012, p. 1). Fence-marking is effective at reducing collisions, but it is unlikely to eradicate collisions completely (Stevens *et al.* 2012, p. 1), and further information is needed to make population-level inferences regarding the impact of reduced collisions (Stevens *et al.* 2013, p. 413).

Candidate Conservation Agreements – Non-Federal lands currently enrolled in CCAAs have restrictions on building infrastructure within sage-grouse habitat, require consolidation of existing infrastructure when feasible, and require relocating or marking existing fences. Rangewide, approximately 745,000 ha (1.8 million ac) of private lands have landowner commitments in the programmatic CCAAs in Oregon and Wyoming. Enrollment of these areas in the CCAAs ensures that no infrastructure will be constructed on those properties in a way that would adversely impact sage-grouse and encourages the modification or management of existing infrastructure to reduce potential adverse effects.

Infrastructure Summary

The potential threat of new infrastructure has changed substantially since the last status review. In 2010, we found habitat fragmentation, due in part to infrastructure, to be a threat to the species, and regulatory mechanisms were not sufficient to address that threat into the future. Since then, regulatory mechanisms provided by Federal Plans reduce potential future infrastructure on more than half the species' range by eliminating or capping new development in important sagebrush habitat and by implementing project design features to minimize impacts (*e.g.,* buffers, noise restrictions, etc.). State Plans in Wyoming, Montana, and Oregon provide similar protections on State and private lands. These protections are most important in Wyoming, where historically infrastructure impacts have been the highest. Further, considerable effort has been undertaken by SGI and private landowners to further reduce impacts from infrastructure, and in particular, existing structures such as fencing. Where existing infrastructure occurs, some localized impacts are likely to continue; however, the Federal and State Plans include measures to avoid placing new infrastructure in the most important habitats for the species, thereby reducing the future risk of infrastructure development in those areas. Together, the Federal Plans and Wyoming, Montana, and Oregon State Plans reduce infrastructure impacts to the areas identified as PHMAs and GHMAs, which encompass approximately 90 percent of the modeled breeding habitat across the species' range (see *Sagebrush Landscape Conservation Planning* for a detailed discussion of conservation measure implementation and effectiveness).

Agricultural Conversion

In the 2010 finding, we concluded that agricultural conversion of sage-grouse habitat was one of the primary causes of habitat loss and fragmentation (75 FR 13910, March 23, pp. 13924–13926). Agricultural conversion describes the removal of sagebrush rangelands to create tilled agricultural crops or re-seeded exotic grass pastures (Schroeder and Vander Haegen 2011, p. 519; Wisdom *et al.* 2011, p. 462; USFWS 2013, p. 48). By converting sagebrush habitats to cultivated croplands and pastures, agricultural conversion can reduce and fragment sage-grouse habitats (Factor A) (Connelly *et al.* 2004, p. 7–203; Davies *et al.* 2011, p. 2575; Wisdom *et al.* 2011, p. 462; Knick *et al.* 2013, p. 1547). Since 2010, new information about potential future risk of agricultural conversion has changed our conclusion about this impact, as discussed below.

In the past, approximately 11 percent of the sage-grouse's historical range was converted to agriculture, with 32 percent of the entire Columbia Basin (MZ VI) and 19 percent of the entire Great Plains (MZ I) converted to agriculture (Knick *et al.* 2011, pp. 208–209). Sagebrush habitats with deep, fertile soils and abundant precipitation were more likely to be converted to agriculture (Connelly *et al.* 2004, p. 1–1; Davies *et al.* 2011, p. 2575). The loss of these productive sagebrush habitats to agriculture displaced some sage-grouse into less productive sagebrush habitats (Manier *et al.* 2013, p. 1). In the rest of the historical range, varied topography, soil types, and drier climates limited the conversion of sage-grouse habitats to agriculture (Knick *et al.* 2011, p. 208). As a result, only 10 percent of the Snake River Plain (MZ IV) and less than 5 percent of the total area of each remaining MZ were converted to agriculture (Connelly *et al.* 2004, p. 5–55; Knick *et al.* 2011, p. 209). Our previous 2010 Finding summarized specific historical losses of sage-grouse habitats from agricultural conversion (75 FR 13910, March 23, pp. 13924–13925).

By reducing and fragmenting sage-grouse habitats, agricultural conversion may reduce sage-grouse populations (Smith *et al.* 2005, p. 314; Walker *et al.* 2007a, p. 2650; Tack 2009, p. iii; Johnson *et al.* 2011, p. 407; Knick *et al.* 2011, p. 208). Although sage-grouse will forage on some crops, such as alfalfa (Schroeder *et al.* 1999, p. 4), they typically will not nest or rear broods in cultivated croplands (Holloran *et al.* 2005, p. 648; Aldridge and Boyce 2007, pp. 508, 523). Agricultural conversion can also reduce the connectivity of habitats and limit the movement of sage-grouse between populations and seasonal habitats (Schroeder and Vander Haegen 2006, pp. 7–8; Knick *et al.* 2011, p. 211). Agricultural conversion may also expose sage-grouse to indirect effects, such as increased predation, exposure to pesticides, and the drying and loss of riparian habitats when water is diverted for irrigation (Knick *et al.* 2011, pp. 208–209). Based on the foraging distances of human-associated predators hunting near croplands and urban areas, agricultural conversion could indirectly influence approximately 49 percent of sagebrush habitats rangewide (Connelly *et al.* 2004, pp. 1–1 and 7–23; Manier *et al.* 2013, p. 30).

Although agricultural croplands and pasturelands do not provide suitable habitat, sage-grouse may feed on irrigated croplands, particularly during the late brood-rearing period when other native plant foods have matured and dried (Connelly *et al.* 2004, pp. 4–1 and 4–10; Knick *et al.* 2011, p. 211). The type of crop and proximity to adjacent sagebrush habitats influences whether sage-grouse will feed on the irrigated croplands (Swensen *et al.* 1987, p. 128; Blus *et al.* 1989, p. 1141; Connelly *et al.* 2004, p. 4–18). Sage-grouse generally do

not feed on dry, unirrigated fields that have fewer forbs and insects than irrigated fields. Additionally, increased predation, exposure to pesticides, WNv, and collisions with fences may outweigh any benefits to sage-grouse provided by cultivated cropland and pastures (Blus *et al.* 1989, pp. 1141–1142; Braun 2006, p. 11; Walker 2008, p. 184, Holloran *et al.* 2005, p. 648, Aldridge and Boyce 2007, p. 508; Coates *et al.,* in press).

Rates of agricultural conversion likely slowed and will continue to slow because the most productive sagebrush habitats have already been converted to croplands or pasturelands (Baker *et al.* 1976, p. 167). Since 1982, acres of new cropland within occupied sage-grouse range have decreased in every State except South Dakota (NRCS 2013, pp. 63–79), likely due to the decreasing suitability of the remaining habitats for agriculture. However, economic incentives for biofuels and technological advances in irrigation and cultivation could potentially increase conversion rates in the future (Knick *et al.* 2011, p. 208). In 2010, we determined that agricultural conversion would continue to affect sage-grouse in the future based on historical loss and fragmentation of sage-grouse habitat from agricultural conversion.

To more precisely evaluate the potential risk to sage-grouse from future agricultural conversion, we compared a new cropland suitability model (Lipsey *et al.* 2015, entire) with the Population Index (Doherty *et al.* 2015, entire). The cropland suitability model uses soil and climate data to predict the probability that an area could be converted to cropland (Lipsey *et al.* 2015, entire). The Population Index model identifies important sage-grouse population centers (Doherty *et al.* 2015, entire). By comparing these two models, we quantified the percent of the sage-grouse Population Index that overlaps with sagebrush habitats in the MZ I that have a high potential to be converted to agriculture in the future. Because the cropland suitability model was only finalized for MZ I for reasons explained below, the results of this exercise specifically apply only to MZ I, but can be used to assess potential probabilities of conversion to agriculture rangewide.

The cropland suitability model was developed only for the Great Plains (MZ I), and not for the Columbia Basin (MZ VI) or the Snake River Plain (MZ IV), where agricultural conversion also occurred, due to the limited availability of land cover data, the small size of the Columbia Basin (MZ VI), and differences in the way sage-grouse use agricultural fields between these three MZs. Additionally, more of the Columbia Basin (MZ VI) has already been converted to cropland (Knick *et al.* 2011, pp. 208–209) and the Great Plains (MZ I) has the highest percentage (69 percent) of private lands (TABLE 2, above), so the potential risk of agricultural conversion is greatest in the Great Plains (MZ I). As a result, the cropland suitability model focused only on the MZ with the greatest potential to be converted in the future, so our overlay analysis with the sage-grouse breeding distribution model could only be calculated in the Great Plains (MZ I). However, by limiting the analysis to the MZ I, the MZ with the greater potential to be converted, the result represents a worst-case scenario that is informative for the rest of the range where future conversion is less likely to occur. Additionally, it would be speculative to analyze future technological agricultural advancements or economic incentives that could potentially increase agricultural conversion on lower quality soils.

Our comparison of the cropland risk model and the Population Index model showed that the majority of the sage-grouse Population Index overlaps with sagebrush habitats in MZ I that have a low probability of being converted to agriculture (Lipsey *et al.* 2015, entire; USFWS 2015a). Specifically, 87 percent of the sage-grouse Population Index in the MZ I occur in sagebrush habitats unlikely to be converted into agriculture due to their soils, climate, and other factors that were incorporated into the cropland suitability model. This analysis confirms that the sage-grouse habitats in MZ I have already been converted to agriculture and the remaining habitats important to sage-grouse are less suitable for agriculture and less likely to be converted in the future.

Although some sage-grouse in MZ I could be exposed to agricultural conversion in the future, 87 percent of the Population Index are not likely at risk from agricultural conversion. Although this result contradicts other sources of information that postulated a greater risk to sage-grouse from future agricultural conversion (RISCT 2012, p. 7; USFWS 2013, pp. 16–29), this analysis quantitatively determined that the risk of exposure to future agricultural conversion is low in MZ I. Because the risk of conversion is greatest in MZ I, a portion of MZ IV in the Snake River Plain in Idaho and the Columbia Basin in Washington (MZ VI) would likely have lower percent overlap between sage-grouse breeding populations and areas likely to be converted to agriculture. With improved land cover datasets, the cropland suitability model could be expanded to the other MZs to test this assumption. However, the overlay analysis indicates that the potential for agricultural conversion is low in the Great Plains (MZ I), and there is no information to indicate that the risk to sage-grouse would be greater in any other MZ.

Conservation Efforts

Since 2010, a number of conservation efforts have been implemented to reduce the risk of new habitat loss due to agricultural conversion or to address effects from historical agricultural conversion. These include the NRCS efforts with private land owners and other State and Federal Plans or programs. As discussed below, these conservation efforts are relevant to the potential threat of agricultural conversion.

Sage Grouse Initiative—In 2010, NRCS launched the SGI to reduce potential threats facing sage-grouse on private lands (see Sage Grouse Initiative, above, for a detailed discussion of this program). Conservation measures used by the NRCS to reduce impacts to sage-grouse from agricultural conversion include conservation easements, the Farm Bill's Sodsaver provision, and the Conservation Reserve Program (CRP).

Conservation easements are voluntary agreements between landowners and land trusts, the NRCS, or other organizations and agencies that maintain the easement in private ownership to benefit natural resources, often in perpetuity. The conservation easements carry binding and enforceable restrictions on development and other activities, and landowners may be reimbursed. Conservation easements may permanently protect sagebrush habitat from ex-urban development or agricultural conversion. The NRCS estimates that, since 2010, approximately 183,013 ha (451,884 ac) have been protected by conservation easements across the overall range of the sage-grouse (NRCS 2015a, p. 6). Conservation easements effectively block the loss and fragmentation of sage-grouse habitats by prohibiting ex-urban development and agricultural conversion on the easement lands and were recommended in the COT Report (USFWS 2013, pp. 48, 50). Approximately 79 percent of the conservation easements are located inside PACs, and 94 percent of the easements provide permanent protection against future agricultural conversion and ex-urban development (NRCS 2015a, p. 8). Although SGI easements address a variety of potential impacts to sage-grouse, including

agricultural conversion, many of the easements that are already in place are not currently located in sagebrush habitats that are at risk of agricultural conversion, according to the new cropland suitability and breeding distribution models (Lipsey *et al.* 2015, entire; USFWS 2015a). However, Montana's recently finalized Greater Sage-Grouse Stewardship Act funds additional sage-grouse conservation that could be used to secure new conservation easements in Montana (NRCS 2015a, p. 3), and with the new models, new easements could be better targeted to conserve sage-grouse habitats that may be vulnerable to future agricultural conversion in Montana. Expanding the cropland suitability model into the Snake River Plain (MZ IV) and the Columbia Basin (MZ VI) would also help target conservation easements to prevent future agricultural conversion in those MZs.

The 2014 Farm Bill's Sodsaver provision also reduces habitat loss and fragmentation from agricultural conversion in Montana, North Dakota, and South Dakota (MZ I) (NRCS 2015a, p. 3). The Sodsaver provision discourages agricultural producers from converting native vegetation to annually tilled crops by reducing their insurance subsidies and disaster assistance if they convert native habitats into croplands (NRCS 2015a, p. 4). The NRCS reports that the Sodsaver policy, in conjunction with proposed policies on State lands and continued investments in conservation easements, reduces sage-grouse population declines that would have occurred without these conservation measures (NRCS 2015a, p. 1).

The voluntary Conservation Reserve Program (CRP) allows private landowners to receive annual payments from USDA's Farm Service Administration in exchange for establishing permanent vegetation on idle or erodible lands that were previously used for growing crops. Enrolled lands are set aside for 10 to 15 years and cannot be grazed or used for other agricultural uses except under emergency drought conditions. The enrollment of CRP lands can be detrimental to sage-grouse when sagebrush rangelands are converted to marginal croplands, and then converted into grasslands, not sagebrush habitats (USFWS 2013, p. 48). However, some CRP lands can provide nesting, brood-rearing, and wintering habitat for sage-grouse (Schroeder and Vander Haegen 2006, p. 32; Schroeder and Vander Haegen 2011, pp. 524–528). When agricultural fields are returned to sage-grouse habitats, enrollment in the CRP generally benefits sage-grouse, especially in the Columbia Basin (MZ VI) and Great Plains (MZ I) where agricultural conversion historically occurred (Knick *et al.* 2011, p. 208). However, enrollment in CRP fluctuates with Federal funding and crop prices, and the long-term effectiveness of the CRP to improve sage-grouse habitats is uncertain. However, in Washington, lands have frequently remained enrolled long enough for sagebrush to reestablish and sage-grouse to return to nest (Schroeder and Vander Haegen 2011, p. 524).

Candidate Conservation Agreements – The CCAAs for sage-grouse in Oregon and Wyoming include appropriate restrictions on agricultural conversion, habitat fragmentation, and removing sagebrush that benefit sage-grouse rangewide. Approximately 745,000 ha (1.8 million ac) of private lands have landowner commitments in the programmatic CCAAs in Oregon and Wyoming. Enrollment in these CCAAs ensures that these lands are managed consistent with sage-grouse habitat objectives.

State Plans—The Wyoming and Montana Plans have regulatory mechanisms that reduce agricultural conversion in these States on applicable lands. The Wyoming Plan covers all land ownership types and contains a 5 percent disturbance cap in Core Areas that includes disturbance from agricultural conversion (Wyoming E.O. 2015–4, Attachment A, p. 6). The Montana Plan allows the State to prohibit agricultural conversion and the eradication of sagebrush on State Trust Lands in core habitat, general habitat, and connectivity areas (Montana 10–2014, pp. 7–14). By regulating where and how much agricultural conversion can occur within sage-grouse habitats, whether by regulating the amount of disturbance or prohibiting habitat loss on State Trust Lands, both the Wyoming Plan and Montana Plan provide effective regulatory mechanisms to limit future agricultural conversion in their State (see *Regulatory Mechanisms,* below).

Federal Plans—The Federal Plans were not designed to address agricultural conversion, because Federal lands are not used or converted for agricultural production (BLM and USFS 2015, entire). However, transfer of Federal lands to private ownership is possible and, once privately owned, could be converted to agriculture. The Federal Plans require that any PHMA and GHMA be retained in Federal ownership, thus preventing agricultural conversion (BLM and USFS 2015, entire). Exceptions to this requirement could occur if the land transaction would benefit sage-grouse or not cause any adverse effects. By prohibiting their transfer to private ownership, the Federal Plans reduce the risk of agricultural conversion on more than half the occupied range of the species.

Agricultural Conversion Summary

In 2010, we identified agricultural conversion as one of three factors contributing to the loss and fragmentation of sage-grouse habitats, based on past rates of agricultural conversion that would likely continue. Historically, agricultural conversion reduced and fragmented sage-grouse habitats, resulting in population declines and the loss of connectivity in some areas (Knick *et al.* 2011, p. 208). Agricultural conversion may also expose sage-grouse to pesticides, increased predation, and invasive plants. However, the sage-grouse habitats most conducive to agriculture have already been converted to crop and pasturelands, and the remaining habitats are generally not suitable for agriculture and will likely not be converted. The new cropland suitability model compared with the breeding distribution model confirms that the sage-grouse habitats in the Great Plains (MZ I) most likely to be converted to agriculture have already been converted and that the remaining habitats have a low probability of conversion because of soil types and climatic limitations. Approximately 87 percent of the important sage-grouse populations in MZ I occur in habitats that have low probabilities of conversion to agriculture. The potential for agricultural conversion is also low in the Columbia Basin (MZ VI) and the Snake River Plain (MZ IV), where more sagebrush habitats have already been converted. Additionally, acres of new cropland decreased in every State except South Dakota over the last 30 years. Further, NRCS SGI conservation easements, the 2014 Farm Bill's Sodsaver provision, USDA's CRP, the Wyoming and Montana Plans, and BLM and USGS land-transfer prohibitions implemented since 2010 help reduce habitat loss and fragmentation from agricultural conversion, consistent with recommendations in the COT Report (USFWS 2013, p. 48–49).

Wildfire and Invasive Plants

In 2010, we evaluated the effect of wildfire on sage-grouse and concluded that wildfire was a substantial contributor to habitat loss and fragmentation, particularly in the Great Basin portion of the range (MZs III, IV, V, and VI). The number and size of fires

has increased compared to historical fire regimes (Miller *et al.* 2011, pp. 169, 176). A spatial analysis of areas burned reveals that approximately 18 percent of sagebrush habitat across the occupied range of sage-grouse burned between 1980 and 2007, including 27 percent of the habitat in the Great Basin portion of the range. Further, increased fire frequency is being driven by the expansion of nonnative invasive annual grasses, primarily cheatgrass. In 2010, we analyzed invasive annual grasses separately and concluded that it was a serious rangewide threat (75 FR 13910, March 23, 2010, pp. 13937). The 2010 finding concluded that habitat fragmentation, caused in part by fire, was a threat to the species such that listing was warranted under the Act (75 FR 13910, March 23, 2010, pp. 13986–13988).

Since 2010, the rangeland fire management community has made strides in addressing wildfire and its effects on habitat fragmentation in sage-grouse range, as well as the interactions between wildfire and invasive plants. Specifically, a suite of efforts such as the revised/amended Federal Plans and the associated FIAT assessments; Secretarial Order 3336; and other, related efforts represent a marked shift by the fire management community toward a more holistic approach to identifying, prioritizing, and managing impacts from wildfire in sage-grouse habitat (with fire fighter and human health and safety remaining as the highest priority in wildfire management). This marked shift is particularly important given the degree to which invasives and wildfire have the potential to reduce available habitat. Given the increased management emphasis, we still expect to lose some habitat to fire, but we now expect those losses to be less than would have otherwise occurred.

This new approach includes numerous updates to wildfire management strategies and planning tools. For example, the FIAT and Secretarial Order established local guidance and set forth enhanced policies and strategies for preventing and suppressing wildfire and for restoring sagebrush landscapes impacted by fire across the Great Basin region. Fuel treatments in sage-grouse habitats are now prioritized over treatments in other areas (Murphy *et al.* 2013, p. 4). Additionally, managers have developed protocols to ensure that plans are current and include guidance for fire management in relation to sage-grouse and sage-grouse habitats. These changes have affected what areas are prioritized for firefighting resources during periods of fire activity (Murphy *et al.* 2013, p. 4). While we do not currently know the extent to which these regulatory and non-regulatory mechanisms will alleviate the wildfire impact to sage-grouse, we are confident that that this strategic and coordinated effort by wildfire managers to protect sage-grouse habitat will reduce the impacts from wildfire. Targeting the protection of important sage-grouse habitats during fire suppression and fuels management activities could help reduce loss of key habitat due to fire if directed through a long-term, regulatory mechanism.

Altered Fire Cycle

Historically, wildfire was the principal natural disturbance in the sagebrush ecosystem (Factor A). Sagebrush likely consisted of extensive sagebrush habitat dotted by small areas of grassland. This ecosystem was maintained by long interludes of primarily numerous small fires, punctuated by large fire events that consumed larger expanses (Baker 2011, pp. 196–197; Bukowski and Baker 2013, pp. 559–561). Historical mean fire-return intervals (the average number of years between two successive fires) have been estimated to be 100 to 350 years in low-lying, xeric, Wyoming big sagebrush communities, and 50 to more than 200 years in more mesic areas and mountain big sagebrush communities (Baker 2006, p. 181; Mensing *et al.* 2006, p. 75; Baker 2011, pp. 194–195; Miller *et al.* 2011, p. 166; Bukowski and Baker 2013, entire). Fire by itself, managed within a historical range of variation, may not necessarily be a threat to sage-grouse. However, altered fire intensity, size, and frequency, due in part to the presence of invasive annual grasses, has resulted in fire posing an increasing threat to sage-grouse, especially in the Great Basin.

Since the mid- to late 1800s, human activities have changed the vegetation composition and structure of the sagebrush ecosystem that has subsequently altered the fire regime (Chambers *et al.* 2014a, p. 3). Changes in wildfire frequency have adversely affected larger parts of sage-grouse range, particularly in the Great Basin (Figure 6). From 1980 to 2007, the number of fires and the total area burned increased in most MZs (Miller *et al.* 2011, pp. 169, 176). We conducted a geospatial analysis of burned areas that shows that between 2000 and 2008, within the Great Basin, more than 2.7 million ha (6.7 million ac) burned within the occupied range of sage-grouse, with more than 2 million ha (5 million ac) occurring in MZ IV alone (Table 7). Between 2009 and 2014, an additional 1.8 million ha (4.6 million ac) burned within the occupied range of sage-grouse, with most of the impact occurring in MZs IV and V in the Great Basin (Table 7). Between 2000 and 2014, the Great Basin experienced an average burn rate of approximately 0.85 percent per year (Table 7).

Figure 6. Fires from 2000 to 2014 in the Great Basin (including the Columbia Basin) in sage-grouse occupied range. Overlap captures fires from 2000 to 2014 that reburned any fires from 2000 to 2008.

TABLE 7—AREA OF SAGE-GROUSE OCCUPIED RANGE BURNED FROM 2000 TO 2014 IN THE GREAT BASIN

[Including the Columbia Basin]

Management zone		2000–2008 area burned	2009–2014 area burned	2000–2014 area burned	Annual burn rate [1] (percent)
III	ha	410,730	148,993	559,723	0.32
	ac	1,014,937	368,171	1,383,108	
IV	ha	2,029,750	1,073,048	3,102,789	1.32
	ac	5,015,622	2,651,560	7,667,182	
V	ha	262,033	580,745	842,788	0.72
	ac	647,499	1,435,053	2,082,552	
VI	ha	27,649	61,963	89,612	0.54
	ac	68,434	153,116	221,550	
Totals	ha	2,730,162	1,864,749	4,594,912	0.85
	ac	6,746,492	4,607,900	11,354,392	

[1] Annual burn rates were calculated using average number of acres burned per year (2000–2014) divided by total occupied range for each area assessed.

We anticipate that these average burn rates will continue in the future and could increase due to cheatgrass expansion, climate change, and drought (see Wildfire and Invasive Plant Impacts, below). These burn rates are based on wildfire-impacted acres each year and do not account for areas previously burned that re-burn each year; as a result, this rate likely overestimates the amount of habitat that could be impacted each year, as re-burn areas may no longer provide habitat. This burn rate is similar to the current and future burn rates analyzed in the 2010 finding.

Fire occurring within the range of sage-grouse can cause direct loss of habitat, resulting in negative impacts to breeding, feeding, and sheltering opportunities for the species (Call and Maser 1985, p. 17). In addition to the direct habitat loss, fire can also create a functional barrier to sage-grouse

movements and dispersal that compounds the influence wildfire can have on populations and population dynamics (Fischer *et al.* 1997, p. 89). In some cases, fire can isolate sage-grouse populations, thereby increasing their risk of extirpation (Knick and Hanser 2011, p. 395; Wisdom *et al.* 2011, p. 469).

Wildfire is associated with sage-grouse declines across the West (Beck *et al.* 2009, p. 400; Johnson *et al.* 2011, p. 424; Knick and Hanser 2011, p. 395). The extent and abundance of sagebrush habitats, the proximity to burned habitat, and the degree of connectivity among sage-grouse populations affects persistence (Johnson *et al.* 2011, p. 424; Knick and Hanser 2011, pp. 403–404; Wisdom *et al.* 2011, p. 461). Fire has been found to cause negative population trends and lek extirpation (Knick and Hanser 2011, p. 395; Johnson *et al.* 2011, p. 422).

Invasive Plants and the Wildfire Cycle

In 2010, we analyzed the effects of wildfire and invasive plants separately (75 FR 13910, March 23, 2010, pp. 13931–13937). Since that time, we have come to better understand the positive feedback loop between cheatgrass and wildfire, and believe that fire and invasive plants must be assessed, and managed, together to fully address potential impacts on sage-grouse and its habitat. Evidence of a significant relationship exists between an increase in wildfire occurrence caused by cheatgrass invasion in the Snake River Plain (MZ IV) and Northern Great Basin (MZ V) since the 1960s (Miller *et al.* 2011, p. 167) and in northern Nevada and eastern Oregon since 1980 (MZs IV and V). The extensive distribution and highly invasive nature of these invasive annual grasses poses increased wildfire risk and permanent loss of sagebrush habitat, because areas disturbed by fire are highly susceptible to further invasion and ultimately habitat conversion to an altered community state (Miller *et al.* 2011, p. 182). Progressive losses of resilience and resistance can result in the crossing of abiotic and biotic thresholds (Beisner *et al.* 2003, pp. 376–382) and may lead to a catastrophic shift in community structure (Scheffer *et al.* 2009, pp. 53–59; Reisner *et al.* 2013, p. 1047). Functional habitat loss is occurring because of long-term loss of sagebrush cover and conversion to nonnative annual grasses (primarily cheatgrass), mainly due to an increase in wildfire occurrence, intensity, and severity (Miller *et al.* 2011, p. 183). The positive feedback process between cheatgrass and wildfires facilitates future fires, sagebrush loss, and cheatgrass dominance, resulting in entire landscapes being converted to nonnative annual grasslands (Miller *et al.* 2011, p. 183). Invasive plants reduce and, in cases where monocultures occur, eliminate vegetation that sage-grouse use for food and cover and fragment existing sage-grouse habitat (Miller *et al.* 2011, pp. 160–164). Invasives do not provide quality sage-grouse habitat and, where invasive plants are present, sage-grouse are potentially impacted both seasonally (*e.g.,* loss of forbs and associated insects) and long term (*e.g.,* functional habitat loss) (Manier *et al.* 2013, p. 88).

Interactions among disturbances and stressors may have cumulative effects (Chambers *et al.* 2014c, pp. 365–368). Invasive annual grasses and noxious perennials continue to expand their range, facilitated by ground disturbances, caused by more frequent and more severe wildfires, improper grazing of native perennial plants by domestic livestock and free-roaming equids, infrastructure, and other anthropogenic activity (Rice and Mack 1991, p. 84; Gelbard and Belnap 2003, p. 420; Zouhar *et al.* 2008, p. 23), but disturbance is not required for invasives to spread (Young and Allen 1997, p. 531; Roundy *et al.* 2007, p. 614). Invasions also may occur sequentially, where initial invaders (*e.g.,* cheatgrass) are replaced by new invasive plants (Crawford *et al.* 2004, p. 9; Miller *et al.* 2011, p. 160). Long-term changes in climate that facilitate invasion and establishment by invasive annual grasses further exacerbate the fire regime and accelerate the loss of sagebrush habitats (D'Antonio and Vitousek 1992, pp. 63–87). The effects of disturbance will likely be amplified by greater susceptibility of habitats to burn as well as decreased likelihood for recovery of sagebrush ecosystems (Miller *et al.* 2011, p. 183).

The arrival of European settlers in the mid-1800s initiated a series of changes in vegetation composition that impacted sagebrush ecosystems (Chambers *et al.* 2014a, p. 3). For example, improper grazing practices decreased native perennial grasses and forbs (Chambers *et al.* 2014a, p. 3; Miller and Eddleman 2001, p. 17; Miller *et al.* 2011, p. 181), which facilitated the invasion of nonnative annual grasses, particularly cheatgrass and *Taeniatherum caput-medusae* (medusahead). This increase in fuel load and the lower fuel moisture content of the invasive annual grasses has resulted in more frequent, higher intensity fires (Brooks *et al.* 2004, pp. 679–680). Moreover, invasive annual grasses expand rapidly after fire disturbances becoming a readily burnable fuel source, and ultimately lead to a recurrent fire cycle that prevents sagebrush reestablishment (Zouhar *et al.* 2008, p. 41; Eiswerth *et al.* 2009, p. 1324; Miller *et al.* 2011, pp. 163–170).

Currently, invasive annual grasses are known to occur across the sage-grouse occupied range, with the greatest infestations occurring in the Great Basin (Figure 7). In the Great Basin, cheatgrass dominates over 6.9 million ha (17 million ac) and occupies an additional 25 million ha (62 million ac) as a component of the plant community (Diamond *et al.* 2012, p. 259). Approximately 58 percent of sagebrush habitat in the Great Basin is believed to be at moderate to high risk of cheatgrass invasion during the next 30 years (Suring *et al.* 2005, p. 138). Although nonnative annual grasses are more pervasive in the Great Basin than the Rocky Mountain States (Figure 7) (Connelly *et al.* 2004, p. 5–9; Miller *et al.* 2011, p. 160), in recent years, cheatgrass (and other nonnative annual grasses) has increased its spread across the eastern portion of the species' range (Mealor *et al.* 2012, p. 427). Without effective management, the invasion of cheatgrass into the eastern portion of the species' range is likely to continue (Mealor *et al.* 2012, p. 427), and even now, with more effective management being employed, we expect that sage-grouse habitat will continue to be lost to some degree in the future.

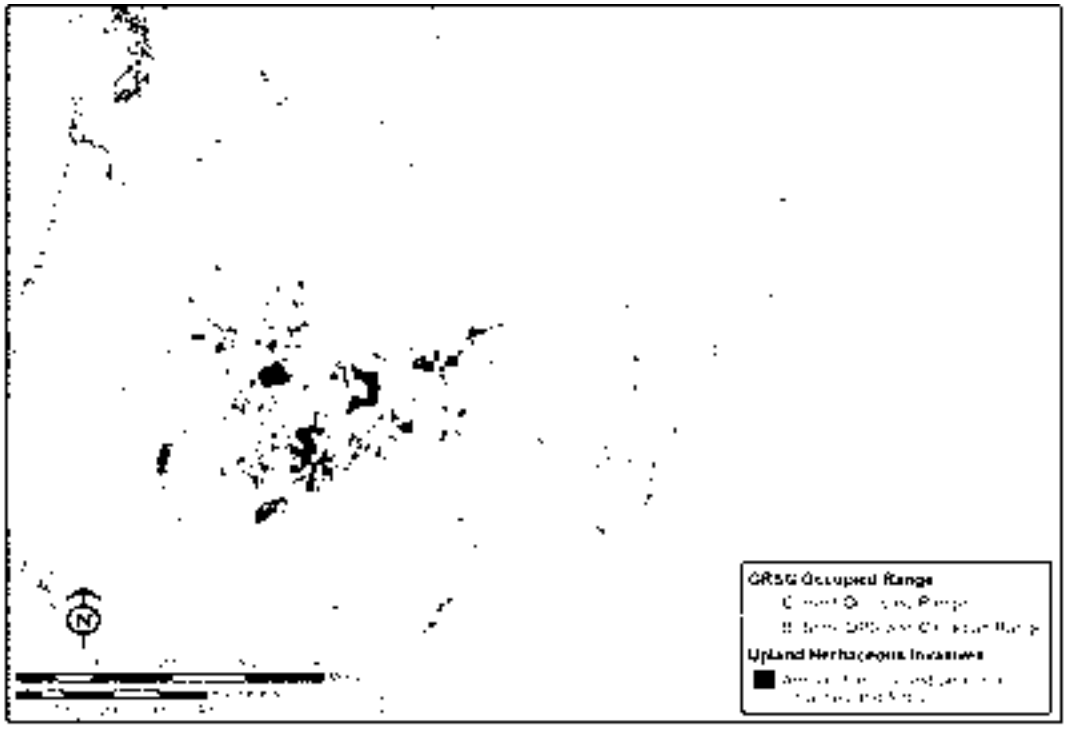

Figure 7 Approximate distribution of upland, herbaceous invasive plants across the occupied range of sage-grouse

Nonnative annual grasses, such as cheatgrass and medusahead, have substantially altered regional fire regimes (Balch *et al.* 2013, p. 179). Cheatgrass-dominated rangelands affect sagebrush ecosystems by shortening fire-return intervals and perpetuating their own persistence and intensifying the role of wildfire (Whisenant 1990, p. 4). Sites dominated by cheatgrass may be four times more likely to burn than native sagebrush (Balch *et al.* 2013, p. 178). Invasive annual grasses increase the amount of fine fuels, resulting in wildfires that burn hotter and more evenly than historical times (Miller *et al.* 2011, p. 167). Hotter and more expansive wildfires frequently burn larger contiguous areas of sagebrush and leave fewer pockets of unburnt sagebrush that would be available to recolonize the burned areas. The positive feedback process between cheatgrass and wildfire converts high-diversity native communities into low-diversity communities dominated by invasive plants that are unsuitable for sage-grouse and at increased risk of wildfire reoccurrence (Chambers *et al.* 2014a, pp. 3–8).

Wildfire and Invasive Plant Impacts

While it is known that sage-grouse respond negatively to wildfire (Johnson *et al.* 2011, pp. 424–425; Knick and Hanser 2011, pp. 395–403), it is challenging to predict the location and extent of future wildfires. However, a recent study provides insight to the wildfire and invasive plant cycle and serves as a useful tool in predicting future impacts (Chambers *et al.* 2014a, entire). This study used soil temperature and moisture regimes as an indicator of landscapes' resilience to disturbance and resistance to invasive annual grasses. This work classified different ecological soil and moisture regimes (Chambers *et al.* 2014a, p. 16) into three categories of resiliency and resistance to wildfire and invasive species disturbance (which is known as the R&R matrix). For example, areas with low R&R values tend to be prone to invasion by cheatgrass (and, therefore, are at higher risk of large catastrophic wildfires) because these ecosystems have relatively lower resilience to disturbance and higher climate suitability for invasive annual grasses; therefore, low R&R areas are less likely to provide ecological benefits within the sagebrush ecosystem in the future. We assessed the risk of future wildfire and invasive plant invasion by examining the amount of breeding habitat occurring within the three R&R matrix classes. Habitat identified as low resistance was considered most likely to be adversely affected by wildfire and invasives. Because nonnative annual grasses are more prevalent in the Great Basin than the Rocky Mountain States (Connelly *et al.* 2004, p. 5–9; Miller *et al.* 2011, p. 160), we limited our analysis to the Great Basin MZs III, IV, and V.

In our analysis, sage-grouse in MZ III appear to be at greatest risk from wildfire and nonnative annual grass invasion, with 54 percent of sage-grouse breeding habitat occurring in areas classified as having low resistance. The majority of sage-grouse breeding habitat in MZs IV and V occur in areas having either high or moderate resistance and resiliency to fire and invasives (Table 8).

TABLE 8—PERCENT OF SAGE-GROUSE BREEDING HABITAT WITHIN EACH GREAT BASIN MANAGEMENT ZONE THAT OCCURS WITHIN THE THREE CLASSES OF RESILIENCY AND RESISTANCE TO INVASIVE PLANTS AND WILDFIRE

	MZ III (%)	MZ IV (%)	MZ V (%)
Wetland/Riparian	2	2	1

TABLE 8—PERCENT OF SAGE-GROUSE BREEDING HABITAT WITHIN EACH GREAT BASIN MANAGEMENT ZONE THAT OCCURS WITHIN THE THREE CLASSES OF RESILIENCY AND RESISTANCE TO INVASIVE PLANTS AND WILDFIRE—Continued

	MZ III (%)	MZ IV (%)	MZ V (%)
High Resistance	16	35	8
Moderate Resistance	28	36	59
Low Resistance	54	27	33

While useful for estimating future wildfire and invasive plant risk, sagebrush resistance and resilience does not necessarily equate to sage-grouse resilience and resistance. Depending on the location and extent of wildfires, the amount of undisturbed habitat may be diminished such that it cannot sustain local populations. In addition, depending upon where wildfires occur, impacts to sage-grouse could be greater due to lost connectivity between populations. However, without the ability to predict the location, size, and severity of a wildfire, it is difficult to predict with certainty the location and degree of habitat fragmentation that may occur in the future or the associated population impacts.

A recent study examined the potential impact of wildfire and invasive plants on future sage-grouse population trends in the Great Basin (Coates *et al.* 2015, entire). This study examined 30 years of wildfire and population trend data to estimate Great Basin population trends over the next 30 years, with and without additional management to reduce wildfire impacts (Coates *et al.* 2015, pp. 6–18). Without additional management, wildfire and invasive plants are forecast to cause sage-grouse abundance in the Great Basin to decline by 43 percent by 2044 (Coates *et al.* 2015, pp. 18–31). Improved management of wildfire suppression and invasive plant infestation could reduce the rate of decline depending upon the success rate of the management approach (Coates *et al.* 2015, p. 34). This study did not consider the impact of post-wildfire restoration projects, which could further reduce the rate of population decline (Coates *et al.* 2015, p. 34). The projected future impact of fire on abundance trends likely also depends upon climatic conditions (Coates *et al.* 2015, p. 34), which, as discussed in *Climate Change and Drought* (see below), is difficult to forecast with certainty 30 years into the future.

Without changes in wildfire and invasive plant management, we anticipate that wildfire would continue to affect the Great Basin at the current rate of about 0.85 percent per year (see Altered Fire Cycle, above). This rate could potentially increase due to the intensifying synergistic interactions among fire, human activity, invasive plants, and climate change (Neilson *et al.* 2005, p. 157; Miller *et al.* 2011, pp. 179–184). Increased human presence and associated infrastructure, such as roads and power lines, could increase the risk of human-caused wildfires. Any future decreases in wildfire and invasive plant risk is dependent upon the successful implementation of wildfire and invasive conservation efforts, as discussed below.

Conservation Efforts

As mentioned above, since 2010, wildfire managers have taken significant steps to better understand and address the impacts of wildfire on sage-grouse habitat. As part of that effort, local, State, and Federal land managers have undertaken considerable efforts to address the impacts of wildfire and invasive plants. Federal, State, and local partners have implemented a number of projects and programs to prevent and suppress the spread of wildfire and invasive plants, and where impacts have already occurred, to restore, consistent with recommendations in the COT Report (USFWS 2013, pp. 40–43). As discussed further below, the Federal Plans, FIAT assessments, and Secretarial Order provide guidance, coordination, and commitments for Federal and State agencies and private landowners to address the wildfire and invasive plants cycle and reduce impacts to sage-grouse.

The BLM has a long history of implementing vegetation management treatments and has made considerable investments in fuels and restoration treatments within the sagebrush ecosystem since 2010. Analyses of more than 4,000 completed BLM projects suggest these treatments provide direct and indirect benefits to sage-grouse populations and have been effective at ameliorating the impacts of wildfire and invasives to sage-grouse (Table 9). The strong emphasis on sage-grouse since 2010 is reflected through focusing additional and existing resources to protect, conserve, and restore sage-grouse habitat. This emphasis has shifted priorities in many of the BLM's programs that treat vegetation, including fuels management and post-fire recovery. The BLM has incorporated emerging science, monitoring results, and adaptive management to influence and modify vegetation management work to achieve the most ecosystem and landscape benefit.

TABLE 9—BUREAU OF LAND MANAGEMENT PROJECTS IMPLEMENTED SINCE 2009 TO AMELIORATE THE IMPACTS OF WILDFIRE AND INVASIVES TO SAGE-GROUSE

Habitat Restoration Following Wildfire	554	620,955	1,534,412	25	40,635	100,410	7	16,442	40,628
Totals	3,250	1,156,940	2,858,858	291	135,149	333,961	236	185,322	457,941

The Federal Plans require that livestock grazing and feral horses be managed at levels necessary to achieve Land Health Standards (LHS) (see *Grazing and Rangeland Management* and *Free-roaming Equids,* below). These standards include minimizing the presence of cheatgrass and other invasive annual grasses within sage-

grouse habitat. These Federal Plan requirements will reduce the infestation of cheatgrass over the long term, reducing wildfire intensity, size, and frequency, and restoring a more natural role of wildfire in the sagebrush ecosystem.

Within the Great Basin, the efforts by BLM, USFS, and DOI to address the impacts of wildfire and invasive plants on a landscape scale are particularly noteworthy. The BLM and USFS are implementing FIAT as part of their Federal Plans to prioritize actions directed at reducing the impacts of invasive annual grasses, wildfires, and conifer encroachment (BLM 2014, entire). Additionally, DOI has committed to the implementation of Secretarial Order 3336, Rangeland Fire Prevention, Management, and Restoration (Secretarial Order), which will result in a multiagency wildfire management paradigm shift that highlights the protection of sagebrush habitat. The BLM and USFS continue to implement measures to reduce the potential threat of wildfire to sage-grouse habitat through greater emphasis on preventing and suppressing wildfire, and restoring sagebrush landscapes threatened by wildfire and invasive species by means of improved Federal–State–local collaboration and coordination. Those efforts, as well as work by local and State wildfire managers, are discussed in further detail below.

Fire and Invasives Assessment Tool – The FIAT is a collaborative multiagency effort by Federal, State, and local wildlife, forestry, and firefighting organizations that identified potential project areas and management strategies in highly valued sage-grouse habitats. As committed to in the Federal Plans, implementation of the FIAT assessments will reduce the potential impacts to sage-grouse resulting from invasive annual grasses, wildfires, and conifer expansion by prioritizing and focusing wildfire and invasive plant management efforts on the most important sage-grouse habitat while still prioritizing fire fighter and human safety. Focal habitats were identified within PACs based on patterns of ecological resistance and resilience, landscape sagebrush cover, burn probability, and conifer expansion, resulting in the following priority landscapes: Central Oregon, Northern Great Basin, Snake/Salmon/Beaverhead, Southern Great Basin, and Western Great Basin/Warm Springs Valley. For each priority landscape, regional findings were stepped down to describe local conditions by Project Planning Area and associated treatment needs and management priorities (BLM 2014, p. 9). Assessment of treatment needs and priorities were based on recent scientific research on resistance and resilience of Great Basin ecosystems (Chambers *et al.* 2014a, entire, which was described above) and NRCS soil surveys that include geospatial information on soil temperature and moisture regimes (BLM 2014, p. 3; and Campbell 2014, entire).

Potential management actions to resolve resource issues were divided into proactive approaches (*e.g.,* fuels management and habitat recovery/restoration) and reactive approaches (*e.g.,* fire operations and post-fire rehabilitation) (BLM 2014, p. 3). Proactive management strategies are intended to favorably modify wildfire behavior and restore or improve desirable habitat to provide greater resistance to invasive annual grasses and/or resilience after disturbances such as wildfires. Reactive management strategies are intended to reduce the loss of sage-grouse habitat from wildfires or stabilize soils and reduce impacts of invasive annual grasses in sage-grouse habitat after wildfires. Proactive management strategies, if implemented and effective, will result in long-term sage-grouse habitat improvement and stability, while effective reactive management strategies are essential to reduce current impacts of wildfires on sage-grouse habitat, thus maintaining habitat stability, and allowing for long-term improvements (BLM 2014, pp. 2–3).

Cumulatively, the FIAT assessments of the five priority areas identify more than 16,000 km (10,000 mi) of potential linear fuel treatments, approximately 2.99 million ha (7.4 million ac) of potential conifer treatments, more than 2 million ha (5 million ac) of potential invasive plant treatments, and more than 7.7 million ha (19 million ac) of post-fire rehabilitation (*i.e.,* should a fire occur, the post-fire rehabilitation identifies which areas BLM would prioritize for management) within the Great Basin region (Table 10). The FIAT assessments also identify site-appropriate management strategies for fire operations and post-fire decisions. These assessments provide direction about the extent, location, and rationale for management opportunities to address potential threats to sage-grouse. This comprehensive and forward-looking approach to both prevention and post-fire treatments in the Great Basin represents a distinct change in approach and emphasis since we made our 2010 finding.

TABLE 10—FIAT ASSESSMENT PROJECTS FOR FIVE PRIORITY LANDSCAPES IN THE GREAT BASIN REGION—Continued

[Adapted from BLM 2015a, entire]

Potential treatment type		FIAT Assessment area					Totals
		MZ III	MZ IV		MZ V		
		Southern Great Basin	Northern Great Basin	Snake/ Salmon/ Beaverhead	Central Oregon	Western Great Basin/Warm Springs Valley	
Invasive Plant Treatment [3]	ha	1,196,979	164,748	90,407	212,909	396,197	2,061,239
	ac	2,957,796	407,100	223,400	526,109	979,024	5,093,429

[1] Fire operations include preparedness, prevention, and suppression activities. As opposed to proactive, site-specific planned treatments, fire operations and post-fire rehabilitation treatments are reactive responses to random wildfires.

[2] Post-fire rehabilitation includes the BLM's ESR Program and the USFS's BAER Program. Program policies limit available funding from 1 to 3 years.

[3] For the purposes of FIAT, invasive species were limited to invasive annual grasses.

The planning, implementation, and monitoring of the FIAT assessments are a multiyear process. Planning is completed for some FIAT assessment projects, and implementation has begun (Table 11). Others similar projects are in early planning stages, but are expected to be implemented in the near future. To date, the BLM has made substantial investments in fuels and restoration treatments to address the impacts of fire and invasives on sage-grouse habitats, especially within the FIAT assessment areas.

TABLE 11—FIAT PROJECTS IMPLEMENTED IN FISCAL YEAR 2015 AS OF AUGUST 30, 2015

Secretarial Order 3336—On January 5, 2015, the Secretary signed Secretarial Order 3336 (Secretarial Order), which sets forth enhanced policies and strategies for preventing and suppressing rangeland fire and for restoring sagebrush landscapes impacted by fire across the Great Basin region (DOI 2015b, entire). The Secretarial Order establishes a Rangeland Fire Task Force (Task Force), which completed an Implementation Plan (DOI 2015d, entire) that established a roadmap to accomplish the objectives of the Secretarial Order. The Implementation Plan also provided a timeline and methodology to be used in developing two separate reports on short- (2015 western fire season) and long-term (2016 western fire season and beyond) actions and activities that will be implemented to further address the impacts of wildfire in the Great Basin. The Secretarial Order complements the FIAT process by providing support and resource commitments for some of the projects identified in the FIAT assessments. For example, the Secretarial Order emphasizes the research on wildfire and invasive plant prevention and restoration (DOI 2015b, entire) that will support the adaptive management of FIAT assessment projects.

Further, the Secretarial Order provides clear direction to all affected Department of the Interior bureaus (DOI 2015b, entire), in particular BLM, for prioritizing actions to address key elements of wildfire management, including effective rangeland management, fire prevention, fire suppression, and restoration at a landscape scale. Building on BLM and USFS' long and successful history of managing wildfire in the Western United States, the Secretarial Order focuses the existing rangewide commitment to effective wildfire management—as well as invasive species control and restoration—to protect large, intact sagebrush landscapes against the destructive effects of wildfire and invasive species. For example, BLM has dedicated increased resources to all aspects of fire management within the species' range for the 2015 wildfire season. Similarly, BLM is actively pursuing the long-term directives in the Final Report component of the Secretarial Order, such as a national seed strategy, to support effective restoration efforts (DOI 2015a).

Initial Report

On March 1, 2015, the Task Force completed ''SO 3336—The Initial Report: A Strategic Plan for Addressing Rangeland Fire Prevention, Management, and Restoration in 2015'' (DOI 2015c, entire), detailing activities that could be undertaken in advance of the 2015 western fire season to improve the efficiency and effectiveness of wildfire management efforts. The actions identified in the Initial Report included priorities to strengthen planning and preparedness, such as increasing capabilities of rangeland fire protection associations (RFPA) and volunteer departments, utilizing veteran crews, ensuring fire management organizations are prepared and functional, and increasing initial attack and extended attack capability. In

response, the BLM has allocated additional resources to reflect these FY15 priorities (BLM 2015h; DOI 2015a; DOI 2015e), including:

- Allocating 6 million dollars in additional base funding to bolster fire programs for the long term.
- Allocating approximately 10.6 million dollars to hire additional seasonal firefighters and to support equipment (*e.g.,* dozers, water tenders, etc.). Using this funding, the BLM hired 100 additional firefighters in 2015, and DOI gave each Great Basin State supplemental funding to cover staffing shortages. With supplemental funds from the DOI, the BLM also purchased new equipment for the 2015 fire season. An additional 20 single-engine air tankers were pre-positioned near critical sagebrush habitat throughout the western United States. Helicopters were mobilized to address sage-grouse priority areas, and the helitack crew size was increased in order to provide more efficient initial attack. An additional jet lead plane was available to insure support for retardant planes mobilized to protect these critical areas. The BLM has also purchased several dozers, dozer transports, water trailers, and semi-trucks to boost or maintain the BLM's initial attack resource capability and initial attack success rate in critical sagebrush areas in the Great Basin.
- Committing 500,000 dollars to train rural fire departments and RFPAs in important sagebrush ecosystems and sage-grouse habitat areas.
- Providing training for more than 200 veterans to work on 20-person firefighting crews. California, Nevada, and Oregon BLM offices have hired returning veterans who bring skills such as physical fitness, endurance, leadership, communications, and operation of heavy equipment.

In addition to these actions, the BLM dedicated fuels program funding for fuels treatment and fire suppression to Great Basin States (BLM 2015h). Fuels treatment projects are prioritized and implemented based on location, opportunities for success, and overall benefit to protecting, conserving, and restoring sagebrush ecosystems and key sage-grouse habitat. Fire management actions taken by the BLM during the 2015 wildfire season has resulted in fewer acres of sage-grouse habitat burned in the early fire season compared to past years with similar weather and fuel conditions (BLM 2015h). For example, the Fuels Treatment Effectiveness Monitoring (FTEM) system is a database that captures anecdotal information when a wildfire intersects a past fuels treatment (BLM 2015h). So far in 2015, two fires in sage-grouse habitat (*i.e.,* the ''499'' wildfire in Prineville, Oregon and the ''Hwy 290'' wildfire in Winnemucca, Nevada) have been entered into the system and demonstrate the effectiveness of the fuels treatment. Additionally, fuels treatments have reduced the size of unplanned wildfires, assisted in providing opportunities to stop or slow the spread of the wildfire, provided for greater firefighter safety, and protected sage-grouse habitat (BLM 2015h). Currently the BLM has completed more than 80 percent of the action items and activities outlined in the Initial Report (Table 12).

TABLE 12—SECRETARIAL ORDER INITIAL REPORT ACTIONS IMPLEMENTED IN FISCAL YEAR 2015

[McKnight, BLM, 2015, pers. comm.]

Status	Action item and description	Deliverable
	Section 7.b.i. Integrated Response Plans	
Completed ...	Action Item #1: Increase the capabilities and use of rural/volunteer fire departments and RFPAs and enhance the development and use of vet- eran crews.	Coordinate with State, tribal, and local government partners to leverage training assets and capabilities. Specifically, the DOI/BLM will seek to deliver training to approximately 2,500 cooperators and increase the utilization of veteran crews.
Completed ...	Action Item #2: Ensure local, multi-agency coordination (MAC) groups are functional and MAC plans are updated.	Report out from States. MAC groups, working with local Federal wildland fire suppression agencies, tribes, State fire suppression agencies, local fire departments, RFPAs, and other cooperators.
Completed ...	Action Item #3: Develop and implement minimum draw-down level and step up plans to ensure availability of resources for protection in priority greater sage-grouse habitat.	Report out from States. All units managing priority sage-grouse habitat will develop and implement a minimum draw-down level and step up plans to clearly identify those suppression resources necessary in order to main- tain an effective, aggressive initial attack capability.
Completed ...	Action Item #4: Apply a coordinated, risk-based approach to wildfire response to ensure initial attack response to priority areas.	Report out from States. Review and update CAD systems to ensure initial attack response to priority sage-grouse areas in protection of sage- grouse habitat.
Completed ...	Action Item #5: Develop a standardized set of briefing materials.	Prepare standardized briefing materials on sagebrush-steppe and sage-grouse wildfire protection for incoming Type 1–3 Incident Management Teams and other fire management resources.
Completed ...	Action Item #6: Review and update local plans and agreements for consistency and currency to ensure initial attack response to priority greater sage-grouse areas.	Report out from States. Update and approve all Fire Prevention Plans, Wildland Fire Decision Support System data, Fire Danger Operating Plans, Preparedness Level Plans, and Agreements and Annual Operating Plans.
Completed ...	Action Item #7: Develop supplemental guidance for the use of ''severity funding''.	Review severity funding policy and update guidance.
Ongoing	Action Item #8: Evaluate the effectiveness of ac- tion plans.	Develop annual reporting metrics for effectiveness monitoring of wildland fire response, with particular emphasis on the effectiveness of measures to improve success in rangeland fire response, based upon CAD changes, and reporting of success and/or failure as it pertains to Federal Plans and FMPs, and effectiveness of enhanced training and capacity measures.
Ongoing	Action Item #9: Increase the availability of technology and technology transfer to fire management managers and suppression resources.	Increase access to digital maps and mapping software by providing appropriate technology (such as smartphones and tablets) to fire managers and suppression personnel. Remove barriers for acquisition of appro- priate software and hardware.

TABLE 12—SECRETARIAL ORDER INITIAL REPORT ACTIONS IMPLEMENTED IN FISCAL YEAR 2015—Continued

[McKnight, BLM, 2015, pers. comm.]

Status	Action item and description	Deliverable
Completed ...	Action Item #10: Improve the description and awareness of critical resource values threatened in various stages of the fire response process including large fire management.	Improve the collection of information about critical resource values threatened, including sage-grouse habitat and populations, on the existing Incident Status Summary (ICS 209) and ensure this information is captured in the Incident Management Situation Report (SIT Report).
Completed ...	Action Item #11: Ensure compliance and evaluation of the implementation plan action items.	During annual preparedness reviews, review all CAD systems and MAC plans for compliance with the action plans outlined in Action Items #1 through #4.
	Section 7.b.ii. Prioritization and Allocation of Resources	
Completed ...	Action Item #1: Communication plan	Establish protocols for providing Federal agency leadership with regular briefings and information on wildfire activity, fire conditions, and signifi- cant issues in relation to rangeland fire and the implementation of the Secretarial Order throughout the 2015 wildfire season in order to provide leadership with an accurate understanding and insight to the conditions on the ground. Senior leadership will regularly communicate national stra- tegic priorities and expectations to line officers and fire staffs during the wildfire season.
Completed ...	Action Item #2: Review and update the delegation of authority for the National Multi-Agency Coordination (NMAC) Group.	Ensure roles and responsibilities.
Completed ...	Action Item #3: Issue national level ''Leader In- tent''.	Provide expectations for 2015.
Completed ...	Action Item #4: Engage Geographic Multi-Agency Coordination (GMAC) groups.	Communicate Leaders Intent.
Ongoing	Action Item #5: Develop ''Delegation of Authority'' template for use by local line officers.	Create standard language for use in a Delegation of Authority template that identifies the sage-steppe ecosystem and protection of species as a priority. Line officers will use this standard template when delegating authority to an Incident Commander who has responsibility for managing a wildfire incident within a FIAT area or has nexus to one. Delivery to Districts.
Completed ...	Action Item #6: Engage line officers to communicate Leaders' Intent and expectations.	Each agency use appropriate internal mechanisms to communicate intent and expectations to regional and unit-level managers.
	Section 7.b.v. Post Fire Restoration	
Ongoing	Action Item #1: Review and update Emergency Stabilization (ES) and Burn Area Rehabilitation (BAR) policy guidance to address rating and evaluation criteria, project design to promote the likelihood of treatment success, cost containment, monitoring, and continuity and transition to long-term restoration activities and treatments.	Update BAR evaluation and rating criteria and review ES policy and procedures.
Ongoing	Action Item #2: Address acquisition, financial management, and other procedures that pose challenges to timely project implementation.	Work with Departmental and bureau acquisition and finance offices to pro- vide funding and project continuity at the beginning of, and across, fiscal years.
Ongoing	Action Item #3: Accelerate schedule approving BAR projects consistent with the guidelines established for the 2015 fire season.	Accelerate preliminary approvals that will allow sufficient lead time to complete cultural and other clearances (e.g., NEPA and National Preservation Act of 1966 [Section 106]6), procurement planning, and other advance work that will take place prior to the application of full funding at the be- ginning of the fiscal year.
Completed ...	Action Item #4: Identify non-fire programs and activities that will fund treatments and restoration activities for the long term in conjunction with BAR and ES policy and program review to be conducted in 2015.	Funding of ES and BAR projects will be evaluated based on opportunities and commitments from non-fire program and activities if the work that is proposed will extend beyond the ES and BAR duration.
Ongoing	Action Item #5: Identify requirements for National Fire Plan Operations and Reporting System (NFPORS) capabilities.	Implementation of new criteria for project evaluation and oversight may require updates and changes to NFPORS.
	Section 7.b.ix. Seed Strategy	
Completed ...	Action Item #1: Develop the draft National Seed Strategy and Implementation Plan.	Complete the National Seed Strategy and Implementation Plan.
Completed ...	Action Item #2: Identify a forum to discuss and highlight current native seed and restoration techniques and research.	Attend the Institute for Applied Ecology's National Native Seed Conference.
Completed ...	Action Item #3: Provide an opportunity to discuss current research, case-studies, and tools that inform applied restoration opportunities in the Great Basin.	A series of 15 webinars on seeding and restoration entitled, ''The Right Seed in the Right Place at the Right Time: Tools for Sustainable Restoration'' are offered through May 2015.

The BLM has longstanding national and local policies that require monitoring vegetation treatments (both implementation and effectiveness monitoring) and guidance to apply monitoring data for adaptive management. These planning policies require the BLM to set land use goals and objectives, and to ensure that all vegetation treatments are responding to those goals and objectives. The FIAT process requires partnership with cooperators, agencies, and others involved in land or wildlife management in the FIAT assessment areas, which helps ensure BLM's treatments are benefitting the sagebrush ecosystem and that proposed treatments provide direct and indirect benefits to sage-grouse populations.

The management strategies identified by the FIAT process are consistent with broader land use plan direction. Habitat restoration treatments (*e.g.,* biological, chemical, seeding, and broadcast burning) are effective at reducing fine fuel loads and ultimately decrease fire spread and area burned. Chemical applications are effective at removing nonnative annual grasses and promoting growth and establishment of native species. Seeding treatments implemented by the BLM are effective at reducing undesirable species and promote the establishment of desirable species because they are timed to achieve a high probability of success. Conifer removal treatments are implemented to reduce fuel loading and effectively reduce fire intensity, fire spread, and area burned. Wildfire pre-suppression activities alter vegetation composition, reducing the negative impacts from wildfire and invasives. Projects are planned using fire behavior analysis tools that consider topography, weather patterns, fire history, and fuel conditions to ensure effectiveness. These treatments ultimately slow fire spread and reduce fire size and area burned (DOI 2015e, entire). Fuels treatment effectiveness monitoring reports of 722 wildfire/fuels treatment intersections since 2001 demonstrate fuels treatment effectiveness within the BLM (BLM 2015b, p. 1). Of the wildfire/treatment interactions reported, 85 percent of the treatments helped control the wildfire, and 90 percent changed the fire behavior (BLM 2015b, p. 2). The BLM found that hazardous fuels treatments reduced the size of many unplanned ignitions, assisted in providing opportunities to stop or slow the spread of wildfire, provided for greater firefighter safety, allowed opportunities to manage unplanned ignitions for resource benefits, reduced the burn area rehabilitation needs and costs, reduced smoke emissions, and allowed for greater resiliency of the environment in returning to a functional ecosystem following wildfire (BLM 2015b, p. 1). The BLM's post-fire emergency stabilization and burned area rehabilitation treatments are planned, deliberate actions that promote land stabilization and rehabilitation of burned landscapes. The BLM is aggressively treating burned areas where there is a high probability of cheatgrass invasion (BLM 2015h). Post-fire recovery treatments are designed to promote native vegetation and to inhibit the establishment of nonnative annual grasses. Some previous post-fire seeding restoration attempts were found to be ineffective, with seeded areas as likely to have sage-grouse occupancy compared to non-seeded areas (Arkle *et al.* 2014, p. 15). However, post-fire seeding restoration was more likely to be successful in higher elevation areas with particular climate regimes and when projects were implemented in years preceding cool, wet growing seasons (Arkle *et al.* 2014, p. 15). Therefore, the FIAT process prioritizes restoration activities in areas with higher resiliency and resistance to fire based on soil and moisture regimes (Chambers *et al.* 2014b, p. 453). These treatments are effective at addressing the impacts posed by invasive plants and ultimately address future wildfire threats.

Once implemented, projects and treatments identified by FIAT will follow the same monitoring protocols as non-FIAT management actions, in accordance with overarching guidance in the Federal Plans. Specifically, monitoring that evaluates the implementation and effectiveness of FIAT management strategies will follow The Greater Sage-Grouse Monitoring Framework (BLM and USFS 2014, entire). Given past effectiveness and ongoing monitoring efforts, the BLM expects 95 to 99 percent of all habitat restoration, wildfire pre-suppression, and conifer removal projects that are completed or in progress to effectively ameliorate the impacts of wildfire and invasive plants to sage-grouse (DOI 2015e, p. 9).

At the time of this writing, the 2015 fire season is under way, and we cannot currently predict the outcome of the season in terms of impacts to sage-grouse habitat. Similarly, it is premature to assess how implementation of the wildfire and invasive plant conservation efforts discussed above are working to address impacts during this fire season. At the time of publication, approximately 200,000 ha (500,000 ac) of sage-grouse habitat has been estimated to be affected by wildfires this year, including approximately 12 ha (30 ac) of SFA. Much of the area burned is associated with a single wildfire that occurred along the Idaho and Oregon border—the Soda Fire. This fire does provide some insight into the implementation of the wildfire conservation measures.

The Soda Fire started on August 10, 2015, burning approximately 114,000 ha (283,000 ac) of Federal, State, and private lands in southwestern Idaho and eastern Oregon (NIFC 2015). Almost all of the burned area is sage-grouse habitat, with more than 20,000 ha (about 50,000 ac) designated by BLM as PHMA for the species. Despite extreme fire behavior, firefighters safely suppressed this wildfire with no loss of life and no serious injuries to firefighters or the public. An interagency Emergency Stabilization and Rehabilitation (ES&R) team of more than 40 natural resource specialists has completed 5 days working on the ground to assess damage and threats to life, property, and resources on BLM-managed lands in both Idaho and Oregon. The ES&R team is now designing treatments to mitigate threats and begin the rehabilitation of the burned area (BLM2015h). Rehabilitation of burned areas on State and private lands affected by the Soda Fire is being handled through similar authorities and processes by Idaho Department of Lands (IDL) and the NRCS. Other local, State, and Federal organizations are participating throughout the process. A Memorandum of Understanding (MOU) established in 2014 between BLM, Idaho Department of Fish and Game, and IDL plays a key part in authorizing restoration efforts and processes on State land, particularly in PHMAs and Important Habitat Management Areas (IHMAs).

The Soda Fire is one of many examples of why the Secretary of the Interior issued Secretarial Order 3336 to prioritize resources to address the threat of wildfire in sagebrush habitats for Federal land managers. We expect that the actions outlined in the Secretarial Order and BLMs commitments to implement other new strategies and tools identified (BLM 2015h) above will ultimately prove valuable in reducing the negative effects of wildfire on sage-grouse habitat. Importantly, the rapid completion of many of the near-term action items outlined in the Initial Report – many of these measures were in place *before* the onset of the 2015 fire season – signal a strong commitment from wildland fire managers to implement these measures into the future.

Final Report

The ''SO3336—Final Report: An Integrated Rangeland Fire and Management Strategy'' (DOI 2015c, entire), completed May 1, 2015, outlines a long-term approach to improving the efficiency and efficacy of actions to better prevent and suppress wildfire and to improve efforts to restore fire-impacted landscapes both including and beyond 2016. This approach involves targeted investments to enhance efforts to manage wildfire in the Great Basin, based on relative resilience and resistance of habitat to fire. The Final Report also outlines longer term actions to implement the policy and strategy set forth in the Secretarial Order, including the continued implementation of approved actions associated with the National Cohesive Wildland Fire Management Strategy (DOI 2014, entire) that provides guidance for the safe and effective suppression of wildfires. The actions outlined in the Final Report primarily focus on the Great Basin region, but DOI intends for the strategies developed under the Final Report to be applied rangewide where there is benefit to sagebrush ecosystem habitat and sage-grouse. Measures outlined in the Final Report include the following:

- Designing and implementing comprehensive, integrated fire response plans for the FIAT assessment areas in the Great Basin subject to fire and invasives;
- Providing clear direction on the prioritization and allocation of fire management resources and assets;
- Expanding the focus on fuels reduction opportunities and implementation;
- Fully integrating the emerging science of ecological resilience into design of habitat management, fuels management, and restoration projects;
- Reviewing and updating emergency stabilization and burned area rehabilitation policies and programs to integrate with long-term restoration activities;
- Committing to multiyear investments for the restoration of sagebrush ecosystems, including consistent long-term monitoring protocols and adaptive management for restored areas;
- Implementing large-scale experimental activities to remove cheatgrass and other invasive annual grasses through various tools;
- Committing to multiyear investments in science and research; and
- Developing a comprehensive strategy for acquisition, storage, and distribution of seeds and other plant materials.

The Secretarial Order places a priority on ''protecting, conserving, and restoring the health of the sagebrush-steppe ecosystem and, in particular, sage-grouse habitat, while maintaining safe and efficient operations,'' and looks to the allocation of fire resources and assets associated with wildfire to reflect that priority. In preparing the Final Report, the Task Force considered a wide variety of possible actions for conserving habitat for the sage-grouse and other wildlife species as well as economic activity, such as ranching and recreation, associated with the sagebrush ecosystem in the Great Basin. The strategy outlined in the Final Report builds upon the National Cohesive Wildland Fire Management Strategy (DOI 2014, entire) and is intended to ensure improved coordination with local, State, Tribal, and regional efforts to address the potential threat of wildfire at a landscape level.

In 2015, BLM initiated implementation of the National Seed Strategy, a key program included in the Secretarial Order (BLM 2015c, entire; BLM 2015h, entire). The ''National Seed Strategy for Rehabilitation and Restoration 2015–2020'' (Seed Strategy) provides a coordinated approach for stabilization, rehabilitation, and restoration treatments. The Seed Strategy also provides a framework for actively working with the private sector in order to build a ''seed industry'' for rehabilitation and restoration. This program was developed specifically in response to concerns about the wildfire and invasive plant cycle in the sagebrush ecosystem, and was identified in the Secretarial Order. The Seed Strategy has the following four goals:

1. Identify seed needs, and ensure the reliable availability of genetically appropriate seed;
2. Identify research needs and conduct research to provide genetically appropriate seed and to improve technology for native seed production and ecosystem restoration;
3. Develop tools that enable managers to make timely, informed seeding decisions for ecological restoration; and
4. Develop strategies for internal and external communication.

The Seed Strategy ensures that adequate supplies of native seed will be available for sagebrush ecosystem restoration. The use of locally appropriate native seed will improve restoration success, serving as an important tool in the suppression of invasive plant infestations after habitat disturbances, such as wildfire. The measures in the Seed Strategy are consistent with COT Report conservation recommendations for post-wildfire restoration (USFWS 2013, p. 40). The initiation of the Seed Strategy by BLM is evidence of DOI's commitments to fully implement the measures included in the Secretarial Order and serves as an important tool for the minimization of the wildfire-invasive plant cycle across the species' range (BLM 2015h, entire).

We analyzed the certainty of implementation and effectiveness of the Secretarial Order pursuant to PECE (68 FR 15100, March 28, 2003). As noted above, the purpose of PECE is to ensure consistent and adequate evaluation of recently formalized conservation efforts when making listing decisions. The policy provides guidance on how to evaluate conservation efforts that have not yet been implemented or have not yet demonstrated effectiveness. The evaluation focuses on the certainty that the conservation efforts will be implemented and the effectiveness of the conservation efforts to contribute to make listing a species unnecessary.

The majority of the actions identified in the Initial Report have been implemented (BLM 2015h, entire). Specifically, the following actions have taken place: Investments targeted to enhance efforts to manage wildfire in the Great Basin; a process has been established for allocating funds to support policies and strategies for preventing and suppressing wildfire and for restoring sagebrush landscapes impacted by fire across the Great Basin; and funds were provided this year to support efforts under the Secretarial Order (BLM 2015h, entire). The agencies have the legal authorities to carry out the responsibilities under the Secretarial Order and it builds on the BLM and USFS' long and successful history of managing wildfire in the Western United States. Therefore, we expect that the efforts will continue to be implemented to accomplish the objectives of the Secretarial Order.

The Secretarial Order is expected to work with FIAT and other authorities to further help address the effects associated with wildfire suppression and restoration and the spread of invasive species. The Secretarial Order provides an implementation plan and specific objectives including short-term actions for the 2015 fire season and long-term actions needed to meet the objectives identified in the order. Pursuant to the Secretarial Order, protocols for monitoring vegetation treatments (both implementation and effectiveness monitoring) were established and guidance was developed to apply monitoring data for adaptive management (BLM 2105h, entire).

We expect that the measures will be effective in reducing the impacts of wildfire and invasive plants to sage-grouse and its habitats. The COT Report recommends containing wildfire within the normal range (including size and

frequency), eliminating intentional fires, and restoring burned sagebrush habitats (USFWS 2013, p. 40). As the COT Report noted, reduction of the threat of wildfire is difficult (USFWS 2013, p. 40). However, the Secretarial Order, FIAT and other authorities and actions working in concert have provided the direction needed as described in the COT Report. Many of the actions identified in the Initial Report have already been implemented (BLM 2015h, entire). The actions yet to be fully implemented from the Initial and Final Report have a high level of certainty of implementation, given BLM's past track record of implementation and their commitments and policy direction for future implementation(BLM 2015h, entire). The Secretarial Order and associated actions, both short and long term directly address the recommendations found in the COT Report, are based on the best available information, and address the major issues related to wildfire prevention and suppression, as well as restoration of areas impacted by wildfire and invasive plants. We expect that the Secretarial Order and associated actions, both short- and long-term, will be implemented and will be effective in reducing the effects to sage-grouse and its habitat from wildfire and invasive species sufficient enough be considered in making our determination.

Resilient Landscapes Funding and Projects – The Wildland Fire Resilient Landscapes (WFRL) program is a new approach to achieve fire resiliency goals across landscapes with the collaborative efforts defined in the National Cohesive Wildland Fire Management Strategy (DOI 2014, entire), and in support of Secretarial Order 3336—Rangeland Fire Prevention, Management, and Restoration. The WFRL program provides opportunities for the DOI bureaus, working together with other Federal, tribal, State, and local governmental and nongovernmental partners, to identify and complete projects that are intended to contribute significantly to restoring fire resilience in a variety of fire-adapted ecosystems across the country. The Fiscal Year 2015 appropriation provided 10 million dollars to the Fuels Management program to fund resilient landscape activities, as a pilot initiative. Ten proposals were selected for funding in 2015; three projects, representing 68 percent of the funding, are located within the range of sage-grouse, and support the goals of the Secretarial Order (Table 13). The Fiscal Year 2016 President's Budget proposes funding for the WFRL program at 30 million dollars to provide multiyear support for landscape-scale projects and expand the program to new partnerships.

TABLE 13—FISCAL YEAR 2015 WILDLAND FIRE RESILIENT LANDSCAPES PROGRAM PROJECTS FUNDED WITHIN THE RANGE OF SAGE-GROUSE

Collaborative	Location/lead agency	Project objective	Project acres (millions)	Approved funding
Bruneau-Owyhee	Located in Idaho Lead: BLM	Treat conifer encroachment to benefit fire resiliency and sage-grouse habitat.	>1	$166,000
Greater Sheldon-Hart Mountain.	Located in parts of Oregon, Nevada, California. Lead: Service	Focus on restoring sagebrush shrub and native perennial grass/forb communities by controlling juniper expansion.	~4	3,984,250
Southern Utah	Located in Utah Lead: BLM	Remove encroaching pinyon pine and juniper, diversify age class of sagebrush communities, estab- lish desired understory to restore resilience, bene- fitting sagebrush-dependent wildlife.	7.4	2,605,000
Totals			>12	6,755,250

State Fire Management Programs – Federal, State, and local land and wildlife management agencies collaborate and work under national fire guidance strategies to achieve common goals and objectives. Within the Great Basin region, State Forest Action Plans address the coordinated management of wildfire. State and local fire management agencies view all wildfires as ''full suppression'' incidents, and make every effort to suppress fires safely and quickly with a strong initial attack. Many States have agreements with their neighboring States to ensure that a rapid initial attack is possible, even if it is from a neighboring State or jurisdiction. Additionally, they may utilize a ''unified command'' concept to assist in coordination and cooperation (Havlina *et al.* 2015, p. 26). Specific projects are detailed in the State Forest Action Plans to reduce fuels, improve preparedness and initial attack response, identify equipment and training needs, and ensure safe, rapid, and aggressive response to wildfire ignitions, and address rehabilitation of wildfire-damaged lands to mitigate the spread of invasive plants (Havlina *et al.* 2015, pp. 25–27). For example, Utah's Forest Action Plan (UDFFSL 2015; pp. 33–35) was updated in 2015 to include five Sage-grouse Management Areas (SGMAs) (Box Elder, Bald Hills, Sheep Rock Mountains, Hamlin Valley, and Ibapah) as high priorities in the wildfire risk assessment and as part of the Governor's Catastrophic Wildfire Reduction Strategy. Collectively, these five SGMAs hold 26 percent of the sage-grouse in the State of Utah (UDFFSL 2015, p. 35).

The Oregon State Plan recognizes wildfire as one of the most significant impacts to sage-grouse and their habitat in Oregon and the Great Basin. The Plan also recognizes the interrelated nature of the threat from wildfire with the threats from nonnative annual grasses and juniper encroachment. The Plan outlines more than 40 conservation actions to address the impacts from wildfire, which are defined as any activity or action which, when implemented or continued to be implemented, will reduce potential threats to sage-grouse and will improve or maintain healthy sagebrush-steppe habitat. These conservation actions are categorized into four areas: Reducing wildfire risk, wildfire suppression, building capacity and supporting local efforts, and post-fire rehabilitation. All of the conservation actions for wildfire are predicated on the FIAT as well as the Secretarial Order, use data specific to Oregon, and are coordinated with the goals and objectives of the BLM's Federal Plans as well as local jurisdictions.

Local Fire Management Programs – Many communities throughout sage-grouse habitat in the Great Basin have rangeland fire protection associations

(RFPAs). The RFPAs are remotely located firefighting units staffed by public volunteers. The RFPA volunteers are trained and equipped to respond to wildland fires with the intent to control wildfires at the smallest size that can be safely accomplished. Their location in remote areas allows firefighters to access fires quickly, which increases success of controlling fires before they grow in size, become more challenging to suppress, and cause greater effects to sage-grouse. In Oregon, 18 RFPAs have been created and currently field more than 600 volunteer fire fighters and more than 200 pieces of water-handling fire equipment to protect more than 2 million ha (5 million ac) from wildfire. In southern Idaho, there are currently seven RFPAs with 230 trained members who support wildland firefighters to protect more than 1.4 million ha (3.5 million ac) of the sagebrush ecosystem from catastrophic wildfire. On June 23, 2015, Governor Brian Sandoval signed emergency regulations related to the formation of RFPAs within the State of Nevada (NRS 472 per AB 163, sec. 3.5(1) of the 78th Session of the Nevada legislature).

Wildfire and Invasive Plants Summary

In 2010, we concluded that wildfire was one of the primary factors linked to declines of sage-grouse due to long-term loss of sagebrush and conversion of sagebrush habitats to invasive annual grasses. Loss of sagebrush habitat to wildfire had been increasing in the western portion of the sage-grouse range mainly due to an increase in wildfire occurrence, intensity, and severity (Miller *et al.* 2011, p. 183). We found this change to be the result of incursion of nonnative annual grasses, primarily cheatgrass. The positive feedback loop between cheatgrass and wildfire facilitates future fires and precludes the opportunity for sagebrush, which is killed by fire, to become reestablished. Cheatgrass and other invasive plants also alter habitat suitability for sage-grouse by reducing or eliminating native forbs and grasses essential for food and cover.

While the manner in which wildfire and invasive plants affect sage-grouse has not changed since the 2010 finding, there has been a significant change in the approach to rangeland firefighting and fuels management to address these potential threats. Through development of the FIAT, as well as the Secretarial Order, the BLM and USFS have developed and implemented wildfire management strategies and actions intended to reduce the impact of wildfire and invasive plants (BLM 2015h, entire). Similarly, a paradigm shift is occurring in the way land managers and the larger conservation community approach invasive plant control and in particular the relationship between invasive plants and wildfire.

Without management, current burn rates would likely continue, potentially impacting another 17 to 25 percent of the species' range within the Great Basin over the next 20 to 30 years. If this level of wildfire did occur, sage-grouse populations in the Great Basin could decline 43 percent over the next 30 years (Coates *et al.* 2015, p. 32), and some small populations could be extirpated. However, we expect that the rates of wildfire and invasive plant habitat loss seen over the past decades will be reduced by conservation efforts. The FIAT assessments that are included in the Federal Plans and the actions implemented under the Secretarial Order provide enhanced policies, strategies, and tools for preventing and suppressing wildfire and for restoring landscapes affected by fire across the Great Basin region. Many of those measures are in place for the current fire season (DOI 2015a). As a result, sagebrush habitats will now be given priority consideration in the treatment of fuels, the deployment of firefighting resources, and the rehabilitation of burned areas. Much of that effort will be focused in those areas most resistant to wildfire and invasive plants, where more than half the breeding habitat in the Great Basin occurs and where prevention and restoration projects are most likely to be successful; this strategy is consistent with recommendations provided in the COT report (USFWS 2013, pp. 40–42) and a recent study of wildfire impacts over the next 30 years (Coates *et al.* 2015, p. 34). Further, if wildfires do occur, monitoring of sage-grouse habitat and population responses to that impact will occur so that other land use activities can be adjusted, if necessary. In response to monitoring, development allowable under the Federal Plans may be adjusted based on adaptive management criteria to provide an immediate, corrective response to any identified triggers for population or habitat declines. While not directly related to habitat losses due to fire, these provisions provide a backstop for other disturbance if adaptive management triggers are exceeded. The continued long-term implementation of these wildfire management strategies, in coordination with the Federal Plans and Oregon State Plan (see *Sagebrush Landscape Conservation Planning* for additional details) reduce the risk, or the degree to which, fire and invasive plants are likely to impact sage-grouse. We expect that the current management emphasis will reduce future losses.

Grazing and Rangeland Management

In 2010, we evaluated the effect of grazing on sage-grouse (including domestic livestock, free-roaming equids, and wild ungulates) and concluded that improper grazing was likely having negative impacts to sagebrush and sage-grouse at local scales, but that population-level impacts were unknown. However, given the widespread nature of grazing, the potential for population-level impacts could not be ignored (75 FR 13910, March 23, 2010, p. 13942). In this section we evaluate the best available information on the impacts of livestock grazing on sage-grouse and on conservation actions since 2010 intended to ameliorate those impacts. We have no new information regarding impacts of native ungulates on sage-grouse populations, which were not considered a substantive threat in 2010; therefore, our analysis focuses exclusively on domestic livestock grazing. The impacts on the species and its habitat of free-roaming equid grazing are addressed in a separate section of this document (see *Free-Roaming Equids*).

Improper grazing by domestic livestock during the late 1800s and early 1900s, along with severe drought, affected sagebrush ecosystems across the range of sage-grouse (Knick *et al.* 2003, p. 616). Improper grazing, for the purposes of this assessment, is defined as grazing practices that are inconsistent with local ecological conditions and result in degradation of habitat for local wildlife species. This historical improper grazing caused long-term changes in plant communities and soils (Knick *et al.* 2003, p. 611). In low-elevation Wyoming big sagebrush and low sagebrush habitat, improper grazing reduced perennial herbaceous vegetation and caused high levels of ground disturbance, which promoted the establishment of exotic annual grass species such as cheatgrass (Mack 1981, pp. 148–152). In higher elevation mountain big sagebrush habitat, improper grazing likely reduced fine fuels and decreased fire frequency, resulting in the expansion of fire-sensitive native conifers (Miller and Tausch 2001, pp. 19–26). In both instances, these shifts in the vegetative community have facilitated changes in the wildfire cycle, leading to loss of sage-grouse habitat (see *Wildfire and Invasive Plants,* above).

Livestock grazing is currently the most widespread land use in the sagebrush ecosystem and occurs in all MZs (Knick *et al.* 2011, p. 219; Boyd *et al.* 2014, p. 62). Livestock grazing may positively or negatively affect the structure and composition of sage-grouse habitat (Factor A), depending on the intensity and timing of grazing and local climatic and ecological conditions (Crawford *et al.* 2004, pp. 10–12; Aldridge *et al.* 2008, p. 990; Boyd *et al.* 2014, p. 63). As a result, drawing broad inferences regarding the current impact of grazing on sagebrush habitats across the range of sage-grouse is difficult.

The total number of livestock that currently graze within sage-grouse habitats is unknown. No rangewide data set is available describing the level of livestock grazing that occurs on private lands across the occupied range. Most grazing on Federal lands is managed by BLM and USFS (GAO 2005, p. 5). The BLM and USFS index the number of livestock grazed by Animal Unit Months (AUMs), which takes into account both the number of livestock and the amount of time they spend on public lands. An AUM is defined by BLM as the amount of forage needed to sustain one cow and her calf, one horse, or five sheep or goats for 1 month. The number of AUMs allowed depends upon land health assessments that evaluate the ecological condition of an area and its ability to support grazing (BLM and USFS 2015, entire). The number of AUMs permitted on Federal lands has gradually declined since the 1960s (Mitchell 2000, pp. 64–68). This decline was concurrent with a decline in productivity of western shrublands due to previous grazing history, changes in soils and vegetation, or drought (Knick *et al.* 2011, p. 232). The reduction in AUMs permitted on public lands over time may not translate to a reduction in the effects of grazing in sagebrush systems (Knick *et al.* 2011, p. 232).

Properly managed grazing may benefit sage-grouse. Light to moderate livestock grazing can help maintain perennial vegetation that provides important food and cover for sage-grouse (Crawford *et al.* 2004, pp. 2–12; Boyd *et al.* 2014, p. 63). It can also help control invasives and woody plant encroachment, which may improve habitats and may reduce wildfire risk (Connelly *et al.* 2004, p. 7–49; Boyd *et al.* 2014, p. 68). The net impact of different use levels will vary in accordance with climatic variability, local environment, and season of use (Crawford *et al.* 2004, pp. 10–12). Implementing proper grazing practices that maintain adequate residual grass height and cover under shrubs provides for suitable cover and minimizes the negative effects of grazing on sage-grouse productivity (Boyd *et al.* 2014, p. 64).

Alternatively, improperly managed grazing can have adverse impacts to sage-grouse habitat. Improper grazing directly influences the composition, productivity, and structure of herbaceous plants in sagebrush plant communities (Boyd *et al.* 2014, p. 64), which in turn influences the quality and quantity of food and cover for sage-grouse (Fleischner 1994, pp. 633–635). By reducing protective vegetative cover, improper grazing may make nesting and brood-rearing habitats less suitable for sage-grouse. Sage-grouse rely on the cover of tall grasses and shrubs to hide from predators, especially during the nesting season, and females will preferentially choose nesting sites based on the height of grasses and shrubs (Hagen *et al.* 2007, p. 46). Grass height is a strong predictor of nest survival and hiding cover can increase nest success, a key vital rate for sage-grouse (Doherty *et al.* 2014, pp. 322–323). Loss of this hiding cover may increase predation during nesting and brood-rearing, subsequently reducing reproductive success rates (Gregg *et al.* 1994, p. 165). Maintaining adequate residual grass height and cover under shrubs minimized the negative effect of grazing on sage-grouse productivity (Boyd *et al.* 2014, p. 64).

Improper livestock grazing can reduce food available to sage-grouse, which can impact reproductive success and chick survival (Coggins 1998, p. 30; Aldridge and Brigham 2003, p. 30; Pederson *et al.* 2003, p. 43). Improper livestock grazing in mesic, brood-rearing habitat may further reduce food resources by altering soils and hydrology and reducing herbaceous plants (Braun 1998, p. 147; Dobkin *et al.* 1998, p. 213). Improper livestock grazing may also reduce the cover and height of sagebrush in key wintering habitats (Rasmussen and Griner 1938, p. 852), potentially affecting the condition and survival of sage-grouse during the winter when resources are scarce. However, implementing appropriate grazing practices can maintain habitat and food resources for sage-grouse or, under very specific conditions, improve conditions by stimulating succulent forb growth (Evans 1986, p. 67; Crawford *et al.* 2004, p. 12; Beck and Mitchell 2000, p. 997).

Beyond habitat impacts, improper grazing can also directly affect sage-grouse (Factor E). Nearby livestock can cause females to flush from their nests (Coates *et al.* 2008, p. 426), inadvertently revealing the nest and its eggs to predators, such as ravens (*Corvus corax*) (Coates 2007, p. 33) and the abundance of raven predators in sage-grouse habitats may increase near livestock grazing (Coates *et al.*, in press). Livestock can trample or disturb nests (Crawford *et al.* 2004, p. 12). However, no information is available about the extent these potential impacts may be occurring across the occupied range. When they do occur, adverse impacts are likely limited to the local population.

Construction and development associated with grazing, such as watering developments and fences, can have a variety of impacts such as habitat fragmentation and the facilitation of predators and disease. There have been documented incidences of sage-grouse drowning in stock tanks, which can have localized population-level effects (Boyd *et al.* 2014, p. 65), but the rangewide impact is unknown. Grazing management that strategically considers placement and design of fences and livestock water developments could protect other habitats by localizing and minimizing the area of impact. In addition, the timing of water diversions can minimize these impacts and provide mesic vegetation and wet meadow habitats during critical brood-rearing periods when the availability of succulent plants may be limited (Boyd *et al.* 2014, pp. 65–66).

Conservation Efforts

Since 2010, State and Federal agencies have worked collaboratively to develop regulatory mechanisms to reduce or eliminate the impact of improper livestock grazing on sage-grouse habitats. The BLM and USFS amended or revised Federal Plans to set appropriate rangeland health standards in sage-grouse habitats that are required to maintain a Federal grazing permit. States developed and implemented State plans that govern issuance of grazing permits on some State lands. Other conservation efforts designed to improve grazing, including voluntary efforts, are discussed below.

Federal Plans—The BLM and USFS are currently the principle land managers within the range of the sage-grouse, and collectively manage more than 98 percent of the livestock grazing on Federal lands (GAO 2005, p. 5). Nearly all federally owned sage-grouse habitat is managed for livestock grazing (BLM and USFS 2015, entire). Grazing permits and leases generally cover a 10-year period and are renewable if the BLM or USFS determine that the terms and conditions of the expiring permit or lease are being met (BLM and USFS 2015, entire). Permits include standards and guidelines that describe specific conditions required to achieve land

health and the recommended techniques to achieve these standards on each allotment (Knick *et al.* 2011, p. 222; BLM and USFS 2015, entire), as well as mandatory terms and conditions to ensure that land health standards (LHS) are being met (43 CFR 4130). If LHS are not being met or terms and conditions are not being followed, the BLM and USFS have the authority to modify the terms and conditions of grazing permits to correct any deficiencies, suspend the permit, or to revoke the grazing permit entirely (33 CFR 222.4; 43 CFR 4180.2).

In our 2010 finding, we identified concerns with BLM and USFS management of rangelands, contributing to our finding that regulatory mechanisms were not sufficient (75 FR 13910, March 23, 2010, pp. 13975–13980). Historically, not all allotments have been monitored to ensure compliance with LHS and permit terms and conditions, and there was no mandated prioritization of field checks to ensure compliance within sage-grouse habitats. Between 1997 and 2007 the percent of allotments monitored for LHS ranged from 22 percent to 95 percent across surveyed States, with an overall average of 57 percent (Veblen *et al.* 2014, p. 72). Of the allotments monitored, 15 percent failed to meet LHS due to improper livestock grazing (Veblen *et al.* 2014, p. 72).

The Federal Plans represent a major shift in grazing management and monitoring since 2010, with respect to meeting LHS and sage-grouse conservation objectives (BLM and USFS 2015, entire). The Federal Plans manage grazing specifically for sage-grouse habitat objectives by evaluating the numbers and distribution of livestock, evaluating environmental conditions such as drought, closing or changing allotments, managing riparian habitat for sage-grouse, and authorizing water developments only if they would not adversely impact sage-grouse. Specific grazing guidelines have been developed based on the best available science and are applied in upland and riparian/wet meadow habitats to maintain or achieve desired conditions of sagebrush, forbs, and perennial grasses. Upland vegetation guidelines will be applied seasonally and within 4 to 6.2 miles from leks, depending on site-specific information. Riparian and wetland protective measures will be applied in all sage-grouse habitat areas. Further, BLM directed resources in 2015 to fund monitoring crews, and funded activities, like data management, to ensure successful implementation of the monitoring commitments (Lueders, BLM, 2015, pers. comm.). The President's Budget request for BLM included 8 million dollars to directly support monitoring the implementation and effectiveness of the land use plans (BLM 2015d, p. II–5–6).

Given the large number of allotments across the occupied range, the Federal Plans ensure that the most important habitats are prioritized for protection. Permit review, renewal, and/or modifications occur first in SFAs, followed by PHMA and allotments containing riparian areas. The same prioritization is used for field checks to ensure compliance with permit terms and conditions. In addition, the USFS commits to modify grazing permit conditions and existing livestock improvements within 2 years and mitigate any adverse effects from grazing improvements within 5 years (BLM and USFS 2015, entire). Progress at achieving rangeland health objectives at multiple spatial scales is monitored by BLM and USFS using a habitat assessment framework that provides a consistent approach and similar data set (BLM and USFS 2015, entire).

The Federal Plans' vegetation standards and grazing management measures are consistent with the best available science on sage-grouse habitat needs and the COT report recommendations to minimize grazing impacts (USFWS 2013). The Federal Plans also include monitoring requirements and adaptive management that will ensure that the measures will be effective for the long term and that grazing occurs at proper levels for sage-grouse conservation. With changes in management direction and immediate allocation of resources, full implementation of the Federal Plans will, over time, address effects due to improver grazing. As a result of the Federal Plans, and associated monitoring commitments and adaptive management approach, the risk of improper grazing occurring on Federal lands across the occupied range is greatly reduced from 2010 levels.

State Plans—State plans in Montana and Wyoming include measures to reduce the impact of improper grazing to sage-grouse on State-owned or managed lands. Montana's State plan requires that State Trust grazing lands maintain and improve sage-grouse habitat in core and connectivity areas on State Trust lands in Montana (Montana EO 10–2014, pp. 7–17). In addition, Montana's plan includes voluntary incentives to conserve sagebrush habitats on private and State-owned lands in core and general habitat areas (Montana EO 10–2014, pp. 7–27). Under the Wyoming Plan, in order to receive a permit, new grazing operations on State Trust Lands must demonstrate that they will not cause declines in sage-grouse populations. While the amount of grazing on lands subject to these State requirements and incentives is minimal compared to that on Federal lands, these measures will reduce the potential for improper grazing that could negatively affect sage-grouse.

Sage Grouse Initiative—Rangeland health inside PACs has been improved through SGI practices by applying grazing systems, re-vegetating former rangeland with sagebrush and perennial grasses, and controlling invasives. To date, grazing systems have been implemented on more than 985,000 ha (2.4 million ac); seeding projects have occurred on more than 19,000 ha (over 48,000 ac); and weed management projects were implemented on more than 6,000 ha (over 15,509 ac), and restoring more than 70 ha (179 ac) of wet meadow (NRCS 2015a, p. 6). To maximize conservation gain, SGI targets their efforts within PACs. Of the more than 985,000 hectares (2.4 million acres) enrolled in grazing systems, 76 percent are clustered within the following five populations: Powder River Basin, Yellowstone Watershed, and the Dakotas in MZ I; Wyoming Basin in MZ II; and Snake/Salmon/Beaverhead in MZ IV (NRCS 2015a, p. 7). In addition more than 74 percent of the newly seeded acres are concentrated in the following five populations: Dakotas, and Yellowstone Watershed in MZ I; Northwest Colorado in MZ II; and Northern Great Basin and Box Elder in MZ IV (NRCS 2015a, p. 7). Although participation in SGI programs is voluntary, participants that receive financial assistance enter into binding contracts or easements to ensure that conservation practices are applied according to schedule and in compliance with NRCS standards and specifications. As part of implementation, the SGI includes a monitoring and evaluation component that measures the response of sage-grouse populations and associated vital rates in order to gauge effectiveness and provide an adaptive management framework to SGI programs. For the private lands involved with this program, SGI has removed the risk of habitat degradation due to improper grazing through the implementation of accepted habitat management tools, and restored previously affected habitat to benefit sage-grouse.

Candidate Conservation Agreements—Lands currently enrolled in CCAAs reduce the potential threat of improper grazing on private lands through implementation of grazing management plans that we have

determined maintain or enhance habitat for sage-grouse. Approved grazing management plans include measures concerning the types of livestock and the appropriate timing, location, duration, and frequency for grazing. All private lands within the species' range in Oregon and Wyoming are eligible for enrollment in CCAAs. Rangewide, approximately 745,000 ha (1.8 million ac) of private lands have landowner commitments in the programmatic CCAAs in Oregon and Wyoming. In addition, approximately 1.4 million ha (about 3.5 million ac) are covered by CCAs covering range management on BLM-administered lands in Oregon and Wyoming, and covering maintenance operations on DOE lands in Idaho (BLM 2013a). The CCAs require the same conservation measures as the CCAAs, including grazing management plans and habitat enhancement. These CCAAs and CCAs are consistent with the recommendations of the COT Report (USFWS 2013, p. 45) for conservation measures that will effectively reduce impacts to sage-grouse.

Grazing and Rangeland Management Summary

Livestock grazing is the most widespread land use in the sagebrush ecosystem, and impacts can be positive, negative, or neutral depending on management practices and site-specific characteristics. Improper grazing practices can have adverse effects to sage-grouse and its habitat, and may work synergistically with other potential threats, such as invasive plants and wildfire, to increase impacts. However, well-managed grazing practices can be compatible with sagebrush ecosystems and sage-grouse persistence. In 2010, we concluded that grazing was likely having localized negative effects, but due to the widespread extent of the activity, greater impacts were possible. Since our 2010 finding, updated Federal Plans have been amended or revised in the species' range to ensure that appropriate grazing prescriptions are applied on Federal lands, covering more than half of the range of sage-grouse. As discussed in the *Federal Plans* section above, monitoring and adaptive management provisions within the Plans contribute to the certainty that livestock grazing will be permitted at levels compatible with sage-grouse persistence. Further, prioritization of field checks and permit reviews provides additional assurances that these regulatory mechanisms will be effective in those areas with the highest breeding bird densities. Rangewide, the Federal Plans, along with the Wyoming, Montana, and Oregon State Plans, reduce impacts from grazing to approximately 90 percent of the modeled breeding habitat across the species' range (see *Sagebrush Landscape Conservation Planning* for a detailed discussion of conservation measure implementation and effectiveness). In addition to these regulatory mechanisms on Federal lands, SGI and State CCAAs provide well-coordinated programs to encourage private landowners to address the impact of improper grazing on non-Federal lands. Taken together, these conservation efforts reduce the potential threat of improper livestock grazing from the levels assessed in 2010. Therefore, we conclude that, although livestock grazing is widespread in the sagebrush ecosystem, and we expect some continued impacts from improper grazing at local scales, existing Federal regulations with full implementation, in combination with voluntary efforts on non-Federal rangelands are reducing the prevalence of improper grazing and its impacts to sage-grouse.

Free-Roaming Equids

In 2010, we evaluated the effect of free-roaming equids (also known as free-roaming horses and burros) on sage-grouse and concluded that grazing (including grazing by free-roaming equids, native ungulates, and livestock) can have negative impacts to sagebrush (Factor A) and consequently to sage-grouse at local scales. Further, we concluded that the impacts of grazing at large spatial scales, and thus on population-levels, was unknown, but given the widespread nature of grazing, the potential for population-level impacts could not be ignored (75 FR 13910, March 23, 2010, p. 13942).

Free-roaming horses (*Eques cabalas*) and burros (*E. sinus*) were first brought to western North America in the late 16th century. A number of equids subsequently escaped captivity or were released forming free-roaming populations (Beever 2003, p. 888; Garrott and Oli 2013, p. 847). When the BLM began monitoring free-roaming equid populations in the 1970s, they reported the total number of free-roaming horses to be approximately 17,000 individuals, although some believe this was an underestimate (BLM 2005a, p. 3). With protection afforded by the Wild Free Roaming Horse and Burro Act of 1971 (Pub. L. 92–195) (Horse and Burro Act), the number of horses on public lands rose sharply, and by 1980 the number of free-roaming equids had increased to 65,000–80,000 animals (Beever 2003, p. 888, BLM 2005a, p. 3). Active management, starting in the 1980s, reduced free-roaming equid numbers to more than 40,000 by 1999 and to about 37,186 in 2003 (BLM 2005a, p. 3).

The BLM and USFS manage free-roaming equids on Federal lands according to the Wild Free-Roaming Horses and Burros Act of 1971. The BLM's implementing regulations designated Herd Areas as places used as habitat by a herd of free-roaming equids at the time the law was passed (43 CFR part 4700). The BLM evaluated each Herd Area to determine if it had adequate food, water, cover, and space to sustain healthy and diverse free-roaming equid populations over the long term. The areas that met those criteria were designated as Herd Management Areas (HMAs). The BLM manages HMAs to maintain the appropriate management level (AML) of free-roaming equids to be in balance with other public rangeland species, resources, and uses in a given area. The USFS has designated Territories for the management of free-roaming equids and manages them in a similar way. The HMA/Territories currently overlap with about 12 percent of the sage-grouse occupied range, primarily in Oregon, Nevada, and Wyoming (Figure 8).

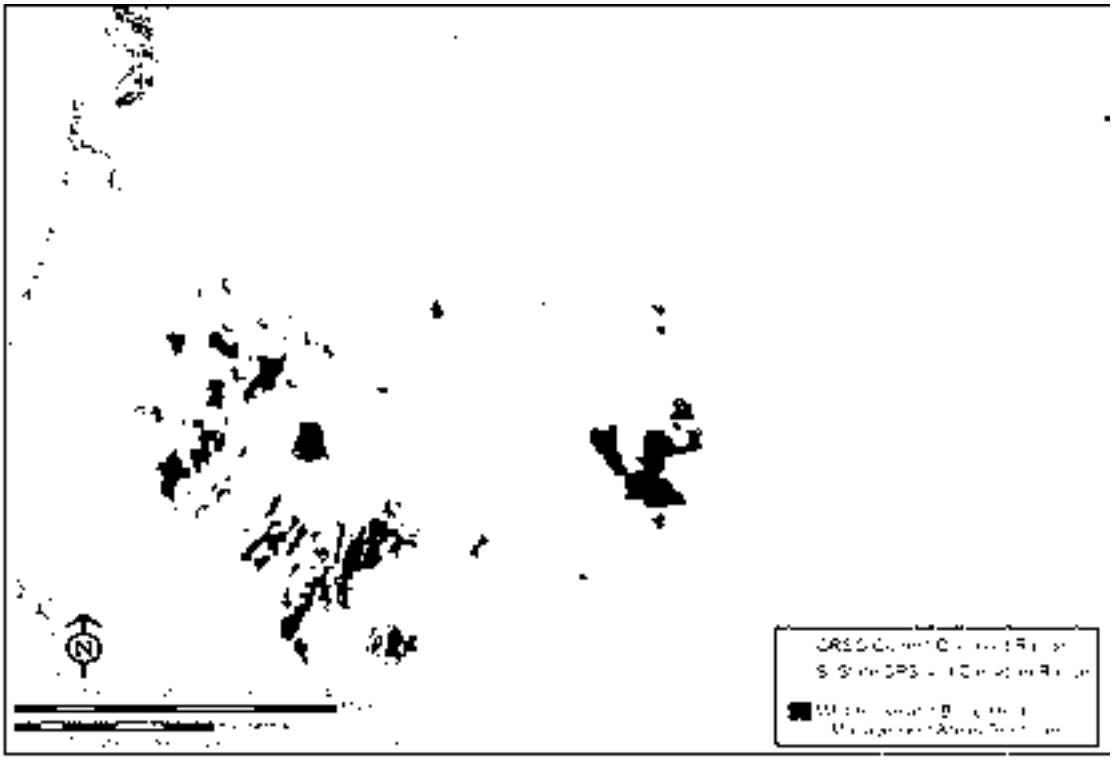

Figure 8 Free-roaming Equid Management Areas within the sage-grouse occupied range

In 2010, the BLM estimated that 31,000 free-roaming equids were found on BLM-administered lands (75 FR 13910, March 23, 2010, p. 13941). Currently, the BLM estimates 58,150 free-roaming equids (about 47,329 horses and 10,821 burros) exist on BLM-administered rangelands in 10 western States, including two States outside the range of the sage-grouse (BLM 2015e). In 2014, USFS estimated that, on lands it manages, there are an additional 7,447 free-roaming equids (Shepherd & Frolli 2015, BLM and USFS, pers. comm.). The number of free-roaming equids on public lands has been over AML for more than 15 years (BLM 2014c, p. 1). The extent to which free-roaming equids occur on land outside of designated Federal management areas is unknown.

The current population of free-roaming equids is estimated to be nearly double the amount that the BLM and USFS have determined can exist in balance with other public land resources and uses (BLM 2015e, p. 1). Free-roaming equids reproduce rapidly and can have rates of increase averaging 15 to 20 percent annually (BLM 2015e, p. 1). Assuming a population of 45,000 animals and a 20 percent annual growth rate, Garrott *et al.* (1991, p. 647) estimated that 9,000 horses must be removed annually to maintain a stable population. The number of horse and burro removals by BLM have not kept this pace in recent years, with removals declining from 8,255 in 2012, to 4,176 in 2013, to 1,863 in 2014 (BLM 2015e, entire). At the same time, numbers of horses and burros in BLM corrals and pastures is close to capacity (BLM 2015e, entire).

Free-roaming equids' use of sagebrush landscapes have different ecological consequences than livestock grazing at both local and landscape scales due to biological and behavioral differences (Beever 2003, pp. 888–890; Beever and Aldridge 2011, p. 273). Equids are generalists, but grasses comprise the majority of their diet throughout the year (McInnis and Vavra 1987, p. 61). Because of physiological differences, a horse forages longer and consumes 20 to 65 percent more forage than a cow of equivalent body mass (Wagner 1983, p. 121; Menard *et al.* 2002, p. 127). Unlike domestic cattle and other wild ungulates, equids can crop vegetation closer to the ground, potentially limiting or delaying recovery of plants (Menard *et al.* 2002, p. 127). Equids tend to move to higher elevations in late spring until early fall, which may increase the interactions with sage-grouse, as sage-grouse often move to higher elevation communities to more mesic habitats with forbs throughout the summer (Beever and Aldridge 2011, pp. 285–286). Conversely, equids tend to spend less time at water, and range farther from water sources than cattle (Beever and Aldridge 2011, p. 286). Because of these differences, greater habitat impacts occur when both horses and cattle are present, compared to when only cattle are present (Beever and Aldridge 2011, p. 286).

As with all herbivores, equid effects on ecosystems vary markedly with elevation, density, season, and duration of use (Beever and Aldridge 2011, p. 273). In some contexts, equid grazing can reduce shrub cover as equids trample, rub against, and consume shrubs (Plumb *et al.* 1984, p. 132; Beever *et al.* 2003, pp. 119–120; Beever *et al.* 2008, p. 180). Equid grazing has also been associated with reduced plant diversity, altered soil characteristics, lower grass cover, lower grass density, and 1.6 to 2.6 times greater abundance of cheatgrass (Beever *et al.* 2008, pp. 180–181). Sage-grouse need grass- and shrub-cover for protection from predators, particularly during nesting season (Connelly *et al.* 2000a, pp. 970–971). Reduction in shrub and grass cover can result in increased predation pressure on both nests and birds. The greatest risk of adverse effects to habitat occurs in the areas with large numbers of horses over AML; the area of greatest concern is Nevada (MZs III, IV, and V)

where free-roaming equid populations are estimated to be more than twice AML.

In addition to adverse effects in sagebrush habitats, free-roaming equids can also negatively affect important meadow and brood-rearing habitats that provide forbs and insects for chick survival (Beever and Aldridge 2011, p. 277; Crawford *et al.* 2004, p. 11; Connelly *et al.* 2004, p. 7–37), as streams and springs within sagebrush ecosystems receive heavy use by horses (Crane *et al.* 1997, p. 380; Beever and Brussard 2000, pp. 243, 246–247). Brood-rearing habitat is often limited in availability compared to other sage-grouse habitats; therefore, any impacts to these areas can adversely affect local populations (NRCS 2015a, p. 44).

Conservation Efforts

Wild Free-Roaming Horses and Burros Act of 1971—The Wild Free-Roaming Horses and Burros Act of 1971, as amended, charges the BLM and USFS with managing wild [free-roaming] equids to achieve a thriving ecological balance with the land (Pub. L. 92–195). The BLM and USFS manage free-roaming equids by conducting surveys, administering fertility control drugs, gathering excess horses, and facilitating adoptions (National Academy of Sciences 2013, pp. 55–73). The BLM plans gathers based on population estimates and vegetation monitoring, but takes into account issues such as areas where equids have moved onto private property or severe local conditions are affecting the health of the herd. The scheduled gathers may be influenced by court orders or emergency situations. Planned gather numbers are based on the available space in holding facilities, anticipated adoptions, and budgets (BLM 2015e, p. 1).

Management of herd size by Federal agencies is an ongoing challenge. Free-roaming equid populations grow rapidly, and in most areas, they have no natural predators (National Academy of Sciences 2013, p. 1). The Wild Free-Roaming Horses and Burros Act (Pub. L. 92–195) requires that free-roaming equid populations be managed at appropriate management levels, and allows for the removal of excess animals for adoption, sale, or destruction. Free-roaming equid management is expensive and often controversial, sometimes limiting options to manage free-roaming equids at appropriate levels (National Academy of Sciences 2013, pp. 1–2).

Federal Plans – The Federal Plans address the impacts of free-roaming equids by prioritizing management in areas most important for sage-grouse conservation (BLM and USFS 2015 entire). Management actions are prioritized for SFAs and PHMAs, and are managed for AML. Rangeland health assessments will be conducted in PHMAs and SFAs, and herd management area plans (HMAPs) will be amended to incorporate sage-grouse habitat objectives. The plans provide that, if needed to achieve AML and sage-grouse habitat objectives, gathers and population growth suppression techniques would be utilized in prioritized areas. Additionally, if needed, free-roaming equids would be removed or excluded from areas following emergencies, such as wildfire or drought. Further, monitoring and adaptive management criteria provide an additional layer of management to address species or habitat declines regardless of the sources of the impact. The BLM has committed to completing the actions within SFAs in the next 5 years; free-roaming equid management in PHMAs will be the next priority after SFAs (BLM 2015h, entire; DOI 2015a, p. 3).

The Federal Plans' direction to manage free-roaming equid populations at appropriate levels reduces impacts from free-roaming equids into the future. The inclusion of sage-grouse objectives in HMAPs ensures that future decision making is done with consideration of sage-grouse ecological needs. Managing SFAs and PHMAs at AML substantially reduces the potential for habitat degradation in those areas. Based on past BLM and USFS plans and planning efforts, we expect the Federal Plans, including these free-roaming equid measures to be implemented for the next 20 to 30 years.

Sheldon-Hart Mountain National Wildlife Refuge Complex—The Hart Mountain National Wildlife Refuge (NWR) removed free-roaming equids and cattle in the 1990s. Cattle were also removed from the Sheldon NWR in the 1990s. The last gather to remove all equids from Sheldon NWR occurred in the fall of 2014 (Collins, USFWS, pers. comm. 2015). Recovery of plant communities in sagebrush ecosystems, aspen woodlands, and riparian habitats have been documented since these removals (Earnst *et al.* 2012, entire; Davies *et al.* 2014, entire; Batchelor *et al.* 2015, entire). Together, free-roaming equid and livestock removals from Sheldon-Hart Mountain NWR have improved conditions for 9.1 percent of the sage-grouse modeled breeding habitat in MZ V. This area has been identified as important to long-term sage-grouse viability due to the high density of breeding birds and the connectivity to adjacent populations (USFWS 2014a, entire).

Candidate Conservation Agreements—CCAAs and CCAs, which together can cover up to about 1.4 million ha (3.5 million ac) in Oregon, include conservation measures for free-roaming equids. To date, approximately 745,000 ha (1.8 million ac) are currently enrolled in CCAAs rangewide. Measures include monitoring of free-roaming equid impacts in sage-grouse habitat and reporting to BLM for consideration of horse and burrow relocation (USFWS 2014d, p. 52; USFWS 2015b, p. 55; USFWS 2015c, p. 53; USFWS 2015d, p. 54; USFWS 2015e, p. 53; USFWS 2015f, p. 54). Although not regulatory in nature, these measures will assist BLM in their management of free-roaming equids.

Free-Roaming Equid Summary

In our 2010 finding, we reported that approximately 36,000 free-roaming equids occurred in 10 western States (including 2 States outside the range of sage-grouse) and HMAs/Territories occupied approximately 12 percent of the range of sage-grouse. The number of free-roaming equids has increased since 2010, with about half occurring in Nevada where estimated free-roaming equid population levels are twice AML. Since our 2010 finding, the Federal Plans provide a suite of actions that, with full implementation, will manage free-roaming equids to substantially reduce potential impacts to sage-grouse, as recommended by the COT Report (USFWS 2013, pp. 46–47). Some localized degradation of habitat will likely continue, particularly in Nevada, as implementation of these actions will take time. However, full implementation of the measures outlined in the Federal Plans will reduce impacts in the most important areas for sage-grouse (see *Sagebrush Landscape Conservation Planning* for a detailed discussion of conservation measure implementation and effectiveness). Important habitats that are designated as SFAs will receive priority management to reduce wild-equid population levels that can exist in the sagebrush ecosystem without adverse effects to sage-grouse habitats (BLM 2015h, entire). In addition, conservation efforts directed at these issues have been implemented on other lands since 2010, most notably the removal of horses from Sheldon NWR in 2014, which provides habitat for an important breeding bird stronghold. As a result, while some localized impacts to habitat are likely to continue in the near future, management measures by the BLM and USFS substantially reduce

the impact of free-roaming horses and burros across the range of the species.

Conifer Encroachment

In 2010, we evaluated the effect of pinyon juniper encroachment and concluded that it contributed to habitat fragmentation, particularly in the Great Basin portion of the range. Pinyon and juniper and some other native conifers were expanding due to decreased fire-return intervals, livestock grazing, and increases in global carbon dioxide concentrations associated with climate change, among other factors. The 2010 finding recognized the potential value of conifer removal treatments, particularly when done in the early stages of encroachment when sagebrush and forb understory is still intact (75 FR 13910, March 23, 2010).

Prior to 1860, two-thirds of the Great Basin was treeless and occupied by sagebrush ecosystems (Miller *et al.* 2008, p. 13), but since that time the extent of pinyon-juniper has increased ten-fold (Miller and Tausch 2001, pp. 15–16). Based on 1999–2012 imagery (LANDFIRE 1.3.0), approximately 4.7 million ha (more than 11.5 million ac) of conifer woodlands occur within the current range of sage-grouse, comprising more than 6 percent of the current occupied range. Conifer encroachment is of greatest concern in MZs III, IV, and V, but is present at least locally in all MZs (USFWS 2013, pp. 23–36).

Conifer expansion presents a stressor to sage-grouse because sites invaded by conifers do not provide suitable sage-grouse habitat (Factor A). For example, when juniper increases in mountain big sagebrush communities, shrub cover declines and the season of available succulent forbs is shortened due to soil moisture depletion (Crawford *et al.* 2004, p. 8). Sage-grouse have been found to avoid areas where conifers have encroached (Doherty *et al.* 2010b p. 1547; Casazza *et al.* 2011, p. 163; Baruch-Mordo *et al.* 2013, p. 239). Trees may also offer perch sites for avian predators, potentially increasing the predation risk (see *Predation,* below).

The extent of conifers within the species' range is anticipated to expand in the future unless effectively treated. Rangewide, 6 to 13 percent of sage-grouse habitat may be at risk of conifer encroachment (Manier *et al.* 2013, p. 92). The most pronounced risks are across the Great Basin (Manier *et al.* 2013, p. 92) where approximately 35 percent of sagebrush habitat is estimated to be at high risk of alteration by pinyon-juniper in 30 years, 6 percent at moderate risk, and 60 percent at low risk (Connelly *et al.* 2004, pp. 7–8 to 7–14). While pinyon-juniper expansion appears less problematic in the eastern portion of the range (MZs I, II and VII) and silver sagebrush communities (primarily MZ I), conifer encroachment is an impact mentioned in Wyoming, Montana, and Colorado State sage-grouse conservation plans, indicating that this is of some concern in these States as well (Stiver *et al.* 2006, pp. 2–23). Based upon current habitat information, approximately 10 percent of the occupied range in the Great Basin and 2 percent of the occupied range in the Rocky Mountains are impacted by conifer encroachment (USFWS 2015a). Efforts are under way to more precisely identify areas at risk of conifer encroachment; that information is currently unavailable, but will help target removal efforts in the future. Conifer encroachment rates have been estimated between 0.4 and 4.5 percent annually (Sankey and Germino 2008, p. 413). Encroachment rates are predicted to increase with long-term changes in climate (see Climate Change and Drought, below; Neilson *et al.* 2005 cited in Miller *et al.* 2011, p. 145).

Miller *et al.* (2005, p. 24) characterized three stages of woodland succession: Phase I, where conifer are present but shrubs and herbaceous species remain the dominant vegetation that influence ecological processes (*e.g.,* hydrologic, nutrient and energy cycles); Phase II, where conifer are co-dominant with shrubs and herbaceous species, resulting in modifications of ecological processes; and Phase III, where conifer becomes the dominant species, with reduced shrub canopy cover and herbaceous species diversity. Approximately 80 percent of sites invaded by conifers are still in Phase I and Phase II, where some native shrubs and bunchgrasses are present (Miller *et al.* 2008, p. 9). Transition of sagebrush habitats from Phase II to Phase III is of particular concern because treatment options become more limited in Phase III (Johnson and Miller 2006, p. 8). Without intervention, 75 percent of conifer encroachment in the western portion of the sage-grouse range may transition into Phase III within the next 30–50 years (Miller *et al.* 2008, p. 12).

Conservation Efforts

Since 2010, considerable effort has been undertaken to remove conifers, thus reducing the impacts of conifer encroachment to sage-grouse habitat. Federal Plans and State Plans provide commitments to reduce conifer encroachment. The SGI has been actively treating conifer encroachment on private lands across the species' range. Lastly, private land owners have pursued conifer removal projects, including commitments associated with enrollment in CCAAs.

The effectiveness of these current and planned treatments varies with the technique used and proximity of the site to invasive plant infestations, among other factors (Knick *et al.* 2014, p. 553). The plant-community response to these treatments is not always consistent or predictable, and succession may not move in a desirable direction following treatment (Miller *et al.* 2014, entire). Areas treated for conifers have the greatest likelihood of sage-grouse using them after treatment when implemented in areas still containing some sagebrush, near mesic habitats, and near sage-grouse populations (Cook 2015, p. 96). Sage-grouse appear to be more likely to use treated areas when suitable habitat is limited in an area (Frey *et al.* 2013, pp. 269–270). We are not aware of any study documenting a direct correlation between conifer treatments and sage-grouse population response. Successful treatment of conifers in the future requires targeted management of conifers in the most important habitats for sage-grouse.

Sage Grouse Initiative—Most of the conifer treatments completed to date have been accomplished on private lands by the SGI. Since 2010, SGI has removed conifers from 163,995 ha (405,241 ac) primarily in Phase I and II encroachment areas in the Great Basin (MZs III, IV, V) (NRCS 2015a, p. 7). Eighty-four percent of these treatments occurred in PACs in the Great Basin. Nearly half of these acres are in Oregon (MZ V), where conifer encroachment was reduced by 68 percent on private lands (NRCS 2015a, p. 2). The SGI in Oregon targeted conifer removal in PACs near active leks and other occupied seasonal habitats (NRCS 2015a, p. 18). SGI will invest an additional 80 million dollars over the next 3 years to implement restoration and enhancement projects on approximately 1.4 million ha (3.4 million ac), including conifer treatment projects (NRCS 2015a, p. 29; NRCS 2015b, p. 6). Given the past accomplishments and the continued dedication of NRCS to sage-grouse conservation, we are confident that these investments in conifer treatments will continue.

Candidate Conservation Agreements—Approximately 745,000 ha (1.8 million ac) are currently enrolled in CCAAs rangewide. Lands enrolled in CCAAs require removing undesirable conifers/junipers encroaching into sage-grouse habitats (USFWS 2014d, p. 47; USFWS 2015b, p. 50; USFWS 2015c, p. 48; USFWS 2015d, p. 49; USFWS 2015e, p. 48; USFWS 2015f, p. 49).

Federal Plans—The Federal Plans completed in 2015 include commitments to remove conifers through implementation of the FIAT. The FIAT assessments include treatment schedules for mechanical and prescribed fire removal. Conifer removal is prioritized in areas closest to occupied sage-grouse habitat and where juniper encroachment is in Phase I or Phase II. Cumulatively, the FIAT step-down assessments identify approximately 3 million ha (7.4 million ac) of conifer treatments for five priority landscapes (*i.e.,* Central Oregon, Northern Great Basin, Snake/Salmon/Beaverhead, Southern Great Basin, and Western Great Basin/Warm Springs Valley) in the Great Basin region (MZs III, IV, and V).

Conifer Encroachment Summary

The potential threat of conifer encroachment has changed since the last status review. In 2010, we found habitat fragmentation, due in part to conifer encroachment, to be a threat to the species; regulatory mechanisms and conservation efforts were insufficient to address this threat. Based on past trends and the current distribution of pinyon-juniper relative to sagebrush habitat, we anticipate that expansion will continue at varying rates across the landscape and cause further loss of sagebrush habitat. However, projects to remove conifers near sage-grouse habitat have been implemented for PACs, and regulatory measures included in Federal and State plans have resulted in a paradigm shift in land management objectives and practices that will further reduce conifer impacts on sage-grouse and sagebrush habitat. The Federal agencies have committed to continue conifer removal projects in the most important habitats identified in the COT Report (USFWS 2013, pp. 16–29) and the FIAT Assessments (BLM 2015a, entire). For a detailed discussion of conservation measure implementation and effectiveness, see *Sagebrush Landscape Conservation Planning*.

Mining

In 2010, we evaluated mining as part of the energy development assessment and concluded that energy projects contributed to habitat loss and fragmentation. Mining was identified as occurring across the species' range, but was most prevalent in Nevada (MZs III, IV, and V) and Wyoming (MZs I and II). At that time, regulations addressing effects from mining were determined to be inadequate. As a result, the 2010 finding concluded that habitat loss and fragmentation, caused in part by mining and inadequate regulatory mechanisms, were significant threats to the species such that listing was warranted under the Act (75 FR 13910; March 23, 2010).

Mining has occurred throughout the range of sage-grouse since the mid-1800s (Nevada Mining Association 2015), and mining in sagebrush habitats continues today (American Mining Association 2014). Mining is generally divided into three categories, based on the type of mineral extracted: Locatable, leasable, and salable minerals (BLM 2015f, p. 1). Additionally, each of these mining categories has its own specific regulations. Locatable minerals are hard rock minerals whose extraction is subject to the General Mining Law of 1872, such as gold, silver, and copper. Leasable minerals include resources such as coal, oil, and gas. Saleable minerals are more common, lower value resources, such as sand and gravel (BLM 2015f, p. 1). The extent of mining for any individual mineral varies widely, as does the size and activity of individual mines, making generalizations of impacts difficult.

Consistent with our 2010 finding (70 FR 13910, March 23, 2010, pp. 13948–13949), we do not have a comprehensive dataset about existing and proposed mining activity to do a quantitative analysis of potential impacts to sage-grouse. In 2010, we were aware of approximately 25,500 ha (63,000 ac) of existing mining-related disturbance within the range of sage-grouse; those mining projects and associated impacts are likely continuing today. These projects likely removed sagebrush habitat when first implemented (70 FR 13910, March 23, 2010, pp. 13948–13949) and continue to have indirect effects to sage-grouse populations near the project sites through disturbance from noise, human presence, equipment, and explosives (Moore and Mills 1977, entire). Overall, the extent of these projects directly affects less than 0.1 percent of the sage-grouse occupied range. Although direct and indirect effects may disturb local populations, ongoing mining operations do not affect the sage-grouse rangewide.

Currently, surface and subsurface mining activities are conducted in all 11 States within the sage-grouse range (Minerals Education Coalition 2015; National Mining Association 2014a BLM 2011, entire). Minerals are not distributed evenly across the sage-grouse landscape, and as a result, mining activities tend to be localized or regional. Coal is primarily found in the Rocky Mountain States, while lithium has been mined exclusively in Nevada (although a more recent discovery has been made in southwestern Wyoming) (Mining.com 2014). Precious metals, while being mined to some degree in all 11 States across the sage-grouse range, primarily occur in Nevada and Colorado (USGS 2013).

By reducing and fragmenting habitats and disturbing individual sage-grouse, mining can directly or indirectly affect sage-grouse. Surface and subsurface mining can reduce sagebrush habitat, ranging from potential losses of many thousands of hectares at large industrial mines to 4 ha (10 ac) or less at smaller mining operations (Factor A). Habitat loss and fragmentation could preclude movements of sage-grouse between seasonal habitats (Connelly *et al.* 2011a, pp. 82–83; Knick and Hanser 2011, entire). In addition, indirect effects associated with mining include disturbance from increased human presence, traffic, blasting, reduced air quality, noise, increased dust, and an increased abundance of human-associated predators (Factor E) (Moore and Mills 1977, entire; Brown and Clayton 2004, p. 2). Mining operations can also contaminate water sources in sage-grouse habitats (Moore and Mills 1977, pp. 115, 133; Adams and Picket 1998, p. 486; Ramirez and Rogers 2002, pp. 434–435). Settling ponds near mines could also provide breeding areas for mosquitos and increase the risk of WNv (Walker and Naugle 2011, p. 132).

Projections of future mining activities are difficult, as market prices for any specific mineral commodity vary greatly. The overall extent of mining activities in the United States has remained fairly consistent over the past 5 years (National Mining Association 2014b, p. 1), although coal production, including the number of coal mines, within the range of sage-grouse has generally declined since 2008 (EIA 2015, p. 93). We anticipate that some amount of mining will occur within the range of the sage-grouse indefinitely, depending on the extent of the desired mineral resource, development of new mining techniques, and market conditions. Conservation efforts are discussed below.

Conservation Efforts

Since 2010, a number of landscape-scale efforts have been undertaken to reduce impacts to sage-grouse across the range, including habitat loss and fragmentation from mining. The Federal Plans are the primary tools for managing mining impacts to sage-grouse. State plans in Wyoming and Montana include regulatory mechanisms to address impacts from mining. These conservation efforts are consistent with the recommendations in the COT Report (USFWS 2013, p. 49). The Federal and State plans, as well as individual efforts

reported to the CED, are discussed in detail below.

Federal Plans – In the United States, mining activity is authorized under an array of statutes affecting resources administered or leased by the BLM, both on federally administered lands as well as other lands where mineral rights have been reserved to the United States (*i.e.,* split-estate lands). The BLM's statutory and regulatory authority depends upon the nature of the mineral deposit (*i.e.,* leasable, salable, or locatable). The General Mining Law of 1872 called for all locatable mineral deposits on Federal lands to be free and open to exploration and purchase (BLM 2011c, p. 3), limiting the ability to manage these activities for sage-grouse conservation. Only areas that have been withdrawn to mineral entry by a special act of Congress, regulation, or Secretary of the Interior public land order are truly closed to locatable mineral entry. Coal is administered by the Office of Surface Mining Reclamation and Enforcement, which in turn may delegate their authority to the States.

The majority of mining activity within the sage-grouse range occurs on Federal lands where the Federal Plans direct the management of mineral development (BLM and USFS 2015, entire). Except in Wyoming, all PHMA is closed to new mineral material sales and leasable mineral operations, with exceptions for Free Use Permits and the expansion of existing operations. Free Use Permits allow governmental agencies and nonprofit organizations to extract and use mineral materials for up to 10 years (BLM 2013b, p. 1). Any proposed expansion of existing mining operations in PHMA would require design features to minimize impacts and would require mitigation of any impacts. Wyoming remains open to new mining activities within PACs, but those activities are restricted by a disturbance and density cap as per the Wyoming Plan (see *Wyoming State and Federal Plans,* above).

The Federal Plans designate the most important sagebrush habitat as SFAs where locatable mineral withdrawal is recommended, except in Wyoming where only a portion is recommended for withdrawal. For proposed coal projects, the BLM will determine at the time of a new lease if an area is suitable for development. During that evaluation, PHMA will be considered essential for sage-grouse conservation, ensuring that decisions are made with consideration of sage-grouse conservation needs. General sage-grouse habitats (GHMA) are open to mineral development, but are subject to stipulations designed to protect sage-grouse. In addition to these mining-specific measures, no discretionary anthropogenic activities in PHMA would be allowed to impact more than 3 percent (or 5 percent in Wyoming and Montana) of the total sage-grouse habitat within a Biologically Significant Unit (BSU). Any authorized activities that result in loss of sage-grouse habitat would require mitigation in an amount or manner that results in a net conservation benefit to the species. Further, in response to monitoring, activities allowable under the Federal Plans may be adjusted based on adaptive management criteria to provide an immediate, corrective response to identified triggers for population or habitat declines. Due to limitations explained above, the disturbance caps may have limited applicability to some types of mining activities, but do place limits on other disturbance if adaptive management triggers are exceeded.

These measures reduce potential mining impacts to sage-grouse on approximately 14 million ha (35 million ac) of PHMA. The restrictions on leasable and salable mining in PHMA eliminate nearly all potential habitat loss associated with those activities. To the limited extent those activities could occur in PHMA, design features would be required to minimize disturbance, and mitigation would be required for any impacts. The laws governing locatable mineral development and coal mining limit the ability to completely remove this threat from PHMA. Locatable mineral development is likely to continue in the future, but it is difficult to know the location or extent of future mining activity within the range of sage-grouse. The SFAs contain the habitats and populations most important to the long-term conservation of the species and needing protection from future mining impacts, and at this time we are currently unaware of planned mining activity in these areas that rise to the level of causing population-level impacts to sage-grouse.

Within the areas of greatest conservation importance (SFAs), DOI will recommend withdrawal from locatable mineral entry. We support the recommendations for mineral withdrawal in SFAs that would remove potential impacts on approximately 4 million ha (10 million ac) of sage-grouse habitat. In Wyoming, the BLM adopted the State strategy, which has proven to be effective in directing activities outside of habitat and limiting impacts when they do occur (see *State Plans,* below). These measures minimize mining impacts in priority habitats for the life of the management plans, estimated to be the next 20 to 30 years. Based on what we know today, no mining activities are likely to result in loss of these important areas for conservation, but we recognize that economic changes or technological advances may increase the risk of development in the future. Therefore, the long-term protection of the sage-grouse habitat in the SFAs from locatable mineral development will ensure that these important populations are conserved into the future.

State Plans – State plans in Wyoming and Montana include regulatory mechanisms that reduce impacts to sage-grouse from mining on applicable lands. The Wyoming and Montana Plans include controlled surface use, lek buffers, and seasonal and noise restrictions to reduce impacts in Core Areas (Montana EO 10–2014, pp. 14–19; Wyoming EO 2015–4, entire).

The States also implement Federal regulations for coal mining. Coal mining is regulated by the Surface Mining Control and Reclamation Act of 1977 (SMCRA), which is implemented by the Office of Surface Mining and Reclamation. This Federal law requires consideration of fish and wildlife resource information for the permit and adjacent area, along with a detailed analysis by the permittee on how impacts will be minimized or avoided. Permittees must also include a plan for enhancement of fish and wildlife resources on the permit area. The OSM has delegated the regulatory authority for implementing the SMCRA to five States within the range of sage-grouse: Wyoming, Montana, Utah, Colorado, and North Dakota. Sage-grouse, therefore, must be considered in the implementation of the SMCRA, and coal mining, in those States. The implementation agency must consider impacts on fish and wildlife, including sage-grouse. Sage-grouse are also typically addressed in all States within its range during the development of coal resources simply due to its status as a State trust resource.

Mining Summary

The impacts of mining have been reduced since the last status review. In 2010, we concluded that habitat fragmentation, due in part to mining, was a significant threat to the species, and regulatory mechanisms were not sufficient to address the threat. The scattered nature and intensity of mining, coupled with market uncertainty, makes it difficult to accurately predict impacts to sage-grouse on a rangewide basis. If future locatable mineral development occurred, it could have local impacts to leks and populations. This type of mining impact is most likely to occur in

Nevada where locatable mineral development has occurred the most historically; however, predictions of future mining activities would be speculative. The regulatory mechanisms in the Federal and State Plans will be effective in reducing potential mining impacts on State owned-lands, and in the case of Wyoming and Montana, in Core Areas. Controlled surface use directs activities outside of sage-grouse habitat to minimize the potential for habitat loss and fragmentation. Indirect impacts from human activity, noise, and traffic are reduced by lek buffers and seasonal and noise restrictions. When mining does occur, disturbance caps ensure that no more than 3 percent of the habitat in an area is impacted in most areas, and no more than 5 percent in Wyoming and Montana. Collectively, the Federal and State plans reduce impacts related to various types of mining on 90 percent of sage-grouse breeding habitat (see *Sagebrush Landscape Conservation Planning* for a detailed discussion of conservation measure implementation and effectiveness).

Renewable Energy

In 2010, we evaluated the impacts of renewable energy development (wind, solar, and geothermal) on sage-grouse, and concluded that it was a threat to the species (75 FR 13910, March 23, 2010, pp. 13949–13954). At that time, renewable energy development was increasing across the species' range, and regulatory mechanisms were inadequate to address impacts to the species.

Development of commercially viable renewable energy continues to increase across the sage-grouse range (EIA 2015, entire; DOE 2014, entire). Studies examining the impacts of renewable energy development on sage-grouse populations are limited. Renewable energy facilities typically require many of the same features for construction and operation as do nonrenewable energy resources, and, therefore, we anticipate their impacts will be similar. These include direct habitat loss and habitat fragmentation (Factor A) through construction and operation of an energy facility, and indirect effects resulting from the presence of power lines, human activity, introduction of invasive plants and novel predators, and noise (Connelly *et al.* 2004, pp. 7–40 to 7–41; Holloran 2005, p. 1; Pruett *et al.* 2009, p. 1258; Patricelli *et al.* 2013, p. 231; Howe *et al.* 2014, p. 46; see *Nonrenewable Energy, Mining,* and *Infrastructure*).

Given the incentives provided by the Energy Policy and Conservation Act, and State mandates, we anticipate the development of commercially viable renewable energy will continue into the future. However, since 2010, conservation efforts have been implemented to direct the location of development to reduce renewable energy impacts across the occupied range of the species. The potential future extent and impacts of the three primary kinds of renewable energy within the occupied range of sage-grouse (wind, solar, and geothermal) are discussed further below, as well as the conservation efforts that ameliorate the effects.

Wind

Wind energy development is facilitated by Federal and State energy laws and policies that encourage its development. In 2008, the DOE issued an initiative to increase wind energy production by 20 percent by 2030 (DOE 2014, entire). Idaho and California provide tax incentives and loan programs for renewable energy development (State of Idaho 2015; California Energy Commission 2015), and Colorado and Nevada have laws requiring increased renewable energy production (AFWA and USFWS 2007, p. 8; Nevada Public Utilities Commission 2015). With the advent of Federal tax credits for wind energy facilities, wind development increased 20 percent in 2013 (Esterly and Gelman 2013, p. 3).

The current amount of implemented wind development within the species' occupied range is low. A geospatial assessment of currently implemented projects reveals that, within the species' occupied range, about 1,400 ha (3,500 ac) have been impacted by wind energy development; these projects occur in MZs I, II, III, and IV and impact less than approximately 0.002 percent of the occupied range (USFWS 2015a). The BLM has issued several ROWs in support of continued and future wind development that may influence sage-grouse habitats, but actual development of these ROWs into commercial facilities is not certain (Manier *et al.* 2013, p. 61).

Wind energy has the potential for development throughout the sage-grouse's occupied range. The National Renewable Energy Laboratory has modeled and mapped the wind resources in each of the States and classified the potential for wind power generation. All MZs contain areas where wind resources have been identified as economically developable over the next 20 years. More than 14 percent of the sage-grouse occupied range has high potential for commercial wind power, with MZs I and II having the greatest potential (BLM 2005b, p. 5–103; NREL 2014, p. 2). In a separate assessment, the BLM estimated that 600 km^2 (232 mi^2) of BLM-administered lands could be developed within the sage-grouse's range before 2025 (BLM 2005b, pp. ES–8, 5–2). We are aware of four preliminary, planning-stage wind project proposals in Montana (MZ I) that may encroach into sage-grouse habitat (USFWS 2015a). Adverse impacts to sage-grouse could occur if these projects were implemented, but whether or not these proposals may be further refined, or even constructed, is unknown.

Wind development projects can have a variety of direct and indirect impacts to sage-grouse (LeBeau *et al.* 2014, entire). Habitat loss and fragmentation can occur from the construction of wind farms and associated facilities such as power lines, roads, power substations, meteorological towers, and work facilities (BLM 2005b, pp. 3.1–3.4). Sage-grouse, similar to other lekking birds, have been found to avoid human-made structures such as power lines and roads (*e.g.,* Holloran 2005, p. 1; Pruett *et al.* 2009, p. 1258). Wind power facilities may provide perches and subsidized food that attracts predators and increases predation on sage-grouse (LeBeau *et al.* 2014, p. 528). Noise from turbines or associated human activities may interfere with normal foraging, resting, and breeding behaviors and contribute to higher stress levels and reduced fitness (Patricelli *et al.* 2013, p. 231). Sage-grouse could be killed by flying into turbine rotors or towers (Erickson *et al.* 2001, entire), although reports of this happening are limited.

Solar

Like other forms of renewable energy, solar energy development has increased in recent years, but minimal activities have occurred within the range of sage-grouse. Currently, only two solar projects have been constructed within the range of sage-grouse, in Nevada and Oregon (USFWS 2015a). The primary impact from solar facilities is habitat loss due to the installation of solar panels and diversion of water to support the facilities (Manier *et al.* 2013, p. 66). However, at this time large-scale solar-generating systems have not contributed to any calculable direct habitat loss for sage-grouse.

Future impacts from solar energy development are forecast to be extremely limited. In 2012, the BLM assessed potential solar development on their lands within six western States (BLM 2012). That assessment provided direction to exclude solar development from identified sage-grouse habitat on BLM public lands in Nevada and Utah.

Future development on private lands is possible, but the best available information does not indicate that any large-scale solar projects are planned on private lands within the range of sage-grouse at this time.

Geothermal

Geothermal exploration and development activity on Federal lands has been sporadic, but activity has increased in recent years. Currently, four geothermal facilities have been constructed within the range of sage-grouse in MZs III and IV, totaling 57,384 ha (141,800 ac; Manier *et al.* 2013, p. 70). The BLM has approved several geothermal leases throughout MZs III, IV, and V and covering approximately 0.29 percent of the occupied range, but the potential of these leases being developed is unknown. Many of these leases have existing stipulations protecting sage-grouse seasonal habitats (BLM and USFS 2015, entire). No geothermal development has occurred in MZs I and II, although geothermal potential exists throughout these MZs (Manier *et al.* 2013, p. 70).

The greatest potential for future commercial geothermal energy development is within MZs III, IV, and V (EIA 2009, entire). Currently, approximately 1,800 km^2 (694 mi^2) of active geothermal leases exist on public lands primarily in the Southern (MZ IV) and Northern Great Basin (MZ III) (Knick *et al.* 2011, p. 245). However, it is unknown what portion of these leases will ever realize an operational geothermal project. Nevada is predicted to experience the greatest increase in geothermal growth across the United States (BLM and USFS 2008, pp. 2–35).

Impacts from geothermal energy development have not been studied, but are expected to be similar to oil and gas development (Manier *et al.* 2013, p. 70). Direct habitat loss could occur from development of well pads, structures, roads, pipelines, and transmission lines. Sage-grouse could be disturbed by human activity during installation and operation of geothermal projects (EIA 2009, entire). Water needed for installation and operation of geothermal facilities could deplete local water sources and potentially impact brood-rearing habitat.

Conservation Efforts

Since 2010, State and Federal agencies have worked collaboratively to develop regulatory mechanisms to reduce or eliminate the potential threat of new renewable energy development. The BLM and USFS amended or revised Federal Plans to restrict development in priority habitats. States developed and implemented State plans that govern development on State and private lands. These efforts are in addition to direction to conserve sage-grouse that was provided by wind, solar, and geothermal assessments conducted by the BLM.

Federal Plans – The Federal Plans substantially reduce potential impacts to sage-grouse from renewable energy development on more than half the species' occupied range. The Federal Plans generally exclude new utility-scale and commercial solar and wind developments on 14 million ha (35 million ac) of PHMA (BLM and USFS 2015, entire). Within the 13 million ha (32 million ac) of GHMA, renewable energy project locations are to be prioritized for development outside sage-grouse habitat. In addition, in Nevada, California, Utah, and Colorado, the Solar Energy Development Programmatic Environmental Impact Statement (EIS) (BLM 2012, entire) excludes solar development in sage-grouse habitat, protecting a majority of the habitat areas on BLM lands with solar potential. Based on a geospatial assessment of these measures, the Federal Plans reduce the percentage of modeled breeding habitat potentially impacted by solar development from 15 percent to less than 1 percent and by wind development from 42 percent to 6 percent.

For geothermal projects, NSO is required in the 14 million ha (35 million ac) of PHMA for all States except Nevada and Wyoming. In Nevada, limited geothermal development could occur on Federal lands if it is determined that sage-grouse will not be impacted (BLM and USFS 2015, entire). In Wyoming, geothermal projects are subject to use restrictions including disturbance caps. Geothermal projects are allowed in GHMA, with measures such as timing limitations to minimize impacts. Priority will be given first to leasing and authorizing developing geothermal projects outside of PHMA and GHMA, then to non-habitat areas within PHMA and GHMA, and lastly to the least suitable sage-grouse habitat. Based upon a geospatial assessment of the land uses, the Plans reduce the percentage of breeding habitat potentially impacted by geothermal development from 33 percent to 4 percent (USFWS 2015a).

State Plans – Three State Plans provide regulatory mechanisms that effectively reduce impacts from renewable energy development in that State. In Wyoming, the Wyoming Plan does not allow wind energy development, the primary type of renewable energy pursued in Wyoming, in Core Areas, effectively removing this potential threat on approximately 6 million ha (15 million acres) of important sage-grouse habitat. Since 2007, Wyoming has denied 27 lease applications for wind development on State trust lands due to this restriction in Core Areas. On State lands or where State authorizations are required, Montana's Plan requires avoidance of wind development in Core Areas and recommends no such development within 4 miles of active leks in general habitat (unless best available science demonstrates there will be no decline in sage-grouse populations) (Montana EO 10–2014, pp. 18, 19, 21). Oregon's Plan requires avoidance, minimization, and compensatory mitigation actions for development in sage-grouse habitat on State and private land and, in conjunction with BLM's Federal Plan, caps the amount of disturbance on sage-grouse core habitat to 3 percent per PAC (Oregon OAR 635–140–0025, entire; and Oregon OAR 660–023–0115, entire).

Renewable Energy Summary

In 2010, renewable energy was identified as a potential contributor to habitat fragmentation, and we concluded that regulatory mechanisms were not sufficient to address the threat in the future. Since 2010, regulatory mechanisms provided by Federal Plans and Wyoming, Montana, and Oregon Plans that eliminate or restrict most new renewable energy development in important sagebrush habitats substantially reduce this potential impact on approximately 90 percent of the sage-grouse breeding habitat. Some renewable energy development will occur in the future, primarily on private land or in GHMA, but it is impossible at this time to predict if, where, or how much development could occur. Avoidance and minimization measures included in the Wyoming, Montana, and Oregon Plans and the Federal Plans would reduce potential impacts if those projects did occur (see *Sagebrush Landscape Conservation Planning* for a detailed discussion of conservation measure implementation and effectiveness), consistent with recommendations in the COT Report (USFWS 2013, pp. 43–44). Based on previous land use planning efforts, we expect these regulatory measures to be in place for the next 20 to 30 years.

Urban and Exurban Development

In 2010, we evaluated the impact of urban and exurban development together with agricultural conversion and infrastructure, and determined that collectively those land uses were contributing to habitat fragmentation (75 FR 13910, March 23, 2010, p. 13931).

Furthermore, the 2010 finding concluded that habitat fragmentation and inadequate regulatory mechanisms were threats to the species such that listing was warranted under the Act (75 FR 13910, March 23, 2010).

Impacts from European settlement began in the southwestern portion of the sage-grouse range (MZ III) as early as the 1600s and were widespread in the northern portion of the range by the mid-1800s (Schroeder *et al.* 2004, pp. 371–372). Today, urban and exurban development are part of the human footprint on the landscape along with other anthropogenic features, such as roads and power lines (Leu *et al.* 2008, p. 1119; Bar-Massada *et al.* 2014, p. 429). We consider urban areas to be those areas that are densely developed residential, commercial, and industrial built-up areas (U.S. Census Bureau 2012, p. 1) and typically have a housing density of more than one unit per 0.4 ha (more than one unit per ac) (Brown *et al.* 2005, p. 1853). Exurban development includes both development at the fringe of urban areas and rural residential development, typically with a housing density of one unit per 0.4 to 16 ha (1 to 40 ac) (Brown *et al.* 2005, p. 1853). Exurban development has been one of the fastest growing land uses in the United States in recent years (Hansen *et al.* 2005, pp. 1893–1894; Theobald 2005, p. 1).

Most urban development is at the edge of the sage-grouse range while exurban development is scattered throughout the range, though limited to private lands (Connelly *et al.* 2004, p. 7–25; Knick *et al.* 2011, p. 212). Major urban areas include the Columbia River Valley in Washington (MZ VI), the Snake River Valley in Idaho (MZ IV), and the Bear River Valley in Utah (MZ II) (Connelly *et al.* 2004, p. 7–25). Using the information in Theobald 2014 (entire), we completed a geospatial assessment of 2010 Census data and estimated that urban and exurban development directly affects less than 1 percent of the sage-grouse occupied range. Indirect areas of influence related to increased predator impacts may extend up to 3.0 km (1.86 mi) from these direct footprints (Bui *et al.* 2010, p. 65). Factoring in these indirect effects, urban and exurban development could influence approximately 12.4 percent of the sage-grouse's occupied range. Since human population data only considers primary residences, the impact of exurban development in rural areas, especially areas affected by seasonal and recreational use, is likely underestimated (Brown *et al.* 2005, p. 1852).

Urban development affects sage-grouse habitat through the removal of vegetation and subsequent construction of buildings and associated infrastructure (Factor A; Knick *et al.* 2011, p. 217). In contrast to urban areas, exurban areas may continue to provide some sagebrush habitat, but it is typically less suitable due to associated anthropogenic disturbances (Connelly *et al.* 2004, p. 7–26). Both urban and exurban development can result in an increase in predation from pets and novel predators typically associated with humans (*e.g.,* ravens, skunks [*Mephitis mephitis*], fox), invasive plants, and recreation impacts. Noise associated with urban and exurban development may also affect breeding activity and other sage-grouse behavior (Factor E); however, little information is available that assesses this impact relative to urban activities (Blickley *et al.* 2012, p. 470). Sage-grouse avoid human development for nesting and brood-rearing (Aldridge and Boyce 2007, p. 508). Approximately 99 percent of active leks are in landscapes with less than 3 percent developed lands; whereas inactive leks have more than 25 times the development and human density of active leks (Wisdom *et al.* 2011, p. 462; Knick *et al.* 2013, p. 1547). Sage-grouse extirpation was determined to be most likely in areas that had a human population density of at least four persons per 100 ha (four persons per 0.01 km^2 or 247 ac) (Aldridge *et al.* 2008, pp. 983 and 991).

Human populations have increased in size and spatial extent over the past century, particularly in the western portion of the sagebrush biome (Stiver *et al.* 2006, Appendix C–2; Torregrosa and Devoe 2008, p. 10). Between 2000 and 2039, the U.S. population is projected to increase by 29 percent, with much of that increase likely to happen in western States (Torregrosa and Devoe 2008, p. 10). The areas of the species' occupied range at highest risk of development are private lands along the southeastern, southwestern, and southern portions of the species' range, and south of the Snake River, and in the Columbia Basin (USFWS 2013, pp. 16–29). If these projected population increases occur, the human footprint from development and resultant impacts will also increase, leading to additional habitat loss and fragmentation in those areas. Over half of the sage-grouse's occupied range is on federally owned lands that are not at risk of urban and exurban development. Nonetheless, development on adjacent private lands could have indirect impacts, as discussed above.

Conservation Efforts

Avoiding or minimizing additional urban and exurban development in sage-grouse habitats requires identifying habitats most at risk to development, developing and implementing land policies to acquire, maintain, or enhance habitat, and promoting ecologically sustainable private lands and ranches in sage-grouse habitat (Stiver *et al.* 2006, p. 33). Because urban and exurban development occurs primarily on private lands, conservation efforts focused on private land management, such as CCAAs and SGI, are most effective in ameliorating this impact.

Candidate Conservation Agreements – CCAAs are an effective tool for eliminating future development on private lands within the occupied range of sage-grouse. This outcome is because landowners enrolled in sage-grouse CCAAs have agreed not to pursue subdivision of rangeland, new building construction, or other new associated infrastructure. To date, all private lands within the species' range in Oregon and Wyoming are potentially covered by CCAAs; approximately 745,000 ha (1.8 million ac) have landowner commitments, effectively removing the risk of urban and exurban development in these areas.

Sage Grouse Initiative – Conservation easements are voluntary agreements between a landowner and with a land trust, the NRCS, or other organizations or agencies that maintain the land in private ownership with development restrictions that are typically permanent. Conservation easements can permanently protect sagebrush habitat from subdivision while providing compensation to landowners. The NRCS, through implementation of the SGI, has entered approximately 182,870 ha (451,884 ac) into conservation easements through fiscal year 2013 (NRCS 2015a, p. 38). Most easements for sage-grouse are located inside PACs (79 percent), and 94 percent of them provide permanent protection from future development.

State Plans – The Montana, Wyoming, and Oregon Plans include measures to address urban and exurban development. The Montana Plan regulates habitat loss due to urbanization on State lands and on private lands if a project needs an authorization from the State. The Montana Plan includes seasonal, timing, and noise restrictions; disturbance caps; lek buffers; and other conservation measures to reduce the potential threat of urbanization (Montana EO 10–2014, pp. 13–21). The Wyoming Plan includes

disturbances from exurban and urban development in calculations of their disturbance caps, which are used to limit overall disturbance in Core Areas. Oregon's State regulations require cities and counties to avoid sage-grouse habitat when amending land use planning designations that could increase opportunities for urban and exurban development or when making changes to their codes that may affect sage-grouse habitat. To the extent that urban and exurban development were to occur, it also would be subject to regulations (requiring avoidance, minimization, and compensatory mitigation) and a cap on the amount of disturbance on sage-grouse core habitat to 3 percent per PAC (Oregon OAR 635–140–0025, entire; and Oregon OAR 660–023–0115, entire).

Federal Plans – Lands administered by the BLM and USFS are not directly affected by urban and exurban development, as those agencies are not authorized to permit those land uses. The Federal Plans require that any PHMAs and GHMAs be retained in Federal management, thus preventing transfer to private landownership that could result in urban or exurban development. Limited exceptions to this provision could be allowed if transfer of land ownership would benefit sage-grouse or not cause any adverse effects. As a result of the Federal land ownership and limitations on transference provided by the Federal Plans, the risk of urban and exurban development is reduced on approximately 90 percent of the breeding habitat across the species' range.

Summary of Urban and Exurban Development

The 2010 finding concluded that growing human populations and associated urban and exurban development were adversely affecting sage-grouse. Urban and exurban development is expected to continue to affect sagebrush habitat throughout the sage-grouse range, causing localized impacts to individuals and populations. The impacts are not anticipated to occur evenly across the range; they are expected to occur primarily upon private lands and likely near existing developed areas as populations expand. Fifty-three percent of the occupied range is on federally owned lands where urban and exurban development is unlikely to occur, although associated infrastructure and indirect effects are possible. Existing urban and exurban development will continue to affect sagebrush habitat at many locations scattered throughout the sage-grouse's range, causing impacts to individuals or populations. Substantial private land conservation efforts that are consistent with the recommendations of the COT Report (USFWS 2013, pp. 50–51), including SGI's completion of more than 182,870 ha (451,884 ac) of conservation easements, have minimized potential impacts of new development throughout the range.

Recreation

In 2010, we evaluated the effect of recreation on sage-grouse and concluded that it was not a threat to the species (75 FR 13910, March 23, 2010, pp. 13984–13985). We have no new information at this time to change the conclusion that recreation is not a threat to the species. Recreational hunting of sage-grouse is discussed in another section (see, *Hunting*) and is not discussed in this section.

Recreational activities occur across the range of the species (42 of the 48 sage-grouse populations; USFWS 2013, pp. 16–29), but are of limited severity and typically concentrated in specific, designated areas, such as trails and campgrounds. Recreational activities include hiking, camping, fishing, horseback riding, mountain biking, off-highway vehicle use, and wildlife viewing (Ouren *et al.* 2007, p. 2; Ibrahim and Cordes 2008, p. 14; Knight 2009, p. 167; NDOW 2014, p. 1). The majority (72 percent) of recreational visits to BLM-administered lands occurred in areas not containing sagebrush (ECONorthwest 2014, p. 13), indicating that sage-grouse habitat may be affected less frequently by recreation than other areas. Little information exists about the level of impacts that may be occurring from recreational activities (ECONorthwest 2014, p. 13); however, off-highway vehicle impacts to sage-grouse habitat have been reported in a few areas in Oregon (Hagen 2011, pp. 197–198). Impacts have also been reported at leks in Oregon and Nevada, where regular lek viewing has caused disturbance (Budeau, Oregon Department of Fish and Wildlife, 2014a, pers. comm.; Espinosa, Nevada Department of Wildlife, 2014a, pers. comm).

Though limited in extent and frequency, recreational activities can have a variety of direct and indirect effects to sage-grouse. Although rare, people can crush eggs or strike birds with vehicles (Factor E) (Connelly *et al.* 2000b, p. 228; Wiechman 2013, p. 12). Activities could degrade habitat, introduce invasive plants, or increase wildfire risk (Factor A) (NWCG 1999, pp. 6–7, Ouren *et al.* 2007, p. 16; Knick *et al.* 2011, p. 219). Noise and movement associated with recreational activity may disrupt sage-grouse behavior or movement patterns (Factor E) (Blickley *et al.* 2012, pp. 467–470, Patricelli *et al.* 2013, p. 242). Predation (Factor C) may increase due to increases in trash associated with recreational activities or due to the presence of pets accompanying humans (Knick *et al.* 2011 p. 219; Young *et al.* 2011, pp. 126–127).

Given the limited data about recreational activities occurring in sage-grouse habitat, it is difficult to accurately predict future impacts on sage-grouse throughout the range. However, based on historical and current trends, recreational activities are likely to continue on the landscape indefinitely. Recreational activities may increase over time in correlation to predicted increases in human populations.

Conservation Efforts

Federal Plans—The Federal Plans include conservation measures consistent with the COT Report recommendations (USFWS 2013, p. 50) to reduce recreation impacts (BLM and USFS 2015, entire). The Federal Plans exclude new recreational facilities in PHMA, with limited exceptions when needed for safety or when beneficial to sage-grouse. Off-highway vehicle travel will be limited to existing routes and trails and that have neutral or net positive impacts on sage-grouse in PHMA and GHMA. Additional measures to minimize potential impacts that might result from development of recreational facilities and infrastructure include seasonal and timing restrictions, lek buffers, disturbance caps, and mitigation.

State Plans—The Montana State Plan includes conservation measures, such as seasonal and noise restrictions and lek buffers, to reduce impacts from new recreation facilities on State lands and private lands where State authorization is required (Montana E.O. 10–2014, pp. 4, 13–21). In addition, most States discourage recreational viewing of sage-grouse during the breeding season and do not provide lek locations to the general public (Budeau, Oregon Department of Fish and Wildlife 2014a, pers. comm.; Robinson, North Dakota Game and Fish Department, 2014a, pers. comm.; Schroeder, Washington Department of Fish and Wildlife 2014, pers. comm.; Wightman, Montana Fish, Wildlife, and Parks 2014a, pers. comm.). In addition, Wyoming and Washington have measures to minimize impacts from recreational lek viewing, including wildlife harassment laws (Christiansen, Wyoming Game and Fish Department,

2014a, pers. comm.; Schroeder, Washington Department of Fish and Wildlife, 2014, pers. comm).

Summary of Recreation

In the 2010 finding, we concluded that recreation was not a threat to the species. No additional evidence has been discovered or presented suggesting that recreational activities or the associated impacts have changed since the 2010 finding. Recreation continues to be an activity that occurs sporadically across the range of the species, with some localized impacts, but no population-level effects to the species. Together, the Federal Plans and Wyoming, Montana, and Oregon State Plans reduce impacts from recreation to the areas identified as PHMA and GHMA, which encompass approximately 90 percent of the modeled breeding habitat across the species' range (see *Sagebrush Landscape Conservation Planning* for a detailed discussion of conservation measure implementation and effectiveness). Therefore, we conclude that recreation is not a threat to the species, now or in the future.

Climate Change and Drought

In 2010, we evaluated the effect of climate change and drought on sage-grouse (75 FR 13910; March 23, 2010; pp. 13954–13957). While the direct impact of climate change on sage-grouse was unknown, we found climate change to be intensifying other threats such as fire and invasive species. We found drought not to be a substantial threat to the species across its range.

Climate Change

Our analysis of impacts to sage-grouse attributable to climate change includes the consideration of ongoing and projected changes in climate across the sage-grouse's range. The terms ''climate'' and ''climate change'' are defined by the Intergovernmental Panel on Climate Change (IPCC). ''Climate'' refers to the mean and variability of different types of weather conditions over time, with 30 years being a typical period for such measurements, although shorter or longer periods also may be used (IPCC 2007, p. 78). The term ''climate change'' thus refers to a change in the mean or variability of one or more measures of climate (*e.g.,* temperature or precipitation) that persists for an extended period, typically decades or longer, whether the change is due to natural variability, human activity, or both (IPCC 2007, p. 78). Various types of changes in climate can have direct or indirect effects on species. These effects may be positive, neutral, or negative, and they may change over time, depending on the species and other relevant considerations, such as the effects of interactions of climate with other variables (*e.g.,* habitat fragmentation) (IPCC 2007, pp. 8–19). In seeking to evaluate the potential impacts of climate change on sage-grouse, we have weighed relevant information, including areas of uncertainty, together with our understanding of sage-grouse biology and ecology.

Increases in global and regional ambient temperature and variable changes in precipitation are projected out to the end of the 21st century (IPCC 2013, p. 19). Some degree of uncertainty is inherent in these and other projections of future change; however, climate change will likely affect to some degree the entire range of sage-grouse, with the greatest potential adverse impacts occurring in the southern Great Basin (Schlaepfer *et al.* 2011, p. 380).

Direct impacts of climate on individual birds are unknown for most species, including sage-grouse (Factor E), but climate is likely to influence the distribution and quality of sage-grouse habitat (Factor A) (Miller *et al.* 2011, pp. 174–179, Gardali *et al.* 2012, p. 3). The natural distribution of sagebrush is driven by soil-water availability (Schlaepfer *et al.* 2014, p. 349; Schlaepfer *et al.* 2015, pp. 7–8), which is influenced by the amount and seasonality of precipitation and by temperature (Bradford *et al.* 2014, p. 595). Changes in precipitation timing and increases in ambient temperature are projected to lead to increased evaporation and transpiration in sagebrush habitat and a lengthening summer period of dry soil conditions (Bradford *et al.* 2014, p. 599). These conditions are projected to be most pronounced along the southern edge of the current distribution of sagebrush (MZs III and VII), and particularly at low elevations (Schlaepfer *et al.* 2015, p. 13; Still and Richardson 2015, p. 33). In these areas, climate change may result in northward and upslope shifts in frost-sensitive woodland vegetation into areas currently suitable for sagebrush (Neilson *et al.* 2005, pp. 153–155; Comer *et al.* 2012, p. 142; reviewed in Friggens *et al.* 2012, pp. 8–11; Rehfeldt *et al.* 2012, p. 126), potentially altering, or displacing sagebrush habitat. It is unknown to what extent these changes could result in habitat loss and fragmentation, but adverse effects to populations could occur if habitat loss exacerbates impacts from other stressors (Johnson *et al.* 2011, pp. 447–450; Miller *et al.* 2011, pp. 183–184; Wisdom *et al.* 2011, pp. 465–468).

Beyond affecting sagebrush directly, the effects of climate change can interact with and increase effects from other stressors (Chambers *et al.* 2014c, p. 368), such as invasive plants, drought, and wildfire. For example, cheatgrass grows best with wet and warm conditions, so increasing temperature coupled with increased winter and spring precipitation is likely to facilitate its spread (Balch *et al.* 2013, p. 174). Combined, these stressors could have additive impacts to sagebrush habitat (Bradford *et al.* 2014, p. 599; Chambers *et al.* 2014c, entire) as discussed further in *Cumulative Effects.* Climate change is likely to shift the distribution of sagebrush at the southernmost extent of the species' range, including areas in MZ III (Schlaepfer *et al.* 2011, p. 380). Any other effects of climate change are unknown at this time, and the extent of potential cumulative effects is also unknown.

Drought

Drought is a natural, periodic occurrence throughout the range of the sage-grouse. Large-scale drought lasting a decade, similar to the 1930s Dust Bowl drought, has occurred once or twice per century on average (Woodhouse and Overpeck 1998, p. 2706; Ault *et al.* 2014, p. 7529), and periodic drought regularly influences sagebrush ecosystems (Bar-Massa *et al.* 2006, p. 1; Miller *et al.* 2011, p. 145; Miller *et al.* 2011, p. 145). In the future, certain portions of the range (MZs I and VI and portions of MZs II and IV) are forecast to have increased risk and higher severity of drought, though the entire range will likely be affected (Cook 2015, p. 6).

Drought impacts to sage-grouse habitat may affect adult survival, nesting success, and chick survival (Factor A). Structural composition of plants vital for sustaining sage-grouse nesting success, including plant height and percent plant cover, may be affected during drought (Hanf *et al.* 1994, p. 41). Decreases in insects and forbs important for sage-grouse chick survival during drought may negatively affect sage-grouse populations (Johnson and Boyce 1990, p. 91; Crawford *et al.* 2004, p. 6; Aldridge and Bridgham 2003, p. 31; Fischer *et al.* 1996, p. 197). Drought has been correlated with declines in populations (Patterson 1952, p. 33; Braun 1998, p. 139) and has coincided with periods of low population levels (Connelly and Braun 1997, pp. 231–232). In the period 1950–2003, drought had a weak negative effect on sage-grouse persistence, with extirpation most likely in areas having three or

more severe droughts per decade (Aldridge *et al.* 2008, pp. 983, 992).

Based on precipitation and temperature projections, drought frequencies are expected to increase across the country, especially in the Rocky Mountain and southwestern States, including all sage-grouse MZs (Strzepek *et al.* 2010, p. 1).

The risk of decade-scale drought occurring within the southern MZs within the sage-grouse range (MZs III, V, and VII and portions of MZs II and IV) this century is estimated between 20 and 70 percent (Ault *et al.* 2014, pp. 7541–7542). The probability of decade-scale drought in the northern MZs (MZs I and VI and portions of MZs II and IV) is between 10 and 50 percent (Ault *et al.* 2014, pp. 7541–7542).

Conservation Efforts

Ameliorating the impacts of climate change and drought to sage-grouse involves addressing other impacts to the species to improve the resilience of the species and its sagebrush habitat under changing environmental conditions. Maintaining large expanses of undisturbed habitat is the best way to address potential impacts that could lead to habitat fragmentation; as discussed in other impacts sections and *Sagebrush Landscape Conservation Planning,* new regulatory mechanisms and conservation efforts are in place to address those potential impacts. In addition, many conservation actions have been implemented to address those other impacts that are most influenced by climate change and drought, such as wildfire, invasive plants, improper grazing, and conifer encroachment. Full discussions of the best management practices, conservation efforts, and regulatory mechanisms associated with these compounding impacts are included under each impact section in *Summary of Information Pertaining to the Five Factors.*

Climate Change and Drought Summary

The understanding of impacts from climate change and drought has not changed substantially from the 2010 finding. Climate change effects on the timing and amount of precipitation could adversely affect sagebrush habitat and food availability, with potential negative consequences for sage-grouse survival and recruitment; however, the extent and nature of this potential impact is not understood. Drought is a natural part of the sagebrush ecosystem, and sage-grouse abundance has been shown to fluctuate in correlation to drought conditions. Climate change and drought are most likely to affect individuals and populations at the southern extent of the species' range; however, the extent or nature of those effects to sage-grouse are unknown at this time. The greatest concern from climate change and drought is their potential to increase wildfire and invasive plant impacts in the Great Basin. If hotter and drier conditions lead to increased burn rates, then increased habitat loss due to wildfire could be predicted (see *Wildfire and Invasive Plant*s, above); however, the extent to which climate change and drought may change burn rates is unknown. Therefore, based on the best available information, climate change and drought are not threats to sage-grouse, now or in the future.

Predation

In 2010, we evaluated the effect of predation on sage-grouse and concluded that predation was not a threat to the species (75 FR 13910, March 23, 2010, p. 13973). We concluded that landscape fragmentation is likely contributing to increased predation on sage-grouse. However, except in localized areas where habitat is compromised, we found no evidence to suggest that predation is limiting sage-grouse populations rangewide. New information developed since that time does not alter our conclusion.

Predation (Factor C) is the most commonly identified cause of direct mortality for sage-grouse during all life stages (Blomberg *et al.* 2013b, p. 347; Caudill *et al.* 2014, p. 808). Rangewide, sage-grouse are exposed to a number of different predators, including raptors, small mammals, and snakes (Schroeder *et al.* 1999, pp. 10–11; Coates *et al.* 2008 pp. 424–425; Lockyer *et al.* 2013, p. 248). However, sage-grouse have co-evolved with their predators, resulting in the development of cryptic plumage and behavioral adaptations that have allowed them to persist despite this mortality factor (Coates and Delehanty 2008, p. 635; Hagen 2011, p. 96). Sage-grouse mortality rates due to predation vary widely by location and time of year, and short-term studies are often not representative of population dynamics for the species across the range (Taylor *et al.* 2012b, p. 337).

The habitat fragmentation and development that began across the sagebrush ecosystem in the late 19th century (see *Habitat Fragmentation,* above) has caused predator dynamics to change (Fichter and Williams 1967, p. 225; Baxter *et al.* 2007, p. 266; Coates and Delehanty 2010, p. 240). Decreased habitat quality and quantity has created a situation in which the sage-grouse are more vulnerable to predation (Connelly *et al.* 1991, p. 524; Coates 2007, pp. 38–39; Hagen 2011, p. 96). Agricultural development, landscape fragmentation, and encroaching human populations may increase the diversity and density of predators (Summers *et al.* 2004, p. 523; Coates and Delehanty 2010, p. 246; Dinkins *et al.* 2014, p. 639). Degraded and fragmented landscapes can benefit predators by increasing their kill efficiency, as well as subsidizing their food and nest or den substrate (Hagen 2011, p. 100). The abundance of red foxes (*Vulpes vulpes*), raccoons (*Procyon lotor*), crows (*Corvus brachyrhynchos*), and ravens, which historically were rare in the sagebrush landscape, has increased in association with human-altered landscapes (Luginbuhl *et al.* 2001, p. 570). Raven abundance has increased as much as 1,500 percent in some areas of western North America since the 1960s (Coates and Delehanty 2010, p. 244). Several studies have documented negative effects to sage-grouse associated with increased corvid populations (corvids are a group of birds that include ravens, crows, magpies (*Pica* spp.), and jays) (Holloran 2005, p. 58; Coates 2007, p. 130; Conover *et al.* 2010, p. 335; Lockyer *et al.* 2013, p. 242; Coates *et al.* 2014, pp. 73–74; Howe *et al.* 2014, p. 36). Ravens may prefer certain sage-grouse habitats, such as big sagebrush communities and wet meadows, and the abundance of ravens may increase near livestock grazing and agriculture (Coates *et al.,* in press).

High predator abundance within a sage-grouse nesting area may negatively affect sage-grouse productivity without causing direct mortality. The increase in the numbers of corvids within the sagebrush ecosystem is an important change because sage-grouse nests are at greater risk of predation by these visual predators (Conover *et al.* 2010, p. 335). Even low but consistent raven presence can influence sage-grouse reproductive behavior (Bui 2009, p. 32; Dinkins *et al.* 2012, p. 606). Sage-grouse females tend to select nest and brood-rearing locations that are farther away from predator perches and have lower densities of avian predators (Dinkins *et al.* 2012, p. 606; Dinkins *et al.* 2014, p. 637). When nesting in areas with relatively higher abundances of ravens, females reduce the amount of time they spend off their nests, potentially compromising their ability to secure sufficient nutrition to complete the incubation period (Coates and Delehanty 2008, p. 636).

Data are lacking that definitively link sage-grouse population trends with predator abundance. At the rangewide scale, predation is not believed to be a widespread factor limiting sage-grouse

population growth (Connelly *et al.* 2000a, p. 975; Connelly *et al.* 2004, p. 10–1). However, in localized areas where habitat is compromised by human activities, predation could be limiting local sage-grouse populations (Coates 2007, p. 131; Bui 2009, p. 33; Lockyer *et al.* 2013, p. 242). Holloran (2005, p. 58) attributed increased sage-grouse nest depredation to high corvid abundances in western Wyoming, which resulted from anthropogenic food and perching subsidies in areas of natural gas development. Mammalian predators and ravens are suspected of causing sage-grouse population decline and extirpation in Washington (Schroeder *et al.* 2014, p. 10). Raven abundance was also strongly associated with sage-grouse nest failure in Nevada, resulting in negative effects on sage-grouse reproduction (Coates 2007, p. 130; Lockyer *et al.* 2013, p. 242). Studies on increasing raven populations have also been recently conducted in Idaho (Coates *et al.* 2014, entire; Howe *et al.* 2014, entire) and central Utah (Conover *et al.* 2010, entire).

Since 2010, conservation efforts have been implemented to address predation and associated impacts. Conservation measures can limit the effects of predation by preventing habitat fragmentation caused by transmission lines, roads, and nonnative vegetation (Howe *et al.* 2014, p. 46). As discussed in other sections of this finding, regulatory measures provided by the Federal Plans and certain State Plans limit new development within important sage-grouse habitat, thus reducing habitat fragmentation that facilitates increased predation (see *Nonrenewable Energy Development, Mining, Renewable Energy,* and *Urban and Exurban Development*). Measures to remove predator perches or subsidized food sources could minimize effects, but predator removal programs have not yet proven to be effective, as predator populations quickly rebound without continual control (Coates 2007, p 152; Hagen 2011, p. 99).

In summary, predation was identified as a potential threat in the 2010 finding and will likely continue to have adverse impacts to local populations, particularly in areas where habitat fragmentation has occurred. Mortality due to nest predation by ravens or other human-subsidized predators is increasing in some areas (*e.g.,* in MZs III, VI, and VII), at times causing local population declines, and in extreme cases, local extirpations. However, information about the rangewide extent of predation is limited and there is no indication that predation is causing a rangewide decline in population trends. Since the 2010 finding, regulatory mechanisms from Federal Plans and Wyoming, Montana, and Oregon State Plans have been implemented that limit additional future habitat loss and fragmentation to the areas identified as PHMA and GHMA which encompass approximately 90 percent of the modeled breeding habitat across the species' range (see *Sagebrush Landscape Conservation Planning* for a detailed discussion of conservation measure implementation and effectiveness). These restrictions on future development will effectively eliminate new disturbances that remove cover habitat and facilitate the expansion of predators, thus reducing the potential for predation on sage-grouse.

Disease

In 2010, we evaluated the effect of disease (Factor C) on sage-grouse and concluded that disease was not a threat to the species (75 FR 13910, March 23, 2010, p. 13970). In that finding, we determined that, while WNv was affecting some populations, no evidence existed that disease was a substantial mortality factor for the persistence of sage-grouse across the species' range (75 FR 13910, March 23, 2010, p. 13970). We have no new information to indicate that analysis has changed.

Sage-grouse are host to numerous parasites and pathogens (Connelly *et al.* 2004, pp. 10–4 to 10–8; Christiansen and Tate 2011, pp. 114–118). The presence of parasites or pathogens is not synonymous with the presence of disease or population-level impacts (Connelly *et al.* 2004, p. 10–3; Christiansen and Tate 2011, p. 114). To date, most parasites and pathogens found in sage-grouse are not known to cause substantial, chronic mortality or other adverse impacts to sage-grouse populations (reviewed in Christiansen and Tate 2011, pp. 114, 119–125).

West Nile virus is known to have localized impacts to sage-grouse populations (Christiansen and Tate 2011, p. 122; Walker and Naugle 2011, p. 139). Similar to other North American bird species (McLean 2006, p. 54), sage-grouse are highly susceptible to WNv, with mortality rates nearing 100 percent of infected birds (McLean 2006, pp. 53–54; Clark *et al.* 2006, p. 18). West Nile virus is transmitted among birds mainly through a mosquito-bird-mosquito infection cycle that relies on optimal climate conditions and movement of birds (McLean 2006, p. 52). The mosquito (*Culex tarsalis*) is the primary vector of WNv in sage-grouse (Naugle *et al.* 2005, p. 617). Most sage-grouse infected with WNv die in as few as 6 days, but a small proportion of infected birds survive, as evidenced by the presence of WNv-specific antibodies in live birds (Walker *et al.* 2007b, p. 691; Dusek *et al.* 2014, p. 726). High mortality rates from WNv can reduce average annual adult survival, a limiting factor in sage-grouse population growth (Johnson and Braun 1999, p. 81; Taylor *et al.* 2012b, p. 343). Population-level impacts can also result from WNv mortality in juvenile sage-grouse by decreasing recruitment into the breeding population the following year (Kaczor 2008, p. 65; Taylor *et al.* 2012b, p. 343).

West Nile virus has been detected across the species' range, with localized outbreaks occurring in 10 of 11 States and 1 of 2 Canadian provinces in the species' range (WNv has not been detected in Washington or Saskatchewan (USFWS 2014b)); however, sage-grouse are likely to have been infected in Saskatchewan as well (Walker and Naugle 2011, p. 133). West Nile virus infections in other species in Washington suggest that sage-grouse in the Columbia Basin could be exposed to the disease (USGS NWHC 2014). West Nile virus was first detected in sage-grouse in 2003, with localized outbreaks occurring from 2004 to 2009 (Naugle *et al.* 2004, p. 705); no outbreaks have been recorded since 2009 (USFWS 2014b). However, no rangewide disease surveillance program exists to know for certain the extent of outbreaks across the species' range, and it is likely that many WNv-related sage-grouse mortalities go undocumented.

Although WNv is present throughout the range of sage-grouse, on a finer scale WNv presence depends upon water sources that provide aquatic breeding habitat for mosquitoes (Zou *et al.* 2006, p. 1035; Doherty 2007, pp. 60–61). The development of anthropogenic water sources could provide breeding habitat for mosquitoes that contribute to WNv outbreaks. In addition, WNv outbreaks in humans are associated with drought conditions and high ambient temperature in spring and summer (Epstein and Defilippo 2001, p. 106), and drought conditions likely increase the probability of WNv outbreaks in sage-grouse as well. When high temperature and drought combine, sage-grouse are concentrated in shrinking mesic habitats (Schrag *et al.* 2011, p. 2). Under these conditions, contact between mosquitoes and birds increases, and the risk of WNv transmission and an outbreak among sage-grouse is elevated (Walker and Naugle 2011, p. 131).

The primary conservation measure for WNv is the control of mosquitoes and their breeding habitat (Walker and

Naugle 2011, pp. 140–141). Measures that limit development that creates new mosquito breeding habitat or measures that manage existing water features so that mosquitos cannot use them to breed (*e.g.,* circulating water, using larvicides, or mosquito fish (*Gambusia* spp.)) are most effective in reducing future WNv outbreaks. As discussed in other sections of this finding, regulatory measures provided by the Federal Plans and the Wyoming, Montana, and Oregon Plans limit new development within important sage-grouse habitat, thus reducing the risk of anthropogenic water sources being constructed that could provide mosquito breeding habitat (see *Nonrenewable Energy Development, Mining, Renewable Energy,* and *Urban and Exurban Development*). In addition, the Federal Plans contain RDFs that will minimize the risk of WNv outbreaks, such as requirements for water feature installation to minimize the likelihood of mosquito breeding (see *Sagebrush Landscape Conservation Planning* for a detailed discussion of conservation measure implementation and effectiveness). The SGI program includes assistance to private landowners to manage water features in a way that minimizes the likelihood of mosquito breeding.

With the exception of WNv, we could find no evidence that disease poses an impact to sage-grouse across the species' range. West Nile virus currently is a localized stressor that has had impacts on some sage-grouse populations, having caused declines and in some cases local extirpations of populations in North Dakota, South Dakota, southeast Montana, and Idaho. In those affected areas, WNv is likely to have an adverse effect on population growth rates, with small populations being at greatest risk of extirpation if outbreaks reduce population size below a threshold where recovery is no longer possible (Walker and Naugle 2011, pp. 137–139, 140). The incidence of WNv is likely to continue across the species' range in the future. The factors most likely to affect future occurrence are climate change and the abundance and the distribution of anthropogenic surface water. Conservation measures that limit and or manage the development of new artificial water sources will minimize habitat availability for mosquitoes that could spread WNv. As noted in our 2010 finding, a complex set of environmental and biotic conditions that support the WNv cycle must coincide for an outbreak to occur, and the annual patchy distribution of the disease is currently keeping population-level impacts at a minimum (75 FR 13910, March 23, 2010, p. 13970).

Recreational Hunting

In 2010, we evaluated the effect of recreational hunting on sage-grouse and concluded that recreational hunting is not a threat to the species (75 FR 13910; March 23, 2010; p. 13965). In 2010, we also determined that the effects of falconry hunting and poaching are negligible due to their extremely limited extent (75 FR 13910; March 23, 2010; p. 13965). We have no new information about falconry hunting or poaching to change those determinations; therefore, they will not be discussed further in this status review.

During the late 1800s and early 1900s, the sage-grouse was heavily exploited by both commercial and sport hunters (Factor B) (Patterson 1952, pp. 30–33; Autenrieth 1981, pp. 3–11). State wildlife agencies were sufficiently concerned with the observed declines in the 1920s and 1930s that many closed their hunting seasons and others reduced bag limits and season lengths as a precautionary measure (Patterson 1952, pp. 30–33; Autenrieth 1981, p. 10). By the 1950s, populations were considered recovered and recreational hunting was again allowed throughout the range (Patterson 1952, p. 242; Autenrieth 1981, p. 11). In recent years, hunting seasons and bag limits have fluctuated and become more conservative across the species' range as States responded to changing population numbers and perceived threats to birds (Reese and Connelly 2011, p. 104).

In 2014, sage-grouse hunting took place in 8 of the 11 States where sage-grouse occur. Sage-grouse are listed as a threatened species in Washington (Stinson *et al.* 2004, p. 1), and hunting has been closed since 1988. Sage-grouse has not been hunted in Saskatchewan since 1938, and Alberta closed the season in 1996 (Aldridge and Brigham 2003, p. 25). In 1998, sage-grouse was designated as endangered in Canada, and hunting is prohibited there (Connelly *et al.* 2004, p. 6–3). North Dakota closed its hunting season in 2008 due to low lek count numbers, and it has remained closed. South Dakota closed its hunting season in 2013 due to low lek count numbers; it also remained closed in 2014. Montana Fish and Wildlife Commission closed all or parts of 32 counties to sage-grouse hunting in 2014, and shortened the hunting season from 2 months to 1 month.

Sage-grouse hunting is regulated by State wildlife agencies. Hunting seasons are reviewed annually, at which time States can adjust harvest management based on updated abundance information and adaptive management criteria established in State wildlife management plans. Information on abundance and local habitat conditions is used to make any adjustments to the hunting season necessary to reduce the potential for additive mortality. Seasonal adjustments take the form of changes to the number of permits issued, changes to the season length or bag limit, or total closure of the hunting season. Bag limits and season lengths are relatively conservative compared to prior decades (Connelly 2005, p. 9; Gardner, California Department of Fish and Game, 2008, pers. comm.; USFWS 2014b). Emergency closures, changes in permit numbers, and implementation of more conservative hunting seasons have been used for populations in decline or in areas experiencing other issues of potential concern (Budeau, Oregon Department of Fish and Wildlife, 2014b, pers. comm.; Christiansen, Wyoming Game and Fish Department, 2014b, pers. comm.; Espinosa, Nevada Department of Wildlife, 2014b, pers. comm.; Griffin, Colorado Parks and Wildlife, 2014, pers. comm.; Moser, Idaho Department of Fish and Game, 2014, pers. comm.; Robinson, Utah Division of Wildlife Resources, 2014b, pers. comm.; Wightman, Montana Fish, Wildlife, and Parks, 2014b, pers. comm.).

Recreational hunting is anticipated to continue into the future, though it is difficult to make accurate predictions about specific levels of hunting mortality because States make adjustments annually. Given the downward trend in hunting mortality reported over the last several decades, mortality rates from hunting will likely continue to decrease. Rangewide, hunting seasons are more conservative than in the past, which has resulted in a reduction in sage-grouse hunting mortality across all sex and age classes (USFWS 2014b). Many States have reported estimated hunting mortality to be lower than the 10 percent mortality cap recommended by Connelly *et al.* (2000a p. 976) (Christiansen 2010, p. 12; Budeau 2014b, pers. comm.).

In 2010, we concluded that hunting was not a threat to the species and based on current information about harvest rates, it continues not have substantial impacts to sage-grouse. To date, changes in the management of sage-grouse hunting have resulted in a substantial reduction in sage-grouse hunting mortality rangewide.

Scientific and Educational Use

In 2010, we evaluated the potential overuse of sage-grouse for scientific and educational purposes and determined

that it was not a threat to the species (75 FR 13910, March 23, 2010). Scientific use was occurring at low levels, but no evidence existed to indicate that scientific use was affecting populations or abundance trends. No educational use was known at that time. As discussed further below, we have no new information indicating that the level of utilization for scientific purposes has changed since the 2010 status review.

Sage-grouse are one of the most intensely researched and monitored birds in North America. Scientists researching or monitoring sage-grouse typically observe, approach, capture, handle, band, or attach radio transmitters to individual sage-grouse to study their movements, behaviors, and population dynamics. Translocations have been used for a variety of scientific purposes, such as a management tool to restore or augment declining populations of sage-grouse and to improve the genetic diversity of populations (Alberta Environment and Sustainable Resource Development 2013, p. viii; White 2013, p. 9; Schroeder *et al.* 2014, p. 8; Yakama Nation 2015, entire).

During research-related activities, scientists could unintentionally kill, disturb, or reduce the survival of individual sage-grouse (Factor B) (Connelly *et al.* 2003, p. 32; Gibson *et al.* 2013, p. 773). Despite these potential impacts, sage-grouse mortalities from scientific activities are extremely rare. Annually, less than 3 percent of the sage-grouse captured for research or monitoring activities die as a result of their capture and handling (USFWS 2014b). Radio transmitters have had negative impacts to individual birds (Connelly *et al.* 2003, p. 32; Colorado Parks and Wildlife 2013, p. 48; USFWS 2014b), but no population-level impacts have been observed.

Survival rates of translocated sage-grouse vary from 36 percent in central Idaho (Musil *et al.* 1993, p. 88) to greater than 45 percent in north-central Utah (Baxter *et al.* 2013, p. 809) and 62.4 percent in northeastern California (Bell and George 2012, p. 373). The efficacy of translocation efforts have been questioned because translocation success, as measured by persistence of reintroduced populations or increases of extant populations, has been low (Reese and Connelly 1997, pp. 235–238). However, more recent attempts have been successful (Alberta Environment and Sustainable Resource Development 2014, p. 6; Baxter *et al.* 2006, p. 182). When translocation protocols are followed, translocated female sage-grouse survive just as well as resident individuals and quickly integrate into the local population (Bell and George 2012, p. 373). Sage-grouse translocated into the Columbia Basin in Washington (MZ VI) have generally survived (White 2013, p. 9; Schroeder *et al.* 2014, pp. 8, 17, 21). Translocations will likely continue at similar rates, and there is no evidence that the removal of sage-grouse from source populations has caused declines in abundance.

In summary, although research or monitoring of sage-grouse could potentially affect individuals, the best available information does not indicate that adverse impacts are occurring at the population level. Information gained through these methods has directly benefited the species. In addition, while translocations have variable success rates, the best available information does not indicate that the translocations affect the populations from which the birds were removed. Although sage-grouse are intensely studied and monitored, there is no evidence to indicate that sage-grouse use for scientific purposes is affecting the species locally or rangewide.

Contaminants

In 2010, we determined that contaminants were not a threat to the sage-grouse (75 FR 13910, March 23, 2010, pp.13982–13984). Sage-grouse exposed to contaminants may become sick or die (Factor E), and contaminants may reduce or remove sage-grouse habitats (Factor A). Types of contaminants that potentially affect sage-grouse include but are not limited to pesticides, products from mining and energy development, human waste, fire retardants, and airborne pollutants from roads, vehicles, and other machinery (Beck and Mitchell 2000, p. 997; Olsgard *et al.* 2009, p. 178; Hansen *et al.* 2011, p. 593; Christiansen and Tate 2011, p. 125). Contaminants may be intentionally introduced into sage-grouse habitats to improve conditions for crops and livestock, extract nonrenewable and nuclear energy resources, construct infrastructure, and manage wildfires (Larson *et al.* 1999, p. 115; Gibbons *et al.* 2015, p. 105). Spills or leaks along pipelines, highways, roads, and railroads can also unintentionally release contaminants into sage-grouse habitats.

In the past, pesticides were used to remove sagebrush, other unwanted woody shrubs, invasive plants, and nuisance insects in sage-grouse habitats in order to improve conditions for agricultural crops and livestock (Connelly *et al.* 2004, p. 7–28; Beck *et al.* 2012, p. 445). Exposure to pesticides and herbicides can kill sage-grouse, cause abnormal behavior, or degrade sagebrush habitat (Blus and Connelly 1998, p. 23; Christiansen and Tate 2011, p. 125; Mineau and Palmer 2013, p. 20; Gibbons *et al.* 2015, p. 105). However, Federal and State regulations to protect air and water quality and ban certain pesticides have likely reduced applications in sagebrush habitats. Generally, pesticides and herbicides are now used to improve sagebrush habitats for native wildlife rather than for livestock (Beck *et al.* 2012, p. 446), and properly applied pesticides should not poison sage-grouse (Call and Maser 1985, p. 15; APHIS 2002, p. 10). Furthermore, light applications of some herbicides may benefit sage-grouse by decreasing the shrub canopy and increasing the cover of grasses and forbs that are important to sage-grouse during the nesting and brood-rearing periods (Crawford *et al.* 2004, p. 2). Therefore, pesticides do not likely affect more than individual sage-grouse.

Nonrenewable energy development and chemical spills could expose sage-grouse to contaminants, such as oil, gas, and waste products. Sage-grouse may encounter harmful radiation, metals, minerals, or contaminated fluids and waste released by nuclear facilities, nonrenewable energy developments, and mines (Ramirez and Rogers 2002, pp. 434–435; Beyer *et al.* 2004, p. 116; Hansen *et al.* 2011, p. 593). Although nonrenewable energy development can expose sage-grouse to contaminants, there is only one documented case of a dead, oil-covered sage-grouse discovered in a wastewater pit near an oil and gas well (Domenici 2008, USFWS, pers. comm.). Deaths or injury from wastewater pits are likely rare as sage-grouse typically do not require free water (Schroeder *et al.* 1999, p. 6) and the intense noise, activity, and lack of vegetative cover around the pits likely deter sage-grouse. Therefore, contaminants released from nonrenewable and chemical spills are not likely to affect more than individual sage-grouse.

Conservation Efforts

The risk of exposure to contaminants is often related to anthropogenic activities that also present potential impacts to sage-grouse, such as nonrenewable energy development and mining, as discussed in other sections of this finding. Any conservation measures that minimize the exposure of sage-grouse to those activities also minimize the risk of exposure to contaminants. Regulatory measures provided by the Federal Plans and the Wyoming Plan limit new development within important sage-grouse habitat, thus

potentially reducing the risk of contaminant exposure in those areas (see *Nonrenewable Energy,* and *Mining*). Based on previous Federal plans, we expect these regulatory mechanisms to be implemented for the next 20 to 30 years.

Summary of Contaminants

While potential exposure to contaminants occurs across the species' range, the best available information indicates that killing or injury of birds is rare and has not had population-level impacts. Regulatory mechanisms that substantially reduce new energy development and mining in important habitats further reduce the potential for impacts to sage-grouse. For a detailed discussion of conservation measure implementation and effectiveness, see *Sagebrush Landscape Conservation Planning*.

Military Activity

In 2010, we did not identify military activity as an impact to the species. Since 2010, we have become aware of several military facilities that overlap to varying degrees with the occupied range of sage-grouse and which have confirmed sage-grouse presence. Military installations in Idaho, Montana, Nevada, Utah, Washington, and Wyoming encompass less than 1 percent of the currently estimated sage-grouse range. With the exception of YTC, most of the installations have little habitat or sage-grouse on the property. The YTC contains one of the two sage-grouse populations in MZ VI (Stinson and Schroeder 2014, p. 3), and was designated as a PAC in the COT Report (USFWS 2013, p. 39).

Military training and testing activities have the potential to negatively impact sage-grouse (Factor E) and their habitats. Training activities can ignite wildfires resulting in habitat loss and fragmentation (Factor A). This issue has been a particular concern in MZ VI, where approximately one quarter of the remaining sage-grouse in the MZ are located on YTC (Stinson and Schroeder 2013, p. 3). In addition to impacts from wildfire, habitat can be degraded by cross-country maneuvers with military vehicles if they crush vegetation, compact soil, or introduce invasive plants (Stinson and Schroeder 2014, p. 3). These kinds of impacts are limited, because the levels of military surface training occurring across the sage-grouse range are limited.

Compared to surface training, the military manages more extensive sections of the sage-grouse occupied range as Special Use Airspace for both testing and training. Military training airspace occurs over portions of all MZs. Recent research has demonstrated that sage-grouse are sensitive to noise (Blickley *et al.* 2012, p. 467); however, this study did not examine aircraft noise (Blickley *et al.* 2012, entire). The behavioral response of sage-grouse to overflight noise has not been examined. Potential impacts include increased detectability by predators and disruption of breeding and nesting behavior if sage-grouse repeatedly flush in response to the noise (Blickley *et al.* 2012, pp. 467–470).

The U.S. military must balance its role of public land steward with its primary mission of maintaining a well-trained, combat-ready fighting force. The Sikes Act (16 U.S.C. 670a–670f, as amended), enacted in 1960 with subsequent amendments, provides for cooperation between the DoD and DOI for planning, developing, and maintaining fish and wildlife resources on military lands (see *Regulatory Mechanisms,* below). The Sikes Act applies to Federal land under DoD control and requires military services to establish Integrated Natural Resources Management Plans (INRMPs) to conserve natural resources for their military installations. Through installation-specific INRMPs, developed in cooperation with the Service and State fish and wildlife agencies, the military has implemented conservation and mitigation actions for sage-grouse.

The YTC continues to manage habitat in Washington that supports one of two populations of sage-grouse in the State. Management of sage-grouse and its habitat at YTC is described in the Western Sage-Grouse Management Plan (Livingston 1998, entire), which is incorporated in the Cultural and Natural Resource Management Plan (CNRMP) (DoD 2002, entire). The CNRMP specifies management prescriptions and actions for sage-grouse and their habitat, including identifying conservation objectives and measures for habitat quantity and quality necessary for maintaining a sage-grouse population at or above the 10-year average of 200 birds. Direct protection of sage-grouse and their habitat is done through timing and area restrictions, including air space restrictions. Vegetation restoration of sagebrush ecosystems is required to address habitat impacted by wildfire and military training activities. Wildfire protection measures are required to prevent, contain, and rapidly extinguish wildfires. Monitoring of sage-grouse and their habitats, including monitoring of habitat restoration activities, is conducted within YTC jurisdictional boundaries.

In 2011, additional measures were implemented to protect sage-grouse on YTC. The Fort Lewis Army Growth and Force Structure Realignment Record of Decision's realigned sage-grouse protection area (SGPA) boundaries to incorporate new sage-grouse habitat use information and updated habitat management objectives (DoD 2011, entire). As a result, all but one active lek on the installation are protected. In addition, vegetation management of five primary containment areas within SGPAs was changed to fit with wildfire management objectives; flight restrictions were revised to cover newly proposed SGPAs; WNv surveillance and control was increased; and construction of forb greenhouse facilities was proposed for use in habitat restoration projects. The Army is currently updating the YTC resource management plan to reflect these improved sage-grouse conservation measures.

Overall, military installations cover less than 1 percent of the species' occupied range, and most installations have little or no sage-grouse habitat on or near their property. The YTC is the only installation where impacts to sage-grouse are a potential concern, in part because two of the four populations in MZ VI occur on that installation. The CNRMP has been effective in minimizing impacts to these populations, and its implementation is expected to continue into the future. Based on studies of noise impacts from others activities, it is possible that overflight noise could affect sage-grouse, but no research has been done to know if this impact actually occurs and any assessment of potential impacts would be speculative.

Small Populations

In 2010, we determined that small population size could result in extirpation of some populations, but was not a threat to sage-grouse rangewide (75 FR 13910, March 23, 2010, p. 13985). As summarized below, although small population size likely places some populations at risk of extirpation, sage-grouse is a widely distributed species with large, interconnected populations at the core of the range (USFWS 2013, pp. 16–29 and Appendix A). As discussed below, we again find that small population size is not a rangewide threat to the species, now or in the future.

Overall, small, isolated populations are more susceptible to impacts and relatively more vulnerable to extinction due to potential losses of genetic diversity, demographic and environmental fluctuations, and susceptibility to environmental

catastrophes (Pimm *et al.* 1988, p. 757; Frankham and Ralls 1998, p. 442). As population size decreases, a population's susceptibility to adverse impacts and its risk of extinction can increase. In general, the minimum population size needed to sustain the evolutionary potential of a species has been estimated to be approximately 500 to 5,000 adult individuals so that the population retains sufficient genetic diversity needed to avoid the detrimental effects of inbreeding (Traill *et al.* 2010, p. 32). Although we know of no published estimates of minimum population sizes in sage-grouse, up to 5,000 individual sage-grouse may be necessary to maintain an effective population size of 500 birds based on individual male breeding success, variation in reproductive success of males that do breed, and the survival rate of juvenile birds (Aldridge and Brigham 2003, p. 30; 75 FR 13910, March 23, 2010, p. 13985).

A number of sage-grouse populations across the species' range have been identified as at risk due to their small population size (Figure 9 and Table 14). These small populations (Table 14) may lack connectivity to other habitats and populations, and may have experienced negative population impacts from other stressors, such as WNv outbreaks, recent wildfire, habitat loss, and habitat fragmentation (USFWS 2014b). These populations may be at increased risk of extirpation due to their isolation, low population numbers, and continued impacts from natural and human-caused sources (Pimm et al. 1988, p. 757). Further, these small populations may be at risk from loss of genetic diversity. For example, populations in Jackson Hole and Gros Ventre in Wyoming and southeastern Montana were genetically isolated with reduced genetic diversity compared to nearby populations (Schulwitz *et al.* 2014, p. 567). Sage-grouse populations in Canada (MZ I) are also small, with less than 100 sage-grouse counted in 2012 (Alberta Environment and Sustainable Resource Development 2013, p. 8). Some of the small populations have already been estimated below minimum population values (Garton *et al.* 2011, entire; WAFWA 2015, entire), suggesting their ability to persist long term may have already been compromised if that value is correct.

Although small, some of the identified sage-grouse populations may not have experienced declines in genetic diversity. For example, small sage-grouse populations in northern Montana may have a sufficient number of dispersing sage-grouse to maintain genetic diversity. Additionally, despite population declines and habitat loss, sage-grouse populations occupying fragmented landscapes at the northern extent of the species' range (Bush *et al.* 2011, p. 539) and in a peripheral population in northeastern California (Davis *et al.* in press) exhibited high genetic diversity with no evidence that these populations were genetically depressed. However, increased habitat fragmentation could cause demographic declines in these small, peripheral populations (Bush *et al.* 2011, p. 539).

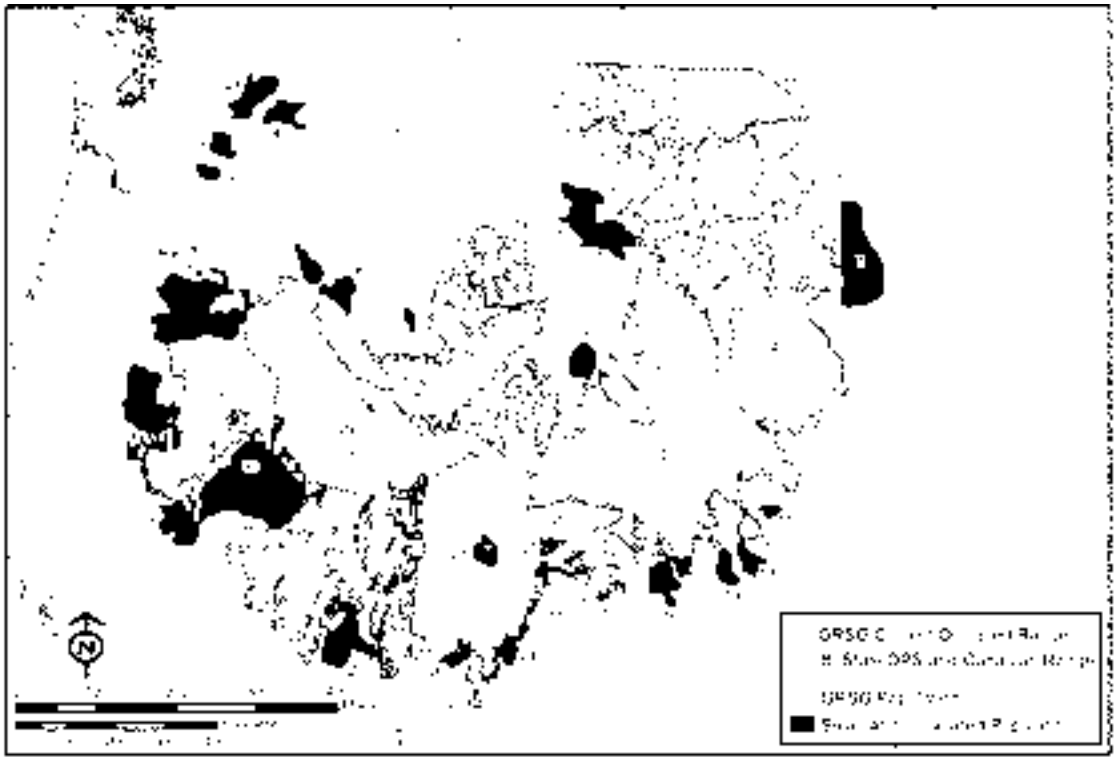

Figure 9. Sage-grouse populations identified as 'small' and/or 'isolated' in the Conservation Objection Team Final Report (USFWS 2013, pp. 16–29). For the purposes of the status review, Ibapah (UT) and Hamlin Valley (UT) were joined with the rest of the southern Great Basin population.

TABLE 14—SAGE-GROUSE POPULATIONS THAT HAVE BEEN IDENTIFIED AS SMALL AND/OR ISOLATED

[USFWS 2013, pp. 16–29]

Management zone	Population ID No.	Population name (state)
I	3	Dakotas (ND/SD).
II	6	Jackson Hole (WY).
	11	Laramie (CO/WY).
	13	Middle Park (CO).
	14	Eagle-South Routt (CO).
III	21	Strawberry Valley (UT).
	22	Carbon (UT).
	23	Sheeprock Mountains (UT).
	24	Parker Mountain & Emery (UT).
	26	Bald Hills (UT).
	30	Northwest Interior (NV).
	27	Quinn Canyon Range (NV).
	[1]28 [1]28	Ibapah (UT; *portion of the Southern Great Basin*).
		Hamlin Valley (UT; *portion of the Southern Great Basin*).
IV	7	Belt Mountains (MT).
	10	East Central (ID).
	35	Sawtooth (ID).
	36	Weiser (ID).
	37	Baker (OR).
V	31	Warm Springs Valley (NV).
	33	Klamath (OR/CA).
VI	38	Yakama Indian Nation (WA).
	39	Yakima Training Center (WA).
	40	Crab Creek (WA).
	41	Moses Coulee (WA).
VII	15	Meeker-White River (CO).
	16	Parachute-Piceance-Roan Basin (CO).

[1] For the purposes of the status review, the Ibapah (UT) and Hamlin Valley (UT) populations were joined with the rest of the southern Great Basin population.

As summarized above, the potential loss of the small, Columbia Basin populations in Washington (MZ VI), which contain approximately 0.6 percent of the estimated rangewide abundance (Doherty *et al.* 2015, entire), would not represent a significant loss for the status of the sage-grouse as a whole (See *Columbia Basin Population* section). However, the four populations in MZ VI are identified above as being at risk due to small population size and are reliant on management actions, such as translocations, to maintain the population size and its genetic diversity. These populations also face potential habitat loss and fragmentation from agricultural conversion (See *Agricultural Conversion* section above) and military training activities (See *Military Activities* section above). Connectivity between these populations is also very limited (Crist *et al.* 2015, p. 12). Although the populations in MZ VI have declined from historical levels, are exposed to a variety of potential impacts, and have limited connectivity, population trends in MZ VI are currently stable (WAFWA 2015, pp. 40–41), likely due to active management and translocations. Further, the State of Washington has protected sage-grouse as a State threatened species since 1998 and developed a recovery program (Stinson *et al.* 2004, entire).

Although some populations of sage-grouse are small and/or isolated (Table 14), with some at risk of extirpation, the remaining populations of sage-grouse are well distributed across the overall range of the species (see Distribution and Population Abundance and Trends, above). The number and size of these more robust populations provide redundancy for the sage-grouse, and the wide distribution of the populations across the species' overall range provides resiliency. Additionally, the rangewide distribution of the larger populations provides representation, by capturing the variation of habitat and climatic conditions across the species' range such that the loss of any of the small populations will not result in the loss of ecological diversity. These small or isolated populations represent only a small percentage of the overall species' range, and the relative population index and their potential loss may affect connectivity (Crist *et al.* 2015, p, 18) but is unlikely to put the entire species at risk now or in the future.

Regulatory Mechanisms

In the 2010 finding, we concluded that existing regulatory mechanisms were inadequate to protect the species (75 FR 13910, March 23, 2010, p.13982). Since 2010, there have been substantial changes in regulatory protections for sage-grouse and their habitats (Factor D). The most significant change is the Federal Plans and the Montana, Wyoming, and Oregon State Plans, which collectively manage approximately 90 percent of the breeding habitat (See *Sagebrush Landscape Conservation Planning* section above). Combined, these efforts have substantially improved the regulatory mechanisms across the range of the sage-grouse since the 2010 finding, such that we now determine that existing regulatory mechanisms adequately address effects to the species and its habitats (Factor D). Other Federal and State laws and local authorities are discussed below.

Federal Laws

In addition to the Federal Plans, other Federal laws provide regulatory authorities to Federal agencies to address sage-grouse and habitat management for the species.

Other BLM Authorities—The Mineral Leasing Act of 1920, as amended, and the Mineral Leasing Act for Acquired Lands of 1947, as amended, gives the BLM responsibility for oil and gas leasing on BLM, USFS, and other

Federal lands, as well as private lands where mineral rights have been retained by the Federal Government. The Geothermal Steam Act of 1970, as amended (84 Stat, 1566; 30 U.S.C. 1001–1025), provides the Secretary of the Interior with the authority to lease public lands and other Federal lands, including USFS lands, for geothermal exploration and development in an environmentally sound manner. This leasing authority has been delegated to the BLM. The BLM implements the Mineral Leasing Act through 43 CFR 3200.

The General Mining Law of 1872, as amended, opened the public lands of the United States to mineral acquisition by the location and maintenance of mining claims. Mineral deposits subject to acquisition in this manner are generally referred to as locatable minerals. Locatable minerals include metallic minerals (*e.g.,* gold, silver, lead, copper, zinc, and nickel), nonmetallic minerals (*e.g.,* fluorspar, mica, gypsum, tantalum, heavy minerals in placer form, and gemstones), and certain uncommon variety minerals. Under the new Federal Plans, locatable minerals have been recommended for withdrawal in the SFAs. Valid existing rights would not be impacted by these recommended withdrawals. Withdrawals on BLM and USFS lands are processed under the BLM's withdrawal regulations (43 CFR 2310) and, if 5,000 acres or more, shall be subject to the Congressional review provision (43 U.S.C. 1714(c)).

Other Federal Agencies—Other Federal Agencies in the DoD, DOE, and DOI (including the Bureau of Indian Affairs, the Service, and National Park Service) are responsible for managing less than 5 percent of the species' occupied range (Knick 2011, p. 28). Regulatory authorities and mechanisms relevant to these agencies' management jurisdictions include the National Park Service Organic Act (39 Stat. 535; 16 U.S.C. 1, 2, 3, and 4), the National Wildlife Refuge System Administration Act (16 U.S.C. 668dd–668ee), and the Department of the Army's Integrated Natural Resources Management Plans for their facilities within sage-grouse habitats. Due to the limited amount of land administered by these agencies, we have not described them in detail here. However, most of these agencies do not manage specifically for sage-grouse on their lands, except in localized areas (*e.g.,* specific wildlife refuges, reservations). A notable exception, where substantial populations of sage-grouse occur, is the YTC (discussed above under *Military Activity*).

The YTC continues to manage habitat in Washington that supports one of two populations of sage-grouse in the State. As a joint base, YTC is now a sub-installation of the Fort Lewis McChord Army installation. Management of sage-grouse and its habitat at YTC is dictated by management direction described in their Western Sage Grouse Management Plan (Livingston 1998, entire), which is tiered to their CNRMP (DoD 2002, entire), combined with changes contained in the Fort Lewis Army Growth and Force Structure Realignment Record of Decision (DoD 2011, entire) (also known as Grow the Army). The 2002 CNRMP is currently being updated into a newer Integrated Natural Resources Management Plan, but is not yet final. The Grow the Army Final Environmental Impact Statement analyzed the environmental and socioeconomic impacts of stationing approximately 5,700 soldiers and their families at Fort Lewis and additional aviation, maneuver, and live-fire training needs at both installations.

The CNRMP specifies management prescriptions and actions for sage-grouse and their habitat, including identifying conservation objectives and measures for habitat quantity and quality necessary for maintaining a sage-grouse population at or above the 10-year average of 200 birds. Direct protection of sage-grouse and their habitat (*i.e.,* mating, nesting, and brood-rearing) is achieved through timing and area restrictions, including air space restrictions. Vegetation restoration of sagebrush ecosystems is required to address habitat impacted by wildfire and military training activities. Wildfire protection measures are required to prevent, contain, and rapidly extinguish wildfires. Monitoring of sage-grouse and their habitats, including monitoring of habitat restoration activities, are conducted within YTC jurisdictional boundaries. Army participation in sage-grouse recovery planning efforts and adaptive management through implementation reviews are also required.

The Grow the Army Record of Decision realigned sage-grouse habitat and core use area protection boundaries to incorporate new sage-grouse habitat use information and updated habitat management objectives. New leks were incorporated into the management scheme, SGPAs were reconfigured, vegetation management of fire primary containment areas within SGPAs were changed to fit with wildfire management objectives, flight restrictions were revised to cover newly proposed SGPAs, WNv surveillance and control was increased, and construction of forb greenhouse facilities were proposed for use in habitat restoration projects. The SGPAs currently protect almost all active leks at YTC. The Grow the Army Record of Decision also established Army commitment to updating their Sage-Grouse Management Plan; participating in sagebrush ecosystem conservation partnerships to promote sagebrush ecosystem conservation, restoration, and protection from wildfire in and around the PAC; and establishment of a candidate conservation agreement with the Service.

Coal mining is regulated by the provisions identified in the Surface Mining Control and Reclamation Act of 1977 (SMCRA), which is implemented by the Office of Surface Mining and Reclamation. This Federal law requires consideration of fish and wildlife resource information for the permit and adjacent area, including species listed under the Endangered Species Act, along with a detailed analysis by the permittee on how impacts will be minimized or avoided. SMCRA also requires that activities permitted under this law cannot result in the jeopardy of a listed species, or the destruction of adverse modification of designated critical habitat. Species-specific standards and procedures must also be developed if necessary to protect listed species and their habitats (USFWS 1996). Permittees must also include a plan for enhancement of fish and wildlife resources on the permit area. While SMCRA does not specifically address candidate species, protection must be given to all potential future listed species that may be affected by coal mining activities (USFWS 1996, p. 4).

The OSM has delegated the regulatory authority for implementing SMCRA to five States within the range of sage-grouse: Wyoming, Montana, Utah, Colorado, and North Dakota. Sage-grouse, therefore, must be considered in the implementation of SMCRA, and coal mining, in those States. The implementation agency must consider impacts on fish and wildlife, including sage-grouse. Sage-grouse are also typically addressed in all States within the species' range during the development of coal resources simply due to its status as a State trust resource.

State Mining Regulations

The Utah Executive Order provides a regulatory mechanism to minimize potential effects from mining to sage-grouse habitat on State and private lands (Utah EO 2015–002). The Utah Executive Order requires the Utah Division of Oil, Gas and Mining to coordinate with the Utah Division of Wildlife Resources before issuing

permits for energy development. The Executive Order further directs the Utah Division of Oil, Gas and Mining to implement recommendations provided by the Utah Division of Wildlife Resources that could require avoidance and minimization measures on State and private lands consistent with the conservation plan. However, these measures are subject to the statutory requirements to protect rights on private property and avoid waste of the mineral resource.

State General Wildlife Protection Laws

All States across the range of sage-grouse have laws and regulations that provide for the general protection, conservation, propagation, management, and use of wildlife and that regulate the taking of wildlife, including sage-grouse (see Connelly *et al.* 2004, pp. 2–2 through 2–11). While these statutes limit direct taking of sage-grouse, none provide specific and binding protections for sage-grouse habitat.

Many States have laws to list and protect threatened and endangered species, but these laws vary in their statutory provisions to protect species from threats (George and Snape 2010, pp. 345–346). Sage-grouse are listed as a threatened species by the State of Washington under the authorities of RCW 77.12.020. Threatened status in Washington means that a species cannot be hunted (WAC 2015, 232–12–011) and also requires the State to develop a recovery plan, which must include target population objectives, criteria for reclassification, an implementation plan, and a monitoring plan (WAC 2015, 232–12–297). However, implementation of recovery plan actions is discretionary and subject to funding.

Several States list the sage-grouse as a ''species of concern,'' (*e.g.,* Montana) or ''species of special concern (*e.g.,* California, South Dakota), but these are administrative designations and do not afford any substantive regulatory protections.

State Sage-Grouse Hunting Regulations

Sage-grouse hunting is regulated by State wildlife agencies. Hunting seasons are reviewed annually, and States can adjust limits on updated abundance information and adaptive management criteria established in State wildlife management plans. States maintain flexibility in hunting regulations through emergency closures or season changes in response to unexpected events that affect local populations. As discussed in more detail under the *Hunting* section, 8 of the 11 States with sage-grouse had open hunting seasons for sage-grouse in 2014, with hunting prohibited in Washington, South Dakota, North Dakota, and Canada (Aldridge and Brigham 2003, p. 25; Connelly *et al.* 2004, p. 6–3; Stinson *et al.* 2004, p. 1). In 2014, Montana closed hunting of sage-grouse across much of the State and reduced the length of the hunting season to respond to population declines (Montana Fish, Wildlife and Parks 2014). South Dakota closed its hunting season for sage-grouse in 2013 and 2014. As evidenced by recent changes, States can and have adopted more conservative hunting seasons based on new information and population levels. Rangewide, hunting seasons are more conservative than in the past, which has resulted in a large reduction in sage-grouse hunting mortality. Therefore, hunting regulations are adequate in managing hunting impacts to sage-grouse.

State Noxious Weed Laws

Some State regulations require that landowners control noxious weeds on their property, but designations of noxious weeds and the development of noxious weed lists vary by State. For example, only five States list medusahead as a noxious, regulated weed, but the grass is problematic in at least two additional States. Similarly, despite the proliferation of cheatgrass across the range of the sage-grouse, Colorado is the only western State that recognizes the grass as a noxious weed (USDA 2015). Therefore, State regulations that address noxious weeds may help reduce impacts to sage-grouse in local areas, but large-scale control of the most problematic invasive plants is currently unfeasible and uncoordinated (Pyke 2011, p. 543; Ielmini *et al.* 2015, pp. 2–3). While State noxious weed laws are not effectively addressing potential impacts from invasive plants, measures provided by the Federal and State plans, as discussed above, have substantially reduced the potential threat of invasive plants (see *Wildfire and Invasive Plants*).

Canadian Federal and Provincial Laws and Regulations

Sage-grouse were first listed in Canada in 1997 as threatened by the Committee on the Status of Endangered Wildlife in Canada because of very small and declining populations in Saskatchewan and Alberta. The species' status was changed to endangered in 1998, and sage-grouse are now federally protected in Canada as an endangered species under schedule 1 of the Species at Risk Act (SARA). This designation protects sage-grouse and their nests and eggs on Federal lands and prohibits unauthorized killing, harming, harassing, capturing, taking, possessing, collecting, buying, selling, or trading of individuals of the species (SARA 2002, p. 17). SARA also provides for identification of habitat on Federal lands that is critical to the survival and recovery of species designated as threatened or endangered, and the Canadian Government is responsible for ensuring that critical habitat is protected. Although voluntary measures are the preferred method for protecting critical habitat, SARA provides the means for the government to promulgate regulations to ensure that critical habitat is not destroyed (SARA 2002, pp. 27–30). However, at this time, no such regulations have been developed for sage-grouse critical habitat.

On December 4, 2013, the Canadian Government issued an Emergency Order for the protection of the sage-grouse under SARA (CWS 2013, entire). The Emergency Order prohibits construction of new tall (greater than 1.2 m [3.9 ft]) structures, new roads, and new fences and destruction of native plants, and requires nightly noise reduction in April and May (CWS 2013, p. 112). These restrictions apply to critical habitat identified on 1,672 km^2 (646 mi^2) of Federal and provincial crown lands in southeastern Alberta and southwestern Saskatchewan (CWS 2013, p. 111).

In 2014, the Canadian Government finalized an amended recovery strategy for sage-grouse (Environment Canada 2014, entire). In addition to updating the 2008 document to reflect the most recent scientific information about the status of sage-grouse in Canada and establishing population objectives, the 2014 amended strategy completed the identification of critical habitat for the species in accordance with SARA (Environment Canada 2014, p. 23). The 2008 recovery strategy did not identify critical habitat, citing a lack of information (Lungle and Pruss 2008, p. 27). In 2009, a replacement for the critical habitat section of the strategy identified ''necessary, but not sufficient'' critical habitat in breeding, nesting, and brood-rearing habitat for sage-grouse in Alberta and Saskatchewan (Lungle and Pruss 2009, p. 2) for a total of 165 km^2 (63 mi^2). The amended recovery strategy identifies 2,812 km^2 (1,086 mi^2) of year-round habitat and 12.5 km^2 (4.8 mi^2) of lek critical habitat in Saskatchewan and Alberta (Environment Canada 2014, pp. 23–30). Therefore, as a result of the amended recovery strategy and the Emergency Order combined, a total of 3,354 km^2 (1,295 mi^2) of Federal and provincial crown lands in Saskatchewan and Alberta, including Grasslands National Park in Saskatchewan, is

identified as critical habitat for sage-grouse (Environment Canada 2014, p. iv; Parks Canada 2015, p. 693). The amended recovery strategy also includes numerous nonregulatory actions for the protection of critical habitat and the recovery and conservation of sage-grouse.

The sage-grouse is listed as endangered at the provincial level in Alberta and Saskatchewan, affording additional protections to the species on provincial and private lands. Recreational hunting has been closed in Saskatchewan since at least the 1930s (Weiss and Prieto 2014, p. 1), and in Alberta since 1995 (Alberta Environment and Sustainable Resource Development 2013, p. 1). In Saskatchewan, sage-grouse were designated as threatened in 1987 under The Wildlife Regulations (Saskatchewan 1981, entire), and as endangered in 1999 under the province's Wildlife Act of 1998 (Weiss and Prieto 2014, pp. 1, 13). The Wildlife Act states that, without a license, no one may ''kill, injure, possess, disturb, take, capture, harvest, genetically manipulate or interfere with or attempt to do any of those things . . . export or cause to be exported from Saskatchewan . . . [or] traffic in'' designated species (Saskatchewan 1998, p. 20). Sage-grouse habitat in Saskatchewan is protected under The Wildlife Habitat Protection Act, which prohibits sage-grouse habitat from being sold or cultivated (Saskatchewan 1983, p. 4). Restrictions put in place under the Wildlife Act formerly prohibited development within 500 m (1,640 ft.) of leks and prohibited construction activities within 1,000 m (3,281 ft.) of leks between March 15 and May 15 (Aldridge and Brigham 2003, p. 32). In our 2010 finding, we deemed these buffers inadequate to protect sage-grouse from disturbance. These activity restrictions were revised in 2012 to increase lek buffers to 3,200 m (10,499 ft.); include 1,000-m (3,281-ft) buffers between development and lekking, brood-rearing, and wintering habitat; and make these restrictions apply year-round instead of only during the breeding season (Environment Canada 2014, p. 16; Weiss and Prieto 2014, p. 13).

Alberta's Wildlife Act requires that an Endangered Species Committee provide recommendations to the provincial Minister regarding designation of endangered species in Alberta and development of recovery plans, which may include population goals, conservation strategies, and the identification of critical habitat (Alberta Wildlife Act 2000, p. 13). The law states that ''[a] person shall not willfully molest, disturb or destroy a house, nest or den of prescribed wildlife'' (Alberta Wildlife Act 2000, p. 25), but does not require development and implementation of recovery plans for species designated as endangered. However, Alberta Environment and Sustainable Resource Development has designated more than 3,880 km^2 (1,500 mi^2) as conservation habitat for sage-grouse, including areas adjacent outside of federally identified critical habitat (Nicholson, Alberta Environment and Sustainable Resource Department, 2015, pers. comm.). All known active and inactive leks are protected by 12-ha (30-ac) Protective Notations designated by the Province, and Protective Notations covering the range of sage-grouse in Alberta prohibit public land sales and potentially restrict surface development (Alberta Environment and Sustainable Resource Development 2013, pp. 19–20). In addition, in 2013 the Alberta Department of Energy restricted all new surface access for oil and gas development through subsurface addenda to leases or other drilling rights accorded to private businesses (Nicholson, Alberta Environment and Sustainable Resource Department, 2015, pers. comm.). Aside from Protective Notations, regulation of new surface access, and the protection of individual sage-grouse by provincial law, efforts to recover the species and protect its habitat in Alberta (*e.g.,* Alberta Environment and Sustainable Resource Development 2013, pp. 18–21) are nonregulatory.

Regulatory Mechanisms Summary

In 2010, we concluded that regulatory mechanisms in place at that time were not adequate to reduce the threats to the species and its habitat, and that the absence of adequate regulatory mechanisms was a threat to the species, then and into the foreseeable future. Since then, there have been major changes in the regulatory mechanisms that avoid or minimize impacts to sage-grouse and their habitats. Most importantly, BLM and USFS adopted amended or revised Federal Plans to conserve sage-grouse over more than half of its occupied range (See *Federal Plans* section above). The Federal Plans include provisions to address activities that could occur in sage-grouse habitats and threats identified in 2010 as having inadequate regulatory measures including: Oil and gas development, wildfire and invasive plants, infrastructure, and improper livestock grazing. In addition, the Federal Plans include provisions to avoid or minimize impacts authorized in sage-grouse habitats for monitoring, adaptive management, limitations on anthropogenic disturbance, and requirements for mitigation. The Federal Plans are the foundation of land-use management on BLM and USFS managed lands. We are certain that the Federal Plans will be implemented and that the measures included are based on the best scientific information and are effective at avoiding and minimizing impacts to the species and its habitat.

Since 2010, of the 11 States within the occupied range of the sage-grouse, 10 have revised and adopted grouse conservation plans and regulatory mechanisms to address threats to the species and its habitat identified in 2010. State sage-grouse conservation plans in Wyoming, Montana, and Oregon contain regulatory mechanisms that minimize impacts to the species and its habitat. Since 2008, the Wyoming Plan has effectively minimized impacts within core habitats, protecting the highest density areas for the species within the State. The Montana and Oregon regulatory mechanisms include proven conservation measures, including disturbance caps, density restrictions, and lek buffers, to minimize disturbance to important habitats. In combination, the Federal and three State plans, cover 90 percent of the sage-grouse breeding habitat. Taken together, these efforts have substantially altered the regulatory landscape across the range of sage-grouse since the 2010 finding, such that we now determine that existing regulatory mechanisms adequately address effects to the species and its habitat (Factor D).

Other Conservation Plans

Since 2010, all States except California have drafted, revised, finalized, or implemented conservation plans for the sage-grouse to address threats to the sage-grouse. These plans take different approaches, but in general, they identify important conservation objectives and provide mechanisms to incentivize conservation. We anticipate that state plans and related efforts will continue into the future and will strengthen as implementation continues. In this section we provide a summary of the non-regulatory conservation plans (See *Conservation Efforts* section above for a description of the Wyoming, Montana, and Oregon Plans and the *Regulatory Mechanisms* section above for a description of the Utah Executive Order).

California

California does not have a State Sage-grouse Conservation Plan. California

recognizes sage-grouse as a State-species of special concern that should be considered during the State's environmental review process. The California Environmental Quality Act (CEQA) (Public Resources Code sections 21000–21177) requires that State agencies, local governments, and special districts consider impacts that their proposed project may have to species of concern, including sage-grouse.

Colorado

Colorado has contributed to greater sage-grouse conservation and research, working with numerous partners over the last several decades. This coordination spans from local and State levels, to rangewide participation. The State conservation plan for greater sage-grouse (State of Colorado 2008, entire) has been implemented since 2008 over 1.5 million ha (approximately 3.7 million ac) across all landownership types. The plan uses voluntary conservation strategies to address and promote the conservation of sage-grouse in Colorado. It provides guidance to address impacts to sage-grouse from habitat fragmentation and conversion, agriculture, urbanization, conifer encroachment, recreation, nonrenewable energy, and other impacts.

The plan and the State of Colorado recommend measures to help reduce impacts from nonrenewable energy development. Colorado regulations require that effects to sage-grouse be considered by the Colorado Oil and Gas Conservation Commission (COGCC) and the Colorado Department of Reclamation and Mining Safety during their permitting processes. In addition, Colorado Parks and Wildlife (CPW) makes recommendations based on the State's conservation plan designed to reduce impacts to greater sage-grouse from nonrenewable energy development (State of Colorado 2008, pp. 22, 109, 123, 313, 325–331).

In addition, the State of Colorado issued an Executive Order (Colorado E.O. D 2015–004) in May 2015 to promote the conservation of greater sage-grouse and further implement the 2008 conservation plan. This order enhances communication and coordination among State agencies, including CPW, the State Land Board, and COGCC, as well as designating a single point of contact for external greater sage-grouse communications. Under the order, the COGCC will evaluate its existing wildlife siting rules for potential improvement and develop a comprehensive tracking system for development in sensitive wildlife habitat. Lastly, the order also prioritizes the completion of the Colorado Habitat Exchange, a voluntary compensatory mitigation tool for impacts to the species.

Dakotas

North and South Dakota finalized State management plans that emphasized working cooperatively with private landowners due to the relatively large acreages of private lands in those States. Both States have provided assistance working through the Sage Grouse Initiative under NRCS and are continuing sage-grouse research efforts to prioritize the best sage steppe habitat for conservation, expand core areas, and further their understanding of WNv. Both States have closed sage-grouse hunting seasons.

South Dakota has provided additional firefighting resources and in the past has restricted off-road travel if drought conditions may elevate fire danger during hunting seasons (State of South Dakota 2014, p. 23). Further, the South Dakota Department of Game, Fish and Parks works with the South Dakota School and Public Lands Office, Public Utilities Commission, and the Department of Environment and Natural Resources to provide comments and input if oil and gas development, wind development, or other proposed projects may impact sage-grouse core areas (State of South Dakota 2014, pp. 23, 24).

Idaho

Earlier this year, the Governor signed an Executive Order adopting Idaho's Sage-grouse Management Plan, which focuses on the management of invasive vegetation, fuels and wildfire (Idaho E.O. 2015–04). The plan provides wildfire suppression guidance to complement Secretarial Order 3336, and commits the State to assist with fire rehabilitation and with implementation of fuel breaks, weed control, and conifer removal in mixed State and Federal ownerships. Under the plan, Idaho assumes responsibility for development, coordination, and equipping and training for Rangeland Fire Protection Associations to provide rapid response to sagebrush fires. In FY 2016 the Idaho legislature appropriated over $500,000 for various sage-grouse conservation efforts of which $120,000 was dedicated to better support RFPA implementation and effectiveness (S–1128). In Idaho, RFPAs currently account for approximately 230 firefighters in 6 areas in Idaho resulting in protection of approximately 5.7 million acres within greater sage-grouse habitat. An additional 4 RFPAs are in development within greater sage-grouse habitat. Idaho's Governor directed that all State agencies, to the extent consistent with existing State law, apply the elements of Idaho's Sage-grouse Plan to all land ownerships across the State (Idaho E.O. 2015–04).

Nevada

The State of Nevada has implemented several measures to conserve habitat in the State. On September 26, 2008, the Governor of Nevada signed Executive Order 2008–10–29 calling for the preservation and protection of sage-grouse habitat in the State of Nevada. The Executive Order directs the Nevada Department of Wildlife (NDOW) to work with State and Federal agencies and the interested public to implement Nevada's conservation plan for sage-grouse (Nevada E.O. 2008–10–29). The Executive Order also directs other State agencies to coordinate with the NDOW in these efforts. Further, the Nevada Conservation Credit System establishes a mitigation market to facilitate exchanges between credit sellers and buyers. In November 2012, the Governor signed Executive Order 2012–09 establishing the Sagebrush Ecosystem Council, a multiagency and multidiscipline group that was tasked with developing a conservation strategy for sage-grouse in Nevada. In October 2014, the Sagebrush Ecosystem Council finalized the Nevada Greater Sage-grouse Conservation Plan (State of Nevada 2014, entire). The Nevada plan creates the Conservation Credit System, which creates financial incentives for private landowners to conserve sage-grouse habitat for use as compensatory mitigation. Nevada's plan requires that any development that affects greater sage-grouse habitat in Nevada will need to acquire credits to compensate for those effects before the development proceeds. In addition, on June 23, 2015, the Governor signed emergency regulations related to the formation of Rural Fire Protection Associations (RFPAs) within the State of Nevada (NRS 472 per AB 163, sec. 3.5(1) of the 78th Session of the Nevada legislature). RFPAs, as seen in other States, help support fire suppression efforts by adding capacity and resources for fire suppression.

Utah

Utah issued a final conservation plan for the sage-grouse on February 14, 2013, and the Governor of Utah's Executive Order (Utah E.O. 2015/002) mandated its implementation on February 25, 2015. Utah's Plan and Executive Order includes mechanisms aimed at addressing threats to sage-grouse associated with fire, invasive species, predation, conifer

encroachment, recreation, energy development, and the removal of sagebrush. The Utah Plan applies to all lands within the State's 11 Sage-Grouse Management Areas (SGMAs) across approximately 3 million ha (7.5 million ac), which conserves 90 percent of the State's greater sage-grouse habitat and approximately 94 percent of the State's population. Many of the conservation measures in the plan are voluntary and rely on negotiated incentive-based covenants, easements, or leases to achieve conservation on private lands, School and Institutional Trust Administration Lands, and local government lands (See Regulatory Mechanisms section above for a discussion of the Utah Executive Order). In 2014, Utah's incentive-based approach, coupled with efforts from State, Federal, and private partners, exceeded the Utah conservation plan objectives, reporting 249,170 acres of habitat enhancement and restoration (UDNR 2014, p. 5).

The Utah Plan addresses fire control, suppression, and rehabilitation by providing an organizational framework for partners to prioritize suppression efforts and fire rehabilitation, and leverage funding and agency resources (State of Utah 2013, p. 13). The Utah Governor's Executive Order also directs the Utah Division of Forestry, Fire and State Lands to prioritize fuels-mitigation activities and pre-attack planning and coordination with other Federal and local fire suppression partners, second only to the protection of human life and structures (State of Utah 2015, p. 4). Furthermore, the Utah Governor's Catastrophic Wildfire Reduction Strategy was completed in 2013, establishing a Statewide steering committee and regional working groups to develop a Statewide risk map that will include prioritized sage-grouse habitat areas (UDNR 2014, page 10).

Washington

Sage-grouse are State-listed as threatened in Washington. The State's recovery plan and actions implemented to date have relied heavily on voluntary conservation actions, on which the State and its partners have made progress (Stinson *et al*. 2004, entire). For example, sage-grouse have been translocated to the Columbia Basin from Idaho, Oregon, Nevada, and Wyoming to help supplement and maintain the Washington population (Livingston *et al*. 2006, pp. 2–3; Schroeder *et al*. 2014, pp. 8, 14–15).

Finding

As required by the Act, we considered the five factors in assessing whether the sage-grouse is endangered or threatened throughout all of its range. We examined the best scientific and commercial information available regarding the past, present, and foreseeable future threats faced by sage-grouse. Foreseeable future describes the extent to which we can reasonably rely upon predictions about the future (DOI 2009). In this context, ''reliable'' does not mean ''certain'': It means sufficient to provide a reasonable degree of confidence in the prediction. Because information for each threat may be reliable for different periods of time, each threat may have different extents of foreseeability. The final conclusion may be a synthesis of this information.

For the purposes of this determination, we conclude that the foreseeable future is 20 to 30 years. This timeframe is based on the time horizons for which various threats can be reliably projected into the future. Many of the analyses on which we have relied, such as the fire modeling and the period for climate change predictions, cover a 30-year timeframe. Additionally, other potential threats will be governed by Federal and State Plans across the most important habitats as long as these plans are in place. Based on our assessment of existing BLM and USFS land use plans, the typical lifespan is 20 to 30 years (BLM 2015g). While these plans are in place, the extent of impacts from energy development, infrastructure, grazing, mining, and other regulated activities will be dictated by stipulations in these plans. Therefore, we can reliably predict over 20 to 30 years the extent of impacts from fire, climate change, and potential effects to the species and habitat addressed by the Federal Plans. Beyond these timeframes is a high degree of uncertainty, which precludes credible predictions of the effectiveness of actions that will be implemented beyond the planning horizon and how the species may or may not respond. Exceeding this timeframe, we have concluded, goes into the realm of speculation.

Our regulations direct us to determine if a species is endangered or threatened due to any one or a combination of the five threat factors identified in the Act (50 CFR 424.11(c)). We consider cumulative effects to be the potential threats to the species in totality and combination; this finding constitutes our cumulative effects analysis. The discussions above evaluated the individual impact of the following potential threats to the sage-grouse: Nonrenewable energy development (Factor A), infrastructure (Factor A), agricultural conversion (Factor A), wildfire and invasive plants (Factor A and E), improper grazing (Factor A), free-roaming equids (Factor A), conifer encroachment (Factor A), mining (Factor A), renewable energy (Factor A), predation (Factor C), disease (Factor C), urbanization (Factor A), recreation (Factor A), climate change (Factor E), drought (Factor A), hunting (Factor B), scientific and educational use (Factor B), contaminants (Factor A), military activities (Factor A), and small populations (Factor E). We also evaluated the inadequacy of existing regulatory mechanisms (Factor D). As discussed above, based on new information and effective regulatory mechanisms implemented since the 2010 finding, we determined that none of these impacts are substantial threats to the sage-grouse individually. Additionally, despite past reductions in occupied range, sage-grouse currently occupy 56 percent of their historical range. In this section, we evaluate whether some or all of these impacts act cumulatively to increase the overall scope and magnitude of potential effects to the sage-grouse now and into the foreseeable future such that cumulative effects are a threat to the species.

The sagebrush ecosystem has changed over time. Prior to the influence of human settlement, the sage-grouse inhabited parts of 13 states and 3 Canadian provinces. Before European settlers converted sagebrush habitats to croplands and pasturelands in the 1800s, natural events, such as blizzards, droughts, and large wildfires historically impacted sage-grouse. With the arrival of European settlers, agricultural conversion, urbanization, energy development, and other activities increased the loss and fragmentation of sage-grouse habitats across the overall range. Due to the historical loss and fragmentation of sagebrush habitats, sage-grouse now occupy approximately 56 percent of their historical range. Despite historical losses of occupied range, today the sage-grouse is relatively well-distributed across portions of 11 states and 2 Canadian provinces. The sagebrush ecosystem upon which the sage-grouse depends remains one of the largest, most widespread ecosystems in the United States, spanning approximately 70 million ha (173 million ac).

Declines in the extent of the sagebrush ecosystem and sage-grouse populations have been a concern for more than 25 years. Since 1999, we have reviewed 8 petitions and reviewed the status of the species 3 times. In our first evaluation completed in 2005, we found that listing the sage-grouse was not warranted because the species occurred over a large area and potential threats

were not well defined. In 2010, we determined that sage-grouse were warranted for listing due to a long-term decline in abundance throughout their range, habitat loss and fragmentation, and inadequate regulatory mechanisms to address threats.

The 2010 finding serves as the baseline for this current review. In the 2010 finding, we concluded that sage-grouse was warranted for listing because of habitat loss and fragmentation due to a variety of causes, such as nonrenewable energy development, agricultural conversion, wildfire, and infrastructure and the inadequacy of regulatory mechanisms to address these conditions. We acknowledged the existence of substantial landscape elements containing high-quality habitat and abundant sage-grouse, particularly in southwestern Wyoming and in the northern Great Basin, but expressed concern that, without adequate regulatory mechanisms, habitat loss, and abundance, declines would continue (75 FR 13910, March 23, 2010, pp. 13986–13988). As noted in that finding, when determining its listing priority status, we considered the threats that the sage-grouse faced to be moderate in magnitude because the threats did not occur everywhere across the range, and, where they were occurring, they were not of uniform intensity or of such magnitude that the species required listing immediately to ensure its continued existence. While sage-grouse habitat had been lost or altered in many portions of the species' range, substantial habitat still remained to support the species in many areas of its range (75 FR 13910, March 23, 2010, pp. 14008–14009).

In the 2010 finding, we identified the types of conservation actions that would remediate or ameliorate these threats, and encouraged land managers and other interested parties to implement such measures. In particular, we noted that the Federal Plans could provide adequate regulatory mechanisms to address the threats of nonrenewable and renewable energy development and infrastructure if they were amended to consider sage-grouse conservation needs (75 FR 13910, March 23, 2010, p. 13982). Further, we recommended changes in prevention, suppression, and restoration activities to address threats from the wildfire and invasive plant cycle. This current finding describes the extent to which recent conservation efforts—particularly the Federal and State Plans—have addressed the impact of potential threats and positively affected the species' status.

Since 2010, Federal and State agencies have collaborated on the development of landscape-scale conservation efforts to protect the most important habitats across the range of the species (as discussed in detail in Changes Since the 2010 Finding, above). The 2013 COT Report outlined where those most important habitats occurred (also known as PACs) and identified them as the areas necessary for species' resilience, redundancy, and representation. The COT Report also provided conservation objectives and recommended conservation actions to preserve the PACs and served as the foundation of a landscape-level conservation strategy (Federal, State, and private) developed and implemented by BLM, USFS, SGI, the States of Wyoming, Montana and Oregon, and private landowners. Together, the Federal Plans, Wyoming Plan, Montana Plan, and Oregon Plan reduce potential threats on 90 percent of sage-grouse breeding habitat across the species' range. These conservation efforts result in the preservation of large expanses of undisturbed habitat supporting the largest, best-connected sage-grouse populations into the foreseeable future.

The Federal Plans, Wyoming Plan, Montana Plan, and Oregon Plan provide adequate regulatory mechanisms to reduce the threats of human-caused habitat disturbance on the most important sage-grouse habitats (as discussed in detail in the Changes Since the 2010 Finding, above). The Federal Plans designate PHMAs, and the State Plans designate Core Areas, all of which correspond closely with the PACs identified in the COT Report and include important breeding and seasonal habitats for the species. The PHMAs and Core Areas are managed for sage-grouse habitat objectives, primarily by excluding or avoiding major new surface-disturbing activities that could cause habitat destruction (BLM and USFS 2015, entire). For example, in many important habitats, the Federal Plans require NSO for nonrenewable energy development, which results in no new oil and gas wells or associated infrastructure being constructed within PHMAs. For the few ongoing land uses that could continue to occur in PHMAs, such as limited wind development in certain areas and existing rights for nonrenewable energy or mining, the Federal, Wyoming, Montana, and Oregon Plans work together to limit the total amount of human-caused habitat disturbance on PHMAs and Core Areas to no more than 3 to 5 percent. To prevent indirect impacts to sage-grouse that could occur from land uses in areas outside of PHMAs and Core Areas, the Federal Plans, Wyoming Plan, Montana Plan, and Oregon Plan all require lek buffers so that breeding birds will not be disturbed by human activities. Lastly, the Federal Plans require any project that may adversely affect sage-grouse (in both PHMA and GHMA) to minimize impacts by implementing RDFs and mitigating to a net conservation benefit for sage-grouse. As a result of these measures, the Federal and three State Plans reduce the potential threat of habitat loss caused by human-caused disturbances on approximately 90 percent of breeding habitat across the species' range. These measures were effective immediately upon the implementation of the Federal Plans, the Wyoming Plan, the Montana Plan, and the Oregon Plan and will be in place for the next 20 to 30 years.

Wildfire and its interaction with invasive annual grasses, especially cheatgrass, is a significant risk to the sage-grouse and its habitat. In 2010, we determined that the combination of wildfire and invasive plants was a threat to the sage grouse and a major contributor to our finding that protection for the sage-grouse was warranted. Some wildfires will continue in the Great Basin, as we cannot manage the lightning strikes that spark many wildfires. Between 2000 and 2014, just less than one percent of sage-grouse habitat has burned per year. A recent modeling study predicts there could be a 43 percent decline in sage-grouse abundance within the next 30 years unless effective management is implemented to reduce the effects of wildfire and invasive plants.

The Federal and State Plans include commitments to change ongoing land uses and to prioritize wildfire management and invasive plant treatments in ways that reduce the synergistic threat of flammable invasive vegetation and altered wildfire regimes to sage-grouse habitats (as discussed in detail in Changes Since the 2010 Finding, above). Within the Great Basin, where wildfire is most prevalent, the majority of breeding habitat is in habitats that are most resilient to invasive plants and wildfire. To reduce the magnitude and severity of future wildfires, FIAT assessments prioritize wildfire and invasive plant management strategies in those most resilient areas that reduce the risk of habitat loss from wildlife and invasive plants. Fire and its impacts will be managed across the landscape by the implementation of the FIAT assessments and the Secretarial Order that prioritize suppression of wildfire in sage-grouse habitat. When a wildfire occurs in sage-grouse habitat, suppression in sage-grouse habitat will

continue to receive the highest priority allocation of wildfire suppression and rehabilitation management, after human safety. After a wildfire, the FIAT assessments and the commitments in the Secretarial Order ensure that restoration will be initiated in the immediate aftermath of the fire, when restoration is most effective in preventing invasive plant infestations. To reduce impacts from grazing and free-roaming equids that could stimulate the wildfire and invasive plant cycle, the Federal Plans require that livestock and free-roaming equids be managed at levels that achieve sage-grouse habitat objectives in the 4.5 million ha (11 million ac) of SFAs, and after that in the 14 million ha (35 million ac) of PHMA. Implementation of these measures began in 2015, with the completion of the Secretarial Order, and will continue throughout the 20- to 30-year lifespan of the Federal Plans. The work needed to protect the highest priority areas for conservation (SFAs) will be completed within 5 years (BLM 2015h, entire; DOI 2015a, p. 3). The new focus and prioritization of wildfire suppression and restoration for sage-grouse is an unprecedented change in wildfire fighting in sagebrush habitats that has been successfully implemented during the 2015 wildfire season. As described in the Wildfire and Invasive Plants section above, we expect the Secretarial Order and all other wildfire related actions will be implemented and effective. This sustained change in wildfire strategies reduce the risk that fire and invasive plants are likely to impact sage-grouse now and into the future. While we expect to see some continued loss of habitat and sage-grouse in the future due to wildfire and invasive plants, we do not expect that the species will be at risk of extinction or likely to become so due to risks posed by wildfire and invasive plants.

In addition to the benefits provided by the regulatory mechanisms and management activities in PHMAs and SFAs, the Federal Plans require new minimization measures in GHMA, where habitat is important for connectivity between populations and restoration opportunities (as discussed in detail in Changes Since the 2010 Finding, above). In GHMA, the plans reduce potential threats from human-caused disturbances by avoiding certain uses, such as infrastructure. When land-uses are allowed, science-based lek buffers (Manier *et al.* 2014, entire) are required for any projects implemented in GHMAs to ensure that the project is sited at a distance away from leks so that breeding sage-grouse are not disturbed. All projects implemented in GHMAs include RDFs to minimize indirect effects to sage-grouse, such as design and management of water features so that mosquito habitat is not created that could provide a vector for WNv. Lastly, all projects implemented in GHMAs (and PHMAs) are required to be fully mitigated to a net conservation gain for sage-grouse; these measures are a substantial improvement from management in 2010, where no avoidance, minimization, or mitigation was required. GHMA corresponds with approximately 27 percent of breeding habitat rangewide. These measures were effective immediately upon the implementation of the Federal Plans and will be in place for the next 20 to 30 years.

Some other minor potential threats exist such as hunting, disease, predation, recreational activities, and scientific use. As discussed in the assessment of those potential threats (see Summary of Information Pertaining to the Five Factors, above), some minor or localized adverse effects may occur, but the best available information does not indicate that rangewide population-level effects are occurring. For example, while sage-grouse hunting continues to be allowed in several States, it is highly regulated and monitored with season and bag limits adjusted based on population monitoring so that this activity does not negatively impact the sustainability of this species. In addition, some of those potential threats are ameliorated by the Federal and State Plans, as the exclusion or limitation on land uses thereby further minimizes these minor potential threats. For example, exclusion of surface development of nonrenewable energy in PHMA and Core Areas and RDFs for those projects in GHMA prevents the creation of human-made water sources that provide breeding habitat for mosquitos that are vectors for WNv, thus reducing the potential for disease outbreaks in sage-grouse populations.

In addition to the Federal and State Plans, extensive work by private landowners is an important part of the rangewide sage-grouse conservation effort that has been implemented since 2010 (as discussed in detail in Changes Since the 2010 Finding, above). Private lands comprise about 39 percent of the species' range and contain some key habitat types that are important to sage-grouse. Since 2010, SGI has completed targeted sage-grouse habitat restoration and enhancement actions on more than 1.8 million ha (4.4 million ac) of private ranchlands throughout the species' occupied range. This work includes conifer removal, which will be strategically implemented through use of new conifer mapping (NRCS 2015a, 19). It also includes more than 180,000 ha (450,000 ac) of conservation easements that protect sage-grouse habitat from future agricultural conversion or urban and exurban development. The SGI is also actively engaged in the BLM and USFS efforts to address the wildfire and invasive plants cycle by working with ranchers to implement grazing practices and fuels treatments to improve resistance and resilience of the sagebrush ecosystem. The NRCS has committed 198 million dollars to continue these efforts, with a goal of doubling previous accomplishments by 2018 (NRCS 2015a, p. 30, NRCS 2015b, p. 6).

Private lands conservation has occurred in Oregon and Wyoming with the completion of CCAAs that provide opportunities for enrollment for all private lands within those States (as discussed in detail in Changes Since the 2010 Finding, above). Programmatic and Umbrella CCAAs in these States provide sage-grouse guidance for ranch management practices, ensuring that enrolled lands will be managed to benefit sage-grouse. The programmatic agreements in Oregon provide a framework for other landowners to easily enroll without a large amount of time and paperwork, making it likely that others will enroll in the future. These agreements have resulted in substantial private lands conservation for sage-grouse. For example, landowners in Oregon have either completed enrollment or have signed formal letters of intent to enroll, representing more than 575,000 ha (1.4 million ac) of private rangeland in Oregon. In Wyoming, a completed umbrella CCAA covers important private lands in the range of the sage-grouse, and 36 private landowners have completed CCAAs in Wyoming under this programmatic CCAA. Collectively, there are 180,223 ha (445,343 ac) of private and State lands in the umbrella CCAA.

To summarize, in the 2010 finding, we determined that the regulatory mechanisms needed to address the loss and fragmentation of sage-grouse habitats were inadequate. Five years later, and following an unprecedented conservation planning effort by Federal, State, local, and private partners, we now determine that regulatory mechanisms and conservation efforts adequately address the loss and fragmentation of sage-grouse habitats based on the following reasons:

- The BLM and USFS have successfully amended or revised 98 land use plans that

govern approximately 50 percent of the sage-grouse occupied range. These plans now clearly out outline the expectations for management that will conserve sage-grouse habitat on BLM and USFS lands.

- The States of Wyoming, Montana, and Oregon completed plans with regulatory mechanisms that effectively reduce the loss and fragmentation of sage-grouse habitats. Collectively, the Federal Plans and three State Plans reduce impacts on more than 90 percent of sage-grouse breeding habitat under this umbrella of Federal and State protection.
- The implementation of the FIAT and Secretarial Order is reducing and restoring habitat lost to wildfire in important sage-grouse habitats and making the protection and rehabilitation of sage-grouse habitats a priority second to human health and safety. During the 2015 wildfire season, we are already seeing the positive results of these focused efforts to reduce habitat loss and fragmentation from wildfire.
- The SGI, led by the NRCS, is working with private landowners across the range of the sage-grouse. The initiative targets land within priority sage-grouse habitat and is improving rangeland health on more than 2.4 million acres.
- We have worked with the States and private landowners, especially in Oregon and Wyoming, to implement CCAAs that cover more than 1.8 million acres. These agreements will ensure the conservation of sage-grouse habitat while providing working landscapes for the landowners.

The Act defines an endangered species as any species that is ''in danger of extinction throughout all or a significant portion of its range'' and a threatened species as any species ''that is likely to become endangered throughout all or a significant portion of its range within the foreseeable future.''

We recognize that all impacts to the species have not been completely eliminated, and that existing and ongoing activities will continue to affect the species and its habitat. Therefore, it is likely that, over the foreseeable future, there will be some reduction in available habitat quantity and quality, some decrease in the relative population index, and local range contraction (including the loss of some small populations on the edges of the species' range). The conservation efforts included in this analysis, however, have significantly reduced the impacts in the most important habitats for the species. These areas are highly correlated with the PACs identified in the COT Report as areas necessary for sufficient representation, resilience, and redundancy to ensure persistence of the species.

The conservation efforts by Federal, State, and private partners have greatly changed the likely trajectory of the species from our 2010 projections when we determined that the species warranted listing. We conclude that, taking into account the potential, but now minimized, effects to the species over the foreseeable future, the species is not likely to become endangered within the foreseeable future because of the number of large, connected populations distributed across the species' range and the unprecedented level of conservation actions now in place for 90 percent of the breeding habitat across the species' range. In other words, even with the remaining likely reduction in habitat and populations discussed above, the sage-grouse will retain sufficient representation, resilience, and redundancy throughout the foreseeable future.

The sage-grouse has a broad distribution across the seven MZs, 11 States, and 2 Canadian Provinces. Despite historical reductions in occupied range, sage-grouse occupy approximately 703,453 km^2 (271,604 mi^2), more than 50 percent of their historical range. The species occurs over a variety of habitats that vary by vegetation, elevation, soil type, and precipitation. Through this broad distribution in these varied ecological conditions, the species will maintain representation. The species will continue to exist in the large and most of the small populations across the range, providing species redundancy now and into the future. The larger populations, which comprise the core of the species' range and are protected through Federal and State Plans, will be more resilient to direct impacts and are expected to rebound following disturbance. In summary, for sage-grouse, maintaining representation, redundancy, and resilience means having multiple and geographically distributed populations throughout the varied habitats across the species' range, and we conclude that this goal is achieved through the Federal and State Plans.

The new Federal land-management paradigm is established in 98 amended Federal Plans that reduce and minimize threats to the species in the most important habitat for the species. Several States have adopted their own regulatory measures to reduce habitat loss and fragmentation on non-Federal lands. Many private landowners have also engaged in proactive conservation efforts that provide additional benefits to the species and indicate a shift in cultural attitudes towards the sagebrush ecosystem. Together, the Federal Plans and State Plans in Wyoming, Montana, and Oregon reduce threats on approximately 90 percent of the breeding habitat across the species' range. Looking ahead, we expect these conservation efforts will continue to be implemented for the next 20 to 30 years, ensuring the protection of the most important habitats so that large sage-grouse populations continue to be distributed across the species' range. These conservation efforts occur in the areas needed for redundancy, representation, and resilience of the species.

Therefore, we find that the magnitude and imminence of threats either individually or in combination do not indicate that sage-grouse is currently in danger of extinction (endangered). Further, based on our analysis and the conservation provided by the conservation efforts described throughout this document, we find that the magnitude and imminence of threats either individually or in combination do not indicate that the sage-grouse is likely to become endangered within the foreseeable future (threatened). Therefore, based on our assessment of the best available scientific and commercial information, we find that listing the sage-grouse as a threatened or an endangered species is not warranted at this time.

Significant Portion of the Range

Under the Act and our implementing regulations, a species may warrant listing if it is in danger of extinction or likely to become so throughout all or a significant portion of its range. The Act defines ''endangered species'' as any species which is ''in danger of extinction throughout all or a significant portion of its range,'' and ''threatened species'' as any species which is ''likely to become an endangered species within the foreseeable future throughout all or a significant portion of its range.'' The term ''species'' includes ''any subspecies of fish or wildlife or plants, and any distinct population segment (DPS) of any species of vertebrate fish or wildlife which interbreeds when mature.'' We published a final policy interpreting the phrase ''Significant Portion of its Range'' (SPR) (79 FR 37578, July 1, 2014). The final policy states that (1) if a species is found to be endangered or threatened throughout a significant portion of its range, the entire species is listed as an endangered or a threatened species, respectively, and the Act's protections apply to all individuals of the species wherever found; (2) a portion of the range of a species is ''significant'' if the species is not currently endangered or threatened throughout all of its range, but the portion's contribution to the viability of the species is so important that, without the members in that portion, the species would be in danger of extinction, or

likely to become so in the foreseeable future, throughout all of its range; (3) the range of a species is considered to be the general geographical area within which that species can be found at the time the Service or the National Marine Fisheries Service makes any particular status determination; and (4) if a vertebrate species is endangered or threatened throughout an SPR, and the population in that significant portion is a valid DPS, we will list the DPS rather than the entire taxonomic species or subspecies.

The SPR policy is applied to all status determinations, including analyses for the purposes of making listing, delisting, and reclassification determinations. The procedure for analyzing whether any portion is an SPR is similar, regardless of the type of status determination we are making. The first step in our analysis of the status of a species is to determine its status throughout all of its range. If we determine that the species is in danger of extinction, or likely to become so in the foreseeable future, throughout all of its range, we list the species as an endangered (or threatened) species and no SPR analysis will be required. If the species is neither in danger of extinction nor likely to become so throughout all of its range in the foreseeable future, we then determine whether the species is in danger of extinction or likely to become so in the foreseeable future throughout a significant portion of its range. If it is, we list the species as an endangered or a threatened species, respectively; if it is not, we conclude that listing the species is not warranted.

When we conduct an SPR analysis, we first identify any portions of the species' range that warrant further consideration. The range of a species can theoretically be divided into portions in an infinite number of ways. However, there is no purpose to analyzing portions of the range that are not reasonably likely to be significant and endangered or threatened. To identify only those portions that warrant further consideration, we determine whether there is substantial information indicating that (1) the portions may be significant and (2) the species may be in danger of extinction in those portions or likely to become so within the foreseeable future. We emphasize that answering these questions in the affirmative is not a determination that the species is endangered or threatened throughout a significant portion of its range—rather, it is a step in determining whether a more detailed analysis of the issue is required. In practice, a key part of this analysis is whether the threats are geographically concentrated in some way. If the threats to the species are affecting it uniformly throughout its range, no portion is likely to warrant further consideration. Moreover, if any concentration of threats applies only to portions of the range that clearly do not meet the biologically based definition of ''significant'' (*i.e.,* the loss of that portion clearly would not be expected to increase the vulnerability to extinction of the entire species), those portions will not warrant further consideration.

If we identify any portions that may be both: (1) Significant; and (2) endangered or threatened, we engage in a more detailed analysis to determine whether these standards are indeed met. The identification of an SPR does not create a presumption, prejudgment, or other determination as to whether the species in that identified SPR is endangered or threatened. We must go through a separate analysis to determine whether the species is endangered or threatened in the SPR. To determine whether a species is endangered or threatened throughout an SPR, we will use the same standards and methodology that we use to determine if a species is endangered or threatened throughout its range.

Depending on the biology of the species, its range, and the threats it faces, it may be more efficient to address the ''significant'' question first, or the status question first. Thus, if we determine that a portion of the range is not ''significant,'' we do not need to determine whether the species is endangered or threatened there; if we determine that the species is not endangered or threatened in a portion of its range, we do not need to determine if that portion is significant.

Because we determined that the sage-grouse is neither endangered nor threatened throughout all of its range, due largely to the effective reduction and amelioration of threats by ongoing and future regulatory mechanisms and other conservation efforts, we must next determine whether the sage-grouse may be endangered or threatened in a significant portion of its range. To do this, we must first identify any portion of the species' range that may warrant consideration by determining whether there is *substantial information* indicating that: (1) The portions *may be* significant, and (2) the species *may be* in danger of extinction in those portions or is likely to become so within the foreseeable future. We note that a positive answer to these questions is not a determination that the sage-grouse is endangered or threatened within a significant portion of its range, but rather a positive answer to these questions confirms whether a more detailed analysis is necessary.

While the overall range of the sage-grouse could be subdivided into numerous portions, there are four primary biological divisions based on differences in populations and the concentrations of potential threats. These four portions are: The bi-State population in Nevada and California; the Columbia Basin population in Washington; and the Rocky Mountain and Great Basin portions of the range. We previously evaluated the status of the bi-State population and determined that listing is not warranted. We now consider the Columbia Basin population to be part of the Great Basin portion of the range. The range of the sage-grouse is the general geographical area within which the species is found at the time of this finding. Specifically, the current range of the sage-grouse covers 11 States (Washington, Oregon, California, Nevada, Idaho, Montana, Wyoming, Colorado, Utah, South Dakota, and North Dakota), and two Canadian provinces (Alberta and Saskatchewan), and encompasses all the current populations of sage-grouse, with the exception of the bi-State sage-grouse Distinct Population Segment, and the intervening habitat (Figure 1, above). Analyzing the threats to the Rocky Mountain and Great Basin populations also satisfies the requirement of the Act to address populations and threats in significant portions of the sage-grouse's overall range.

We first evaluated whether potential threats to the sage-grouse might be geographically concentrated in any one portion of its range. We examined impacts to sage-grouse from fire, invasive plants, conifer encroachment, agricultural conversion, renewable- and nonrenewable-energy development, mining, infrastructure, fences, improper grazing, free-roaming equids, urban and exurban development, recreation, climate change, drought, recreational hunting, scientific and educational purposes, disease, predation, contaminants, military activities, small populations, the inadequacy of regulatory mechanisms, and cumulative effects. In our rangewide finding, we determined that impacts to the sage-grouse are found throughout its range. Although these potential threats occur throughout the current range, they are concentrated differently between eastern and western portions of the range. Additionally, there are differences in the composition and ecology of sagebrush habitats in the eastern versus the western portions of the range, and sage-grouse are variably distributed across the landscape from

east to west (see Habitat and Distribution section above). The type and focus of conservation efforts to reduce and ameliorate potential threats vary between eastern and western portions of the range due to the differences in concentration. Therefore, these differences in sagebrush habitats, the distribution of sage-grouse, the concentrations of potential threats, and conservation efforts suggest that eastern and western portions of the range could be significant and warrant additional analysis.

The eastern, or Rocky Mountain portion (MZs I, II, and VII), of the species' current range covers approximately half of the occupied range, contains approximately 49 percent of the sage-grouse estimated abundance, and generally contains sagebrush habitat that is higher in elevation and receives greater amounts of precipitation (Figure 1). The western or Great Basin (MZs III, IV, V, and VI) portion of the species' current range similarly covers about half of the occupied range and approximately 51 percent of the sage-grouse, but contains sagebrush habitat that is lower in elevation and receives less precipitation (Figure 1). Concentrations of potential threats differ between these two portions of the range, with nonrenewable energy development, agricultural conversion, and infrastructure more concentrated in the Rocky Mountain portion, while wildfire and invasive species are more concentrated in the Great Basin portion. The Great Basin portion of the range includes the sage-grouse populations in the Columbia Basin (MZ VI).

Because some potential threats are more concentrated in either the Rocky Mountain or Great Basin portions, we determine that the Rocky Mountain and Great Basin portions warrant further consideration as potential significant portions of the range. Next we evaluate whether the sage-grouse is threatened or endangered in either the Rocky Mountain or Great Basin portions of its current range.

The current range of the sage-grouse could theoretically be divided into an infinite number of portions. In the first step of our significant portion of the range analysis, we identified the Rocky Mountains and the Great Basin as portions that warrant further consideration. Both portions represent approximately half of the current range, and the entire sage-grouse population is distributed equally between both portions. As we discussed in the Bi-State Distinct Population Segment section of this document above, the Columbia Basin represents less than 1 percent of the species' occupied range less than 3 percent of the breeding habitat, and its loss would not result in a significant gap in the occupied range of the sage-grouse. Therefore, the Columbia Basin does not contribute to the overall viability of the species and does not meet the definition of ''significant'' under the SPR policy. We did not identify any other portions within these larger portions that warrant further consideration because the potential threats are not substantially concentrated within any areas other than the Rocky Mountain or Great Basin portions, that are particularly large, constitute a particularly high percentage of the species' range, or are likely to be particularly important for the representation, resilience, or redundancy of the species. Therefore, we conclude that any portions of the range within the Rocky Mountain and Great Basin portions that we have identified do not warrant further consideration as significant portions of the range.

Status of the Rocky Mountain Portion of the Current Range

In our 2010 finding, we were concerned with long-term declines in abundance trends for the Rocky Mountain MZs (MZs I, II, and VII), and we identified a number of threats likely contributing to those declines (75 FR 13910, March 23, 2010). The most important threats identified for the Rocky Mountain portion of the range were habitat loss and fragmentation from energy development, infrastructure, and agricultural conversion; disease—particularly WNv; loss of habitat from improper livestock management; and inadequacy of regulatory mechanisms limiting human-caused impacts. Of these threats, the most significant of these involved a combination of habitat loss and fragmentation from infrastructure and energy development, and inadequate regulatory mechanisms to address these impacts.

The potential threats from fire, invasive grasses, free-roaming equids, conifer encroachment, and urban and exurban development have only limited, localized impacts to sage-grouse in the Rocky Mountain portion of the range now and into the foreseeable future. In addition, our evaluation of the Rocky Mountain portion of the current range focuses primarily on those potential threats most likely to affect, individually or cumulatively, sage-grouse in the Rocky Mountains, which does not include urban and exurban development, recreation, climate change and drought, recreational hunting, scientific and educational uses, contaminants, and military activity. Those threats that are likely to affect sage-grouse in the Rocky Mountains are summarized below. Full discussions of each of these potential threats can be found in Summary of Information Pertaining to the Five Factors (above).

Due to new regulatory mechanisms and conservation efforts, the potential threats identified in 2010 have been adequately ameliorated in the Rocky Mountain portion of the range. Historically, agricultural conversion reduced and fragmented sage-grouse habitats in the Rocky Mountain portion of the range, primarily in MZ I. However, the new cropland risk model (described above in the *Summary of Information for Agricultural Conversion*) indicates that future agricultural conversion is unlikely to have substantial impacts in MZ I of the Rocky Mountain portion of the current range, and future conversions to agriculture are unlikely to occur at greater rates or magnitudes outside of MZ I. Further the implemented regulatory mechanisms effectively reduce impacts from nonrenewable energy development, such that less than 17 percent of the sage-grouse population and 12 percent of the breeding habitat in the Rocky Mountain portion of the range could be exposed to nonrenewable energy development in the future.

We identified improper livestock management as a source of habitat loss and fragmentation in 2010. Since that time, rangeland-health standards in the Federal Plans, Wyoming and Montana State Plan requirements, and SGI practices of applying grazing systems, vegetating former rangeland with sagebrush and perennial grasses, and controlling invasive grasses, effectively ameliorate this threat to the sage-grouse in the Rocky Mountain portion of the range, now or in the future.

Renewable energy development has not occurred extensively within the Rocky Mountains, but potential exists, particularly for wind development. Infrastructure exists throughout the Rocky Mountains and will likely continue into the future. For each of these impacts, the regulatory mechanisms provided by Federal Plans, the Montana Plan, and the Wyoming Plan substantially reduce this potential impact by restricting new development in important sagebrush habitats. Coal mining, the primary kind of mining occurring in the Rocky Mountains, has generally declined since 2008. Regulatory mechanisms provided by the Federal Plans exclude new leasable (except coal) and saleable mineral

development on more than 14 million ha (35 million ac) of PHMA. Because of the effective regulatory mechanisms that protect important habitats, these types of development are not threats to sage-grouse within the Rocky Mountain portion of the range, now or in the future.

As described in the Summary of Information Pertaining to the Five Factors (above), we also evaluated the impacts of predation and disease and found that, although they present localized impacts, they were not likely to result in population-level effects. This remains true when reviewing the information for the Rocky Mountain portion of the range.

Conservation Efforts in the Rocky Mountain Portion of the Current Range

Since the 2010 finding, many parties have collaborated to develop comprehensive strategies that ameliorate the major potential threats, consistent with the COT Report. The Federal Plans and Wyoming and Montana Plans provide adequate regulatory mechanisms to reduce the threats of human-caused habitat disturbance on the most important sage-grouse habitats (as discussed in detail in the Changes Since the 2010 Finding, above). The Federal Plans designate PHMA, and the Wyoming and Montana Plans designate Core Areas, all of which correspond closely with the PACs identified in the COT Report. In the Rocky Mountain portion of the range, more than 67 percent of the sage-grouse breeding habitat distribution is protected as PHMA and more than 30 percent is protected as GHMA.

The Federal Plans address the primary potential threats that reduce and fragment sage-grouse habitats on BLM- and USFS-administered lands in the Rocky Mountain portion of the range, including infrastructure and energy development. All forms of development—from energy, to transmission lines, to recreation facilities and grazing structures—would be avoided in PHMA unless a further assessment found that the project would not adversely affect the sage-grouse. Consistent with COT guidance, a limited amount of development could occur in GHMAs, although additional conservation measures, such as lek buffers, seasonal and timing restrictions, and project-design features, will minimize potential effects in GHMA.

In conjunction with the Federal Plans, the Wyoming Plan incorporates stipulations and conservation measures, such as controlled surface use, seasonal and noise restrictions, consultation requirements, density of development restrictions, and lek buffers to reduce impacts associated with energy development on all lands within Core Areas in Wyoming. The Montana Plan includes a regulatory mechanism similar to the Core Area Strategy to reduce impacts associated with energy development in Core Areas on State-owned lands and private lands when a State authorization is required. The Montana Plan also requires similar conservation measures to reduce impacts, such as seasonal and noise restrictions, density development restrictions, and lek buffers.

Finally, conservation efforts on private lands through SGI and CCAAs reduce potential threats in the Rocky Mountain portion of the range. SGI efforts with ranchers to address grazing systems and fences, to implement habitat restoration, and to provide conservation easements have protected sage-grouse habitat from further fragmentation; NRCS' commitment to adaptive management, partnerships, and flexibility in conservation approaches ensures continued and constantly improving conservation on private lands within sage-grouse habitat. In Wyoming, a completed umbrella CCAA covers important private lands in the range of the sage-grouse, and 30 private landowners have completed CCAAs in Wyoming under this programmatic CCAA. Collectively, there are 180,223 ha (445,343 ac) of private and State lands committed within the umbrella CCAA, 112,212 ha (277,282 ac) of which are located within sage-grouse Core Areas, and 8,235 ha (20,348 ac) are in connectivity areas.

By taking a landscape-level view that spans land ownership in the Rocky Mountain portion of the range, these conservation efforts have significantly reduced the potential threats to sage-grouse now and in the foreseeable future. Many of these conservation efforts are regulatory mechanisms on Federal lands that are managed consistently by BLM and USFS in the five Rocky Mountain States (MT, WY, CO, ND, and SD). Similar regulatory mechanisms are provided by Montana and Wyoming State Plans and Executive Orders to reduce potential impacts on non-Federal lands in those States. These regulatory mechanisms are finalized, are currently being implemented, and are likely to continue to be implemented for the next 20 to 30 years. In addition, SGI and private land owners have implemented conservation projects across the Rocky Mountain portion of the range, further contributing to sage-grouse conservation. The SGI has committed to continue this work for the next 3 years, ensuring private land conservation will continue to be implemented through the authorization of the next Farm Bill (NRCS 2015a, p. 2). All of these conservation actions are consistent with the COT Report recommendations and scientific literature, which indicates they will effectively conserve sage-grouse.

Conclusion for the Rocky Mountain Portion of the Current Range

Based on Federal and State regulations and conservation efforts, the risk and exposure of the sage-grouse to the potential threats of nonrenewable-energy development, agricultural conversion, and habitat fragmentation from infrastructure and other development are significantly reduced. These conservation efforts are ameliorating the potential threats and decreased the amount and rate of development well below what was expected, and by minimizing and mitigating impacts to sage-grouse, have significantly addressed threats facing sage-grouse as described in the 2010 finding, the COT Report, and other published scientific findings. In the Rocky Mountain portion, some habitat loss associated with energy development, infrastructure, agricultural conversion, and urbanization will continue into the future.

Some sage-grouse populations may continue to decline in some parts of the Rocky Mountains. However, the existing and future effective regulatory mechanisms and conservation efforts in the Rocky Mountain portion of the range will protect the most important habitats and maintain relatively large, well-distributed, and interconnected sage-grouse populations across much of the eastern portion of its range. Since the 2010 finding, there has been an unprecedented and substantial proactive conservation effort to reduce potential habitat loss and fragmentation from infrastructure and energy development. More than 67 percent of the sage-grouse breeding habitat in the Rocky Mountains is protected by PHMA, where no development will occur, and more than 30 percent is protected by GHMA, where required conservation measures will avoid and reduce adverse effects. Therefore, we determined that, due to the combination of regulations on Federal lands and regulatory and voluntary measures on private lands that provide adequate avoidance and mitigation, these potential threats are effectively being reduced in the Rocky Mountain portion of the range.

Therefore, we conclude that sage-grouse in the Rocky Mountain portion of

the current range are not in danger of extinction or likely to become so within the foreseeable future, due to the existing effective conservation efforts implemented since 2010 and future conservation efforts. Sage-grouse will remain well-distributed and interconnected into the foreseeable future as these conservation efforts are implemented. Therefore, the sage-grouse is not threatened or endangered in the Rocky Mountain portion of its current range.

Status of the Great Basin Portion of the Current Range

In our 2010 finding, we identified long-term declines in sage-grouse abundance trends for the Great Basin MZs, and we identified a number of threats likely contributing to those declines (75 FR 13910, March 23, 2010). The most important threats identified in the 2010 finding for the Great Basin were: Wildfire, invasive plants, conifer invasion, habitat fragmentation, climate change, loss of habitat quality due to improper livestock and free-roaming equid grazing, and the inadequacy of regulatory mechanisms to address human-caused impacts such as energy and infrastructure development. Of these threats, the greatest concern in the Great Basin was habitat loss and fragmentation from wildfire and invasive plants. Currently, the primary potential threats to sage-grouse in the Great Basin include wildfire and its synergistic effects with invasive plants. We will also specifically summarize habitat loss and fragmentation due to conifer encroachment, mining, renewable energy, and infrastructure in the Great Basin. Our evaluation of the Great Basin portion of the current range focuses primarily on those potential impacts most likely to affect, individually or cumulatively, sage-grouse in the Great Basin and does not include urban and exurban development, recreation, predation, climate change and drought, recreational hunting, scientific and educational uses, contaminants, and military activity. Full discussions of each of these potential threats can be found in Summary of Information Pertaining to the Five Factors (above).

Wildfire and its synergistic relationship with invasive species, climate change and drought, improper grazing, and free-roaming equids was identified in the 2010 finding as the most serious threat to sage-grouse populations in the Great Basin. Wildfire is a natural and integral part of the Great Basin landscape, and will continue into the future. A recent study predicts that a 43 percent decline in Great Basin sage-grouse populations could occur by 2044 if no additional management is implemented to address the wildfire and invasive plant cycle. If conservation measures reduce the area burned by at least 25 percent, the rate of population decline is likely to be reduced. Further, the study emphasizes the importance of implementing conservation actions in areas of moderate and high resistance and resiliency and containing high densities of sage-grouse. The FIAT Assessments and Secretarial Order conservation measures are consistent with this recommendation to prioritize implementation actions in places most likely to be effective and to provide the greatest benefit for sage-grouse. Therefore, we conclude the continued implementation of FIAT and the Secretarial Order will reduce the rate of decline in the Great Basin over the next 30 years.

Through the Federal Plans, the BLM and USFS have established land health standards that now consider and incorporate sage-grouse habitat needs. The Federal Plans restrict grazing in areas that are not meeting standards, and the agencies will manage free-roaming equid populations at levels that minimize impacts to the most important sage-grouse habitats. Voluntary conservation through SGI's invasive species removal programs, improved grazing practices, and the enhancement and protection of healthy rangeland conditions further improve habitat for sage-grouse in the Great Basin. Finally, State conservation efforts in Oregon have further reduced the impacts of wildfire, invasive plants, grazing, and free-roaming equids through regulatory mechanisms.

These and many other positive conservation activities described in this finding were not implemented, planned, or certain to occur when the 2010 warranted finding was completed, leading us to conclude that sage-grouse warranted protections of the Act. The regulatory mechanisms and commitments to manage wildfire and invasive plants will result in a substantial reduction of habitat lost to these impacts, such that sage-grouse populations will continue to be distributed and connected across the Great Basin. Therefore, because the potential impacts have been substantially reduced by effective regulatory mechanisms and the ongoing implementation of conservation efforts, wildfire and the associated synergistic effects from invasive species, climate change and drought, improper grazing, and free-roaming equids are not substantial threats to the sage-grouse within the Great Basin portion of the range, now or in the future.

In addition to wildfire and its synergistic impacts, habitat loss from conifer encroachment has also been identified as a concern in the Great Basin. Conifers are a natural component of the sagebrush ecosystem, and, if not actively managed, are expected to continue to expand, resulting in additional loss of habitat in the Great Basin. However, Federal and State Plan vegetation objectives and on-the-ground removal of conifers through SGI and State efforts have reduced impacts of this potential threat. For the next 3 years, SGI has committed to continue this work, ensuring private land conservation will continue to be implemented (NRCS 2015a, p. 2; NRCS 2015b, p. 6). As a result of direction provided in State and Federal Plans and ongoing implementation of SGI, the rate of encroachment and habitat loss is reduced such that conifer encroachment is not a threat in the Great Basin portion of the range, now or in the future.

Development due to mining, renewable energy, and infrastructure continues to occur in the Great Basin. As discussed above (see *Mining*), mining potential is difficult to predict. The Federal Plans contain regulatory mechanisms to avoid and minimize potential impacts from mining in important sage-grouse habitat. Similarly, infrastructure and development of renewable energy is currently present across the Great Basin and will likely continue at some level, but regulatory mechanisms provided by Federal Plans reduce potential future development by eliminating or capping disturbance in important sagebrush habitat and by implementing project design features to minimize impacts (*e.g.*, buffers, noise restrictions, etc.).

Conservation Efforts in the Great Basin Portion of the Current Range

Since the 2010 finding, many parties have collaborated to develop comprehensive strategies that would substantially ameliorate the major potential threats, consistent with the COT Report. Through Federal Plans, State Plans, and voluntary conservation on private lands through CCAA and SGI, the Great Basin is being actively managed for the benefit of sage-grouse.

The Federal Plans provide clear management regulations with measurable objectives to address invasive annual grasses, conifer encroachment, improper grazing, and free-roaming equids. They prioritize management in the most important habitat (PHMA), which encompasses approximately 60 percent of the

breeding habitat in the Great Basin. All forms of development—from energy, infrastructure, and grazing structures—would be avoided in PHMA unless further assessment found the project not to have any adverse effects on the species. Consistent with COT guidance, a limited amount of development could occur in GHMAs, which support 23 percent of the breeding habitat in the Great Basin (USFWS 2013, pp. 43–52). In those instances, additional measures such as lek buffers, seasonal and timing restrictions, and project design features will minimize potential indirect effects that could occur. A more comprehensive discussion on these measures and their expected effects is provided earlier in this finding (see Summary of Information Pertaining to the Five Factors, above).

The majority of sage-grouse habitat in the Great Basin occurs on Federal lands, making the Federal Plans' implementation most important for sage-grouse conservation in the Great Basin. However, States can help reduce potential threats through collaboration with Federal land managers and by promoting conservation outside Federal lands. To date, Oregon is the only State in the Great Basin that completed and implemented a plan that provides regulatory mechanisms. The Oregon Plan provides regulatory protections for sage-grouse habitat across all land ownerships, a coordinated mitigation system, wildfire management measures, and a development cap for Core Areas that is coordinated with the Federal Plans.

Threat reduction is also enhanced on private lands in the Great Basin through the SGI and associated Farm Bill programs. Throughout the western States, SGI has implemented targeted sage-grouse conservation practices on more than 4.4 million acres, and has allocated more than $424 million in project funding. In the Great Basin portion of the Range, SGI efforts with ranchers to address grazing systems and fences, to implement habitat restoration, and to provide conservation easements have protected sage-grouse habitat from further fragmentation. The NRCS made funding available from 2010 through 2018 to fund and implement the SGI program (NRCS 2015a, p. 2, NRCS 2015b, p. 6). Since 2010, SGI has implemented action on more than 1,000 ranches. NRCS' commitment to adaptive management, partnerships, and flexibility in conservation approaches ensures continued and constantly improving conservation on private lands within sage-grouse habitat. Based on the track record of successfully implemented conservation actions consistent with the COT Report recommendations and commitments to continue implementing the program, we conclude that the SGI program provides substantial conservation benefits to sage-grouse in the Great Basin, now and in the future.

The greatest amount of private lands conservation in the Great Basin has occurred in Oregon. In 2015, we completed a series of programmatic CCAAs for sage-grouse that potentially covers all private lands in the range in Oregon. In Oregon, more than 575,000 ha (1.4 million ac) of rangeland have been effectively conserved for sage-grouse through enrollment of private landowners in CCAAs. These programmatic agreements provide a framework for other landowners to easily enroll without a large amount of time and paperwork, making it likely that others will be enrolled in the near future.

This coordinated approach to conserve sage-grouse and sagebrush habitat has resulted in substantial reductions in all of the potential threats facing sage-grouse in the Great Basin in the foreseeable future. Many of these conservation efforts on Federal lands are consistent across the five States due to the management by BLM and USFS, while programs on non-Federal lands vary from State to State due to different regulatory, political, ecological, and economic circumstances in the respective States. Since 2010, many of the specific measures described in this finding are under way or are being finalized with actions to be implemented during the coming years. We have a high degree of certainty that the majority of the planned future actions will be implemented and will reduce the magnitude of potential threats facing the sage-grouse in the Great Basin.

Conclusion for the Great Basin Portion of the Current Range

Based on Federal, State, and private landowner efforts, the potential threats of wildfire (and associated, synergistic impacts from invasive plants, climate change and drought, improper grazing, and free-roaming equids), conifer encroachment, mining, and infrastructure have been reduced. Some habitat loss in the Great Basin portion associated with wildfire and invasive plants and conifer encroachment will continue into the future, and it is likely that sage-grouse populations will continue to decline in some parts of the Great Basin. However, we expect that the existing and future effective conservation efforts in the Great Basin portion of the range will reduce declines and will protect the most important sage-grouse habitat, resulting in relatively large, well-distributed, and interconnected populations across much of the western portion of its range. Since the 2010 warranted finding, Federal, State, and local entities to identify specific needs of this species and to provide resources for the conservation and protection of the species and its habitat. Due to these conservation efforts, the species will remain well-distributed and interconnected into the foreseeable future as these measures are implemented. Therefore, the sage-grouse is not a threatened or endangered species in the Great Basin portion of its range.

Conclusion

Our review of the best available scientific and commercial information indicates that the sage-grouse is not in danger of extinction nor likely to become endangered within the foreseeable future throughout all of its range. Additionally, we determined that the sage-grouse is not in danger of extinction now or within the foreseeable future throughout either the Rocky Mountain or Great Basin portions of its range. Therefore, the sage-grouse is not in danger of extinction nor likely to become endangered within the foreseeable future throughout a significant portion of its range. Therefore, we find that listing the sage-grouse as an endangered or threatened species under the Act is not warranted at this time.

The completion of this status review is not the end of our commitment to sage-grouse conservation. Our determination today is based on the best scientific and commercial data currently available. That determination, however, cannot guarantee that the sage-grouse (or other sagebrush ecosystem species) will not in the future warrant listing under the Act. New threats may develop, management may change, or the species may not prove as resilient as we concluded based on the currently available science. Thus, although our best judgment today indicates that successful sage-grouse conservation will be achieved by continued implementation of the regulatory mechanisms and conservation efforts we relied on in our finding above, we and our partners must carefully monitor threats to the sage-grouse and its response to those threats. Therefore, we will work with our Federal and State partners to conduct a sage-grouse status review in 5 years. This status review will inform adaptive management and guide future research needs to ensure that conservation efforts continue to

benefit sage-grouse into the future. In the meantime, to ensure the long-term successes of this unprecedented conservation effort, we will continue to work with our partners to augment and improve current management within the sagebrush ecosystem. If at any time new information indicates that the provisions of the Act may be necessary to conserve sage-grouse, we can initiate listing procedures, including, if appropriate, emergency listing pursuant to section 4(b)(7) of the Act.

TO: OWEB Grants Committee

Re: Lower Columbia River Watershed Council Capacity Grant

Dear Committee Members,

It has come to our attention that the Lower Columbia River Watershed Council (LCRWC) has not been recommended for capacity funding. The LCRWC has been an active and vital participant in implementing the Oregon Plan for Salmon and Watersheds since the Council was formed in 1996. The LCRWC has been a significant partner with Columbia County in many projects over the years, especially in important culvert replacements to address fish passage issues. The LCRWC encompasses highly significant stream reaches in Columbia County and has historically had active relationships with landowners and successfully implemented many effective projects.

It appears that the issues of membership and management play a role in the OWEB staff recommendation to not fund the LCRWC. We have reached out to the Columbia SWCD and OSU Extension in Columbia County and would like to offer staff support to assist in the development of a plan to remedy these issues and maintain the operations of the LCRWC. We request that the capacity funding for the LCRWC be granted for the next biennium so that the Council would have the funding to continue operations and to work with us while we address the underlying issues.

We would be happy to meet with OWEB staff to receive the guidance and information required to successfully carry out this project to support the LCRWC in meeting the necessary criteria.

Thank you for your consideration of our request.

Sincerely,

Casey Garrett, Chair

Oregon Watershed Enhancement Board
OWEB Grants Review Committee
75 Summer St NE, Salem, OR 97301

Dear Committee members:

I was informed by the Council Coordinator that the Lower Columbia River Watershed Council has received a "no fund" capacity grant recommendation from OWEB staff.

I attended the LCRWC meetings for many years as an "ex-officio" partner (OSU Extension), helping as I could with membership and clientele recruitment, providing technical advice and recruiting outside expertise as needed. I was elected to the Council about 7 years ago and have, over the last year, been the Secretary.

The combination of the pandemic and the inability of a previous coordinator to translate some good concepts into on the ground action was frustrating for all of us. The Council came close to disbanding when it let the previous coordinator go about a year ago but chose to move forward.

There is a lot to be done within the LCRWC. While most of the culvert passage work has been done under the guidance and hard work of Margaret Magruder, the previous coordinator until she was elected as the Columbia County Commissioner, a lot of other watershed improvement opportunities still remain.

The Clatskanie river system is a high priority at the state/regional level and the current coordinator has made significant strides in engaging the key industrial and small woodland owners that abut the river and its tributaries. This is a relatively small group of owners/managers for most of the riparian habitat.

The relationship with the Columbia SWCD has continued (they are the LCRWC fiscal managers) and have been significantly improved with the current Coordinator.

Getting Council engagement is a challenge with less than 5,500 total residents within the Clatskanie School District Boundaries. That represents ~ 90% of the anadromous fish habitat within the Council's border. Many residents commute to work in the Longview/Kelso area. That said, the Council has had several potential new members attend recent meetings.

Agricultural Sciences & Natural Resources, Family and Community Health, 4-H Youth, Forestry & Natural Resources, Extension Sea Grant, and Open Campus programs. Oregon State University, United States Department of Agriculture, and Oregon counties cooperating. The Extension Service offers its programs and materials equally to all people.

I know this is a tough decision. Please feel free to call or email me if you wish to discuss this further.

Sincerely,

Chip Bubl

OWEB Board
775 Summer Street NE Suite 360
Salem, OR 97301-1290

RE: Lower Columbia River Watershed Council Capacity Grant Application

Dear Co-Chairs McAlister and Boyer and Members of the Board:

We have learned that the Lower Columbia River Watershed Council has received a "no fund" capacity grant recommendation from OWEB staff.

I attended the LCRWC meetings for many years as an "ex-officio" partner (OSU Extension), helping as I could with membership and clientele recruitment, providing technical advice and recruiting outside expertise as needed. I was elected to the Council about 7 years ago and have, over the last year, been the Secretary.

The combination of the pandemic and the inability of a previous coordinator to translate some good concepts into on the ground action was frustrating for all of us. The Council came close to disbanding when it let the previous coordinator go about a year ago but chose to move forward. Very recently, the Council and the new Coordinator came to a mutual understanding to end that working relationship.

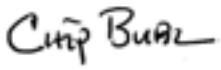
This past Monday, we spent an evening putting together a strategy for going forward.

We are determined to patch some relationships with some of the large timber owners that straddle a lot of the important Clatskanie river drainage. We have a great relationship with the Columbia County Public Works with regards to some of the remaining fish and/or lamprey passage barriers that remain. We still believe that there are opportunities for creating more complex lower elevation resting areas and lamprey/chum reproductive sites.

Significant portions can be done by volunteers. Ideally, we would like to be fully funded by a new Capacity grant. At a minimum, we would like to be able at least retain the funds from the past Capacity grant to allow us to fund some very part time help. Sooner than later, we would like to get a professional rapid bio-assessment to put more teeth to our instincts about where our efforts would provide the largest return in ecological restoration.

Agricultural Sciences & Natural Resources, Family and Community Health, 4-H Youth, Forestry & Natural Resources, Extension Sea Grant, and Open Campus programs. Oregon State University, United States Department of Agriculture, and Oregon counties cooperating. The Extension Service offers its programs and materials equally to all people.

There is a lot to be done within the LCRWC. While most of the culvert passage work has been done under the guidance and hard work of Margaret Magruder, the previous coordinator until she was elected as the Columbia County Commissioner, a lot of other watershed improvement opportunities still remain.



The Clatskanie river system is a high priority at the state/regional level and the current coordinator has made significant strides in engaging the key industrial and small woodland owners that abut the river and its tributaries. This is a relatively small group of owners/managers for most of the riparian habitat.

The relationship with the Columbia SWCD has continued (they are the LCRWC fiscal managers) and is solid.

Getting Council engagement is a challenge with less than 5,500 total residents within the Clatskanie School District Boundaries. That represents ~ 90% of the anadromous fish habitat within the Council's border. Many residents commute to work in the Longview/Kelso area. That said, the Council has had several potential new members attend recent meetings and we spent quite a bit of time last Monday brainstorming some good outreach strategies that should bring a larger group to the Council.

I know this is a tough decision. Please feel free to call or email me if you wish to discuss this further.

Sincerely,

Chip Bubl

OWEB Board
775 Summer Street NE Suite 360
Salem, OR 97301-1290

RE: Lower Columbia River Watershed Council Capacity Grant Application

Dear Co-Chairs McAlister and Boyer and Members of the Board:

This letter is in support of the request to provide OWEB Capacity Grant funding for the Lower Columbia River Watershed Council to allow members to rebuild the Council to its former high functioning status. The City of Clatskanie has been an avid participant in the Council and desires to see it continue. As you may know, the Council was chartered in 1996 and has actively implemented many successful Oregon Salmon and Watershed projects over the years.

The City has partnered with the LCRWC on many successful projects and hope to continue to have the opportunity to implement more restoration projects in the LCRWC area.

We urge your support for their funding request. Thank you for your consideration.

Sincerely,

Greg Hinkelman
City Manager

Re: Lower Columbia River Watershed Council Capacity Grant Application

Dear OWEB Board,

The Scappoose Bay Watershed Council (SBWC) is writing this letter in support of the Lower Columbia River Watershed Council (LCRWC). There is a significant need in the local community for the LCRWC. The current board for the LCRWC is working very diligently with a plan moving forward to be the fundamental organization it once was within the local community. The plan includes seeking new board members, a new coordinator, expanding community outreach, updating council documentation, and seeking the means to do the bio-assessments and surveys that need to be done to perform the most effective restoration within the watershed. There is a need for an effective Watershed Council in this region. The SBWC receives inquiries from homeowners and organizations within the LCRWC region with questions as their neighboring watershed council. The SBWC knows of this need and wants to continue to work in conjunction with the LCRWC to effectively help the community with any conservation needs. The SBWC urges the OWEB Board to consider working with the LCRWC to determine a path forward for an effective transition to meet all OWEB merit requirements. The LCRWC has the support of the SBWC, other local agencies, and a real need within the community to continue.

If you have any questions or need more information, please contact me at 503-298-6996 or coordinator@scapposebay-wc.org.

Sincerely,
Scappoose Bay Watershed Council

RE Lower Columbia River Watershed Council Capacity Grant Application

Dear Co-Chairs McAlister and Boyer and Members of the Board:

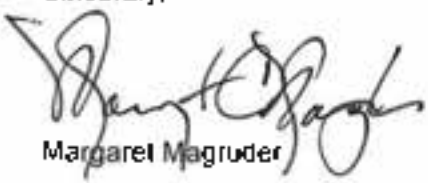
This letter is to request approval of providing OWEB Capacity Grant funding for the Lower Columbia River Watershed Council to allow for the members to rebuild the Council to its former high functioning status. The Council was chartered in 1996 and has actively implemented many successful Oregon Plan for Salmon and Watershed projects over the years.

I recently became aware that the Council was struggling to maintain membership and to identify and implement projects. After learning this, I contacted several LCRWC members, SWCD staff and OWEB staff to develop a path forward to enable the Council to continue operations. After reviewing the OWEB Council Capacity Grant Review document, this core group has developed a plan to facilitate rebuilding the LCRWC

The Council has a remaining balance, approximately $35,000, in its current OWEB Capacity grant fund which, if extended, would allow the Council some funding to work on rebuilding. If required to wait 2 years for the next OWEB Capacity grant funding opportunity, the Council would not be able to fund hiring a new Coordinator to provide the necessary time and expertise to rebuild in a timely manner.

The goals identified

- Seek a volunteer or part time Coordinator
- Increase membership
- Schedule regular meetings in Clatskanie and Rainier
- Update Strategic Plan
- Update Board Self-Assessment Plan
- Improve community outreach
- Build landowner relationships
- Seek funds/talent for a rapid bio-assessment to inform our updated strategic plan
- Identify potential projects



//

We propose:

- Extending the existing Capacity Grant to cover the interim until the next OWEB Capacity Grant window
- Develop an Action Plan which includes the goals noted above
- Meet regularly with OWEB staff to assess progress
- Reevaluate progress at monthly Council meetings

We would welcome other recommendations or requirements that the OWEB Board might suggest Our goal is to preserve the Council and its ability to advance projects within the Lower Columbia Watershed.
Thank you for your consideration of this request.

Sincerely,

Margaret Magruder

RE: Capacity Grant Funding for Greater Yamhill Watershed Council

Dear Oregon Watershed Enhancement Board,

On behalf of the Yamhill Soil & Water Conservation District (District), I am writing to express our support for the Greater Yamhill Watershed Council (Council) to receive full funding of their 2023-2025 capacity grant. We consider the Council a vital partner, with nearly three decades of success in collaborative conservation efforts. Council staff often provide technical expertise and support District efforts. We are concerned that reducing funding for the Council will not only limit their own capacity to do work in the watershed, but also decrease the capacity of the District to implement collaborative restoration projects.

Over the past year, the Council has partnered with the District on several projects, including the successful completion of three OWEB grants: the Fromherz-Cooke oak habitat restoration project, the Miller Woods Phase 1 upland prairie habitat restoration, and a culvert replacement to improve fish passage on a tributary of Mill Creek. The Council is also an active participant in District-led aquatic weed surveys, invasive weed outreach efforts, water quality sampling, and serves as a member of the County's Roadside Vegetation Technical Advisory Committee. Together, we have accomplished more than either organization could have accomplished individually.

With full capacity grant funding, this partnership will continue to thrive. We are currently developing several collaborative projects, including multiple riparian habitat restoration projects within the Deer Creek, Muddy Creek, and South Yamhill Strategic Implementation Area (SIA), and areas adjacent to agricultural land near Yamhill. Other projects include groundwater monitoring in the Chehalem Mountain area, culvert replacements benefiting fish passage on and near commercial timber harvest areas in western portions of Yamhill County, establishment of a carbon planting area on agricultural land outside Dayton, and spawning surveys and monitoring along Panther Creek adjacent to agricultural land.

In the spirit of continuing our successful partnership and the goal of accomplishing multiple projects together that will support Yamhill County and its residents, we hope that you will consider fully funding the Greater Yamhill Watershed Council's capacity grant.

Sincerely,

Andy Bleckinger

OWEB Board
775 Summer St., NE Suite 360
Salem, OR 97301

Dear OWEB Board Members,

On behalf of the Board and Staff of the Columbia SWCD, we offer our full support to helping to keep the LCRWC funded. During the meetings I have been attending, the LCRWC is dedicated to improving landholder engagement, conducting a rapid biological assessment, increasing board membership, and getting out into the community to remind them who the Council is what they can do for them.

We have been a proud partner of the LCRWC since the beginning and we would hate for them to lose their funding and not be able to regrow the Council to what it has been in the past. Without the LCRWC's efforts and support a lot of the great work that has been done in Columbia County would not have happened.

We encourage you to support them in some way that they can accomplish their goals and get the LCRWC back on the right track. This is a time of transition and with some help from partners and volunteers, I fully believe that the Council can be strong once again.

Sincerely,

Malyssa Legg

Re: Comments on Grant Application 224-9902-22741 (Acquisition of Wood River 1864 Priority Water Right)

Dear Co-Chairs McAlister and Boyer and Board Members:

Klamath Water Users Association (KWUA) respectfully requests your consideration of the following comments regarding the subject grant application.

The application should be denied because it is premised on a "paper" water transfer. That is, the application asks that the Oregon Watershed Enhancement Board ("Board" or "OWEB") assume that refraining from the surface application of 3,755.4 acre-feet (AF) of water on a property in the lower Wood River Valley will result in an increase, beyond what would otherwise be present, of exactly 3,755.4 AF in streams, lakes, and rivers downstream of the historic points of diversion for the irrigation right of the transferor property, all the way down to a new point of diversion for consumptive use on another property. That assumption does not withstand technical scrutiny. Approval of the application would amount to the Board paying for a specific quantity of water, but acquiring only a *much* lesser quantity for uses downstream of the transferor property.

KWUA leaves to the Board (and other potential funders) the question of whether to pay for water that will not materialize and thus not provide benefit. But there is an additional negative impact of the transfer and transaction that is under consideration. The plan of action being pursued will result in *reducing* water availability to irrigation water users in the Klamath Project (Project). In other words, the applicant's proposed approach involves payment of money to one irrigator or one group of irrigators outside the Project, in a manner that results in taking water away from Project irrigators. This is not acceptable.

KWUA is a non-profit, mutual benefit corporation, formed in 1953. Our members are irrigation districts and similar water distribution entities who divert and deliver water to irrigated land and two national wildlife refuges in southern Klamath County, Oregon, and Modoc and Siskiyou Counties, California. KWUA's mission is "to preserve and enhance the viability of

irrigated agriculture for our membership in the Klamath Basin, for the benefit of current and future generations."

KWUA members are parties to contracts with the U.S. Bureau of Reclamation (Reclamation) related to the storage, diversion, and delivery of water by facilities that are part of, or associated with, the Project, which was authorized in 1905. The irrigation infrastructure operated by KWUA members is also the sole means by which water from the Klamath Basin can be delivered to Tule Lake National Wildlife Refuge (TLNWR) and Lower Klamath National Wildlife Refuge (LKNWR).

Although the subject application references instream water uses, the driver for the application is to obtain additional supplies of water for diversion to, and consumptive use on, LKNWR. The application indicates that the current temporary transfer is seen as an initial step toward similar, permanent transfers for 30,000 AF of additional water rights to LKNWR. The applicant's motives are understandable. But the problem that the application is attempting to address has nothing to do with water rights or some deficiency of existing water rights.

In this regard, LKNWR already has considerable water rights determined in the Oregon Water Resources Department's (OWRD) Amended and Corrected Findings of Fact and Order of Determination (ACFFOD) in the Klamath Basin Adjudication (KBA). *See* https://www.oregon.gov/OWRD/programs/WaterRights/Adjudications/KlamathRiverBasinAdj/Pages/ACFFOD.aspx (OWRD website location for the Bates-stamped copy of the ACFFOD, cited here as KBA_ACFFOD_[page]. LKNWR's determined water rights claims include a share of a 1905 priority state water right for irrigation associated with the Project, and various federal reserved rights with priorities of 1925 and earlier. KBA_ACFFOD_07017, 07118-7126 (1905 priority state water rights); KBA_ACFFOD_03715, 03728-3744 (federal reserved water rights). These water rights are more than adequate to meet all demand on LKNWR. They have never been curtailed or otherwise had their use restricted as a matter of water law.

In recent years, the once-reliable source of water for Project irrigation and wildlife refuges has been curtailed due to federal water management policies, particularly under the Endangered Species Act (ESA). As a direct result, both irrigators and wildlife refuges have been deprived of water they need. The ESA-driven regulation of the Project-based diversions does not consider water rights; it applies to one group of water right holders (Project irrigators and refuges) irrespective of their water right priority. Other water right holders in the basin are not curtailed under the ESA, even though many of them have later priority water rights. KWUA objects to the federal policies that cause both dry farms and dry refuges, and KWUA and its members have worked diligently to minimize negative impacts to wildlife through various means. But the situation will not improve unless federal ESA administration becomes more reasonable.

Applicant California Waterfowl Association is a respected and effective advocate for waterfowl. Unfortunately, in this instance, the applicant launched an effort without adequate due diligence and based on incorrect assumptions. The erroneous assumptions fed advocacy that has

generated political momentum, private donor attention, and expectations which, in turn, make it more difficult to abandon the erroneous assumptions. KWUA does not seek to be the "bad guy" in this situation. But KWUA insists that decisions be based on facts, and the most complete, correct understanding of facts that is possible.

Setting and Overview of Transaction

The application involves water in the Upper Klamath Basin and rights to the use of water for irrigation on a specific property in the Wood River Valley. The land is a diked-off portion of wetlands that formerly existed at the confluence of the Wood River and Crooked Creek. A substantial portion of the property is below the water level in the Wood River.[1] The owner, Thomas Family Limited Partnership (Thomas), holds a determined claim for irrigation of the property from points of diversion on Wood River and Crooked Creek (a short tributary of Wood River). The duty of water under the determined claim is 3.0 acre-fee per-acre (AFA), and the priority date of the water right is October 14, 1864.[2] The acreage within the place of the determined claim is 1,500.5 acres. Thus, Thomas holds a determined claim for a water right for diversion and application of up to 3.0 AFA, during the period April 1 through October 1 of each year. *See* KBA_ACFFOD_01054, 01057-1059.

The Wood River flows into the interconnected Upper Klamath/Agency Lakes. Water levels in Upper Klamath/Agency Lakes are controlled by Link River Dam, a concrete structure at the lake outlet that is owned by Reclamation as part of the Project. There are also multiple diversions of water directly out of Upper Klamath Lake. The largest, and southernmost, of these is A Canal, also part of the Project, which is operated and maintained by Klamath Irrigation District to deliver water to irrigation water users in Oregon and California. Water released at Link River Dam flows through the short stretch of Link River, then Lake Ewauna, and into the Klamath River proper. On the Klamath River, there are several diversions of water by, and for the benefit of, Project contractors. Two of these diversions, North Canal and Ady Canal, are operated by the Klamath Drainage District (KDD). Ady Canal delivers water to private landowners in KDD and to LKNWR. The LKNWR land within KDD and Oregon is primarily agricultural land leased to growers, and the remainder of LKNWR is in Siskiyou County, California.

On April 20, 2021, Thomas applied to OWRD for approval of a temporary (five-year) change in points of diversion and place of use of the Thomas property water right. As subsequently amended, the application sought approval for new points of diversion at the North Canal and Ady Canal, with the place of use being LKNWR. Also, during the processing of the application, OWRD concluded that approximately 20 percent of the Thomas property is not

[1] The Board can consult LiDAR data from the Oregon Department of Geology and Mineral Industries on this issue. *See also* https://www.oregongeology.org/pubs/ldq/reports/Wood_River_Lidar_Report_2005.pdf.

[2] The property is land formerly part of the Klamath Indian Reservation. The priority date for the water right is the date of the treaty between the Klamath Tribes and the United States and not the date when irrigation commenced. *See United States v. Adair*, 723 F.2d 1394 (9th Cir. 1983).

eligible for transfer. Thus, the application was amended to request temporary transfer from 1,251.8 acres of 3.0 AFA, or 3,755.4 AF per year total. *See* OWRD Special Order, vol. 122, at 204-209.

On August 26, 2021, OWRD approved the amended transfer application, and it issued a revised order approving the amended application on December 27, 2021. According to the grant application (at 6), "payments of $400,000 and $500,000 were made by CWA to the water right holder in 2021 and 2022," with the funds having come from a California agency and private donors for the first two payments. OWEB is being asked for $400,000 to complete a third payment in 2023. The application is not clear or consistent regarding the amount of water expected to be delivered to LKNWR. For example, it states that the current transfer is limited to two-thirds the full duty on the transferor property, and that Reclamation "will determine" how much will be conveyed to LKNWR. Application at 7. Elsewhere, the application states that the transfer will provide "over 10% of the [30,000 AF of] wet water that FWS seeks to acquire for the LKNWR." Application at 11.

It is our understanding that total diversion that has actually occurred under the temporary transfer was 333 AF in 2021, 458 AF in 2022, and 958 AF to date in 2023.[3]

Evaluation of "Wet Water"

The application states that the transfer will increase instream water amounts downstream of the transferor diversion locations by the same amount as the amount of water that could otherwise be applied on the transferor land. We do not concur.

Hydrologic Balance

Under ordinary circumstances, crop (here, irrigated pasture) water demands are met in part by precipitation and sub-irrigation (subsurface water flows) as well as by applied surface water. In such circumstances, the application of additional water can result in the available water being greater than the plant needs.[4] In turn, this results in water exiting the property as surface tailwater and subsurface flows that move to downstream water bodies. This is a universally recognized phenomenon, but not addressed or acknowledged in the application. The evaluation of this issue is site-specific and requires consideration of the consumptive use of water on a property, with and without applied irrigation water, and other factors. The difference between the face value of the water right and the quantity of water that actually manifests at a downstream location due to non-irrigation of the property, is commonly known as "paper" water (which contrasts with actual "wet" water). It is not an original concept that "paper" water cannot

[3] The value for 2021 is taken from Reclamation's annual ESA report. The 2022 and 2023 values are from daily water emails; the 2023 value was identified a few days before this letter was sent.

[4] KWUA has no direct knowledge of historical application of irrigation water or whether the quantity has ever been as high as 3 AFA. For the purposes of these comments, that information is not essential.

be transferred to another consumptive use without resulting in additional consumptive use (i.e., "enlargement" of the right) and harm to other consumptive and nonconsumptive water users.[5]

In the Wood River Valley in particular, the face value of water rights is significantly greater than the net change in consumptive use that results from withholding applied irrigation water. There is no lack of technical information to support this conclusion.

For example, during 2013-2016, several parties, including private landowners, the state of Oregon, the Klamath Tribes, and federal agencies, negotiated, signed, and began implementation of an agreement known as the Upper Klamath Basin Comprehensive Agreement (UKBCA). That agreement has terminated for reasons that are not relevant. But as part of their implementation efforts, these parties made evaluations of the quantity of "wet water" that would result from withholding the application of water for irrigation on properties upstream of Upper Klamath Lake. The reason for this work was that the UKBCA called for the instream dedication of specific quantities of water for instream purposes. The agencies providing funds for these transactions, and the Klamath Tribes, wanted to receive the benefit of their bargain. That is, they required the quantification of "wet" water that would appear instream as a result of non-irrigation of transferor lands. The University of Idaho conducted a study that is significantly at odds with the present application's assumption that non-irrigation of the subject parcel would result in 3.0 AFA of "wet water" for instream uses. For properties in the lower Wood River Valley, the analysis supports that the expected quantity of wet water is closer to 0.5 AFA, which would be 625.9 AF. *See* Attachment A. Based on site-specific conditions for this property, the quantity could well be less than 0.5 AFA.

KWUA also recommends that the Board consult available satellite-based data from openetdata.org (OpenET). According to OpenET, the majority of the subject property has consumed in excess of 35 inches of water per acre annually during the last two years (2022 and 2023) during which the property has not been actively irrigated. This reinforces that a very significant amount of the plant water need is met by sources other than applied irrigation water.

For context in considering the value of any of these quantities, the annual average net inflow to Upper Klamath Lake[6] is approximately 1.2 million AF, and 1.0 foot of depth on Upper Klamath Lake comprises 70,100 AF on average.[7]

---

[5] In the context of this transfer, diversion of paper water holds the potential of decreasing river flows downstream of the transferee point of diversion in the Klamath River. In the context of Project operations, this question is not simple, but it is appropriate to recognize the hydrologic principle. The actual flow in the Klamath River is controlled by the operation of Link River Dam and other infrastructure, but in all events the total amount available for other uses is affected by diversions of paper water.

[6] "Net inflow" is a calculated value that reflects the combined surface and groundwater inflow to Upper Klamath Lake less the sum of evaporative losses, groundwater outflow, and depletions from diversion from non-Project (i.e., non A Canal) facilities.

[7] Reclamation spreadsheets are relied upon for these data.

It has been asserted to KWUA that the excess water that accumulates on the Thomas property, even in the absence of active irrigation diversions, is not hydrologically connected to either the Wood River or Crooked Creek, in that it presumably does not emanate from or return to those sources. Further, it has been asserted that given this disconnection, the pumping of this excess water off the property is additive to downstream flows. This circumstance, it is claimed, is caused by the earthen levee that separates the property from and prevents it from being flooded by the Wood River. These claims are not technically or logically supportable and we are aware of no direct supporting evidence. In addition, the fact that there is water to be pumped off the property despite the lack of direct diversions confirms the condition described above: most of the property is irrigated (very considerably) by natural sub-irrigation.

Existing Instream Protections

The application refers to instream leasing of water and assumed streamflow enhancement of unspecified magnitude. The currently effective temporary transfer is limited to changes in authorized points of diversion and place of application for consumptive use. The temporary transfer, effective for only two more years, does not provide any assurance of any quantity of water that will be added or protected instream below the transferor points of diversion.

In any event, and whatever the quantity of wet water generated by the transfer, the Board should be aware of already-existing streamflow protections for the Wood River and Crooked Creek that preclude the ability to divert water for use on the Thomas property even in the absence of a transfer.

Specifically, in the ACFFOD, there are determined claims for instream flow in both the Wood River and Crooked Creek. These flows have been determined to provide healthy and productive habitat to support tribal fisheries and have a priority of time immemorial. KBA_ACFFOD_05319, 05328, 05330. Thus, diversion for use on the Thomas property is not permissible if it will reduce flows below the level determined to provide healthy and productive fish habitat, and diversions can be curtailed in order to increase streamflow to provide healthy and productive fish habitat. In fact, during the 2021 and 2022 irrigation seasons (April 1-September 30), flows in Crooked Creek fell below the determined claim values on 138 out of 368 days; meaning that on 37.5 percent of all days, water could not have been diverted even without the temporary transfer. During that same period, where flows were above the determined claim, the average excess above the claim was 4.34 cubic feet per second (cfs), which is less than the authorized rate of diversion. In such situations, the transfer adds no instream water that would not otherwise be present. At the time of this letter, it appears that flows in Crooked Creek are just above the determined claim values.[8]

The application states that the "[t]he Tribal Claims are met 100% of the time" as a result of the transaction. The evidence in hand does not support that statement. The application also states that the transfer will, in most instances, "result in an additional 25 cfs remaining in

[8] https://apps.wrd.state.or.us/apps/sw/hydro_near_real_time/display_hydro_graph.aspx?station_nbr=11504109.

Crooked Creek and Wood River on top of the Tribes' instream claims." Again, KWUA does not believe the evidence supports this assertion. KWUA also notes that 25 cfs over the authorized period of diversion for the Thomas property right would amount to approximately 9,000 AF of water, which is far more than the determined claim for the property.

Existing Temporary Change Order and Incomplete Evaluation (USFWS)

As discussed above, OWRD's 2021 order approving temporary changes in the Thomas water right include the diversion right of 3.0 AFA. It is apparently true that, in determining whether a transfer would result in water right "injury,"[9] OWRD presumptively follows an anachronistic policy of approving the full duty of water allowed in the transferor property water right. But water right "injury" occurs if "there is a reduction in return flows available to downstream water right holders." *See* J. Neuman, *Oregon Water Law: A Comprehensive Treatise on the Law of Water and Water Rights in Oregon*, 1st ed. (2011) at 198. In this instance, OWRD did not take into consideration any information related to harm to other water users or negative effects of the transfer on irrigation return flows. KWUA believes this was at least in part because of the relatively short-term nature of the 2021 temporary transfer order. KWUA would object to this kind of superficial analysis by OWRD in the future, and will oppose, and quite probably challenge, any temporary or permanent transfer order that is not limited to the volume of wet water generated by non-use on the transferor parcel. The appraisal document accompanying the application correctly states (at 17) that the volume of water that may be approved in any future order is "presently uncertain."

In the meantime, however, Reclamation and the U.S. Fish and Wildlife Service (USFWS) have acknowledged the uncertainties in the amount of wet water that may result from the transfer, and the potential harm to other water users from transfers of paper water. KWUA respects, and is grateful to regional leadership of the USFWS, who has been clear in not being willing to support a transfer that harms the interests or water supply of Project irrigators. In this regard, in September of 2021, Reclamation and USFWS entered into a Memorandum of Understanding "Regarding 2021-2025 Pilot Program to Transfer Determined Water Rights from the Wood River Valley to Lower Klamath National Wildlife Refuge" (MOU) (Attachment B).

The MOU commits to a study process to "quantify the net change in water available downstream of the original place of use as a result of the transfer." MOU at 1. The reason for quantifying the "wet water" resulting from the transfer is "to avoid negative impacts to other water uses and users in the basin." *Id.* at 1. The federal agencies recognize, for example, that "prior to the transfer, the return flow from [the Thomas Property water right] would have entered Upper Klamath Lake … ." *Id.* at 2.

[9] "Injury" is a term of art in water law and a finding of absence of water right injury does not equate to an absence of negative impact.

KWUA recommends that OWEB seek any information that may be available as a result of work completed under the MOU.

In the meantime, Reclamation and USFWS agree in the MOU that the diversion of water under the temporarily transferred right will be limited to 2.0 AFA. MOU at 3. KWUA believes that this "placeholder" of 2.0 AFA is generous, but KWUA is committed to reciprocate, and cooperate in, the federal leaders' good faith actions related to the temporary transfer that will expire in two years.

The application states that the amount that can be diverted during the five-year period of the temporary transfer is "two thirds of what is restored instream" as a result of the transfer. KWUA disagrees, for the many reasons discussed above.

Negative Effects on Project Farms and Local Communities

As discussed previously, LKNWR is not lacking inwater rights. And, in all years, there is adequate water present at Ady Canal – the point of diversion to LKNWR – to meet all of LKNWR's needs that can be served through Ady Canal. The challenges for Project irrigators and LKNWR are that their diversions are curtailed by federal administration of the ESA that has nothing to do with water rights. Rather, ESA-based management is driven by projected a**ctual inflow** to Upper Klamath Lake, and ultimately controlled by the presence of **wet water** and not state water right entitlements.

Specifically, under present circumstances, the Project is tasked under the ESA with assuring that specific minimum Upper Klamath Lake elevations will be maintained, and with assuring that specific minimum flows will be maintained in the Klamath River in California. Diversion of water for the Thomas property has some effect on the Project's ability to meet those ESA mandates, and thus can affect water availability for Project irrigators. But if the Thomas right is transferred and used to deplete the system of more water than occurs by diversion for the Thomas property, the Project can find itself responsible for making up the difference. In other words, Project irrigators will be required to subsidize the paper water component of the Thomas transfer with their own wet water, despite the fact that they receive no compensation at all.

The Board should also take note that, overall, the advocated transfer plan is based on an unfair double standard. Specifically, if Project irrigators were to arrange for a transfer of water rights from upstream areas, the irrigators would *not* realize more water for irrigation than they otherwise would have. We know this, for two reasons.

First, we have direct experience. Under the current, ESA-driven logic, in the spring of each year, Reclamation calculates a maximum "Project Supply," which is based on then-existing Upper Klamath Lake elevations and forecasted, actual inflow to Upper Klamath Lake. In some years and circumstances since 2013, when the Project Supply would be inadequate to meet demand, the Project has been able to make a priority call that has resulted in regulating off the junior water users. But Project irrigators did not experience an increase in Project Supply equal

to the face value of the water rights that were regulated off. In fact, Reclamation and federal regulatory agencies have insisted that the amount of "wet" water that is generated from non-irrigation of upstream properties is far too uncertain, and to this date there is no agreed methodology for determining the amount of wet water generated. To the (very limited) extent that, in a few years, there was an approved increase in Project Supply due to priority-based regulation of upstream juniors, that only occurred very late in the year, when there was an ability to know how much water had actually flowed into Upper Klamath Lake during the irrigation season.

Second, practically speaking, any increase above Project Supply will frequently be inconsistent with ESA biological opinion requirements. As discussed above, the present approach to Project operations is one that requires the Project to assure minimum flows and minimum Upper Klamath Lake elevations, with wet water, not projections of wet water and not with paper water.

Conclusion

Finally, we are mindful that the staff recommendation is conditioned on the USFWS committing $400,000. The underlying logic may be that USFWS needs to have "skin in the game." But the Board must recognize that if USFWS commits funds to a potential permanent transfer, that almost certainly will not be based on an expectation of any given increase in instream water. Realistically, a USFWS commitment of dollars may create further inertia for the diversion of paper water for consumptive use, to the detriment of Project water users.

The Board should not award the requested grant.

We do not relish the role that has fallen to KWUA in this process. Please contact me at (916) 769-6685 or psimmons@somachlaw.com if you have any questions or if we can provide additional information.

Sincerely,

Paul S. Simmons
Executive Director and Counsel

from the Wood River Valley to
Lower Klamath National Wildlife Refuge

This Memorandum of Understanding (MOU) is hereby made and entered into by and between the U.S. Fish and Wildlife Service (Service) and the Bureau of Reclamation (Reclamation). These entities are collectively referred to hereafter as the Agencies. Authority for the Service to enter into this MOU is provided in the National Wildlife Refuge System Administration Act of 1966, as amended by the National Wildlife Refuge System Improvement Act of 1997 (Public Law No. 105-57), and the Fish and Wildlife Coordination Act (16 U.S.C. §§ 661-667). Authority for Reclamation is provided in the Fish and Wildlife Coordination Act and the Klamath Basin Water Supply Enhancement Act of 2000.

I. PURPOSE AND SCOPE

The purpose of the MOU is to establish a five-year agreement in which the Agencies will initiate a pilot project involving the transfer of determined water right claim KA-67 for use at Lower Klamath National Wildlife Refuge (LKNWR). The information learned through this pilot project will be applied in subsequent transfers in an effort to avoid negative impacts to other water uses and users in the basin.

The Agencies will collaborate to assure that transfer of KA-67 will be consistent with the priorities established under the water rights system of the State of Oregon, and also avoid impact to Federal obligations that are not otherwise protected by State water law. The Agencies will use best available science and seek out both monitoring information and the technical input of interested and affected stakeholders.

The transfer of KA-67 will be facilitated by the Agencies as a pilot project with terms identified in this agreement that have been formulated to avoid negative impacts to the Klamath Project (Project) and its obligations under Federal law, and which are based on best available science and professional judgement. Monitoring conducted as part of the pilot project will be used to quantify the net change in water available downstream of the original place of use as a result of the transfer. The intention of the pilot project is to inform the Agencies about the effects of the transfer and to gather information that will be used in considering future transfers.

II. BACKGROUND

LKNWR wetland acreages have plummeted due to a variety of factors, including recent reductions in the reliability of deliveries to the Project from Upper Klamath Lake. From 2013, to

2019, wetlands on LKNWR have averaged just 13,135 acres annually, a 47% decline from the 1982-2012 average of 24,787 acres annually. Importantly, because of the Service's inability to secure water, LKNWR wetlands have often remained dry during the Pacific Flyway's southern migration season through the Klamath Basin, which occurs from August through November.

Shortages to the LKNWR are due to several factors, including changes in regulatory requirements for Klamath River and Upper Klamath Lake supplies under the Endangered Species Act (ESA) that have occurred since 2013, and reduced pumping through the D Plant and the Tule Lake Tunnel. The challenges facing Project supplies and LKNWR are unlikely to find a comprehensive solution in the near term. In response, the Service has sought to secure reliable water to meet wetland and agricultural habitat objectives at LKNWR now and into the future. These efforts include a temporary transfer of water rights from the Barnes-Agency Unit of Upper Klamath National Wildlife Refuge to LKNWR, and other actions to acquire water rights in partnership with private organizations.

Establishing reliable water deliveries throughout wetland units on LKNWR is paramount to the Service's ability to provide diverse wetlands, protect native habitats, and support wildlife diversity throughout the year. This is consistent with the Service's obligation under the National Wildlife Refuge System Administration Act (16 U.S.C. § 668dd(a)(4)(G)) to "…acquire, under State law, water rights that are needed for refuge purposes…". For additional discussion of water supply issues and hydrology at LKNWR, please see the 2016 CCP/EIS pages 3-6 through 3-8 and 5-56 through 5-63 (U.S. Fish and Wildlife Service, 2016). The Service's specific wildlife and habitat objectives for LKNWR are articulated in the Service's 2016 Comprehensive Conservation Plan for LKNWR (along with objectives for four other proximal refuges).

In 2021, the California Waterfowl Association and the owner of KA-67, which is a determined water right claim that is senior to Project water rights, entered into an agreement that resulted in an application temporarily transfer that determined water right claim to LKNWR for a period of five years. California Waterfowl Association seeks to transfer KA-67 determined water rights claim, changing the point of diversion and place of use to provide for delivery of the water to LKNWR. The current points of diversion are on the Wood River and Crooked Creek and the purpose of use is irrigation. As modified by revised tables and maps submitted to OWRD, the proposed transfer includes 1,251.8 acres, the maximum rate of use is 25.04 cubic feet/second (cfs) (which is 11.81 cfs diversion from the Wood River and 13.23 cfs diversion from Crooked Creek), the duty is 3 acre-feet/acre, and the priority date is October 14, 1864.

Upon review of the August 26, 2021, OWRD order approving transfer of KA-67, the Agencies have identified potential for impacts to federal interests that are not completely addressed under Oregon state water law. The OWRD order approved transfer of the full KA-67 water right, including those portions of the right that might otherwise be available for use by others downstream of the original place of use. As an example of potential impacts to federal interests, prior to the transfer, return flow from KA-67 would have entered Upper Klamath Lake and could have helped Reclamation to meet downstream flow requirements in California. Reclamation is required under federal law to meet those downstream flows, but those obligations are not recognized under Oregon state law.

III. RESPONSIBILITIES

A. Reclamation:

1. Agrees to the diversion and conveyance of water rights transfers through all Reclamation-owned or operated facilities and to reflect those operations in its long-term and annual operations plans, limited by and subject to physical constraints, the terms of this MOU, and applicable law.
2. Agrees to acknowledge and support valid agreements and contracts reached by the Service with independent Project irrigation districts, including the Klamath Drainage District.

B. The Service:

1. Agrees to maintain or secure appropriate and valid agreements for the conveyance of transferred water through non-Reclamation facilities.

C. The Agencies:

1. Agree to facilitate the temporary transfer of the KA-67 determined water right, subject to the following:
    a. The temporary transfer of KA-67 over its full five-year duration at volume limited to 2.0 acre-feet per acre, for a total maximum annual volume of 2,503.6 acre-feet . This volume is based on an initial estimate of the net increase of water quantity downstream of the original place of use as a result of the transfer.
    b. In agreeing to the 2 acre-feet per acre limitation on use, the Agencies expressly state that there is no intent to forfeit or abandon any portion of the KA-67 water right. The Agencies will work together to assure that the KA-67 water right is not abandoned or forfeited. If necessary, to avoid abandonment or forfeiture, the Agencies may consider many options, including but not limited to not applying the limitations in ¶ III.C.1.a within the 5-year transfer period when impacts to other interests can be minimized or avoided.
    c. Agencies agree to collaborate on a plan to monitor, quantify, and document changes in water availability as a result of the transfer, using best available science to the extent practical.
    d. The Agencies will use the information gathered under this pilot project or apply the provisions of this MOU when considering future transfers. Application to other transfers would require a new MOU or an amendment of this MOU. As new information is gathered and analyzed the Agencies will seek and apply the best available science (including but not limited to monitoring data and analysis relating to hydrology, climate, land use, and evapotranspiration in the Klamath

Basin) for quantifying net addition of water to the downstream system that would not have been available but for the transfer. In gathering and analyzing information, the Agencies will remain receptive to technical input from interested and affected stakeholders.

2. The Agencies agree to meet on or before March 1 annually to discuss the timing and quantity of transferred water rights available, subject to all applicable federal and state laws.
3. The Agencies agree to jointly hold formal or informal coordination with Tribal and irrigation stakeholders, as appropriate, on or before March 15 annually to report LKNWR and other refuge water delivery plans and solicit feedback, subject to all applicable federal and state laws.
4. In the event of a dispute between the Agencies that arises after the March 1 start date of irrigation season in any given year, the Agencies agree to meet and confer to explore a mutually agreeable modification of operations.

IV. ADMINISTRATION OF THE MOU

A. **Effective Date and Approval.** This MOU becomes effective upon signature by both of the Agencies and shall continue in effect through October 1, 2025, unless terminated pursuant to ¶ IV.D.

B. **Amendment.** This MOU may be amended through written agreement of both the Agencies.

C. **Conflict Resolution and Elevation.** If disagreements regarding implementation of this MOU occur between the Agencies, the parties agree to meet and work in good faith to resolve such disagreements. If attempts to resolve such disagreements are not successful, the parties may elevate the issue within the respective Agencies and the Department of the Interior.

D. **Termination.** Either party may terminate its participation in the MOU by providing written notice to the other party at least 60 days prior to any such termination becoming effective. No such termination shall affect existing operations plans for the Klamath Project prior to November 1st of the given year. If water right KA-67 is acquired by the Service or any other federal agency, this MOU will terminate on the date of acquisition.

E. **Notice.** All written notices required under this MOU are to be provided to the designate Agency Representative set out below. Each party shall promptly notify the other party in writing of any change to its Agency Representative and/or the Agency Representative's contact information.

V. OTHER PROVISIONS

A. **Authorities not altered.** Nothing in this MOU alter, limits, or supersedes the authorities or responsibilities of the Agencies on any matter within their respective jurisdictions. Nothing in this MOU shall require the Agencies to perform any action beyond their respective authorities. This MOU creates no enforceable legal obligations between the Agencies.

B. **Financial obligations.** Nothing in this MOU may be construed to obligate Reclamation, the Service, the Department of the Interior, or the United States to any current or future expenditure of resources in advance of the availability of appropriations from Congress, nor does this MOU obligate Reclamation, the Service, the Department of the Interior, or the Unites States to spend funds on any particular project or purpose, even if funds are available.

C. **Immunity and Defense Retained.** Each party retains all immunities and defenses provided by law with respect to any action based on or occurring as a result of this MOU.

D. **Third-Party Beneficiaries.** This MOU shall not create any right or interest in the public, or any member thereof, as a third-party beneficiary hereof, not shall it authorize anyone not a party to this MOU to maintain a suit of any kind pursuant to the provisions of this MOU. The duties, obligations, and responsibilities of the Agencies with respect to third parties shall remain as imposed under existing federal or state law.

E. **Elected Officials Not to Benefit.** No member of or delegate to Congress shall be entitled to any share or part of this MOU, or to any benefit that may arise from it.

VI. AGENCY REPRESENTATIVES

Each party has a designated representative listed below. Each party may change its representative by providing written notice to the other party.

Re: Comments of Ft. Klamath Landowners et al. on Application No. 000-0000-22741 for Acquisition and Ecological Use of Wood River Valley 1864 Priority Water Right

I. SUMMARY OF COMMENTS

Fort Klamath Critical Habitat Landowners, Inc., NBCC, LLC, Agri Water, LLC, Roger Nicholson, Martin Nicholson, Goose Nest Ranches, LLC, Randall Kizer, Gerald Hawkins, Harlowe Ranch, LLC, and E. Martin Kerns (collectively "Ft. Klamath Landowners et al.") offer the following comments opposing Application No. 000-0000-22741 submitted by the California Waterfowl Association ("CWA Application") for the funding of an acquisition of a Wood River Valley 1864 priority water right.

First, the CWA Application contains various misrepresentations of fact regarding the water availability within the Wood River Valley. The Klamath Tribes' instream water rights in the Wood River are rarely satisfied, resulting in annual calls on Wood River water users regardless of priority. The CWA Application misleadingly asserts that such calls are rare. The frequent nature of the Tribal calls on Wood River water rights renders the proposed transfer[1] at the foundation of the CWA Application largely ineffective. Therefore, OWEB should reject the CWA Application.

Second, the Thomas Transfer is currently being litigated on account of its impacts on various water right holders, including parties signed onto this letter. The Thomas Transfer is at significant risk of being vacated through this legal action. OWEB should decline to provide any grant funding in favor of the Thomas Transfer until all current legal proceedings are complete.

Third, the CWA Application indicates that its intent is to eventually fund the permanent transfer of the Thomas Family's water right, KA-67, to the LKNWR. Regardless of the results of the pending litigation, the permanent transfer of KA-67 to the LKNWR will be exceedingly difficult under Oregon law. As a practical matter it may be impossible to permanently transfer KA-67 to the LKNWR, as this would constitute an out-of-basin diversion from a basin with a severe

[1] The transfer at the foundation of CWA's application is the Thomas Family Limited Partnership's application to transfer their water right, KA-67, to the Lower Klamath National Wildlife Refuge ("LKNWR"). This transfer is referred to herein as the "Thomas Transfer."

water shortage. Once again, OWEB should reject the CWA application or, at minimum, decline to provide grant funding until the legality of such a permanent transfer is decided.

Fourth, KA-67 is a "Walton" right for irrigation in the Wood River Valley. OWRD's authority to transfer such a right is extremely questionable, and may preclude any permanent transfer. OWEB should reject the CWA Application accordingly.

Fifth, the CWA Application requests that OWEB pay a landowner for their decision to ship water out of state. It is simply poor policy for this state to pay landowners to export their water to a different state, especially where this state already suffers from severe water shortages. Therefore, OWEB should reject the CWA Application.

II. COMMENTER'S INTERESTS AND STATEMENT OF RELEVANT FACTS

Ft. Klamath Landowners et al. are the owners of real property in the Wood River Valley in Klamath County, Oregon. Ft. Klamath Landowners et al.'s properties enjoy appurtenant surface and ground water rights for irrigation and stock watering. Some of these surface water rights have been provisionally recognized in the Klamath Basin Adjudication as having a priority date of 1864, while others were adjudicated in the prior adjudication of the Wood River, with pre-1909 priority dates. Further still, many hold water rights that were issued by OWRD after 1909.

In the Klamath Adjudication the United States in trust for the Klamath Tribes has been awarded instream water rights in many Klamath Basin tributaries, including but not limited to the Wood River, Crooked Creek, Williamson River, Sprague River, and Upper Klamath Lake. These instream "Tribal Claims" have priority dates of "time immemorial," making them the most senior rights in the basin. Within the last few years, Ft. Klamath Landowners et al. have all been issued written shut-off orders for their surface water rights, which have resulted from senior calls on these instream Tribal Claims held by the United States and have, in many cases, required them to cease all irrigation and stock water use from Wood River, Williamson River, Sprague River, and/or their tributaries (*e.g.* Fort Creek, Crooked Creek, Sand Creek, Whiskey Creek).

In 2021, the Oregon Water Resources Department ("OWRD") issued a final order approving the Thomas Transfer, which took water from the Wood River Valley and exported it to the Lower Klamath National Wildlife Refuge in California. Ft. Klamath Landowners et al. protested the approval of the Thomas Transfer on multiple grounds, including but not limited to that the transfer would result in a waste of water, would injure Ft. Klamath Landowners et al.'s water rights, and would constitute an unlawful out-of-basin diversion.

Ft. Klamath Landowners filed a petition for judicial review in the Marion County Circuit Court challenging the Thomas Transfer. The issues raised in the petition were, *inter alia*, that the Thomas Transfer would result in injury, waste, and an unlawful out-of-basin diversion. OWRD disputed these claims. Regarding the claim that the Thomas Transfer was an out-of-basin diversion, OWRD argued that Oregon's out-of-basin diversion statutes do not apply to **temporary** transfers. There is no dispute that Oregon's out-of-basin diversion statutes apply to permanent out-of-basin transfers.

Following summary judgment briefing, the Circuit Court issued judgment for OWRD. Ft. Klamath Landowners appealed, and the case is currently pending before the Oregon Court of Appeals.

III. COMMENTS

A. The CWA Application Contains Misrepresentation of Fact.

In much of the Klamath Basin any persons' ability to utilize their surface water right is wholly dependent on the satisfaction of the Klamath Tribes' instream water rights. The Wood River Valley is no exception. For any party to utilize their surface water rights in the Wood River and/or Crooked Creek, the flows of these streams must first meet or exceed the Tribal Claims. The Klamath Tribe issues a call annually to shut off diversions in the Wood River Valley when streamflows are below the Tribal Claims.

The CWA Application represents that the 1864-priority water right (KA-67) subject to the Thomas Transfer is "satisfied under most hydrologic conditions" and is only subject to regulation "on the infrequent occasions when flows are inadequate to satisfy the subject water right[.]" CWA Application at 16. The CWA Application further represents that only "[d]uring periods of extreme drought" would the Tribal Claims reduce the amount which can be transferred under KA-67. CWA Application at 6.

These representations by CWA are simply false. Ft. Klamath Landowners et al. have intimate knowledge of the effect of the Tribal Claims on their own 1864-priority water rights. In recent years, these water rights on the Wood River have been rendered unusable because the Tribal Claims in the Wood River are rarely satisfied. As Exhibit 1 (attached herein) depicts, the actual flows of the Wood River have fallen below the Tribal Claims every summer since 2015. In the past three years, a period not analyzed in CWA's application, OWRD has ordered the shut-off of 1864-priority water rights on the Wood River. *See* Watermaster District 17 - Klamath Basin Status, OWRD https://apps.wrd.state.or.us/apps/misc/dsb_area_status/Default.aspx?wm_district=17. This has occurred even during very typical hydrologic conditions, as well as historic hydrologic conditions like 2023 when a massive snowpack resulted in heavy spring-and-summer flows.

In short, OWRD's regulation of 1864-priority water rights in the Wood River is not limited to "periods of extreme drought." Rather, even under "most hydrologic conditions" Ft. Klamath Landowners et al. have had their 1864-priority rights regulated on account of the Tribal Claims.

As a result of this frequent regulation, the Thomas Transfer will not result in significant benefits to LKNWR. As the CWA Application acknowledges, the amount which can be transferred is limited by any call on the Tribal Claims. If 1864 water rights on the Wood River are completely regulated off as a result of the Tribal Claims, then the Wood River-portion of KA-67 cannot be transferred to the LKNWR. Because this is a frequent occurrence, that means the benefits of the KA-67 transfer are significantly reduced as a practical matter. Thus, in many years KA-67, or significant portions of it, simply cannot be used to export water to LKNWR.

It makes little sense for OWEB to provide funding for a water right transfer which will not actually occur under most hydrologic conditions. Because that is the exact ask CWA is making, OWEB should reject the CWA Application.

B. The Thomas Transfer is Currently Being Litigated.

As explained herein, the Thomas Transfer at the foundation of the CWA application is currently subject to litigation. Although the Circuit Court ruled in favor of OWRD, the case is now on appeal before the Oregon Court of Appeals.

Ft. Klamath Landowners et al. strongly contest the decision of the Marion County Circuit Court, and respectfully assert that they have strong odds of a favorable decision on appeal. Regardless, there is a likelihood that the ongoing litigation over the Thomas Transfer will invalidate OWRD's final order approving the transfer. If this occurs, then any funding provided to support the Thomas Transfer will be wasted. Ft. Klamath Landowners et al. strongly encourage OWEB not to take exceptional risks with their grant funding. At minimum, OWEB should delay any funding for the Thomas Transfer until the current litigation has concluded.

C. A Permanent Transfer of KA-67 Will Likely Be Subject to More Litigation.

The Thomas Transfer currently exists, and is being litigated, as a temporary transfer of KA-67. As explained herein, one of Ft. Klamath Landowners et al.'s arguments in the litigation is that this transfer of KA-67 is an out-of-basin diversion, which OWRD approved without following the requirements of ORS 537.803 et seq. OWRD contested this claim on the grounds that ORS 537.803 et seq. does not apply to temporary transfers submitted pursuant to ORS 540.523.

The Marion County Circuit Court adopted OWRD's argument that ORS 537.803 et seq. does not apply to temporary transfers submitted pursuant to ORS 540.523. This decision is under appeal. However, it is beyond dispute that ORS 537.803 et seq. does apply to permanent transfers submitted under ORS 540.520. *See* ORS 537.803(1). The only way KA-67 can be permanently transferred, as described in CWA's Application, is through a permanent transfer application submitted under ORS 540.520.

Because KA-67 will eventually need to be permanently transferred to benefit the LKNWR, any such transfer will need to comply with ORS 537.803 et seq. The text, context, and legislative history of ORS 537.803 et seq. all confirm that out-of-state transfers constitute out-of-basin diversions. See ORS 537.801(1)(a) ("'basin' means one of the river basins *within this state*") (emphasis added); Tape Recording, House Committee on Environment and Energy, SB 205, June 24, 1989, Tape 233, Sides A & B at 50:44 (stating intent of SB 205 was to limit out-of-state diversions); Tape Recording, House Committee on Environment and Energy, SB 205, June 24, 1989, Tape 232, Sides, A & B, at 57:25 (same); Tape Recording, House Committee on Environment and Energy, SB 205, June 24, 1989, Tape 233, Sides A & B, at 51:00 (same); Tape Recording, House Committee on Environment and Energy, SB 205, June 24, 1989, Tape 234, Sides A & B, at 15:00-17:20 (same); Tape Recording, Senate Committee on Water Policy, SB 205,

Feb. 7, 1989, Tape 12, Sides A & B, at 8:11 (same); Tape Recording, Senate Committee on Water Policy, SB 205, May 25, 1989, Tape 49, Sides A&B, at 18:44 (same).

Given the forgoing text and legislative history, there is little-to-no question that a permanent out-of-state transfer must comply with ORS 537.803 et seq. Importantly, however, OWEB must recognize how difficult it will be for KA-67 to be transferred consistent with the provisions of ORS 537.803 et seq. Among other things, ORS 537.809 requires that OWRD "reserve an amount of water adequate for future needs in the basin of origin, including an amount sufficient to protect public uses, and subordinate the out-of-basin use to that reservation" before approving any out-of-basin diversion. Unfortunately, in the Klamath Basin there is no excess water to be reserved. OWRD has repeatedly recognized that both the surface water and groundwater resources of the Klamath Basin are woefully over-appropriated. If OWRD cannot reserve water in the basin of origin to offset the transfer of KA-67, then it simply cannot approve the transfer. Moreover, OWRD will be required to subordinate KA-67's priority date, which will render its 1864-priority status meaningless in the context of any subsequent calls on the Tribal Claims.

As a practical matter, ORS 537.803 et seq. prohibits the transfer of KA-67 to the LKNWR. Therefore, OWEB should reject the CWA Application.

D. OWEB Must Analyze Whether KA-67 Can Be Transferred Because it is a Walton Right.

In the Wood River Valley, there are many water rights which are referred to as "Walton Rights." These rights originate from the agricultural uses which occurred on lands within the former Klamath reservation. When portions of the reservation were sold, the water rights which had been used on those lands transferred too. These became "Walton" Rights with 1864 priority dates.

Walton Rights have unique characteristics. First, in the Klamath Basin Walton Rights must be used for irrigation, as that is the use which created the rights under the Klamath Treaty. *See* OWRD's Klamath Adjudication Corrected Findings of Fact and Order of Determination. Second, Walton Rights may only exist within the former Klamath Reservation. Lands outside the former reservation cannot have Walton Rights.

KA-67 is for all intents and purposes a Walton Right.[2] Therefore, it may only be used for the dedicated purpose of irrigation, and can only be used within the former Klamath reservation. Because the Thomas Transfer would both strip KA-67 of its irrigation use and remove KA-67 from the former Klamath reservation, KA-67 would lose both characteristics necessary for a Walton Claim. Consequently, this may invalidate the right entirely. Before OWEB approves the CWA Application it must analyze whether it is legally permissible for a water right holder to transfer a Walton Right outside the former Klamath reservation, for a non-irrigation use.

[2] KA-67 is technically a Klamath Termination Act claim. But, these claims have the same characteristics of Walton Claims. *See* OWRD's Klamath Adjudication Corrected Findings of Fact and Order of Determination at 38.

E. The CWA Application is Bad Policy.

Ft. Klamath Landowners et al. further oppose the CWA Application because it is bad policy. OWEB must clearly recognize what the CWA Applications requests: the export of water from a water-starved area of Oregon to a wildlife refuge in another state. If OWEB approves the application, the State of Oregon will be funding the sale and export of scarce Oregon water to out-of-state users. OWEB should not go down this path. While it is one thing for a water user to transfer water out of state in a manner consistent with ORS 537.803 et seq. (which is impossible here), it's an entirely different issue for the state to fund such a transfer. As water shortages ravage this state, resulting in major hardships in agriculturally-dominated regions, Oregon should take a more protective approach to its scarce recourses. Therefore, OWEB simply should not fund the sale and export of scarce Oregon water to out-of-state users. The CWA Application should be denied accordingly.

IV. CONCLUSION

Ft. Klamath Landowners et al. respectfully request that OWEB reject the CWA Application or, at minimum, delay providing funding for the Thomas Transfer until the issues discussed herein have been resolved.

DATED this 20th day of July, 2023.

Sincerely,

Dominic M. Carollo

Type Comment Here (comments may also be uploaded below):	I would like to express my strong support for funding of the water transfer from Agency Ranch in the Wood River Valley to the Lower Klamath National Wildlife Refuge, I reviewed the staff summary and applaud them for their thoroughness and insight. They do point out the benefits to flow in Crooked Creek and the Wood River as well as water levels in Upper Klamath Lake. However, I do not think the summary entirely captures to dire situation that this transfer is meant to help address. The nation's first migratory bird refuge, the Klamath Basin National Wildlife Refuge Complex, is undergoing actual desertification. The premier wildlife refuge on the west coast of the United States has received essentially no water in the past 3 years, including this year when we received 150% of normal precipitation. This is a result of a combination of misguided polices colliding with mother nature, the story of which goes beyond this public comment. Suffice it to say that this has led to a catastrophe for the Klamath Basin as well as the entire Pacific Flyway, Wetlands are the life blood of the Klamath and the loss of the vital wetlands on the refuge is decimating fish and wildlife populations, disrupting hydrologic processes like ground water recharge and river flow, and deleteriously impacting the water quality of what we have left. The Wood River Valley acquisition is a very important step in addressing this environmental calamity and should be funded. This is the only ongoing, concrete effort I know of to provide meaningful water to the refuges and sets a precedent for future transfers that could provide longterm solutions to the water right issues for the refuge complex. Staff brought up the issue of cost in their excellent review. In my past role an OWEB board member, I was always a bit skeptical of the prices paid for water. However, the situation is critical and is getting worse every minute there is no water on the refuge. I believe the prices quoted are quite acceptable in this unique and dire scenario.

Type Comment Here (comments may also be uploaded below):	I support the Water Acquisition and Ecological Use of Wood River Valley 1864 Priority Water Right (app. # 224-9902-22741) This project provides not only a solution to the long-term effort to save the fish and wildlife at the Lower Klamath National Wildlife Refuge. As the water will pass through Agency Lake and Upper Klamath Lake will improve the quality of habitat and enhance the water quality to support the endangered species in this system. This project will provide benefits with no negative impacts for fish and wildlife. And supports the many interests to protect all the organisms in this ecosystem.
I would like to give verbal comment at the meeting in person	No
I would like to give verbal comment at the meeting virtually	No

(503) 986-0178

Agenda Item H supports OWEB's Strategic Plan priority #3: Community capacity and strategic partnerships achieve healthy watersheds.

MEMORANDUM

TO: Oregon Watershed Enhancement Board

FROM: Courtney Shaff, Monitoring and Reporting Program Manager
Brian Wolcott, Water Acquisition Coordinator

SUBJECT: Agenda Item H – Council Capacity Grant Awards
July 25-26, 2023 Board Meeting

I. Introduction

This staff report provides an overview of the 2023-2025 Council Capacity grant cycle process and outlines staff recommendations for grant awards. Staff recommend funding 56 watershed councils for $9,220,881. Fifty-four are recommended for full funding, two are recommended for reduced funding and one is not recommended for funding. Evaluations may be found in Attachment A.

II. Background

Council Capacity grants are within the Operating Capacity category of the Board's spending plan and help support the operating costs of effective watershed councils. OWEB has provided Council Capacity grants for more than 20 years. Watershed councils are located throughout the state (Attachment B). OWEB does not create or oversee councils; they are locally designated watershed restoration organizations, but OWEB may provide grants to councils in support of those actions described in Measure 76.

Council Capacity grants are awarded biennially and support engagement with local communities around voluntary restoration projects to protect and restore native fish or wildlife habitats and watershed functions to improve water quality or stream flows. The Board adopted administrative rules and guidance for council capacity grants in 2014. These grants are intended to help support the operating capacity of effective watershed councils. The Council Capacity grant process includes an eligibility determination as well as initial and secondary merit reviews.

III. Merit

Merit criteria evaluate watershed councils for performance and progress including how they addresses challenges.

A. Initial Merit Review. OWEB staff completed the initial review of all fifty-seven councils that applied for funding. Staff reviewed application materials and considered their

knowledge of each council's performance history over the last two years, progress towards meeting the merit criteria, and the council's ability to meet reporting and fiscal requirements of OWEB grants when making the initial merit determination. Five watershed councils did not meet all merit criteria and were referred to the secondary review and interview process.

B. Secondary Review and Interview. The secondary review panel consisted of OWEB staff and external reviewers with expertise in watershed council operations. Reviewers considered: 1) application materials and supplemental materials provided by the council; 2) reviewers' knowledge of the council; 3) OWEB staff input; and 4) an interview with council staff and board officers. Application materials for the councils that participated in the secondary review process are available online for review.

C. **Staff Funding Recommendations**

A. Staff funding recommendations are based on the results of the initial and secondary reviews and available funding. The evaluations for councils recommended for full funding are provided via link in Attachment A. Staff recommend full funding for 54 councils that meet all merit criteria, reduced funding with conditions for two councils that met some, but not all the merit criteria, and a do not fund recommendation for one council that demonstrated inadequate progress across all the merit criteria. In addition, staff recommend one council receives continued merger funding on top of the base award as approved in previous biennia.

B. Reduced Funding. Staff recommend two councils, Greater Yamhill and Umatilla Basin, receive reduced funding because they met some but not all of the merit criteria. In addition to reduced funding, staff also recommend both councils be funded only for one year and grant agreements would include specific benchmarks each council needs to meet in order to receive the second year of funding. The evaluation summaries describing the rationale for the staff recommendations and the grant agreement conditions are provided in Attachment A, pages 10-13.

C. Do Not Fund. Staff recommend Do Not Fund for one council, Lower Columbia River WC. The evaluation summaries describing the rationale for the staff recommendations is provided in Attachment A, page 5. Given the significance of the Do Not Fund recommendation for the council, their council capacity application is found in Attachment C. It is important to note that the Do Not Fund recommendation is not permanent, and the council may submit a council capacity grant application in future cycles.

D. **Recommendation**

Staff recommend the board award council capacity grants as described in Attachment D with an award date of July 1, 2023.

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-002

Project Name: LCRWC Council Capacity and Support

Applicant: Columbia SWCD

Application Description

This project seeks to fund a Watershed Council Coordinator for the Lower Columbia River Watershed Council. Council-identified watershed limiting factors include habitat access – impaired access to habitat, hydrograph/water quantity – altered hydrology, knowledge gaps – lack of information, physical habitat quality – altered quality of physical habitat, water quality - altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council to ***demonstrate some progress in planning*** through the recent submittal of a monitoring application for a Rapid Bioassessment in the watershed. Besides the pending application, the council uses no other documents to plan or prioritize the work of the council. If the monitoring application is funded the council would convene a technical advisory team; however, members of the team have not yet been identified or contacted to see if they would be willing to participate.

Concerns

OWEB staff found the council ***does not demonstrate effective governance and management***. The council is currently operating with the fewest number of board members in the history of the organization. The vice chair recently resigned over the decision to submit a monitoring application and there are no candidates for chair or vice chair in the upcoming October council officer election. The council board has not demonstrated effective management of staff and it is not clear how the board participates in management and oversight of the coordinator, in collaboration with the SWCD, who is the employer.

OWEB staff found the council ***does not demonstrate effective progress in on-the-ground watershed restoration***. The council has implemented no restoration projects in the last two years and the two projects it was working on in the last biennium were transferred to the SWCD for implementation. The council has no clear vision for its restoration niche in the watershed.

OWEB staff found the council ***does not demonstrate effective progress in stakeholder engagement for watershed restoration purposes***. The council did not complete any stakeholder engagement activities during the 2021-2023 biennium and has no activities planned for the 2023-2025 biennium. The current board members have created an isolated environment that does not appear to be welcoming to the general public and is not effective at recruiting new engagement or interest in the council's activities.

Concluding Analysis

The watershed council does not demonstrate it is engaging with its local community to plan and develop restoration projects to support local, state, and federal restoration goals. The council membership does not include a diverse range of community interests and does not appear to be open and welcoming to the broader community. The review team did recognize the council

is showing some limited progress toward future planning with the recent submittal of a monitoring application for a rapid bioassessment, but the council did not meet any of the other merit criteria required by OWEB to receive funding.

Recommendations

Staff Recommendation to the Board: Do Not Fund

Staff Recommended Award: $0

Staff Conditions: N/A

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-007

Project Name: TBWC Capacity Grant 2023-25

Applicant: Tillamook Bay WC

Application Description

This project seeks to fund a Watershed Council Coordinator for the Tillamook Bay Watershed Council. Council-identified watershed limiting factors include habitat access – impaired access to habitat, physical habitat quality – altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council has addressed most of the concerns that were raised previously during the council capacity review process. The council was re-recognized by the Tillamook County commissioners, has engaged a new board of directors that is representative of the community, regularly holds meetings, and recently updated its bylaws and policies.

OWEB staff found the council demonstrates ***effective progress in planning***. The council has continued to plan and engage with the community despite having no council capacity funding. The council recognizes the need to engage with the local community and update the strategic plan before restarting the council's restoration program.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council continued to make progress on some restoration projects, led by volunteer board members, despite having no council capacity funding. The council is working with local partners to determine future restoration priorities.

OWEB staff found the council demonstrates ***effective progress in stakeholder engagement*** for watershed restoration purposes. Council board members have worked to rebuild relationships throughout the watershed and demonstrated the council has broad support from the watershed community.

Concerns

None

Concluding Analysis

The council was without funding for two biennia and has demonstrated it has addressed OWEB's previous concerns and is making progress in all of OWEB's merit criteria. The council should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: None

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-021

Project Name: Elk Creek Watershed Council Support 2023

Applicant: Elk Creek WC

Application Description

Project will provide funding for the Coordinator/Executive Director, and operations of the Elk Creek Watershed Council in the northern part of Douglas County. The Council will work with local landowners and state and federal agencies to plan, develop, and implement on-the-ground projects to benefit fish and wildlife, and water quality in the Elk Creek Watershed, and in the Umpqua basin. Key partners are local landowners, Douglas and Umpqua SWCD, ODFW, Roseburg District BLM, and others.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board is engaged and supportive of the council and has recently recruited a new board member. The council recently reviewed its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council recently completed bioassessment surveys, which were used to inform the newly adopted restoration action plan, which will guide future restoration actions.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council focuses its restoration efforts on private lands and is making progress on existing restoration projects.

OWEB staff found the council demonstrates some ***progress in community engagement*** for watershed restoration purposes. The council has struggled to restart its usual stakeholder engagement approaches post-COVID and is reaching out to landowners to discuss restoration opportunities as its primary outreach tool.

Concerns

The council continues to struggle to recruit a board member from the industrial timber industry, which should be an organizational priority during the next biennium.

The council is using limited approaches to outreach and engage the broader watershed community. Broader stakeholder engagement may lead to increased council participation and help with future board recruitment.

Concluding Analysis

The council has demonstrated progress in all merit criteria and is recommended for full funding. However, the council needs to focus on improving both organization governance and management and stakeholder engagement in the 2023-2025 biennium to ensure it continues to demonstrate process in those two merit criteria areas. The council should consider reviewing its approach to board meetings, including location and time, to make the meetings more accessible to all community members and working to engage with a broader aspect of the watershed.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: 1) The council must submit a progress report by July 1, 2024 reporting on the following:

- Progress toward engaging an industrial timber industry member on the board, including a description of what outreach efforts were taken and the result of those efforts.

- Progress in current stakeholder engagement activities and the development of new approaches and efforts to make the council meetings more available to the community at large.

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-039

Project Name: Greater Yamhill Watershed Council Capacity 2023-2025

Applicant: Greater Yamhill Watershed Council

Application Description

This project seeks to fund a Watershed Council Coordinator for the Greater Yamhill Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***some governance and management***. The council board provided oversight of the council during a period of staff transition and is working to improve governance and management. The council has contracted with a CPA to improve its fiscal management. The council recently updated its policies and bylaws.

OWEB staff found the council demonstrates ***some progress in planning***. The council has identified the need for a new strategic plan to guide its work and is working to secure funding and support to complete the plan early in the next biennium.

OWEB staff found the council demonstrated ***some progress in on-the-ground watershed restoration***. The council has worked with BLM to implement restoration in the watershed.

OWEB staff found the council demonstrates ***some progress in community engagement*** for watershed restoration purposes. The council worked to build connections with private landowners and industrial timber companies.

Concerns

The council struggled with meeting OWEB reporting requirements throughout the biennium. The board recently hired a new coordinator and needs to develop a governance and management structure that provides adequate staff oversight.

The council has not pursued any of its own restoration work and it is not clear what the council's restoration niche is in the watershed.

The council has no clear strategy for stakeholder engagement and completed limited activities during the biennium.

Concluding Analysis

The council did not demonstrate through the application materials and the secondary interview that it meets all the merit criteria. The council has struggled for multiple biennia to demonstrate effective governance and management. The council did demonstrate some progress in all merit criteria, but needs to work on governance and management, identifying a clear restoration and stakeholder engagement niche for the council in the watershed, and being strategic in its future actions.

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Recommendations

Staff Recommendation to the Board: Reduced funding for 1 year. The second year of funding is contingent on the council meeting the conditions described below. Staff will come to the board in July 2024 with a funding recommendation.

Staff Recommended Award: $66,467

Staff Conditions

- All watershed council approved meeting minutes must be posted on the council's website within 30 days of the meeting at which they were approved.
- All council meeting agendas must be posted on the council's website at least 24 hours before the scheduled council meeting.

Progress Report Requirements

Quarterly Progress reports are required to be submitted to the OWEB Project Manager. Reports must address the progress the council is making to meet OWEB's five merit criteria. The council must demonstrate it is making progress in merit criteria by May 2024 or OWEB staff will not recommend a second year of funding to the OWEB Board. The progress reports must include the following information:

Merit Criteria #1: Effective governance and management:

Actions the council is taking to ensure effective governance and management of the council, including: 1) management of the council coordinator, and 2) sound fiscal and project management reporting.

Merit Criteria #2: Progress in planning:

A description of progress the council is making on updating its strategic plan, including how the council is engaging with the community during the strategic plan development process.

Merit Criteria #3: Progress in on-the-ground restoration:

Actions the council is taking to plan and implement on-the-ground restoration including the number of applications submitted.

Merit Criteria #4: Progress in community engagement for watershed restoration purposes:

Actions the council is taking to engage with the watershed community. Including events held and attendance at the events and attendance at board meetings.

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-053

Project Name: Council Capacity 2023-2025

Applicant: Umatilla Basin WS Foundation

Application Description

This project seeks to fund a Watershed Council Coordinator for the Umatilla Basin Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

OWEB staff found the council demonstrates ***some progress in planning***. The council is working with landowners to identify and prioritize barriers for future removal and is planning on reengaging the Umatilla Basin Technical Team.

The council demonstrates ***some progress in on-the ground watershed restoration*****,** the council completed 100% designs for two future restoration projects.

OWEB staff found the council demonstrates ***some progress in community engagement*** for watershed restoration purposes. The council completed two river clean-up events during the biennium.

Concerns

The council continues to struggle with ***effective governance and management.*** Despite many reminders and grant agreement conditions, the council coordinator continues to miss OWEB grant fiscal and project reporting deadlines. The council is struggling to have a quorum at board meetings and is not consistently taking and approving minutes. The council does not have a plan for recruiting new board members or addressing the current organizational challenges.

The council is relying on planning documents completed by local partners, the council would benefit from completing its own strategic plan in the 2023-2025 biennium that could be used to guide the council in its restoration and outreach efforts.

The council completed no restoration projects in the 2021-2023 biennium, and it is not clear what the restoration niche is for the council or how it is identifying and prioritizing its restoration work.

Concluding Analysis

The council has not met all of OWEB's merit criteria. The council does not demonstrate effective governance and management and has not addressed the concerns identified in the 2021-2023 council capacity evaluation. In addition, the council has made limited progress toward on-the ground restoration.

Recommendations

Staff Recommendation to the Board: Reduced funding for 1 year. The second year of funding is contingent on the council meeting the conditions described below. Staff would come to the board in July 2024 with a funding recommendation.
Staff Recommended Award: $66,457

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Staff Conditions

- All watershed council approved meeting minutes must be posted on the council's website within 30 days of the meeting at which they were approved.
- All council meeting agendas must be posted on the council's website at least 24 hours before the scheduled council meeting.
- The OWEB Project Manager must receive, via email, agendas and minutes of all meetings.

Progress Report Requirements

Quarterly Progress reports are required to be submitted to the OWEB Project Manager. Reports must address the progress the council is making to meet OWEB's five merit criteria. The council must demonstrate it is making progress in merit criteria by May 2024 or OWEB staff will not recommend a second year of funding to the OWEB Board. The progress reports must include the following information:

Merit Criteria #1: Effective Governance and Management
Actions the council is taking to ensure effective governance and management of the council, including 1) management of the council coordinator, 2) sound fiscal and project management reporting, 3) copies of all meeting minutes and agendas from the previous quarter.
Merit Criteria #2: Progress in planning:
An update on the status of reconvening the Umatilla Basin Tech Team, including membership, meeting notes, and meeting agendas.
An updated council work plan.
Merit Criteria #3: Progress in on-the-ground restoration:
Actions the council is taking to plan and implement on-the-ground restoration, including number of applications submitted.
Merit Criteria #4: Progress in community engagement for watershed restoration purposes:
Actions the council is taking to engage with the watershed community. Including events held and attendance at the events and attendance at board meetings.

Administrative Information

Abstract

Provide an abstract statement for the project. Include the following information: 1) Identify the project location; 2) Briefly state the project need; 3) Describe the proposed work; 4) Identify project partners.

LCRWC is located in Columbia and Clatsop Counties, Oregon.
The project need is capacity funding for the council, to continue watershed restoration activities within the basin and to continue stakeholder and local landowner outreach activities.

Capacity funds will dedicate resources to strengthen ongoing organizational efforts to develop new partnerships, recruit new watershed council members and continue internal board development activities. Capacity grant addresses need to expound on ongoing strategic planning efforts and expand current project portfolio. The results of an intended Rapid Biologic Assessment will guide the council going forward. component of the plan includes outreach to broaden community involvement in the watershed council mission to stakeholders and community groups. Capacity grant will also provide resources to develop technical proposals that address data gaps and existing uncertainties about watershed processes and function. Examples of these investigations include anchor habitat identification, flood profiles, rapid bio-assessments, water quality data analysis, and groundwater studies.

Capacity grant will be used to leverage additional funding authorities and expertise to maximize restoration effort needed to manage project complexities. This will contribute to shaping project concepts in collaboration with stakeholders and community groups for future feasibility inquiries and preliminary design.

CSWCD, ODFW, OWEB, Columbia County, and the City of Clatskanie are key project partners.

Location Information

Current Location:

What is the ownership of the project site(s)?

✓ *Public land (any lands owned by the Federal government, the State of Oregon, a city, county, district or municipal or public corporation in Oregon)*

What agency(ies) are involved?

City of Clatskanie, Columbia County, Evenson Logging Company, Oregon State Extension, Clastkanie Public Utilities District, City of Rainier, Oregon Department of Fish and Wildlife, Soil and Water Conservation District, Rainier High School, Clatskanie High School, North Coast Watershed Council, Scappoose Bay Watershed Council, Scappoose Sand and Gravel, Oregon Department of Environmental Quality.

❑ *Tribal lands (any lands owned/managed by a Tribal government)*

✓ *Private (land owned by non-governmental entities)*

Please select one of the following Landowner Contact Certification statements:

❍ I certify that I have informed all participating private landowners involved in the project of the existence of the application, and I have advised all of them that all monitoring information obtained on their property is public record.

● I certify that contact with all participating private landowners was not possible at the time of application for the following reasons: Furthermore, I understand that should this project be awarded, I will be required by the terms of the OWEB grant agreement to secure cooperative landowner agreements with all participating private landowners prior to expending Board funds on a property.

Please List your reasons

Scope of grant proposal is not project specific and does not involve contact with specific landownerships other than through project development and outreach activities described in work plan.

❑*Not applicable to this project*

✓*This grant will take place in more than one county.*

List the counties affected:

Columbia and Clatsop County

Permits

Other than the land-use form, do you need a permit, license or other regulatory approval of any of the proposed project activities?

❍ Yes

● No

Racial and Ethnic Impact Statement

Racial and Ethnic Impact Statement

❍ The proposed grant project policies or programs could have a disproportionate or unique POSITIVE impact on the following minority persons. (indicate all that apply)

❍ The proposed grant project policies or programs could have a disproportionate or unique NEGATIVE impact on the following minority persons. (indicate all that apply)

● The proposed grant project policies or programs WILL HAVE NO disproportionate or unique impact on minority persons.

Insurance Information

If applicable, select all the activities that are part of your project - These require a risk assessment tool unless otherwise noted (check all that apply).

❑*Working with hazardous materials (not including materials used in the normal operation of equipment such as hydraulic fluid)*

❑*Earth moving work around the footprint of a drinking water well*

❑*Removal or alteration of structures that hold back water on land or instream including dams, levees, dikes, tidegates and other water control devices (this does not include temporary diversion dams used solely to divert water for irrigation)*

❑*Applicant's staff or volunteers are working with kids related to this project (DAS Risk assessment tool not required, additional insurance is required)*

❑*Applicant's staff are applying herbicides or pesticides (DAS Risk assessment tool not required, additional insurance is required)*

✓*Insurance not applicable to this project*

Additional Information

❑*This project affects Sage-Grouse.*

Problem Statement

Does the watershed council have a fiscal sponsor?

● Yes
❍ No

For Details If yes, upload your fiscal sponsorship agreement.

Is the council a membership organization?

● Yes
❍ No

Date of last annual membership meeting.
11/12/2019

The council is a group of councils operating collectively.

❍ Yes
● No

Is the applicant a group of councils operating independently?

❍ Yes
● No

For Details Upload the council's most recent bylaws.

Councils are required to review their council's bylaws once every three years, provide the date of the last time the council's governing body reviewed the council's bylaws?

03/20/2023

Councils are required to review their policies and procedures once every three years, provide the date of the last time the council's governing body reviewed the council's policies and procedures?
03/20/2023

For Details Upload the council's most recent policies and procedures.

For Details Upload the council's local government designation

For Details Upload the council's policies and procedures.

Date of the council's 2021-2023 self assessment?
03/31/2021

Date of last council officer elections.
11/12/2019

For Details Upload the minutes from the board meeting documenting the results of the officer election.

Does the council have written position descriptions for council board officers?

● Yes
❍ No

Does the council have written roles and responsibilities for council governing body members?

● Yes
❍ No

How many times did/will the council governing body meet between July 1, 2021-June 30, 2023?

22

How many times will the council governing body meet between July 1,-June 30, of the upcoming biennium for which you are seeking funding?

4

Describe how the council advertises its general council meetings.

Regular postings are made through local newspapers, council website, e-mail lists, and through one on one outreach with council partners when guest speakers are on the agenda.

Do council governing body meetings have agendas, sign-in sheets, and minutes?

● Yes
❍ No

Describe how your board membership includes a diverse range of geographic areas and community interests in the watershed.

Current board membership is at a nadir. The current council consists of:

Four landowners along the Clatskanie River, one of whom is a county commissioner, one who does habitat restoration projects, and two timber land owners...

Three others... the county road dept manager, the city manager of Clatskanie, and the OSU extension Service person for the county.

The council currently has these seven members.

However a new person came to the monthly meeting on March 13th, 2023, a new landowner along Carcus Creek. We hope this continues.

The council passed a motion on March 13th, 2023 to review and revise the policies and procedures at the next monthly meeting scheduled for April 10th, 2023. It is hoped this revision might lead to larger membership.

Describe any board membership and recruitment challenges and actions being taken to address those challenges.

The council has been named by locals as "K.C.'s playhouse".
Locally the council is perceived as having lost its way and become ineffective and a waste of time and money. This presents recruitment challenges.
The council is addressing this challenge by attempting to renew it's direction and get some projects done on the ground.
The council is addressing this challenge by the resignation of the Vice Chairman, Gary Soderstrom.

Are projects of the council, including those identified in the work plan, identified in a council action plan or strategic plan?

● Yes
❍ No

Provide the name and date of the most recent action plan or strategic plan.

Lower Columbia River Watershed Strategic Action Plan (Review Draft) 2012

Is the work of the council specifically designed to benefit salmon or steelhead?

● Yes
❍ No

✓Columbia River - Chum Salmon
✓Lower Columbia River - Coho Salmon
✓Lower Columbia River - Chinook Salmon

Describe how the resulting council capacity grant will benefit salmon or steelhead or their habitat?

The Lower Columbia River watershed contains 36 square miles of watershed area supportive of coho, chinook, steelhead, and chum salmon populations. Watershed landscape is unique in its large expanse of private ownership which includes industrial timberlands, legacy local logging companies, small woodlots, and agricultural interests.

The council's emerging strategic action plan (SAP) is intended to capture demographics shifts in landownership from expanding exurban area and increase in visitors from tourism. SAP will select limiting factors that can be managed at local level. This includes impaired habitat complexity, access to off channel habitats, excessive fine sediment deposition, and seasonal water quality degradation. The coordinator will utilize watershed assessments, stream surveys, spatial datasets, water quality data information, and recovery plans updates to inform a prioritized list of key uncertainties and range of restoration strategies. This will be reflected in action plan drafts for council meeting discussion and engagement with council partners. SAP intends to expand diversity of project types to support broader expression of life history strategies needed for salmon recovery. This includes floodplain reconnection to side channel wetland, estuary rearing areas, and identification of anchor habitats .

Proposed Solution

Community Engagement

Briefly describe the council's stakeholder engagement accomplishments from the 2021-2023 biennium.

This coordinator has not been able to identify any stakeholder engagement accomplishments that occurred during this period.

Briefly describe the council's stakeholder engagement challenges from the 2021-2023 biennium

The stakeholder engagement challenges from this period resulted in the previous coordinator and council chairman resigning, as well as the previous SWCD director..

Briefly describe the council's stakeholder engagement plans for the 2023-2025 biennium.

Three landowners who own property on the banks of the Clatskanie River are Council members. They can provide introductions to other landowners along the Clatskanie River.

The Council is in the process of assembling an OWEB monitoring grant application for a rapid biological assessment which engages Bio Surveys Northwest to perform an outreach function with each property holder along the Clatskanie River and its tributaries in the survey area as part of the Rapid Biological Assessment (RBA).

As part of the RBA every landowner along the Clatskanie River and ten of it's key tributaries will be contacted.

Describe the council's efforts to engage with local tribes present in the council's geography.

The current coordinator has reached out to Lamprey Coordinator - Lori Porter of the Columbia River Inter Tribal Fish Commission and obtained a white paper describing lamprey passage criteria involved in evaluating lamprey passage barriers.

The current Chairman and coordinator attended the Connect+ conference and heard the Chairman of the Chinook Tribe give his keynote address.

Describe the council's efforts to engage with non-traditional partners.

None that I am aware of.

Restoration

Provide a brief summary of the council's 2021-2023 restoration accomplishments.

There are no restoration accomplishments by the council per say during this period. Two project were initiated by the council during this period,
1) A lamprey barrier survey project, and 2) a large wood placement in Carcus Creek.
The project management of both these projects were turned over to CSWCD before the current coordinator was engaged. Initiating the projects was accomplished. Management for finishing the projects was turned over to CSWCD.

Briefly describe the council's restoration challenges from the 2021-2023 biennium

Loss of morale, changed coordinators 3x in 3 years, chairman resigned, SWCD director resigned, COVID.

Three 60% design choices were completed for a channel widening and riparian restoration project on Conyer's Creek. As funding was sought, it became obvious that there was no justification for prioritizing funding for this project within the Clatskanie basin. There was no strategic plan for the basin, no action plan, no current prioritization of what needs to be done across the council's area of responsibility.

Provide a brief summary of the council's restoration plans for 2023-2025.

The coordinator is preparing a monitoring grant application for the OWEB spring funding cycle in hopes of success. Project staff will meet with Ken Fetcho (OWEB) on March 24th, 2023 to coordinate monitoring activities.

This project would fund a Rapid Biological Assessment (RBA) of the Clatskanie River Basin, including 20 of its tributaries, which would include a landowner outreach component.
This project would allow the council to prioritize restoration activities across the basin, and understand where the remaining habitat is fixable and where the remaining species of concern are located.

After over two decades of previous restoration activities, the council can identify what remains to be done in the watershed and how to prioritize the work.

The council has no current strategic plan nor a current work plan. The Rapid Biological Assessment would provide the data to create a sound scientific basis for restoration plans going forward.

Planning

Describe how the council uses planning documents to identify and implement on-the-ground watershed restoration and stakeholder engagement projects.

At this time, the council's planning documents need to be re-created and/or reviewed and revised from a 2012 plan.

The current coordinator is expecting to use the results of the Rapid Biologic Assessment (RBA) to create new planning documents and start planning, prioritizing, and providing a plan to fix the degraded habitat.

Enclosed is a draft action plan plan from 2012 found in the Council's files which has been uploaded. This plan was approved on 3/12/2012 but revisions since then have not been approved. It was under review in 2014 and 2019 during the last funding cycle, at that time submitted as a pending strategic plan/action plan.

It was pointed out at the monthly meeting last by the current chairman, who wasn't chairman at the time, that the lack of a vote recorded in the minutes could mean the current strategic plan was left unchanged by the 2014 and 2019 review cycles. Nevertheless, the plan needs drastic review and likely complete replacement.

Are projects of the council identified in a council action plan or strategic plan?

❍ Yes
● No

Wrap-Up

List the watershed council staff (or contractors), their roles, affiliation (staff or contractor), length of time in position (use the Qualifications space), and contact information.

Role	Name	Affiliation	Qualifications	Email	Phone
Coordinator	Henry Franzoni	Lower Columbia River Watershed Council	10 yrs Data Center Manager of the Fish Passage Center of the Pacific States Marine Fisheries Commission. 10 yrs project lead of the Inter-Tribal Monitoring Project of the Columbia River Inter Tribal Fish Commission. 3yrs Consulting USFWS Col. Riv.	hjfranzoni3@gmail.com	(360) 425-7140

Lower Columbia River Watershed Council
Policies and Ground Rules

Adopted 9/7/97
Amended 7/11/00
Amended 6/12/12
Amended 9/9/14
Amended 9/13/16

LCRWC Members agree to the following policies and ground rules:

Council Decision-Making

- Robert's Rules of Order, Second Edition, will be used as a guide for conducting business.

- Before a decision is adopted by the council, sufficient time (30 days) will be provided for the members to seek advice from organizations they represent, agencies, or other experts.

- When a decision is reached, council members will advocate to their respective bodies support for the adoption or implementation of the decision.

- The watershed council may select a person to serve as facilitator.

Participation

- The Council will hold regular meetings and follow provisions of the Open Meetings Law. At least 10 minutes will be set aside at each meeting for public comment.
- Business may be conducted by council members present. In the absence of a majority of the council members or their alternates, a simple majority is required for approval of actions with a minimum of four members present.
- Council members will keep their respective agencies, organizations, or interests informed about the work of the council and bring concerns of their groups to the council.
- Council members may designate a representative of their group to serve as an alternate. Designated alternates will be listed on the membership list of the council.
- Each member will brief his/her alternate on all issues, proceedings, and notifications, prior to the alternate's attendance at council meetings.
- The public is invited to all council meetings and, upon request, provide meeting agendas and records of decisions other than personnel discussions and actions.

Organization and Procedures

Robert's Rules of Order shall be followed (see: Decision-Making/Ground Rules)

The Council will elect a chairperson and vice-chairperson to serve as spokespersons, prepare council agendas, call and manage council meetings, enforce ground rules, and perform other tasks as assigned by the council. The council may select other officers and fill vacancies as needed. The periodic election of officers shall take place at the regularly-scheduled meeting in October of odd-numbered years.

The Council may form subcommittees of its own members and task groups that include individuals not on the council to perform certain functions or focus on specific issues. The council will also identify technical advisors who can provide technical data and assistance and call on these experts as needed.

All Council members are eligible to serve as officers or committee members.

There are no term limits for officers.

The Council will hold monthly meetings on the second Tuesday of every month unless otherwise announced.

Council will seek funding for the ongoing operations.

The Columbia SWCD will act as the Council's fiscal agent and follow Generally Accepted Accounting Principles (GAAP).

The Council will not use litigation as a method to implement the Council's mission.

Amendments
A council member may propose an amendment to these Ground Rules at any regularly-scheduled meeting. A vote on the amendment shall take place at the next regularly-scheduled meeting. An affirmative vote by 10 members, or two-thirds of those members present, whichever is greater, will ratify the amendment.

FISCAL SPONSORSHIP and EMPLOYMENT AGREEMENT
Between the Columbia Soil and Water Conservation District And the Lower Columbia River Watershed Council

PARTIES. The parties to this agreement are:

A. Columbia Soil and Water Conservation District, hereafter referred to as "Columbia SWCD."

B. Lower Columbia River Watershed Council hereafter referred to as "LCRWC."

PURPOSE AND RECITALS.

The Columbia SWCD is a political subdivision of the state of Oregon organized and chartered in January of 1947, and considered a municipal corporation, a form of local government under ORS 190.003. It is governed by a host of statutes in Oregon Revised Statutes, chapter 568 and all corresponding Oregon State Laws. The Internal Revenue Service considers SWCDs as instrumentalities of state or municipal government, thus qualifying as tax-exempt under Section 115 of the Internal Revenue Code. The mission of the Columbia Soil & Water Conservation District is to provide educational, technical and financial assistance to our community for the protection, conservation and restoration of natural resources.

A. The LCRWC is an affiliation of stakeholders formed into a Watershed Council under ORS 541.910 to reflect the interests of the Lower Columbia Watershed. It was organized in July, 1997. It is one of three Watershed Councils in Columbia County. The mission of the Lower Columbia River Watershed Council is to improve watershed functionality across the watershed through education, cooperation, stewardship, and restoration/mitigation projects.

B. The parties listed above have entered into this Fiscal and Employment Sponsorship Agreement in order to: 1) formalize their existing relationship, 2) expand their respective capacities, 3) capitalize on their organizational and membership strengths, and 4) extend their missions to all members of the community and stakeholders in the natural resource arena.

AGREEMENT: The parties listed above agree to be legally bound by the following:

COLUMBIA SWCD'S RESPONSIBILITIES. The Columbia SWCD agrees to serve as the employer of staff working on behalf of the LCRWC. Employees, such as the LCRWC Coordinator, work primarily on LCRWC activities. Other employees of the Columbia SWCD may also work on LCRWC activities as part of their assigned tasks. The Columbia SWCD also agrees to act as Fiscal Sponsor for the LCRWC, to receive donations, grants and sign contracts intended to provide financial support to the LCRWC, to treat all funds intended for the LCRWC as restricted funds, and to use such grants and donations to provide funds and staff for the LCRWC so long as the LCRWC is operating in compliance with this agreement. Specifically, the Columbia SWCD agrees to:

A. Employment Management

1. Consider all employees and volunteers of the LCRWC as employees, and/or volunteers of the Columbia SWCD and require that they abide by the Personnel Policies of the Columbia SWCD and the laws governing SWCDs.
2. Provide staff sufficient to conduct the work of the LCRWC, as delineated in the LCRWC Annual Plan of Work, and as LCRWC financial support allows.
3. Provide workers compensation insurance for staff and volunteers of the LCRWC.
4. Pay all employment taxes and file all employment reports for LCRWC staff, per federal and state laws.
5. SWCD procedures and policies will be followed when recruiting and hiring watershed council staff however the hiring committee will consist of two watershed council representatives plus the SWCD District Manager.

B. Work Plan and Budget Development

1. Assist with development of the annual LCRWC Plan of Work (POW), and incorporate LCRWC POW tasks into the Columbia SWCD annual Plan of Work. Assign SWCD responsibilities to assist on LCRWC projects as SWCD staffing and financial capacities allow. All staff activities paid for by LCRWC funds, such as grants and local match, will be included in the LCRWC Plan of Work.
2. Develop an annual budget that accounts for estimated revenues and expenditures for the LCRWC, as part of the overall annual budget for the Columbia SWCD.

C. Fiscal Management

1. Manage money and assets of the LCRWC as a part of the overall money and assets of the Columbia SWCD. As such, the Board of Directors for the Columbia SWCD will approve an annual budget for the expenditures of the LCRWC and manage the funds of the LCRWC in accordance with the Columbia SWCD's Financial Policies and Procedures.
   Assume liability for any debts, obligations or liabilities of the LCRWC created by the actions or inactions of the LCRWC.
2. Clear and accurate records will be maintained by the Columbia SWCD that distinguish between the money and assets earmarked forthe LCRWC and other money and assets owned or controlled by the Columbia SWCD.

3. Contracts
   a. Assist LCRWC by writing contracts or agreements as needed to implement and continue the LCRWC's operation and projects.
   b. Manage the contracts of the LCRWC in accordance with the Columbia SWCD's Contracting Rules.
   c. Consider all contractors of the LCRWC as contractors of the Columbia SWCD.

4. Reporting and Accounting
   a. Provide funders with documentation of LCRWC expenditures in the format prescribed by the funding source.
   b. Provide to the LCRWC regular (monthly) financial reports that detail income received by the Columbia SWCD to support LCRWC staffing and activities and expenditures made by the Columbia SWCD for LCRWC expenses.
   c. Maintain accounting and other financial records for the LCRWC in accordance with generally accepted accounting principles (GAAP).

d. Conduct annual audit by a municipal auditor to meet funding and legal requirements.
e. Facilitate internal controls and authorization protocols to assure a smooth flow of funds and accurate financial tracking as described in the Columbia SWCD's Financial Policies and Procedures.
f. Request, receive, and track funds from funding sources to support LCRWC activities.
g. Account for LCRWC funds used for fiscal and employer services through monthly and yearly Columbia SWCD staff time-tracking and report annually to the LCRWC membership after the conclusion of the Columbia SWCD's fiscal year.
h. Keep all financial and grant records for at least three years or longer, if required by the Columbia SWCD's Records Retention Policy or grant requirements.
i. Provide archiving in accordance with Columbia SWCD's Records Retention Policy or grant requirements.

5. Invoices and Payments
   a. Make timely payments as authorized by the LCRWC Coordinator.
   b. Make timely payments according to the Columbia SWCD's Financial Policies and Procedures.

LCRWC'S RESPONSIBILITIES. Specifically, the LCRWC agrees to:

A. General

1. Establish an Operations Committee to provide guidance and oversight for the LCRWC Coordinator, review proposed LCRWC annual budgets, and communicate to the Board of Directors of the Columbia SWCD.
2. A member of the Operations Committee who is not a staff member of the Columbia SWCD will be designated as a liaison to the Columbia SWCD. This person will be responsible for oversight and review of LCRWC revenues and expenditures reported in the Columbia SWCD's annual financial reports.
3. Task the LCRWC Coordinator with helping to secure funds through donations, contracts, and grants in order to accomplish tasks and projects described in the annual LCRWC POW and support LCRWC operational costs. LCRWC operational costs include but are not limited to fiscal administration of grants, personnel management, rent, phones/internet, website hosting, computers/software, insurance, audits, meeting costs, travel, printing/copying, and postage.
4. The LCRWC president shall designate a special committee of at least two other individuals to participate in the hiring (ranking of applicants, interview, and final selection) and annual performance review of LCRWC staff.
5. Consider LCRWC staff, as employees of the Columbia SWCD, as "public officials" as defined in ORS 244.020(14). As such, employees must comply with the Oregon Government Ethics law regarding conflicts of interest and other matters relating to financial gain.
6. Consider its staff, as employees of the Columbia SWCD, as "public employees" according to ORS 260.432, and require that they not engage in political activity while on the job.
7. Council will abide by any and all liability requirements of the SWCD relating to LCRWC activities.
8. Abide by the following policies and rules of the Columbia SWCD:
   ✓ Personnel Policies

- ✓ Contracting Resolutions and Rules
- ✓ Records Retention Policy
- ✓ Conflict of Interest Policy
- ✓ Note: any future policies adopted by the Columbia SWCD's Board of Directors that pertain to the LCRWC will be provided to the LCRWC for similar adoption.

B. Grants and Local Match

1. Responsible for fulfilling requirements and funding specifications of all grants for LCRWC activities..
2. Provide grant applications made by the LCRWC to the Columbia SWCD for submission to third-party grantor.
3. Secure, document and report required match funds as needed.
4. Provide documentation required by the grantor for funding releases (including, but not limited to, permits, land use forms and landowner agreements).
5. Notify the Columbia SWCD of all requests for grant changes (including budget changes and time extension requests) prior to submission to a grantor.

C. Reporting and Accounting

1. Provide documentation of expenses in the format agreed upon with the Columbia SWCD and funding sources.
2. Document all "in-kind" work (e.g., match of donated materials, services, and volunteer time) as required by the Columbia SWCD and funding sources.
3. Write and submit to Columbia SWCD all all reports not related to fiscal matters to fulfill the requirements of funders

DONATIONS. All donations intended to support the LCRWC that are made by check should be made out to the Columbia SWCD with a notation about its intended purpose. Donations such as equipment may be given directly to the LCRWC and should be accounted for by the LCRWC Coordinator by labeling with permanent marker and entry onto the Columbia SWCD's non-capitol and asset list.

The parties agree that the Columbia SWCD will assist the LCRWC by receiving donations and gifts from individual donors and businesses wishing to support the activities of the LCRWC, and providing the receipts that such donors need to take tax deductions for their donations.

OTHER DUTIES OF THE COLUMBIA SWCD. In addition to the other duties imposed by this agreement, the Columbia SWCD agrees to properly maintain its legal status as a local governmental unit, and as a tax exempt organization under Section 155 of the Internal Revenue Code; to properly prepare and file its own annual reports required by the State and Federal governments; comply with all applicable laws and regulations governing SWCDs; to operate and make decisions properly as a local governmental unit; to keep the required records of its Board meetings and decisions; and to keep adequate financial records and maintain proper oversight and control over its financial activities. The Columbia SWCD shall be responsible for its own employment taxes, insurance, debts, liabilities and other legal obligations. The Columbia SWCD shall notify the LCRWC immediately of any change in its legal status or tax exempt status.

LCRWC'S ENTITY STATUS. The LCRWC is not a legally incorporated separate entity; its programs and activities are considered a project of the Columbia SWCD. However, the LCRWC directs the work of the LCRWC coordinator through the adoption of the LCRWC annual plan of work and through regular reports from the coordinator to the council at each monthly meeting. The LCRWC will notify the Columbia SWCD immediately of any change in its legal status or tax exempt status. The LCRWC agrees to not incorporate or otherwise create a legal entity without written notice to the Columbia SWCD.

All employees, independent contractors and volunteers who perform services or work for the LCRWC are and shall be the employees, independent contractors and volunteers of the Columbia SWCD. The Columbia SWCD shall be responsible for payment of all compensation to LCRWC staff and independent contractors, paying all payroll withholding taxes and payroll taxes for LCRWC employees, filing all required reports to the IRS regarding payroll taxes, and preparing and filing all W-2 forms and 1099 forms reporting the payment of compensation to LCRWC employees and independent contractors.

The Columbia SWCD shall have the sole responsibility to select, employ, supervise, evaluate, discipline and if necessary terminate the employment or services of all employees, independent contractors or volunteers associated with the LCRWC, with the exception of the hiring, supervision and evaluation of the LCRWC Coordinator, which will be done in conjunction with the LCRWC, as described under LCRWC's Responsibilities, section A.2. Discipline and/or termination of the LCRWC Coordinator shall be done by the Columbia SWCD with input from the LCRWC..

Any tangible or intangible property, including intellectual property such as copyrights, obtained or created by the LCRWC shall be the property of the Columbia SWCD. All equipment and supplies purchased with LCRWC funds are the sole property of the Columbia SWCD.

AGREEMENT TO INDEMNIFY. Because the Columbia SWCD is liable for any acts or omissions of the LCRWC, LCRWC funds may be used to defend the Columbia SWCD and its officers, directors, employees and volunteers from any liability, demands or lawsuits for any claim of loss, damage or injury that arises from any of the activities, programs, decisions or omissions of LCRWC or employees, volunteers, members or agents associated with the LCRWC.

TERMINATION OF THIS AGREEMENT. Either party may terminate this agreement at any time, with cause, by delivering a written statement of termination to the other party at least thirty (30) days in advance of the effective date of the termination. This agreement shall automatically terminate if the LCRWC incorporates as a separate legal entity. If this agreement terminates due to the LCRWC's separate incorporation as an organization qualified to receive IRS recognition of its 501(c)(3) status for purposes and activities significantly related to the activities of the LCRWC under this agreement, then the Columbia SWCD shall:

- ✓ Transfer the remaining funds to the LCRWC minus any accrued payment owed to the Columbia SWCD for its services and expenses related to the LCRWC;
- ✓ Transfer ownership of all LCRWC assets, including its name and any intellectual property developed or created by the LCRWC under this agreement, to the LCRWC.

If this agreement is terminated for any reason other than the LCRWC's separate incorporation, then the Columbia SWCD shall retain the funds held in the account for the LCRWC to be used in

accordance with the mission of the LCRWC and in accordance with any restrictions on the use of those funds.

MEDIATION AND ARBITRATION. In the event of a conflict regarding the terms of this agreement, or if the parties cannot agree to terminate this agreement without serious conflict, they will enter into a mediated conflict resolution process with a third-party mediator chosen by both parties. If resolution cannot be achieved through mediation, the parties agree to submit to binding arbitration of their differences before a single arbitrator in accordance with the arbitration rules of the American Arbitration Association. This agreement shall be governed by and construed in accordance with the laws of the State of Oregon, and any decision or award by an arbitrator shall be made in accordance with such laws.

ENTIRE, INTEGRATED AGREEMENT. This agreement, and any attached and properly executed exhibits, contains and constitutes the entire agreement of the parties with respect to the subject matter it addresses, and it supersedes any prior oral or written understandings or communications between the parties.

AMENDMENTS. This agreement may not be amended or modified, except in writing and signed by both parties.

EXECUTION OF THIS AGREEMENT HAS BEEN PROPERLY AUTHORIZED BY BOTH DECISION-MAKING BODIES. Each of the parties to this agreement certify that its own decision-making body (Columbia SWCD Board of Directors and membership of the LCRWC) has formally approved entering into this Fiscal and Employment Sponsorship Agreement, by passage and adoption of a resolution at a properly called Columbia SWCD meeting at which a quorum was present and for which proper minutes were recorded, or by consensus approval of the LCRWC membership at two properly noticed LCRWC membership meetings.

EFFECTIVE DATE AND TERM. This Agreement is effective on the date of its execution by both parties, as shown below. It shall continue in effect until either party terminates the Agreement in accordance with the provisions for termination stated above.

IN WITNESS WHEREOF, the parties have executed this Fiscal and Employment Sponsorship Agreement:

Signed on behalf of the Columbia SWCD, by:

LOWER COLUMBIA RIVER WATERSHED COUNCIL CHARTER and BYLAWS

*Adopted October 14, 1997
*Amended November 13, 2002
*Amended September 9, 2014
*Amended September 13, 2016

Purpose:

The Lower Columbia River Watershed Council was formed to gather and share information, to reduce duplication of activities, and to help address watershed management issues in the Lower Columbia River Watershed and in Columbia County, and to provide a framework for coordination and cooperation among key interests.

Mission:

To foster better stewardship and understanding of the Lower Columbia River Watershed resources in Columbia County, coordinate, cooperate and try to deal with issues in advance of resource degradation, encourage restoration of natural processes and functions where feasible, and help ensure sustainable watershed health, functions, and uses.

The council will work collaboratively with communities and landowners to develop and carry out voluntary watershed protection, restoration, enhancement and community engagement activities.

Vision:

A balanced ecosystem approach that supports a healthy watershed and provides for sustainable natural resources and for an economic base and viable communities.

Relationship to Decision-Making Bodies and Communities of Interest:

The Lower Columbia River Watershed Council is an advisory group to established decision-making bodies and communities of interest in Columbia County. As such, the council gathers information, facilitates stakeholder dialogue, hopefully gains consensus, and makes recommendations concerning the protection, restoration, and enhancement of the quality of the Lower Columbia River Watershed.
The council shall be non-partisan, non-political, and non-regulatory and shall not have the authority to appeal land use or other decisions of elected or appointed public bodies.

The Council will not use litigation as a method to implement the Council's mission.

The stakeholders, agencies, organizations, and public interests represented on the council are not obligated to adopt or carry out the recommendations of the council, but will give due consideration to the recommendations and take actions they consider appropriate.

These stakeholders, agencies, organizations, and interests will report back to the council on any actions taken in response to council recommendations.

The council welcomes and will respond to the requests for advice on actions affecting the watershed that are proposed by local, state, and federal agencies; organizations; and stakeholder and public interests.

Council members will keep their respective agencies, organizations, and interests informed about the work of the council and will bring their concerns to the council.

The Lower Columbia River Watershed Council shall support other watershed councils' efforts to secure funding for watershed projects and activities.

Goals and Objectives:

- Encourage coordinated efforts to increase natural resource education programs
- Improve communication among affected stakeholders, private individuals, interested citizens, business/industry, and representatives of local, state, and federal agencies
- Gather and evaluate environmental information
- Establish a framework for coordination, cooperation, and citizen involvement
- Provide a forum for resolving problems and conflicts related to the Council's mission when all parties to the problem or conflict agree to refer the matter to the council
- Formulate recommendations
- Facilitate enactment of recommendations
- Provide ongoing program evaluation during implementation
- Promote ongoing monitoring of the health of the Lower Columbia River Watershed

Specific Tasks/Responsibilities:

- Establish a public involvement program to ensure an appropriate level of citizen participation in the council's work
- Use available resource information to determine the current condition and uses of the watershed
- Identify critical information gaps
- Gather new critical information
- Identify the desired condition and uses of the watershed
- Identify high value fish and wildlife areas
- Encourage ongoing monitoring of the conditions of the watershed
- Help resolve issues among diverse interests in the watershed
- Seek funding to support program development and implementation, including funding from agencies represented on the council
- Address the needs and concerns of the respective agencies, organizations, and interests represented on the council
- Adopt and implement a work program
- Monitor work program progress and budget

- Identify ongoing education programs in the watershed

Council Members:

The Lower Columbia River Watershed Council shall at all times include representatives from the following interests: Agricultural Community; Business & Industry Community; Education Community; Public Interest Groups; Forestry Community; Sub-Basins and/or Local Watershed Councils; Countywide Organizations; Local Governments; Fishing Interests; and Mining Industry. A majority of the members shall reside in those portions of Columbia County that drain into the Columbia River.

The members shall serve at the pleasure of their respective stakeholder groups, agencies and organizations. Council members may designate an alternate who will participate on the council in their absence.

The council will act to replace members who resign or are unable to continue to serve on the council. The council will strive to maintain continuity and the balance of interests by giving preference to representation from the same agencies and organizations at a similar or higher level position. The council will request the group, agency or organization to nominate a replacement representative. If the group, agency or organization is unable or unwilling to do so, the council will seek representation from other groups, agencies, and organizations of the same community of interest. In this event the council will consult with the County Commissioners to ensure that the replacement agency or organization does represent the same community of interest. In the event the council is unable to find a replacement representative from the same community of interest, the County Commissioners shall be asked to make a replacement appointment to reflect that community of interest.

All Council members are eligible to serve as officers or committee members. There are no term limits.

MATCH FUNDING FORM

Document here the match funding shown on the budget page of your grant application

OWEB accepts all non-OWEB funds as match. An applicant may not use *another OWEB grant* to match an OWEB grant; this includes ODA Weed Board projects because they are funded through OWEB grants. However, an applicant who benefits from a pass-through OWEB agreement with another state agency, by receiving either staff expertise or a grant from that state agency, may use those benefits as match for an OWEB grant. (Example: A grantee may use as match the effort provided by ODFW restoration biologists because OWEB funding for those positions is the result of a pass-through agreement).

At the time of application, match funding for OWEB funds requested does not have to be *secured*, but you must show that at least 25% of match funding has been *sought*. On this form, you do not necessarily need to show authorized signatures ("secured match"), but the more match that is secured, the stronger the application. Identify the type of match (cash or in-kind), the status of the match (secured or pending), and either a dollar amount or a dollar value (based on local market rates) of the in-kind contribution.

If you have questions about whether your proposed match is eligible or not, see Allowable Match document in OGMS http://apps.wrd.state.or.us/apps/oweb/fiscal/nologin.aspx under Technical Assistance application or contact your local OWEB regional program representative (contact information available in the instructions to this application).

BEFORE THE BOARD OF COUNTY COMMISSIONERS

FOR COLUMBIA COUNTY, OREGON

In the Matter of Establishing the Lower Columbia River Watershed Council	)	ORDER NO. 222-97

WHEREAS, the State of Oregon has enacted ORS 541.345 to 541.400 dealing with watershed management and enhancement; and

WHEREAS, the State has created the Governor's Watershed Enhancement Board (GWEB) to initiate a watershed management program that relies on the establishment of voluntary local watershed councils and that provides for the development of local plans that may include, but are not limited to, the assessment of the watershed condition, the creation of a watershed action plan and a strategy for implementing the action plan; and

WHEREAS, local watershed councils shall consist of a majority of local residents, including local officials, shall represent a balance of interested and affected persons within the watershed and assure a high level of citizen involvement in the development and implementation of a watershed action program, and may include representatives of local government, representatives of nongovernment organizations and private citizens, including but not limited to:

(a) Representatives of local and regional boards, commissions, districts and agencies;
(b) Representatives of federally recognized Indian tribes;
(c) Public interest group representatives;
(d) Private landowners;
(e) Industry representatives;
(f) Members of academic, scientific and professional communities; and
(g) Representatives of state and federal agencies; and

WHEREAS, local watershed councils may submit requests to GWEB or other sources for funding or advice and assistance in developing a watershed enhancement project under the program established by

GWEB, however, the local watershed council needs to be sponsored by a local governing body to be eligible for such funding; and

WHEREAS, the proposed Lower Columbia River Watershed Council has drafted a charter with statements of purpose, mission and vision, goals and objectives, tasks and responsibilities; organization and procedures, and has proposed that the membership on the Council be composed of individuals which include, but are not limited to the following interests:

Agriculture Community
Business and Industry Community
Education Community
Public Interest Groups
Forestry Community
Sub-Basins and/or Local Watershed Councils
Countywide Organizations
Local Governments
Fishing Interests
Mining Industry

NOW, THEREFORE, IT HEREBY ORDERED as follows:

1. The Lower Columbia River Watershed Council is established as a local watershed council under ORS 541.345 to 541.400.

2. The Council shall be composed of individuals representing the following interests. The list is intended to be illustrative, and not exhaustive:

Agriculture Community
Business and Industry Community
Education Community
Public Interest Groups
Forestry Community
Sub-Basins and/or Local Watershed Councils
Countywide Organizations
Local Governments
Mining Industry

3. The Council shall have all of the powers provided by ORS 541.345 to 541.400 for watershed councils and in addition shall be

subject to the following:

a. The Council shall be subject to the public records and meetings laws of ORS Chapter 192;

b. The Council may adopt its own charter and bylaws for the conduct of meetings, voting, appointment of officers, and similar matters. However, representatives of state and federal government agencies and research and technical organizations shall only have voting rights if they are responsible for land management; and

c. The Council shall report to the Board of County Commissioners at least once annually as to its activities and proposed future activities, and the status of the Lower Columbia River Watershed.

4. The Council shall endeavor to include representatives from the interests listed above. The members shall serve at the pleasure of their respective agencies and organizations. The Council shall act to replace members who resign or are unable to continue serving on the Council. The Council will strive to maintain continuity and the balance of interests by giving preference to representation from the same agencies and organizations at a similar or higher level position. The Council will request the agency or organization to nominate a replacement representative. If the agency or organization is unable or unwilling to do so, the Council will seek representation from another agency or organization of the same community of interest. In this event the Council will consult with the County Commissioners to ensure that the replacement agency or organization does represent the same community of interest. In the event the Council is unable to find a replacement representative that represents the same community of interest, the County Commissioners will be asked to make a replacement appointment to reflect that community of interest.

5. The Lower Columbia River Watershed Council shall work with other watershed councils and share information pertinent to the County's interests. The Lower Columbia River Watershed Council's jurisdiction over local watersheds which have their own watershed council, e.g., the Scappoose Bay Watershed Council, shall

be limited to providing assistance and coordination to the local watershed council. The Lower Columbia River Watershed Council shall support other watershed council's efforts to secure funding for watershed projects and activities.

6. The Council shall be non-partisan, non-political and non-regulatory and shall not have the authority to appeal land use or other decisions of appointed or elected public bodies.

7. The Board of County Commissioners reserves the authority to withdraw approval of the Council or its charter whenever, in its sole discretion, it deems it to be in the public interest to do so.

DATED this 15th day of October, 1997.

Appendix I

Lower Columbia River Watershed Council
Action Plan

1.0 Introduction

1.1 Purpose

This document is the Action Plan of the Lower Columbia River Watershed Council (LCRWC). The LCRWC is a voluntary, non-regulatory group that unites the diverse interests to improve and preserve watershed health. The Action Plan is based on the Council's goals and mission statement (Charter). The Action Plan takes a watershed-wide approach and strives to integrate existing plans and efforts. This Plan is a working document that will be updated and reevaluated, as information becomes available.

The LCRWC depends on voluntary efforts. The Council is not a regulatory or enforcement agency, nor does the Council adopt plans or rules in a legal sense. The Council makes recommendations to decision-makers, landowners, and managers on ways to protect and enhance the watershed resources of the Lower Columbia. Implementation of the recommendations in the Action Plan will be completely voluntary. The Council provides a framework for communication, collaboration, and cooperation among its member organizations and others.

The LCRWC Action Plan is a resource guide to better understand the nature of the Lower Columbia watershed.

1.2 Background

The Lower Columbia Watershed is located in northwestern Columbia County and northeastern Clatsop County. It is approximately 215,000 acres, which drain into the Lower Columbia River. Its uses are, and historically have been, timber and agriculture. 90.9% of the land is under private ownership. There is a growing rural residential population. The beneficial uses of the watershed include timber, agriculture, recreation, fish and wildlife populations. Beneficial uses are defined by Oregon Water Quality Rules OAR 340.41 for the North Coast Basin as: domestic water supply, industrial water supply, irrigation, livestock watering, anadromous fish passage, salmonid fish rearing, salmonid fish spawning, resident fish and aquatic life, wildlife and hunting, fishing, boating, water contact recreation, and aesthetic quality. The most sensitive of these uses are fish, wildlife, domestic, and recreational use.

1.3 Watershed Council Membership

The Lower Columbia River Watershed Council includes representatives from the following interests:

- Agriculture Community
- Business/Industry Community

- Education Community
- Public Interest Groups
- Forestry Community
- Sub-Basins or Local Watershed Councils
- Countywide Organizations
- Local Governments
- Fishing Community
- Mining Industry

2.0 Development of the Action Plan

Development of the Action Plan began with the adoption of the Charter October 14, 1997. The goals of the Council are:

- Promote sustainable watershed health
- Provide a forum for watershed issues
- Provide education and outreach on watershed issues

To achieve these goals the Council developed preliminary Action Items.

2.1 Action Items to Meet Council Goals and Objectives

The preliminary Action Items identified by the LCRWC (not prioritized):

Action #1: Develop history of watershed

Action #2: Assess watershed conditions

Action #3: Develop and Implement a Water Quality Monitoring Plan, initial focus on 303d listed streams

Action #4: Identify restoration and enhancement sites

Action #5: Implement restoration projects

Action #6: Develop, support and implement a broad-based education/outreach program

Action #7: Develop demonstration projects in priority areas to encourage restoration on Private lands

Action #8: Secure funding for Council support and projects

2.2 Action Item Tasks

Action #1: Develop history of watershed, Watershed Assessment 8/2001, completed

- Personal interviews
- Collect historical data

Action #2: Assess watershed conditions, Watershed Assessment 8/2001, completed
- Secure funding for assessment
- Secure personnel to conduct assessment using OWEB Assessment Manual
- Develop and maintain GIS database for LCRWC

Action #3: Develop and implement WQMP, initial focus on 303d listed streams, Ongoing
- Secure funding for monitoring
- Develop Water Quality Monitoring Plan with Quality Assurance/Quality Control
- Secure equipment for monitoring
- Obtain procedural training
- Identify sites
- Implement monitoring

Action #4: Identify restoration and enhancement sites, Ongoing
- Identify priority restoration issues based on Assessment
- Identify priority sites based on landowner willingness

- Action #5: Implement restoration projects, Ongoing
- Develop implementation strategy based on Action #4
- Develop plans
- Secure funding
- Undertake project and monitor outcome

Action #6: Develop, support and implement a broad-based education/outreach program
- Work with landowners and interest groups on watershed issues
- Work with local schools to enhance stewardship and science education on watershed and natural resource issues
- Conduct workshops on riparian area management
- Submit news articles to local newspapers
- Presentations at local groups
- Maintain a webpage

Action #7: Develop demonstration projects in priority areas to encourage restoration on Private lands
- Work with local groups to identify and recruit landowners
- Assist landowners with implementation
- Monitor effectiveness of demonstration projects
- Provide information on costshare programs

Action #8: Secure funding for Council support and projects

- Identify funding sources
- Match sources to projects
- Submit grants
- Develop partnerships

3.0 Monitoring and Evaluation

The LCRWC is committed to meaningful and successful restoration activities and to promoting sound management practices in the watershed. Monitoring is an important component in determining the success of a restoration project or management practice and whether the desired results are being achieved.

Monitoring requires a long-term commitment of time and resources. The Council will work with project sponsors to develop a monitoring plan for each action item where appropriate.

4.0 Plan Evaluation and Review

This Action Plan will be periodically reviewed.

- Reviewed at completion of the Watershed Assessment
- Reviewed at the request of the Council

Appendix I
Identified Projects

Revised November 9, 2004

- Monitoring of 303d listed streams: *Completed*
- Westport Slough/Clatskanie River Reconnection Project, Completed
- Temperature monitoring of riprap areas, Completed
- Clatskanie River Riparian Planting, Completed
- Beaver Creek Riparian Planting
- Shallow Water Habitat Restoration
- Flume Creek restoration: *Completed*
- Invasive species
    - Purple loosestrife
    - Japanese Knotweed
- Long term monitoring and evaluation, watershed
- Fox Creek, further restoration: *Completed, lg wood*
- Nice Creek, restoration
- Artificial Barrier Assessment; *Habitat Assessment completed*
- Artificial Barrier Removal: Ongoing
- Merrill Creek Culvert, Completed
- Concrete Bridge Removal/Clatskanie River, Completed
- Page Creek Fish Barriers, Completed
- Miller Creek Fish Barrier: *Completed*
- Clatskanie River Culvert Replacements; 5 sites; *2 Completed*
- Kloppman Large Wood; *Completed*
- Louisiana Swamp Wetland Restoration; *Completed*
- Batwater Station Wetland Restoration
- Clatskanie Flood Plain Restoration; 2 sites

Italicized notations added post 11/9/04

These projects will be prioritized as additional information becomes available to the Council.

LCRWC Current Officer's List

Chairman – K.C. Van Natta – kcvn35@gmail.com – 503-313-7298

Secretary – Marilyn Baker – marilynviola@gmail.com – 503-313-7298

Gary Soderstrom officially resigned as Vice Chairman on March 13th, 2023.

Lower Columbia River Watershed Council

Working toward balanced ecosystems that support healthy watersheds and sustainable natural resources
To support an economic base and viable communities

Draft
Meeting minutes
November 9th, 2021
7:00 pm by Zoom

Attendance by Zoom: Ian Bledsoe, Marilyn Van Natta, K.C. Van Natta, Allan Whiting, Margaret Magruder, Harpiar Gandhi, Mike Russell, Pat Welle, Sephe Fox, and Chip Bubl.

All introduced themselves.

Public Comment: None

Pat Welle Presentation: Pat has a long history with restoration projects in the Lower Columbia River landscape. She described the challenges and opportunities that remain to bring some semblance of the biology and the beauty to the Lower Columbia River estuary. She described the positive level of commitment needed to learn and adapt projects for the best outcomes for the fish. Pat is also a fine writer and excellent photographer and showed many slides of her favorite places in the region and some successful projects. Her "Nature's View" web page is https://www.patwelle.com/ . The site is well worth exploring.

Mike Russell moved and Harpiar Gandhi seconded to approve the September, 9, 2021 minutes. Motion carried.

The financial report was in the packet and reviewed by the Board.

The Council Coordinator's report was also in the packet. Allan noted some of the highlights:

- Technical Assistant Grant submitted to OWEB for a flood plain targeted restoration plans. 60-70% of the ownership is interested. However, there are 7 other TAGs in the same pool. There is a lot of concern about why so few Chinook are in the Clatskanie system. These floodplain locations are crucial to their success.

President's message: Nothing to report.

New Board appointments: None

Officer Elections: Margaret Magruder guided the process with the following that agreed to serve:

President:	Ian Bledsoe
Vice President:	K.C. Van Natta

Secretary: Chip Bubl

President Bledsoe asked if there were any further nominations. Hearing none, President Bledsoe closed the nominations and they were all elected to serve another term.

Reports from partner organizations:

Friends of Fox Creek: Having an abridged Zoom meeting on 11/15 at 6:30 to meeting on future governance and plan for next year's Annual Meeting in February.

Scappoose Bay W.C.: No report.

Columbia County: Mike Russell noted that his crews were getting into winter planning and preparation mode. Most road work done for the year.

City of Clatskanie: Harpiar Gandhi discussed the waterline blowout which lost ~200,000 gallons of water and almost led to a road washout. Both the pipe and the road damage has been repaired.

Next meeting: January 11th, 2022 at 7:00pm by Zoom once again

Meeting adjourned by President Bledsoe.

Respectfully submitted by
Chip Bubl
Secretary

LOWER COLUMBIA RIVER WATERSHED COUNCIL CHARTER and BYLAWS

*Adopted October 14, 1997
*Amended November 13, 2002
*Amended September 9, 2014
*Amended September 13, 2016
*Amended March 20, 2023

Purpose:

The Lower Columbia River Watershed Council was formed to gather and share information, to reduce duplication of activities, and to help address watershed management issues in the Lower Columbia River Watershed and in Columbia County, and to provide a framework for coordination and cooperation among key interests.

Mission:

To foster better stewardship and understanding of the Lower Columbia River Watershed resources in Columbia County, coordinate, cooperate and try to deal with issues in advance of resource degradation, encourage restoration of natural processes and functions where feasible, and help ensure sustainable watershed health, functions, and uses.

The council will work collaboratively with communities and landowners to develop and carry out voluntary watershed protection, restoration, enhancement and community engagement activities.

Vision:

A balanced ecosystem approach that supports a healthy watershed and provides for sustainable natural resources and for an economic base and viable communities.

Relationship to Decision-Making Bodies and Communities of Interest:

The Lower Columbia River Watershed Council is an advisory group to established decision-making bodies and communities of interest in Columbia County. As such, the council gathers information, facilitates stakeholder dialogue, hopefully gains consensus, and makes recommendations concerning the protection, restoration, and enhancement of the quality of the Lower Columbia River Watershed.
The council shall be non-partisan, non-political, and non-regulatory and shall not have the authority to appeal land use or other decisions of elected or appointed public bodies.

The Council will not use litigation as a method to implement the Council's mission.

The stakeholders, agencies, organizations, and public interests represented on the council are not obligated to adopt or carry out the recommendations of the council, but will give due consideration to the recommendations and take actions they consider appropriate.

These stakeholders, agencies, organizations, and interests will report back to the council on any actions taken in response to council recommendations.

The council welcomes and will respond to the requests for advice on actions affecting the watershed that are proposed by local, state, and federal agencies; organizations; and stakeholder and public interests.

Council members will keep their respective agencies, organizations, and interests informed about the work of the council and will bring their concerns to the council.

The Lower Columbia River Watershed Council shall support other watershed councils' efforts to secure funding for watershed projects and activities.

Goals and Objectives:

- Encourage coordinated efforts to increase natural resource education programs
- Improve communication among affected stakeholders, private individuals, interested citizens, business/industry, and representatives of local, state, and federal agencies
- Gather and evaluate environmental information
- Establish a framework for coordination, cooperation, and citizen involvement
- Provide a forum for resolving problems and conflicts related to the Council's mission when all parties to the problem or conflict agree to refer the matter to the council
- Formulate recommendations
- Facilitate enactment of recommendations
- Provide ongoing program evaluation during implementation
- Promote ongoing monitoring of the health of the Lower Columbia River Watershed

Specific Tasks/Responsibilities:

- Establish a public involvement program to ensure an appropriate level of citizen participation in the council's work
- Use available resource information to determine the current condition and uses of the watershed
- Identify critical information gaps
- Gather new critical information
- Identify the desired condition and uses of the watershed
- Identify high value fish and wildlife areas
- Encourage ongoing monitoring of the conditions of the watershed
- Help resolve issues among diverse interests in the watershed
- Seek funding to support program development and implementation, including funding from agencies represented on the council
- Address the needs and concerns of the respective agencies, organizations, and interests represented on the council
- Adopt and implement a work program
- Monitor work program progress and budget

- Identify ongoing education programs in the watershed

Council Members:

The Lower Columbia River Watershed Council shall at all times include representatives from the following interests: Agricultural Community; Business & Industry Community; Education Community; Public Interest Groups; Forestry Community; Sub-Basins and/or Local Watershed Councils; Countywide Organizations; Local Governments; Fishing Interests; and Mining Industry. A majority of the members shall reside in those portions of Columbia County that drain into the Columbia River.

The members shall serve at the pleasure of their respective stakeholder groups, agencies and organizations. Council members may designate an alternate who will participate on the council in their absence.

The council will act to replace members who resign or are unable to continue to serve on the council. The council will strive to maintain continuity and the balance of interests by giving preference to representation from the same agencies and organizations at a similar or higher level position. The council will request the group, agency or organization to nominate a replacement representative. If the group, agency or organization is unable or unwilling to do so, the council will seek representation from other groups, agencies, and organizations of the same community of interest. In this event the council will consult with the County Commissioners to ensure that the replacement agency or organization does represent the same community of interest. In the event the council is unable to find a replacement representative from the same community of interest, the County Commissioners shall be asked to make a replacement appointment to reflect that community of interest.

Titles of Officers, How officers are selected, Length of service for officers, Powers of officers, Minimum number/frequency of meetings of governing body

The Council will elect a chairperson and vice-chairperson to serve as spokespersons, prepare council agendas, call and manage council meetings, enforce ground rules, and perform other tasks as assigned by the council. The council may select other officers and fill vacancies as needed. The periodic election of officers shall take place at the regularly-scheduled meeting in October of odd-numbered years.

The Council may form subcommittees of its own members and task groups that include individuals not on the council to perform certain functions or focus on specific issues. The council will also identify technical advisors who can provide technical data and assistance and call on these experts as needed.

All Council members are eligible to serve as officers or committee members. There are no term limits.

Lower Columbia River Watershed Council
Policies and Ground Rules

Adopted 9/7/97
Amended 7/11/00
Amended 6/12/12
Amended 9/9/14
Amended 9/13/16
Amended 3/20/23

LCRWC Members agree to the following policies and ground rules:

Council Decision-Making

- Robert's Rules of Order, Second Edition, will be used as a guide for conducting business.
- Before a decision is adopted by the council, sufficient time (30 days) will be provided for the members to seek advice from organizations they represent, agencies, or other experts.
- When a decision is reached, council members will advocate to their respective bodies support for the adoption or implementation of the decision.
- The watershed council may select a person to serve as facilitator.

Participation

- The Council will hold regular meetings and follow provisions of the Open Meetings Law. At least 10 minutes will be set aside at each meeting for public comment.
- Business may be conducted by council members present. In the absence of a majority of the council members or their alternates, a simple majority is required for approval of actions with a minimum of four members present.
- Council members will keep their respective agencies, organizations, or interests informed about the work of the council and bring concerns of their groups to the council.
- Council members may designate a representative of their group to serve as an alternate. Designated alternates will be listed on the membership list of the council.
- Each member will brief his/her alternate on all issues, proceedings, and notifications, prior to the alternate's attendance at council meetings.
- The public is invited to all council meetings and, upon request, provide meeting agendas and records of decisions other than personnel discussions and actions.

Organization and Procedures

- Robert's Rules of Order shall be followed (see: Decision-Making/Ground Rules)
- The Council will hold monthly meetings on the second Monday of every month unless otherwise announced.
- Council will seek funding for the ongoing operations.
- The Columbia SWCD will act as the Council's fiscal agent and follow Generally Accepted Accounting Principles (GAAP).
- The Council will not use litigation as a method to implement the Council's mission.

Amendments

A council member may propose an amendment to these Ground Rules at any regularly-scheduled meeting. A vote on the amendment shall take place at the next regularly-scheduled meeting. An affirmative vote by 10 members, or two-thirds of those members present, whichever is greater, will ratify the amendment.

OREGON WATERSHED ENHANCEMENT BOARD

Agenda Item H

Council Capacity Applications

#224-007 - Tillamook Bay WC

Board Meeting July 25-26, 2023

Application Name: TBWC Capacity Grant 2023-25

Application Number: 224-007-22887

By: Tillamook Bay WC

Offering Type: Council Capacity Grants

Application Type: Council Capacity

OWEB Region: North Coast
County: Tillamook
Coordinates: 45.52681172,-123.92085455

Applicant:
Haakon Smith
PO Box 509
Garibaldi OR 97118

Budget Summary:
OWEB Amount Requested: $159,143
Total Project Amount: $159,144

Administrative Information

Abstract

Provide an abstract statement for the project. Include the following information: 1) Identify the project location; 2) Briefly state the project need; 3) Describe the proposed work; 4) Identify project partners.

The goal and purpose of this OWEB Council Capacity grant is to provide operating capacity support for the Tillamook Bay Watershed Council (TBWC), located in Tillamook County. The Tillamook Bay watershed contains over 300 stream miles across five river systems; the Tillamook, Trask, Wilson, Kilchis, and Miami, that provide habitat for Coastal Coho, spring and fall Chinook, Chum salmon, Coastal Cutthroat trout, winter steelhead and Pacific lamprey. Limiting factors in these systems include lack of summer and winter refuge for juvenile salmonids, reduced habitat complexity, limited riparian vegetation, increasing summer stream temperatures, over-appropriation of summer instream flow, diminished tidal wetland habitat, decreased floodplain connectivity, and high levels of nutrients and bacteria, particularly in the floodplain and upper estuary. The support provided in this Capacity Grant will allow the Council to hire a coordinator and provide the needed support to continue to work with area partners to address these limiting factors. The coordinator will also be able to address organizational capacity and lead the council in community engagement, with a goal of broadening council membership and building and maintaining relationships with partners including Tillamook County and the many municipalities located within, Oregon Department of Forestry, Oregon Department of Fish & Wildlife, Bureau of Land Management, US Fish and Wildlife Service, Tillamook County Creamery Association, Tillamook Estuaries Partnership and other non-profit partners, local private timber companies and other landowners, and public and private partners.

Location Information

Current Location:

What is the ownership of the project site(s)?

❑*Public land (any lands owned by the Federal government, the State of Oregon, a city, county, district or municipal or public corporation in Oregon)*

❑*Tribal lands (any lands owned/managed by a Tribal government)*

❑*Private (land owned by non-governmental entities)*

✓*Not applicable to this project*

❑*This grant will take place in more than one county.*

Permits

Other than the land-use form, do you need a permit, license or other regulatory approval of any of the proposed project activities?

❍ Yes
● No

Racial and Ethnic Impact Statement

Racial and Ethnic Impact Statement

❍ The proposed grant project policies or programs could have a disproportionate or unique POSITIVE impact on the following minority persons. (indicate all that apply)

❍ The proposed grant project policies or programs could have a disproportionate or unique NEGATIVE impact on the following minority persons. (indicate all that apply)

● The proposed grant project policies or programs WILL HAVE NO disproportionate or unique impact on minority persons.

Insurance Information

If applicable, select all the activities that are part of your project - These require a risk assessment tool unless otherwise noted (check all that apply).

❑*Working with hazardous materials (not including materials used in the normal operation of equipment such as hydraulic fluid)*

❑*Earth moving work around the footprint of a drinking water well*

❑*Removal or alteration of structures that hold back water on land or instream including dams, levees, dikes, tidegates and other water control devices (this does not include temporary diversion dams used solely to divert water for irrigation)*

❑*Applicant's staff or volunteers are working with kids related to this project (DAS Risk assessment tool not required, additional insurance is required)*

❑*Applicant's staff are applying herbicides or pesticides (DAS Risk assessment tool not required, additional insurance is required)*

✓*Insurance not applicable to this project*

Additional Information

❑ *This project affects Sage-Grouse.*

Problem Statement

Does the watershed council have a fiscal sponsor?

❍ Yes
● No

Is the council a membership organization?

❍ Yes
● No

The council is a group of councils operating collectively.

❍ Yes
● No

Is the applicant a group of councils operating independently?

❍ Yes
● No

For Details Upload the council's most recent bylaws.

Councils are required to review their council's bylaws once every three years, provide the date of the last time the council's governing body reviewed the council's bylaws?

12/20/2022

Councils are required to review their policies and procedures once every three years, provide the date of the last time the council's governing body reviewed the council's policies and procedures?

12/20/2022

For Details Upload the council's most recent policies and procedures.

For Details Upload the council's local government designation

For Details Upload the council's policies and procedures.

Date of the council's 2021-2023 self assessment?

02/28/2023

Date of last council officer elections.

11/28/2022

For Details Upload the minutes from the board meeting documenting the results of the officer election.

Does the council have written position descriptions for council board officers?

● Yes
❍ No

Does the council have written roles and responsibilities for council governing body members?

● Yes
❍ No

How many times did/will the council governing body meet between July 1, 2021-June 30, 2023?
20

How many times will the council governing body meet between July 1,-June 30, of the upcoming biennium for which you are seeking funding?
20

Describe how the council advertises its general council meetings.
Over the past year, as the council is restructuring, meetings have been advertised by word of mouth, email, and by postings at the Bay City Arts Center. The council realizes that more effective advertising is necessary to grow and diversify the membership and is prepared to utilize multiple platforms to reach a broader audience. Posts on the council's website and social media pages will be used along with other public forums such as local newspaper calendars and radio spots.

Do council governing body meetings have agendas, sign-in sheets, and minutes?
● Yes
❍ No

Describe how your board membership includes a diverse range of geographic areas and community interests in the watershed.
The TBWC Board includes diverse community interests including forestry, fish and wildlife, farming and agriculture, recreation, education, and community arts. Members of the board live in, and represent, the Kilchis, Wilson, Trask, and Tillamook River basins, a majority of the waters that enter Tillamook Bay. The TBWC Board includes members who have grown up in Tillamook County and have witnessed the benefits and effects of watershed restoration first-hand, as well as members who have moved to the area and bring additional insights to the board, and both are heavily invested in what the watershed provides. Board members participate in a range of watershed-related activities ranging from stream enhancement projects on their own land, to working on stream enhancement, large woody debris, and fish passage projects in their line of work, to educating the public about the functions of watershed ecosystems and to enjoying fishing and other recreational opportunities the area provides. TBWC is committed to expanding the diversity of its board in order to represent as many community interests as possible and has plans for a robust recruiting campaign when the council is operating at full capacity again.

Describe any board membership and recruitment challenges and actions being taken to address those challenges.
TBWC has had unique challenges in board recruitment over the last biennium, stemming from a loss of support due to past actions of the council. In response, the board has had an almost complete turnover of members and officers and has spent the last two years reorganizing by reviewing bylaws and policies and revamping the operating structure of the council. This type of focused organizational work is not appealing to many who would otherwise be interested in joining a watershed council, and in fact have driven some prospective members away. We believe that with a solid plan for community partner engagement with a focus on getting back to the task of watershed restoration, there will be a much greater interest in board membership. The council has been working to repair relationships throughout the community and identify the unique niche we can occupy in the restoration community, and is confident that with the added capacity of a council coordinator this will once again be an organization that people will want to be a part of.

During board meetings over the past year the council has put a strong emphasis on identifying community interests that lack representation on the board, and creating strategies to address these shortcomings and increase engagement. These workshopping sessions included outside technical support from the Tillamook County Commissioners, TEP, DEQ, and ODF. The result of these sessions is a clear picture of where the board needs to work on diversification and a strategy for outreach and recruitment based on the current board member's broad

network of connections within the community.

The council has heard overwhelming support for its importance in the community from county commissioners, the business community, the education community, state and federal agencies, local cities, and the community at large. With the council coordinator position filled the council is prepared to engage a diverse spectrum of interests in order for the council to do maximum good for the watershed and the community.

Are projects of the council, including those identified in the work plan, identified in a council action plan or strategic plan?

● Yes
❍ No

Provide the name and date of the most recent action plan or strategic plan.

Tillamook Bay Watershed Council Strategic Action Plan, 2015-2025. May 22, 2015.

Is the work of the council specifically designed to benefit salmon or steelhead?

● Yes
❍ No

✓Oregon Coast - Steelhead
✓Pacific Coast - Chum Salmon
✓Oregon Coast - Coho Salmon
✓Oregon Coast - Chinook Salmon

Describe how the resulting council capacity grant will benefit salmon or steelhead or their habitat?

The Tillamook Bay watershed contains over 300 miles of stream habitat for Coastal Coho, spring and fall Chinook, Chum salmon, Coastal Cutthroat trout, winter steelhead. Limiting factors in these systems include lack of summer and winter refuge for juvenile salmonids, reduced habitat complexity, limited riparian vegetation, increasing summer stream temperatures, over-appropriation of summer instream flow, diminished tidal wetland habitat, decreased floodplain connectivity, and high levels of nutrients and bacteria, particularly in the floodplain and upper estuary. The council's 10-year Strategic Action Plan (2015-2025) focuses largely on fish recovery action. In the past 2 years the council has assisted with the development of 2 restoration projects that address salmon and/or steelhead and their habitats. The coordinator will utilize watershed assessments, action plans and relevant Recovery Plans to develop a prioritized list of future restoration and monitoring projects.

Regional Assessments or Recovery Plans
Recovery Plan for Oregon Coast Coho Salmon Evolutionarily Significant Unit
Comprehensive Conservation and Management Plan for Tillamook Bay, Oregon
Oregon's Native Fish Conservation Policy
Oregon Conservation Strategy
The Oregon Plan for Salmon and Watersheds
Oregon Coast Coho Conservation Plan for the State of Oregon

Council Capacity Metrics:
https://www.oregon.gov/oweb/Forms/OC-Application-Watershed-Council-Metrics-23-25.xlsx

Input the total acres encompassed by this watershed.

359601

Input the Federal Recovery plan applicable to your watershed council.

Recovery Plan for Oregon Coast Coho Salmon Evolutionarily Significant Unit, National Marine Fisheries Service Northwest Region, 2016.

Input the description of the plan implemented that outlines the need for this activity

The Oregon Plan for Salmon and Watersheds (1997) provides the governance structure for implementing restoration in Oregon and specifically charges these watershed councils with the task of developing and implementing watershed improvement projects. Additionally, the Oregon Plan indicates that, in order to complete these tasks, watershed councils require funding to provide for stable infrastructure and support for council activities.

Proposed Solution

Community Engagement

Briefly describe the council's stakeholder engagement accomplishments from the 2021-2023 biennium.

During the 2021-2023 biennium TBWC was able to repair trust with important stakeholders and develop new relationships within the community. This ultimately led to the TBWC receiving letters of support from the Tillamook County Commissioners, Tillamook County Creamery Association, Tillamook County Farm Bureau, Stimson Lumber, Hampton Tree Farms, the cities of Tillamook and Bay City, and got renewed support from ODF, ODFW, the BLM, as well as non-profits such as the Tillamook Estuaries Partnership, Wild Salmon Center, Salmon Super Highway, and Trout Unlimited. These organizations, along with others, are committed to working with the council to identify our unique niche in the local conservation community, which will help TBWC achieve our mission of maintaining and improving the health of the watershed.

The board has also put a lot of emphasis on exploring community engagement challenges during board meetings over the past year. These meetings identified several interested parties in the community in which relationships still need to be repaired or increased, and focused on strategies to accomplish this task in order for the council to be more effective. The board also identified non-traditional or underrepresented community interests which are also very important to the mission of the council, and explored opportunities to engage these groups.

Briefly describe the council's stakeholder engagement challenges from the 2021-2023 biennium

Stakeholder engagement challenges in the 2021-2023 biennium stemmed from mistrust caused by previous actions of the council. Former productive working relationships were negatively impacted by a lack of communication during this period and required outreach by the council to renew the conversation about what the council can provide to the community and how we plan to implement those benefits. The council contacted many prominent stakeholders in the community to renew this conversation and results have been promising. The vast majority of former partners showed a willingness to rebuild relationships and work with the council in achieving its goals. Some organizations requested revised bylaws in order to understand what the council has done to prevent future actions that would hinder working relationships and were satisfied with the changes that have been made. Fortunately, many stakeholders expressed a need for the council and the willingness to work together in the future.

Briefly describe the council's stakeholder engagement plans for the 2023-2025 biennium.

Stakeholder engagement plans for the 2023-2025 biennium will focus on broadening the reach of engagement to a more diverse group of stakeholders and community interest groups as well as strengthening engagement with traditional stakeholders. Over the past year the council has reached out to many community partners in order to better understand the unique niche we hold in the local restoration community, renew the conversation on watershed enhancement, and inform potential partners about the council’s plans. A primary objective of the council coordinator will be to establish lasting relationships with community partners in order to identify opportunities for collaboration on projects. The Board’s initial plan is to have members use their connections within the community to inform interested parties about what the watershed has to offer and assist the coordinator in finding opportunities for collaboration.

The council recognizes the benefits of increased engagement with traditional partners associated with fishing and shellfish, forestry, our agricultural and farming community and other industries in the area, as well as tribal interests and other underrepresented and non-traditional groups as being very important to the success of the council. TBWC plans to increase outreach and engagement to these groups throughout the biennium.

Describe the council's efforts to engage with local tribes present in the council's geography.

Although the current presence of local tribes is limited within the Tillamook Bay watershed, the council

nonetheless feels that the indigenous voice is very important and plans to solicit their input on tribal priorities for watershed enhancement and involvement. The council reached out to the Confederated Tribes of Grand Ronde and was unable to establish lasting contact with a representative. Despite the lack of success, the TBWC is committed to engaging with local tribes present in the council's geography and will continue to develop these important relationships over time.

Describe the council's efforts to engage with non-traditional partners.

Planning sessions during TBWC board meetings over the last biennium have made it clear to the council that engaging non-traditional partners is an essential and effective way to create the most impact within the community. Bringing these under-utilized and under-represented partners into the conversation about watershed activities will increase the network of groups that are working towards the same goal, ultimately improving opportunities for collaboration and better efficiency. The council has identified several opportunities and methods to engage with a variety of potential partners including the Spanish and non-English speaking communities, education and scouting groups, the arts and birdwatching communities, hunting, fishing, forest, and river recreation groups, private businesses, and others. The council plans to engage with these non-traditional groups throughout the next biennium and will continue to identify and seek out new opportunities for collaboration.

Restoration

Provide a brief summary of the council's 2021-2023 restoration accomplishments.

Although the 2021-2023 biennium did not hold any large-scale projects for the council due to lack of capacity, the council did continue to participate in activities that implement and advance our mission. TBWC volunteer board members worked to complete monitoring of past council projects and produced reports on the Mill Creek habitat enhancement project, the Skookum Reservoir dam breach project, and the South Fork Trask road obliteration and large wood project. The council also participated in restoration and planting activities after the Pike Road fire of 2020, as well as invertebrate sampling with the City of Bay City and education projects with Tillamook School District.

Briefly describe the council's restoration challenges from the 2021-2023 biennium

The council's restoration challenges from the 2021-2023 biennium were the result of lack of capacity and funding. Without a council coordinator and operating funds, the council was severely limited in what it was able to accomplish on a restoration scale. Many of the restoration actions listed in the 10-year strategic plan have been accomplished, and instead of focusing on developing new restoration projects the council focused on reorganization and planning for the future in order to be effective when resources are again available to pursue watershed enhancement projects.

Provide a brief summary of the council's restoration plans for 2023-2025.

TBWC plans to work with local restoration partners in the basin by providing support, where appropriate, as well as identifying and working within our own unique restoration niche. With a coordinator or restoration professional, the council will consult regional assessments, recovery plans, and relevant planning documents to identify and address priority restoration actions during the 2023-2025 biennium and work with community partners to implement projects with a planned approach. The current board has strong ties with the Oregon Department of Forestry and plans to work closely with ODF to identify opportunities for partnership on watershed enhancement projects, including large woody debris projects and fish passage. TBWC will continue to participate in conversations with the city of Bay City about their culvert removal and stream planting project to identify ways to be involved with this important work. The council has been approached by private landowners and small businesses that are interested in stream enhancement projects on their property and have already identified several potential projects. Additionally, the council is an important vector for federal grants and other funding sources unique to watersheds and plans to work closely with other nonprofit partners such as the Salmon SuperHwy, Tillamook Estuaries Partnership, and the Wild Salmon Center, among others, to leverage and secure funding for important restoration

projects within the basin.

Planning

Describe how the council uses planning documents to identify and implement on-the-ground watershed restoration and stakeholder engagement projects.

TBWC uses the council's Tillamook Bay Watershed Council Strategic Action Plan, 2015-2025, as a guide to identifying, prioritizing and implementing on-the-ground watershed restoration and stakeholder engagement projects. The council has made good progress on achieving the goals of the plan over the past 8 years. A priority of the council for the 2023-2025 biennium will be to create a new strategic action plan that consults regional assessments, recovery plans, and relevant planning documents to identify and address priority watershed restoration actions and community engagement efforts that reflect on the improvements that have been made in the basin and guide the council into the future. Funding of this grant would also allow a staff person to represent the watershed council and participate in the Coho Strategic Action Planning process.

Are projects of the council identified in a council action plan or strategic plan?

● Yes
❍ No

Provide the name and date of the most recent action plan or strategic plan.

Tillamook Bay Watershed Council Strategic Action Plan, 2015-2025. May 22, 2015.

Wrap-Up

Provide context and justification for how your budget was developed. Explain how project costs and/or rates were

determined.

TBWC's budget for the 2023-2025 biennium was developed using information from previous years in which the council was operating at full capacity and updated to reflect current prices and council needs. This budget will allow the council the capacity to pursue projects, engage the community, and to seek out alternate sources of additional funding.

Rates for staffing use comparable rates to similar positions in other organizations and were calculated at ¾ time with the expectation that the coordinator will pursue projects and secure the other ¼ of a full-time salary through other grant-funded monies. The hourly wage reflects current cost of living in the area and a competitive salary that will incentivise a coordinator to stay in the position for an extended period of time. The unit cost includes taxes and workers comp.

Payroll expenses, payroll admin. services, CPA services, insurance premiums, and other fiscal fees were all calculated using actual costs from previous years, updated as necessary, and should reflect very closely what the actual costs will be over the biennium.

TBWC has secured office space and the price of rent is reflected in the budget. Other expenses related to office productivity are also included and prices reflect actual researched amounts for things such as a telephone line, internet, printer, computer software, and other office supplies.

Safety of employees is of utmost importance to the council and a budget item is included for personal protective equipment (PPE) for the council coordinator. This cost reflects actual researched prices for a quality set of PPE that will keep a coordinator safe in the field during council-related duties.

Does the budget identify a contingency amount for specific line item(s) within the Contracted Services and/or Material and Supplies budget category?

❍Yes

Article I - Name & Purpose

The Tillamook Bay Watershed Council ("Council"), a 50l (c)3 non-profit corporation, exists in order to help communities within the Tillamook Bay Watershed address watershed management issues, improve and enhance watershed health, and provide a framework for coordination and cooperation among all of its stakeholders. The Council is established under The Governor's Coastal Salmon Restoration Initiative and House Bill 3441 (Oregon Legislative Assembly, 1995 Regular Session) as codified at ORS 541.890-541.935.

Article II - Mission & Vision

The Council's mission is to build collaborative, voluntary partnerships with communities and landowners, to protect, maintain and improve the health of the Tillamook Bay Watershed through on-the-ground restoration projects, educational outreach programs, and other community engagement activities.

Our vision is for a healthy watershed that supports natural, functioning ecosystems while also providing for a thriving economic base that supports viable communities.

Article III - Council Coordinator

The Board shall hire a Council Coordinator to be the administrative head of the Council, provided that funding is available for such position. The Board Chair shall be responsible for overseeing the duties of such Council Coordinator. The Council Coordinator shall conduct the day-to-day business operations and affairs of the Council. The Council Coordinator shall attend meetings of the Board and shall report to the Board on the business operations and affairs of the Council. The Board shall have the power to delegate to the Council Coordinator such executive power and authority as the Board may deem necessary to facilitate the handling and management of the Council's authority and interests.

Article IV - Board of Directors

Section 1 - Duties & Responsibilities
The Board of Directors is legally responsible for all matters of the Council unless the Board of Directors delegates such responsibility to an officer or officers, the Executive Committee or other authorized representative. The Council membership shall reflect a balance of interests in the community, including a diverse range of geographic areas and community interests in order to engage a balance of interested and affected persons within the watershed as required by ORS 541.910(2). Specific duties and responsibilities of board members include:

- When acting on behalf of the Council, Board members shall put the interests of the Council above personal or professional concerns and avoid potential conflicts of interest.
- Ensuring that the Council complies with all applicable federal, state and local laws and regulations, as well as ethical norms.
- Approving annual budgets, approval of projects and contracts, and reviewing periodic financial reports or appointing a fiscal agent to ensure accountability to donors and the general public.

- Ensuring that the Council has adequate financial resources to fulfill its purpose and mission.
- Reviewing and developing documents that establish policies and guidelines necessary to achieve the Council's purpose and mission.
- Participating in the selection, support, and performance reviews of the Council Coordinator.
- Reviewing and developing plans and projects consistent with the Oregon Plan for Salmon and Watersheds and other conservation plans recognized by the state and federal government.
- Identifying one or more committees to deal with personnel issues, governance or special projects as needed.

A Board member with three (3) consecutive unexcused absences from meetings at which a quorum is required may be removed by a vote of the Board. Board members shall serve without compensation but may be reimbursed for reasonable travel and expenses while conducting authorized and pre-approved business of the Board.

Board members wishing to resign from the Council should notify the Chair in writing. The Board of directors can remove a member from a Board position by a vote of two-thirds (2/3) of all Board members in office.

Section 2 – Membership, Nomination, Election & Removal

- The Board of Directors shall consist of five (5) to twenty (20) members. The Board of Directors shall also be known as the Council.
- The Council will strive for an inclusive, active Board membership that reflects the broadest practicable representation of local citizenry; local, state, and federal agencies; and organizations with vested interests within the watershed in order to engage a balance of interested and affected persons within the watershed as required by ORS 541.910(2). Such representation may include, but is not limited to agricultural, business, commercial & sport fishing, education, environmental, forestry, citizens at large including a representative from each of the five rivers in the watershed, local government and special service districts, federal agencies, and state government.
- A majority of Council membership shall reside in the Tillamook Bay watershed.
- Any individual seeking membership on the Board will notify the Chair of their interest in serving on the Board. The Chair will recommend to the Board approval for membership if the individual seeking membership agrees to active participation on the Council, has attended two meetings of the Council during the preceding six months, and agrees to adhere to the Bylaws. The Board will vote on acceptance of this individual onto the Board of directors.
- Board members shall be elected by a majority vote of the quorum.
- A Board member shall serve a term of three (3) years and may be re-elected without limit. The Board, by resolution, shall stagger the terms of the members so that approximately one-third of the members shall have terms that expire each year.
- A member can be removed from their position with or without cause by a two-thirds (2/3) majority vote of all members in office.

Article V - Council Officers

Section 1- Eligibility, Election, Terms of Office, Resignation & Removal
Any Board member may seek Executive Office and shall notify the Chair of their interest in serving. Officers are held to a higher standard of participation than other Board members, and any Officer with two (2) consecutive unexcused absences from meetings may be removed by a vote of the Board.

Officers will be elected by a majority vote of the quorum. Terms of office for elected Officers will be for a length of one (1) year. There will be no term limits set. Voting of officers shall take place in November and terms will run from January 1 through December 31 of the following year.

An Officer wishing to resign his position shall inform the Council in writing. An Officer may be removed from their position by a majority vote of all members in office. An interim appointment for the remainder of the term of office will be elected, except that a vacancy in the position of Chair will be filled by the Vice-Chair.

Section 2- Powers & Duties
The officers shall have the powers and perform the duties customarily belonging to their respective offices, including the powers and duties listed below (and as prescribed in the TBWC Board Position Descriptions, which see):

A) The Chair will preside at meetings of the Council. The Chair will be responsible for conducting the business of the Council under the provisions of Articles XI and XII (Decision Making & Participation and Meetings). The Chair will provide direction to the staff and coordinate activities with the staff. The Chair and the Administrative Committee will conduct regular performance reviews of the staff. Except as otherwise provided by the Council or these by-laws, the Chair shall sign all agreements and other formal instruments for the Council. The Chair may be a member of all committees as determined by the Chair. In the Chair's absence, The Vice-Chair will perform the duties of the Chair. If the Chair and Vice-Chair are both absent, the Chair may appoint a facilitator to preside at a meeting. If no facilitator is appointed, the meeting will be cancelled or postponed.

B) The Vice Chair shall preside in the absence of the Chair. In instances where the Chair is inaccessible, the Vice Chair shall sign for the Council all agreements and other formal instruments. The Vice Chair may act in such other capacity as the Council or Chair may designate.

C) The Secretary shall be responsible for assuring that all the proceedings of the meetings of the Council are recorded, maintaining a current roster of all board members, seeing that all records are properly stored, seeing that all notices are duly given in accordance with any provisions of these Bylaws and, in general, perform all duties incident to the Office of Secretary and such other duties as may be prescribed by the board.

D) The Treasurer shall be the chief financial officer of the Council. They shall render to the Council at the monthly meetings and whenever else it so requests an accurate account of all

sums received and disbursed during the preceding month. The treasurer shall maintain oversight of the Council's finances and financial policies, and ensure the Council follow Generally Accepted Accounting Principles (GAAP). The Treasurer shall also provide an annual report of all sums received and disbursed during the preceding fiscal year and of all sums and funds which are not expended. The Treasurer shall be responsible for all fiscal aspects of grants that the Council receives.

Article VI - Council Membership and Officer List

The Council Coordinator shall maintain a list of members, including the officers, and this list will include names, complete contact information, the interest each represents, any offices held, and any committees upon which they serve.

Article VII - Committees

The Executive Committee shall consist of the four officers, the chair of any subcommittee, members at large, and the Council Coordinator. Members at large shall be based on nominations by the Chair and elected by the Board. The Executive Committee shall be responsible for the duties as defined by and delegated by the Board.

The Executive Committee will actively recruit new Board membership and prepare a slate of candidates for the Board positions annually.

The Restoration Committee shall consist of Council members and representatives of local communities and agencies to provide guidance to the Council Coordinator in the planning, development and execution of restoration projects.

Other committees may be formed at the direction of the Chair to address topics or projects relevant to the Council's mission, goals, or objectives. Committees may be temporary (for particular tasks or projects) or on-going. A committee will be comprised of at least two members and any other persons as appointed by the Board.

When a committee is formed, the Council must charge it with clear duties. This includes the committee's purpose, terms of existence, decision-making role, reporting expectations, and authority. The role of each committee as it is formed should be documented in writing and made a part of the official record of the Council.

Article VIII - Decision Making & Participation

Section 1 - Quorum
A quorum at any Board or Council meeting shall consist of a majority of the number of the Board members who hold office immediately before any Board meeting (or 3 if there are 5 Board Members). Council decisions will be made only if a quorum is present.

Section 2 - Requirements
Council members shall strive for consensus when making decisions. When the Council cannot achieve consensus on a given decision, decisions will be made using a two-thirds majority vote.

Section 3 - Voting definitions
"Yes"= support, advocate
"Abstain" vote= neutral; not thrilled but could live with it; not informed enough on the matter
"No"= no; can't count on me; need more discussion; may need more information

Section 4 - Decision-making procedure

1. Open discussion. Motions shall be made and seconded by a voting member in order to carry forward.
2. A Board member ("director") shall call for a vote.
3. If consensus is not reached (one or more "no"), the Chair shall set a time limit for further discussion.
4. The Council shall listen to the concerns of the "no". The Council will then listen to those that support an alternative. The goal of this discussion is to seek a solution that can be supported. Each person will have one minute to speak.
5. At the end of the discussion, the Chair shall call for a re-vote.
6. A two-thirds majority of the voting members will carry the motion.
7. If the motion does not carry after the second vote, the item will be tabled. A member may bring the issue forward at a future meeting for another vote.
8. A member who is present at a meeting when corporate action is taken is deemed to have assented to the action unless the member's objection or abstention to the vote is entered into the minutes of the meeting, or the member delivers written notice of such objection or abstention to the Secretary immediately after adjournment of the meeting.

Article IX - Meetings (Frequency, Purpose, and Rules)

- The Council shall strive to meet a minimum of 9 times per year.
- Regular meetings shall be set at times and places determined by the Council.
- All regular meetings are open to the public.
- Meeting conduct shall be in accordance with the "Simplified Rules of Order and administered under the direction of the Chair.
- The Chair may recognize public input at any point during a Council meeting. A public comment period shall be provided at each regular meeting.
- Special meetings may be called by the Chair or by 20% of the members on the Board. Special meetings may be closed to the public for discussion of confidential matters.
- The Board may act without a meeting provided that the action is in writing and consented to by all members and filed with the Council as a Board resolution.
- Council Officers may authorize an emergency vote by the Board via electronic media. The decision will stand as a Board decision if the decision is in writing and all Board members sign their consent to such decision.
- The Chair may permit any or all members to participate in a meeting through use of telephonic

communication where all members participating may simultaneously hear each other during the meeting.

Article X - Policies & Guidelines

The Watershed Council will adopt policies and guidelines to direct Council business.

Article XI - Miscellaneous Provisions

Section 1 - Conflict of Interest
A conflict of interest is a transaction with the Council in which a member has a direct or indirect interest. For the purposes of this article, a coordinator/member has an indirect interest in a transaction if:

1. Another entity in which the member has a material interest or in which the member is a general partner is a party to the transaction; or
2. Another entity of which the member is a member, officer or trustee is a party to the transaction, and the transaction is or should be considered by the Board.

In the event of a conflict of interest between a member or members and the Council, the Board shall follow the Conflict of Interest Policy, described within the Council's Fiscal Policies & Procedures, Section XII, Paragraph E, adopted by the Board.

Section 2 - Public Participation & Transparency
Public understanding and support for the Council is fundamental to its success. The Council operates as an inclusive body, and as stated in Article XI, all regular meetings are open to the public. Additionally, the Council shall, upon request, provide the public with records of its meetings and decisions.

Section 3 - Media Interaction
Council members may not represent the Council without Council authorization. Specific media inquiries will be directed to the Chair. Staff is authorized to represent the Council with authorization by the Chair.

Section 4 - Liability Disclaimer/Indemnification
The personal liability of each member of the Board and each officer of the Council, for monetary or other damages, for conduct as a member or officer shall be eliminated to the fullest extent permitted by current or future law.

The Council shall indemnify its officers and Board members to the fullest extent allowed by Oregon law as defined under ORS Sections 65.387 to 65.414.

The Board may adopt a resolution authorizing the purchase and maintenance of insurance on behalf of an individual against liabilities asserted against or incurred by the individual who is or was a member, officer employee or agent of the Council.

Section 5 - Litigation
The Council does not rely on litigation to compel regulatory enforcement as a means to implement the Council's mission.

Section 6 - Regulatory Activity
The Council does not participate in regulatory activity, and does not report issues to regulatory agencies. When Council staff or members are confronted with potential water or land use violations they will refer those issues to the landowner.

Article XII - Adoption & Amendment

These Bylaws of the Council are effective and adopted by the Board on December 20, 2022.

These bylaws may be amended. Amendments shall be proposed in writing and circulated at least two weeks in advance of any regular meeting or special meeting called for that purpose. The proposals for change must be included on the agenda and distributed in written form with the agenda materials. The amendments must be approved in accordance with the decision-making process identified in these bylaws.

TEN-YEAR PROJECT AND PLANNING MATRIX 24

Introduction and History

This document expresses the goals and strategies of the Tillamook Bay Watershed Council (TBWC) from 2015 through 2025. Bierly & Associates and Watershed Initiatives, LLC were contracted to develop this document with the help of the Council's Board, staff, and committees. Organizational and ecological priorities were refined during two facilitated meetings of the Council's Expanded Restoration Committee in March and April of 2015. The resulting action plan was reviewed and adopted by the TBWC Board during its regular meeting on April 28th, 2015.

This Action Plan includes a description of the topical areas covered in each chapter, the tracking and analysis methodology that has been used, a statement of the status of that chapter's topic, and where appropriate, "actions for improvement" that the Council has identified and agreed to incorporate as a method for adaptive management within the basin.

Geographic Scope

The TBWC's geographic scope includes all the of approximately 582 square miles of the Tillamook Basin, including the five tributaries that feed into Tillamook Bay (Wilson River, Trask River, Tillamook River, the Kilchis River and the Miami River), as well as the estuary and tidal lands of the bay (Figure 1).

Figure 1: Tillamook Bay Catchment

The Tillamook Bay Setting

Tillamook Bay is a drowned river mouth estuary that lies at the terminus of five distinct tributary drainages. The name, "Tillamook", means "land of many waters." The Miami, Trask, Wilson, Tillamook and Kilchis Rivers all drain the Coast Range to Tillamook Bay. The catchment is nearly square with the Miami and Kilchis Rivers flowing into the Bay from the north and northeast. The Wilson and Trask Rivers have the largest catchments and drain from the northeast and east. The Tillamook River flows into the Bay from the southeast.

Large-scale forest fires have affected the Coast Mountain portion of the catchment in 1933, 1939, 1945 and 1951. The lowlands of the catchment have been protected from tidal and river flooding to some extent and converted to dairy pasture to support agriculture. The dairy industry flourished and formed the Tillamook

County Creamery Association (TCCA). Tillamook Bay and the rivers that enter the bay are some of the most productive salmon streams along the Oregon coast. Tillamook Bay produces shellfish in its broad, shallow intertidal flats. Tillamook Bay also supports commercial oyster production. The Bay has a popular recreational fishery that is important to the community, the state and the greater fishing world.

Tillamook Bay Watershed Council

The TBWC was formed in 1998 and in 2006 became a 501(c)(3) corporation. Its mission and vision statements follow.

Vision

The TBWC's vision is for a healthy watershed that supports natural, functioning ecosystems while also providing for a thriving economic base that supports viable communities.

Mission

The Council's mission is to build collaborative, voluntary partnership with communities and landowners, to protect, maintain and improve the health of the Tillamook Bay Watershed through on-the-ground restoration projects, educational outreach programs, and other community-engagement activities.

Goals & Objectives

The Council's goals include:

1. Develop long-range and annual work plans that support the mission and vision of the Council
2. Assess conditions throughout the watershed and identify opportunities to protect or improve those conditions
3. Promote ongoing monitoring of the health of the Tillamook Bay Watershed
4. Provide ongoing project and program management and evaluation for all Council projects
5. Coordinate with and support other organizations in conservation efforts throughout the Tillamook Bay Watershed
6. Encourage coordinated efforts to increase education programs
7. Encourage collaboration and cooperation with other partners in the basin
8. Improve communication among affected private individuals, interested citizens, business/industry, and representatives of local, state, and federal agencies
9. Provide a framework for resolving community problems and conflicts related to the Council's mission, when all parties to the problem or conflict agree to refer the matter to the Council
10. Actively seek the involvement of youth in Council membership and activities
11. Maintain financial transparency and follow Generally Accepted Accounting Principles in all financial matters
12. Increase council capacity to improve management of projects and mission

Council Capacity and Organization

Participation and Accountability

Description
The Board of Directors consists of between seven (7) and twenty (20) members. The Board is legally responsible for all matters of the Council unless it delegates such responsibility to an officer or officers, the Executive Committee or other authorized personnel. Board responsibilities include making judgments that support the Council's purpose and mission; ensuring that the Council complies with all federal, state and local laws and regulations; ensuring the Council acts in an ethical manner in all dealings; providing oversight of finances and fiscal policies; ensuring adequate resources for the Council to fulfill its purpose and mission; hiring and oversight of the Coordinator/Executive Director; reviewing and approving plans consistent with the Oregon Plan and other conservation plans; reviewing and approving grant proposals; creating committees to address personnel, governance or special projects; and adhering to the Council's By-laws.

Metrics
The Council conducts a biennial self-evaluation process. The purpose of the evaluation is to identify how well the council reflects the Tillamook Bay community and to seek additional representation to assure the balance and representativeness required by state statutes that govern watershed councils.

State statute ORS 541.910 provides guidance for selecting representation and interests:

"*Local watershed councils formed under subsection (1) of this section shall consist of a majority of local residents, including local officials. A watershed council may be a new or existing organization as long as the council represents a balance of interested and affected persons within the watershed and assures a high level of citizen involvement in the development and implementation of a watershed action program. A local watershed council may include representatives of local government, representatives of nongovernment organizations and private citizens, including but not limited to:*

(a) Representatives of local and regional boards, commissions, districts and agencies;

(b) Representatives of federally recognized Indian tribes;

(c) Public interest group representatives;

(d) Private landowners;

(e) Industry representatives;

(f) Members of academic, scientific and professional communities; and

(g) Representatives of state and federal agencies.

Status
The Council has experienced attrition of Board members over the past two years, as well as a decrease in public outreach and involvement. With the hiring of a new Coordinator in 2014 and subsequent outreach, the Board is growing its membership. A plan is in place for more public outreach through its "Speakers Series," and an active engagement of diverse constituencies by the Coordinator to increase public awareness about the Council, and to recruit more landowner and citizen involvement in the Council and its Board.

Actions for Improvement

- The Council will review prospective membership against the statutory guidance (above) when recruiting new members.
- The Council will actively recruit new members, with emphasis on representatives of the shellfish industry, sport and commercial fishing industries, and the dairy industry.

Decision-Making

Description
The Council uses a consensus model for decision-making, with a two-thirds "super-majority" fallback vote when consensus cannot be reached. The following steps describe the Council's decision-making process:

1. The Chair opens discussion. Motions shall be made and seconded by a voting member in order to carry forward.
2. A Board member ("director") shall call for a vote.
3. If consensus in not reached (one or more "no" votes), the Chair shall set a time limit for further discussion.
4. The Council shall listen to the concerns of the "no" voting directors. The Council will then listen to those that support an alternative. The goal of this discussion is to seek a solution that can be supported for the entire Board. Each person shall have one minute to speak.
5. At the end f the discussion, the Chair shall call for a re-vote.
6. A two-thirds majority of the voting members will carry the motion.
    a. Voting definitions: "Yes" = support, advocate for the proposal
    b. "Abstain" = neutral: not thrilled by could live with it; not informed enough on the matter.
    c. "No" = no; can't count on me; need more discussion; may need more information
7. If the motion does not carry after the second vote, the item will be tabled. A directory may bring the issue forward at a future meeting for another vote.
8. A director who is present at a meeting when corporate action is taken is deemed to have assented to the action unless the directory's objection or abstention to the vote is entered into the minutes of the meeting, or the

directory delivers written notice of such objection or abstention to the Secretary immediately after adjournment of the meeting.

Meeting Management

Description
The Council strives to meet at least nine (9) times per year, and regularly scheduled meetings are set at times and places determined by the Council, with all regular meetings open to the public.

Meeting conduct is in accordance with the "Simplified Rules of Order" and administered under the direction of the Chair. The Chair may recognize public input at any point during a Council meeting. In addition, a public comment period is provided at each regular meeting.

Special meetings may be called by the Chair or by 20% of the directors on the Board. Special meetings may be closed to the public for discussion of confidential matters.

The Board may act without a meeting provided that the action is in writing and consented to by all directors and filed with the Corporation as a Board resolution. Council Officers may authorize an emergency vote by the Board via electronic media. The decision will stand as a Board decision if the decision is in writing and all Board members sign their consent to such decision(s).

The Chair may permit any or all directors to participate in a meeting through the use of telephonic communication where all directors participating may simultaneously hear each other during the meeting.

Metrics
- Review of attendance records of Board members annually and evaluate what steps necessary to improve attendance

Status
The Council Board has been meeting at least nine times a year since its inception in 1998. A Public Comment time is reserved on each Council Board meeting agenda.

Actions for the Council
- Conduct a review of the number of meetings failing to achieve a quorum over the last year and identify ways to improve attendance.
- Assess the capacity needs of the Council to effectively manage existing projects, and assess the ability to manage new projects.

Staff Management

Description
The Board of directors has authority to hire a Council Coordinator or Executive Director as the administrative head of the Corporation. The Board is responsible for overseeing the Coordinator/Executive Director. The Coordinator/ED is responsible for the day-to-day management and duties necessary to conduct the Council's business, operations and affairs. The Board may delegate to the Coordinator/ED executive powers necessary to facilitate handling and management of the Council's authority and interests, including hiring of additional staff, developing Request for Proposals for soliciting contractors to assist in Council activities, and other tasks.

Metrics
- Annual review of Coordinator's performance over the previous 12-month work period.
- Feedback to Coordinator on areas of competency and areas needing improvement.

Status
A new Coordinator was hired in October of 2014 after a number of short-term tenures of previous Coordinators. The newly hired Coordinator is actively engaged in community outreach efforts, project management—including the development of new on-the-ground restoration projects, as well as pursuing funding and grant opportunities. While it is too early to discern the efficacy of the new Coordinator's actions, early indications of success include the recent addition of new members to the Board, new programs including the "Speakers' Series," outreach to schools and educational institutions, and an increase in programs designed to attract more interest from the larger community, including presentations by ODFW biologists and others on issues that are important to the local community such as the status of salmon population trends in the Tillamook Basin watershed.

Actions for the Council

- The Executive Committee will review staff performance annually.

Fiscal Management

Description
The Council has a "Fiscal Policies and Procedures" manual that articulates the fiscal management policies for the Council, how purchases and disbursements are made, accounts receivables, billings, payroll procedures, financial statements, budgeting and procurement policies.

Metrics

- Review and reconciliation of the Council's funds and bank statements by its fiscal administrator (TEP Accounting Manager)
- Completion of required tax forms and financial reviews
- Biennial audit by a contracted CPA

Status

The Tillamook Estuaries Partnership (TEP) currently manages payroll support, as well as fiscal management of all grants, for the Council. The Fiscal Policies and Procedures manual has not been updated or reviewed since May of 2007. The Coordinator is scheduling a review of the manual for September of 2015.

Actions for the Council

- Complete the scheduled review and provide the Council an updated manual.

Project Management

Description

Oregon Department of Fish and Wildlife (ODFW) staff has provided significant project management assistance since the departure of Denise Lofman in 2012. With the hiring of a new coordinator, project management is now being organized through the software Basecamp, with each project given an identification number in order to provide tracking and other monitoring oversight by members of the Council's Executive Committee and Restoration Committee.

In addition, the Council has developed a two-year work plan for all projects and uses an Excel spreadsheet that provides a description of the project, key partners involved, limiting factors that affect the targeted resource/spatial area, challenges and opportunities associated with the project, and planned deliverables.

Metrics

- Development of a comprehensive database on Basecamp to allow monitoring and tracking of all restoration projects

Status

The new project management processes that have recently been put in place are designed to improve project management for the Council. However, it is too early to determine how effective these new processes will be in assisting and improving project management at this time. With the real potential loss of state-supported technical assistance, additional capacity will undoubtedly be needed.

Actions for the Council

- Build technical expertise either through contracting or hiring, to allow the Council to take on more complex projects

- As the Council manages more projects, it will need to budget for contracted or partner project managers
- Consider each grant application as an opportunity to provide project management capacity

Citizen Involvement and Support

Description
The Council has been challenged in garnering more citizen involvement and support over the past few years. As noted in previous self-evaluations, the broader community has a limited understanding of the Council's work or mission. Consequently, the Council has developed a plan for increasing citizen awareness of the Council's work, as well as greater citizen involvement. Such plans include developing a more robust online presence, including a website and Facebook page, increasing the number of presentations by staff, agency or educational professionals on topics that are of interest to local landowners and citizens, and a more concerted outreach effort by the coordinator to targeted stakeholders and groups. The Council has plans to attend local events such as the Farmers' Market, County Fair and Garibaldi Days, as well as community volunteer activities such as bay/river clean ups, riparian planting parties, and invasive plant removal efforts. Partnering with local schools, the community college and other educational or recreational partners will enhance the Council's presence in the community and increase public awareness and involvement in Council activities.

Metrics
- The number of students helping with citizen monitoring of projects and habitat.
- Attendance at local events such as the Farmer's Market and Garibaldi Days to increase public awareness of the Council

Status
The council has not had a robust outreach and citizen involvement program due to the high level of staff turnover during the past two years. However, the coordinator is working with partners to develop student monitoring opportunities and other outreach activities in order to increase citizen involvement and awareness of council activities. In addition, the council is working with the City of Tillamook on a restoration project on Holden Creek in downtown Tillamook, which will provide new opportunities to engage with the public.

Actions for Improvement

- Encourage board members to engage citizens and community groups to foster broader community awareness of the council and support greater citizen involvement in council activities.

Collaboration with Partners

Description
Maintaining the many relationships developed through time and building additional relationships are core functions of any watershed council. The TBWC has a long track record of collaborating with public and private partners in the catchment. The Council relies on public agencies for technical assistance, especially ODFW staff. Some of that capacity is threatened by budget cuts at the state level. The Council also has a strong partnership with Tillamook Estuaries Partnership (TEP) on projects and planning and for fiscal management. The Council conducts restoration projects on private industrial forestlands, state forest lands, Tillamook County and City of Tillamook lands, as well as lands belonging to other private and governmental entities.

Metrics
- Implementation of projects that maintain and enhance partnerships and collaboration
- Involvement with all appropriate agencies and parties to assure cooperative development and implementation

Status
The Council has recently been approached by partners (City of Tillamook, US Fish & Wildlife Service, and others) to assist in the development of projects that solve liability and ecological problems for the region. These opportunities will be enhanced by successful relationships and effective implementation. Assuring the Council has the capacity to build and maintain relationships while completing projects is an important challenge and links to adding capacity to assure effective project development and implementation.

In addition, the council is working in concert with the Tillamook Estuaries Partnership's Comprehensive Conservation and Management Plan to advance common restoration goals.

Actions for Improvement
- The Council will actively recruit agency and land management interests to its meetings to share information and explore cooperative efforts and opportunities.

Membership and Recruitment

Description
The Council has had poor recruitment of new members as a result of staff turnover and poor outreach and education programs in the recent past. The new coordinator

is actively recruiting new members from the broader community with an emphasis on user groups and stakeholders that are currently under-represented. These include landowners in the forested areas of the basin, and in the floodplain, and local business owners. Local recreationists are also being considered, including anglers, paddlers, hunters and birders.

Metrics

- Diversity of Board members
- Number of Board Members
- Representation from the broadest range of local citizenry

Status

One new board member has been recruited since October 2014, when the new coordinator was hired. Additionally, the Council has revived its "Speaker Series" and corresponding community outreach.

Actions for Improvement

- Recruit representative(s) from the dairy farming community to the Board by December 31, 2015
- Provide one (1) annual training to Board members to increase capacity and relationships
- Provide one (1) annual board social event to support board member morale and acknowledge their contributions to the Council
- Develop and distribute a Board Member Manual and review the contents with new members

Resource & Capital Development

Description

The Council's funding falls into three main categories; 1) Council Capacity Grants; 2) Regular Grants; 3) Non-specific/Miscellaneous funding.

1) Council Capacity Grants (formerly known as Council Support) are awarded biennially by OWEB based on an evolving set of criteria and requirements. TBWC has made every effort to meet these requirements, and anticipates that it will receive funding for the upcoming 2015-2017 biennium. OWEB's decision is due in the summer of 2015. The dollar amount for these awards is tied to OWEB's annual budget, and has not yet been determined for the 2015-2017 biennium.

2) Regular Grants encompass the majority of funding opportunities for Council projects, and include those offered by OWEB, US Fish & Wildlife Service, NRCS, BLM, US Forest Service, ODFW and ODEQ. They include, but are not limited to, grants for restoration, technical assistance, monitoring, education/outreach, land protection

and water protection.

3) Non-specific or Miscellaneous funding is a catch-all for all the other funding opportunities that are not tied to a specific project or outcome, but are intended to support the Council's operations and activities. The TBWC has so far sought very few of these opportunities.

Metrics

- Budget forecasting to measure whether general funding is adequate to support staff and office administration
- Successful development and execution of budgets and funding to support ongoing projects

Status

The Council is awaiting a decision from OWEB regarding ongoing Council Capacity funding, due in the summer of 2015. Currently all of the Council's planned projects are fully funded. Additionally, every prospective project includes a detailed funding plan and budget.

Priority Actions

- Initiate one or more education/outreach projects per year
- Initiate one or more restoration projects per year
- Develop and execute a fundraising plan
- Diversify funding channels
- Expand organizational capacity to add another employee within the next year
- Develop a fundraising strategy (as part of increasing staff capacity) that identifies and solicits funding from a diversified portfolio of funders

Ecological Priorities

Use of Watershed Analyses & Other Resource Inventory and Analysis Information

Description

There is an abundance of natural resource information for the tributaries to Tillamook Bay. The documents identify significant issues associated with the unique history of the catchment. The Coast Range tributaries are dominated by a relatively uniform, young (80 years ±) forest following a series of fires in the 1933-1951 period that covered nearly the entire catchment. The steep and deeply divided topography of the Coast Range grades rapidly to the alluvial fans that fringe Tillamook Bay and its broad intertidal expanse. Much of the lowlands in the bay

front has been diked and drained for conversion to dairy pasture and protected from river flooding by levees and tide gates.

The dominant issues associated with the Tillamook catchment are degraded water quality (temperature and bacteria), chronic flooding, and degraded or lost salmon habitat. While the issues are well known, the causes, and remedies are the subject of significant debate and controversy in the local community. There is abundant documentation of the priority areas for salmon production, tidal marsh restoration, riparian enhancement and stream complexity improvement. While additional work to prioritize or further analyze information about the Bay and its tributary streams is not well justified at this time, there will be a continual debate about approaches and desired outcomes.

Status

Given the abundance of information and differences of opinions on solutions and desired outcomes, it is important to identify a restoration strategy that draws on common goals within the TBWC's partnerships. Ecological priorities have been identified by the Tillamook Bay Watershed Data Synthesis & Computational Ecological Restoration Prioritization (CERP) Tool. The information and priorities identified in this document should be used to help guide both outreach and selection among opportunities.

The strategy proposed at this time is to take actions appropriate to the land uses in the catchment and address the factors that adversely affect aquatic habitat forming processes with an emphasis on the connectivity from Tillamook Bay to the areas of high intrinsic productivity in the upper watershed. The other element of the strategy is to take actions that would create and or maintain habitat complexity to allow for a diversity of life history expressions for the focal streams (the reach from high intrinsic potential areas to the Bay).

Priority Actions

- The following "rules of thumb" will be applied when considering future opportunities for the Council when addressing salmon habitats:

    - Streams with upstream "strongholds" should be prioritized over others.
    - Streams with high intrinsic potential should be protected and restored to the extent possible.
    - Connectivity to upper watershed high intrinsic potential areas should be a priority.
    - Addressing upslope (primarily road related) impacts to high intrinsic potential stream segments should be a priority.
    - Look for ways to address habitat complexity from headwaters to the Bay.

- Develop working relationships with land management groups to build a common understanding of goals and effects. This could mean using opinion surveys, targeted applied research to evaluate potential tradeoffs, conducting demonstration projects, and other methods to build understanding.

- The Council will explore additional operating rules for selecting projects that would address water quality and flooding concerns.
-

Project Selection and Planning

Description
The Council is a member of the North Coast Watershed Councils Restoration Assistance Project. A group of four watershed councils (the Nestucca-Neskowin, Tillamook Bay, Lower Nehalem and Necanicum Councils) hires a contractor each biennium to develop eight grant applications for high priority projects on the ground, with each council securing two projects in 2014-2015. Having this high-level of assistance in developing project and grant applications results in better project selection, and provides more time for public outreach and education, operations management and other duties. The contractor's plans include aligning funding requests with available opportunities and project partners to ensure readiness and timely implementation.

New geographic information tools have been developed that evaluate watershed processes and are being applied to the neighboring area (Nehalem basin) as a part of the planning tool to identify projects for a coho salmon implementation plan. These tools (NetMap and associated tools) use information about physical processes rather than area (hydrological units) conditions to identify limitations to the processes that provide habitat for aquatic species. The council could cooperate with Tillamook Estuaries Partnership to apply the NetMap evaluation to the tributaries to Tillamook Bay.

In addition, the Council is using TEP's Culvert Prioritization Plan for guidance in addressing needed culvert replacements in the basin. The Council is also working with the City of Tillamook on a water quality and restoration planning process for Holden Creek, the most impacted urban stream in the Tillamook Basin.

Metrics
- Percentage of grants awarded
- Percentage of partners who return to participate in future projects
- Number of new partners and prospective projects approaching the Council

Status
Project selection and planning has been stymied by staff turnover and poor grant application management recently. However, with the hiring of the new

Coordinator, along with identification of the Ecological Priorities (see page 12), project selection and planning is expected to improve—both in the frequency of projects selected and implemented, and in their ecological contributions to the Basin.

Priority Actions

- Cooperate with Tillamook Estuaries Partnership in providing fish passage using the prioritization tools they have developed.
- The Council should collaborate with Tillamook Estuaries Partnership to apply for funding to conduct an analysis of process-based conditions in the tributary watersheds using a tool such as NetMap that NOAA Fisheries and others are using to develop salmon recovery plans. NetMap can be used to specifically target restoration actions and priorities. The analysis should include an estuarine habitat evaluation as well as stream analyses.
- Continue to look for projects that address habitat priorities and provide the greatest benefit for the community

Tillamook River Conservation Priorities

The Tillamook River supports significant populations of cutthroat trout, steelhead, coho, and Chinook salmon, as well as a remnant population of chum salmon. It has a long history of disturbance including an extensive history of splash-damming and log drives. These abuses have left a legacy of scoured channels that would benefit from restoration and enhancement. The lowlands make up a significant percentage of Tillamook County's highest value dairy lands. Consequently, they have long been diked and leveed to prevent flooding and salt intrusion. These structures have disconnected the river from its floodplain.

The *Tillamook River Coho Restoration Strategy: Habitat Assessment and Limiting Factor Assessment* provides a careful summary of conditions and specific recommendations for habitat enhancement that would benefit coho salmon. The analysis and recommendations provide guidance for project development with the appropriate landowners. The document also provides reach-by-reach recommendations for conservation activities.

Tillamook River Coho Implementation 1

Description

The Council has developed the *Tillamook River Coho Restoration Strategy: Habitat Assessment and Limiting Factors* that identifies twenty-five priority actions.

Metrics

- Number of projects that address identified limiting factors

Status
The council has begun developing projects identified under the habitat and limiting factors assessment, including riparian planting for improved shade.

Priority Actions
- Strive to instigate a priority project each year that addresses a limiting factor identified in *Tillamook River Coho Restoration Strategy: Habitat Assessment and Limiting Factors*

Tillamook River Coho Implementation 2

Description
Don Averill, TEP and the TBWC are partnering to conduct a riparian restoration project on the Averill property along the Tillamook River. The Averill property is agricultural land used to produce feed for livestock. The riparian zone within the property is dominated by invasive plant species (Himalayan blackberry and reed canary grass) and includes areas of active bank erosion. The riparian areas will be planted with a mix of native trees and shrubs. Cuttings of willow, dogwood and/or twinberry will be planted in and around areas of bank sloughing and erosion. Site preparation will include the clearing of all non-native blackberry. 3-4' diameter holes will be scalped in areas of reed canary grass for individual plantings.

Metrics
- Site preparation and planting of approximately .5 miles of Tillamook River riparian area with trees free to grow in 5 years.

Status
The project has been designed and an OWEB small grant has been acquired to complete the work.

Priority Actions
- Complete funded projects and document work in council materials (webpage and/or Facebook page)

Tillamook River Coho Implementation 3

Description
The TBWC is currently working with the City of Tillamook to design fish passage at Skookum Dam, an earthen dam on Upper Fawcett Creek. The dam was used for water supply for the City of Tillamook but is no longer necessary and poses a liability for the City if the dam fails. The U.S. Fish & Wildlife Service has offered to assist in more complete breaching of the dam.

Metrics

- Success of the project and successful fish passage in the future

Status

This is a new project that is in the development stages. Additional development and funding for design and implementation will be required before the project can become realized.

Priority Actions

- Develop a grant application and pursue funding for the design and implementation of dam removal.

Trask River Conservation Priorities

The Trask River is the second largest drainage in the Tillamook Bay Watershed. It supports significant populations of cutthroat trout, steelhead, coho, and chinook salmon, as well as a remnant population of chum salmon. Water quality in the Trask River is considered impaired by excessive summer temperatures. The Trask River is unique in that the mouth of the mainstem was moved and constricted, resulting in increased flooding. The upper watershed has fish passage barriers, and lacks large wood that creates overwintering habitat. In addition, there is a lack of conifers in riparian areas. The lowlands lack riparian cover and have been extensively altered to expand agriculture. Most lowlands are managed for pasture production. Lower river tributaries such as Holden Creek, Gold Creek, and Mill Creek have extensive water quality problems and have barriers that prevent significant fish use.

Trask River Habitat Restoration Implementation 1

Description

The Council has identified Holden Creek as a priority. Holden Creek is the most impacted urban stream in Tillamook County, and contributes significantly to water quality problems in the Trask River and the Tillamook Bay. Much of the land along Holden Creek is city-owned. The creek has many issues including flooding, fish passage, and riparian health. The Holden Creek Working Group partnership meets approximately every 3 months. TBWC staff and Board members sit on this committee and often lead projects to improve Holden Creek's habitat and water quality.

Metrics

- Water quality in Holden Creek
- Riparian health along Holden Creek
- Fish passage and use of Holden Creek

Status

A recent opportunity to develop a project for Holden Creek has been identified. The project would retrofit three 5' tidegates that currently block fish passage with a more fish friendly alternative. The watershed counsel will initiate the process of developing partners and design funding as well as applying for grants to pay the $120,000 estimated to upgrade those tide gates for the water quality and fish passage benefits.

Priority Actions

- Work with the Holden Creek partners to obtain designs and cost estimates for fish-friendly tide gates. Facilitate conversations with NOAA Fisheries and ODFW on the design.

Trask River Habitat Restoration Implementation 2

Description

Mill Creek is a low gradient, roughly five-mile long tributary to the Trask River--one of the lowest tributaries in the Trask system, joining well within the tidal zone, just upstream of RM 5. The Mill Creek watershed includes several significant tributaries and supports populations of cutthroat trout, steelhead, coho, and chinook salmon. Historically the creek is presumed to have supported chum salmon as well, but none have been documented in the basin in several years. State and industrial forestland are the dominant land uses in the headwater reaches while the majority of the stream flows through rural residential areas. It passes through a short section of agricultural land prior to entering the Trask.

This project site begins roughly 1.1 miles upstream of the confluence of Mill Creek and the Trask River and continues for roughly 0.9 miles to the confluence with Bear Creek. The Trask River Watershed Analysis rated in-stream large wood conditions as "100% undesirable" in the lower Trask watershed. It further specified that management actions to improve salmonid habitat should focus on enhancing large wood conditions, improving future large wood recruitment, and reducing mainstem temperatures.

Metrics

- Successful placement of 22 large wood structures
- Enhancement of riparian areas
- Planting of native trees and shrubs in all areas affected by the project, as well as an expanded area on the north side of the creek

Status

The project is funded and is being implemented in 2015.

Priority Actions

- Manage the project for effective completion.

- Develop descriptive material and report on progress and outcomes to the community.

Trask River Habitat Restoration Implementation 3

Description
The Upper South Fork Trask Habitat Restoration Project will involve in-stream habitat enhancement through addition of large wood and decommissioning of an abandoned road. Project may also include fish passage improvements at three nearby road crossings.

Metrics
- The project could address 20 acres of riparian habitat treated, and approximately 2 miles of riparian habitat treated (both sides). Maintenance would include brush cutting and tube maintenance.

Status
Current task is to seek funding for technical assistance with the initial project scoping and planning. In addition, a larger restoration effort is being assessed to address the alder-dominated riparian areas in the East for of the North Fork of the Trask.

Priority Actions
- Obtain technical assistance funding for project design.

Wilson River Conservation Priorities

The Wilson River is the largest drainage in the Tillamook Bay Watershed and supports the watershed's largest runs of anadromous fish. The upper reaches of the Wilson River are relatively high gradient, confined stream channels with local areas of low gradient, broad floodplain channels. The lower portion of the mainstem forms an interconnected network of sloughs and tidal wetlands in conjunction with the Tillamook, Trask, and Kilchis Rivers. The Wilson has a broad alluvial floodplain that is used primarily for dairying. The lower mainstem is extensively diked and is prone to flooding. Red Alder and riparian shrub species such as Salmonberry dominate the majority of the riparian corridor.

Issues associated with the lack of overwintering habitat, elevated summer temperatures, deciduous riparian corridors and altered low gradient portions of the flood plain are common with the Trask.

Wilson River Habitat Restoration Implementation

Description

TBWC is working with ODF and ODFW to place up to 12 large wood structures in the bed of Ben Smith Creek. Ben Smith has been identified as a high priority stream for coastal coho, but it has very little in-stream wood. ODF and ODFW own significant land along the creek, and both are eager to engage in a restoration partnership with the Council to restore fish habitat. An upcoming timber harvest on ODF land bordering Ben Smith Creek will create an opportunity to contribute wood to the creek, spurring the initiation of this project.

Metrics

- Effective placement of large wood.

Status

Planning and design has been completed. A grant application is in preparation.

Priority Actions

- Prepare for OWEB Review Team site visit with explanatory materials and partners.

Miami River Conservation Priorities

The Miami River is the northernmost and smallest of the five rivers within the Tillamook Bay Watershed. The Miami is unique among the five rivers in that it has few dikes and levees. Cutthroat trout, steelhead, chum, chinook, and coho salmon are present throughout the basin. The lower river has excellent potential for chum production. The upper mainstem has an abundance of off-channel habitat. Large wood remains low in the upper mainstem and may be a limiting factor for salmonid production. The Miami exceeds water quality standards for temperature. The lower mainstem is particularly prone to high summer temperatures, making it unsuitable for summer rearing by juvenile coho.\

Priority Actions

- Maintain contact with Oregon Department of Forestry on potential cooperative efforts to address water quality standards for temperature exceedance.
- Explore cooperative funding for a NetMap evaluation of the Miami watershed.

Kilchis River Conservation Priorities

The majority of the Kilchis watershed burned during the series of fires in the first half of the 20th century collectively known as the Tillamook Burn. As a result, the majority of the watershed is composed of relatively young conifers and dominated by Red Alder and riparian shrub species such as Salmonberry. The Kilchis River

supports populations of Coho, Steelhead, Chinook, Cutthroat, as well as Chum in the lower basin.

Priority Actions

- Maintain contact with Oregon Department of Forestry on potential cooperative efforts for fish passage, road treatments and large wood placement. Explore cooperative funding for a NetMap evaluation of the Kilchis watershed.

Tillamook Bay Lowlands Habitat Restoration 1

Description

To raise awareness of habitat forming processes in the Tillamook Bay lowlands, the council will sponsor a science panel discussion on the conditions and processes that form and impacts to the lowlands of Tillamook Bay with other partners in the basin. The forum will be developed with partners that have an interest in the lowlands. Critical partners will be Tillamook Estuaries Partnership, NOAA Fisheries, US Fish & Wildlife Service, Tillamook County Creamery, Oregon Department of Fish and Wildlife and others. The initial idea is to have a panel discussion focusing on the science of lowland habitats and habitat dynamics. The panel will discuss restoration alternatives and concepts as they relate to aquatic habitats important to salmon and other estuarine biota.

Metrics

- Constructive dialog that results from the presentations and leads to greater public awareness and the recruitment of potential landowners for inclusion in future habitat projects

Status

The Council is in the planning stages to sponsor the panel in the fall of 2015.

Priority Actions

- Identify a date and venue, invite and confirm speakers, and develop and deliver outreach for the program (scheduled for 2016)

Tillamook Bay Lowlands Habitat Restoration 2

Description

Explore with the Tillamook Creamery Cooperative, OSU Extension and other partners what opportunities exist to build understanding about the tradeoffs between full utilization of pastures and habitat restoration and enhancement activities. Explore approaches from other areas and develop a communications and research plan for the Tillamook Bay lowlands.

Metrics

- Clear and effective communications with the dairy industry that results in a mutual commitment to explore tradeoffs for utilization of lowlands for ecological habitat values and agricultural values

Status

The Council needs to develop a clear plan of action and initiate discussions with the Tillamook County Creamery.

Priority Actions

- Develop a plan of action and identification of models from other areas
- Engage discussions with TCC and OSU Extension
- Solicit recruitment of willing landowner(s) to develop and test voluntary pilot conservation projects that improve lowland habitats and ecological functions and document the effects of these voluntary practices on pasture utilization.

Ensuring Effectiveness

Council Effectiveness

Description

The TBWC is implementing three main measures to help ensure effectiveness. These measures include more effectively evaluating its restoration programs, monitoring its spending and budgeting, and tracking the level of public involvement from the broader community.

The biennial Self-Evaluations are one of the tools that the TBWC is using to gauge the level of support and involvement of Board members and other volunteers. These evaluations also provide the Council with opportunities to assess which programs and projects it should continue to support, and which programs and projects should be curtailed or modified.

The recent addition of Basecamp, a robust project-management software, is allowing the Council's staff and technical team members to more closely monitor the Council's restoration projects.

In addition, the Council maintains a two-year work plan in Excel that also provides tracking and assessment of the Councils' restoration projects, as well as the

Council's organizational development, staffing, volunteer capacity, and Board status. The work plan also tracks the Council's public outreach efforts and activities.

Metrics

- Do the Self-Evaluations result in meaningful discussions on progress toward Council goals?
- Does the work plan result in actionable items to help improve the Council's capacity and public outreach activities?

Status

The latest Self-Evaluation was conducted during the March 24th meeting of the Council Board.
Base Camp was initiated as the Council and Coordinator's project management program February 1, 2015.
The Council's "Fiscal Policies and Procedures" manual guides fiscal management. In addition, the Council's funds and bank statements are reviewed and reconciled monthly by the Tillamook Estuaries Partnership Accounting Manager (see the "Fiscal Management" section on page 7.).

Priority Actions

- Use the results of the self-evaluation and the Action Plan to identify a work program for the year. Evaluate resources needed to accomplish the work plan and explore means to obtain the necessary resources.
- Review self-evaluation process with Council officers to identify better utilization of this tool to improve council and board effectiveness.

Project Effectiveness

Description

The Council has completed a significant number of projects over the last 15+ years. There has been limited evaluation of the differences made from the implementation of the projects. The council should look towards both evaluating the effectiveness of any collection of projects in a tributary or reach of stream and evaluate the effectiveness of selected individual projects that may be instructive for future efforts.

At the current time the Council reports on the completion and condition of projects as required under grant funding requirements. While this reporting is important, a more robust evaluation of selected projects, perhaps in cooperation with others such as the Tillamook Estuaries Partnership, would help to build information that could be used for public information purposes or in revisiting project designs for the future.

Metrics

- The number of projects that meet priorities for salmon recovery.
- The number of projects that address water quality and flooding issues.

Status
This is a new approach for the Council and will need to be developed. The considerations that need to be made will require additional capacity for the Council either through contracting or employment.

Priority Action
- Apply a NetMap-type of evaluation for the tributary streams of the basin and compare the completed projects with the locations identified and adjust the council's outreach accordingly.

Ten-Year Project and Planning Matrix

The matrix on the following page identifies priority actions for both improving council capacity, and for pursuing restoration activities. The matrix also suggests a time frame for when the actions could begin, and how long these actions will be engaged by the council.

Actions	2015-2017	2017-2019	2019-2021	2021-2023	2023-2025
Council Capacity					
Review Membership composition					
Recruit new members					
Review Attendance					
Access Capacity for Projects					
Build technical expertise					
Add Project Management capacity					
Build capacity in grant applications					
Recruit interest and involvement					
Provide Board Training					
Conduct social and community event					
Develop and distribute Board Manual					
Build Outreach capacity					
Add outreach capacity as developed					
Restoration Activities					
Apply "Rules of thumb" to opportunities as presented					
Cooperate on process evaluation of tributaries					
Complete current projects effectively					
Develop public information materials on projects completed and in progress					
Add project management capacity					
Work with landholders to identify and develop projects identified in process evaluation					
Develop a cooperative evaluation of opportunities to address lowlands					
Develop a basin scale action plan for long-term funding					

MEMORANDUM

April 13, 2015

To: **Tillamook Bay Watershed Council**

From: **Ken Bierly**

Subject: **Tillamook Bay Watershed Assessment Issues and TBWC Action Recommendations**

Introduction

The Tillamook Bay Watershed Council (TBWC) has conducted watershed assessments from 1998 until 2001 covering each of the tributaries to Tillamook Bay (Wilson River, Trask River, Tillamook River, Miami River and Kilchis River). Each of the 5 tributaries (Figure 1) is addressed in a watershed assessment. The assessments conducted for TBWC are primarily summaries of existing information with limited analysis or issue clarification. The Miami and Trask watersheds were subsequently assessed for management purposes by the Department of Forestry in cooperation with the Bureau of Land Management in 2003 and 2005. The assessments provide a useful compilation of information and provide information that can be used for the development of an action plan for the council.

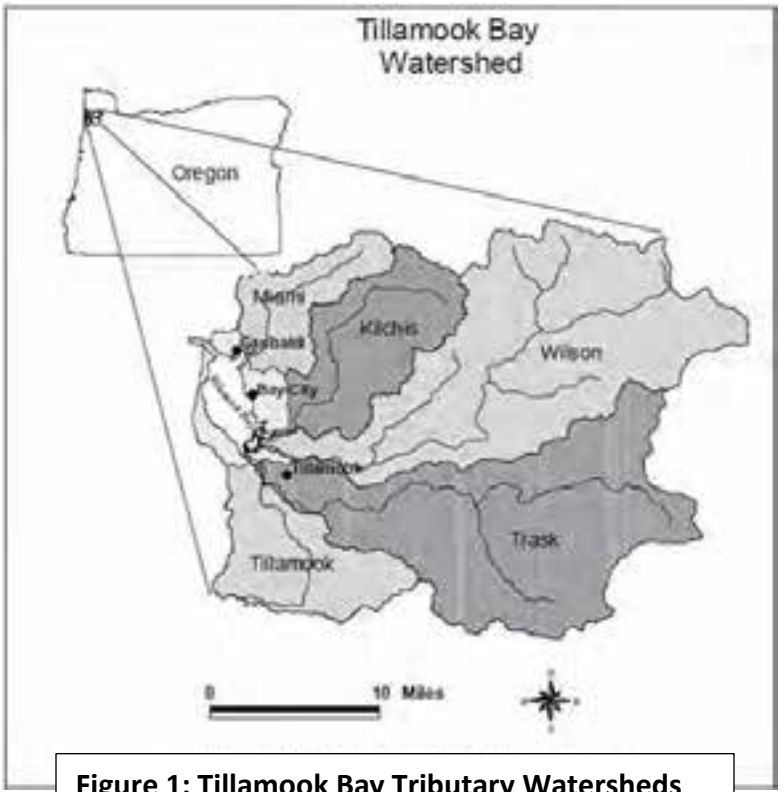

Figure 1: Tillamook Bay Tributary Watersheds

The Tillamook Bay Watersheds also have a great deal of information because of the presence of a National Estuary Program (NEP) that has invested significant financial resources in the evaluation of natural resource conditions and development a resource management program (TBNEP, 1998c.; TBNEP, 1999). The resource inventory and evaluation efforts of the NEP are valuable and usable for selecting appropriate conservation actions.

Fish habitat has been evaluated and prioritized for a number of purposes. Thom and Moore (1997) identified habitat conditions and developed priorities for industrial forest landowners to apply riparian and in-stream restoration practices. Oregon Department of Fish and Wildlife, Oregon Department of

Forestry, and the Wild Salmon Center provided input into prioritization for establishment of salmon "anchor habitats" in the Tillamook Bay watersheds that involve state forest lands. There has been significant evaluation of juvenile fish distribution (biological surveys) and is well summarized in 2007 by Bio-Surveys, LLC (2008). This information has been used to prioritize coho habitat restoration (Demeter Design, 2009) and to provide tools for evaluating priorities (Demeter Design, 2008)

Others have evaluated the lowlands of the bay (Coulton et. al. 1996) evaluating dike breach opportunities (Simenstad et. al. 1999) and tidal marsh restoration priorities (Ewald and Brophy 2012). The specific issues associated with road crossings and tidegates has been evaluated and prioritized (Bailey, 2012 and Charland, 1997).

Water quality of Tillamook Bay has been sampled and found that temperature and bacteria exceed state standards. In response, a Water Quality Management plan for agriculture (North Coast Basin Local Advisory Committee, 2011) and a water quality management plan for the entire basin has been developed by the Department of Environmental Quality (2001) to address temperature and bacterial contamination.

The following information is a summary from each major document that provides resource priorities with notes from the review of the documents. Direct text taken from the documents is presented in *italics*. The brief summaries from the documents is followed by a summary for the catchment and proposed rules of thumb for the TBWC to use in prioritizing outreach, monitoring, and restoration efforts.

Document Summaries

Kilchis Watershed Analysis (1998)

The Kilchis Watershed Analysis identified lack of large wood, lack of riparian forest vegetation, sediment from roads and elevated temperatures affecting habitat for salmon and steelhead. The report suggests reconnection of Hathaway Slough to the Kilchis River to relieve flood flows. The assessment has identified priorities for large wood placement. Recommendations include interplanting conifers in the riparian of the upper watershed and systematically addressing barriers to fish passage.

Trask Watershed Analysis (1998)

Tidal Mainstem RM 0–2: The only area for immediate protection is Hoquarten Slough, which has intact riparian stands and relatively high habitat values, but some problems with water quality. Areas for restoration are: mainstem from RM 0–2 both branches (riparian planting and addition of LWD), and Dougherty Slough (riparian planting and addition of LWD).

Mainstem RM 2–10: There are no areas for immediate protection. Areas for restoration are: mainstem RM 2–10 (riparian planting and fencing, addition of LWD, other habitat enhancement

projects), Mill Creek and Holden creek (reduce contaminant inputs, riparian planting), an unnamed creek that enters the mainstem at Trask River Rd. Bridge (riparian planting), and Hanenkrat Creek (riparian planting). Areas that could be restored, but the cost is high are: Gold Creek (restore fish passage at the hatchery, interplant conifers in riparian), and Green Ck. (replace culvert for fish passage, plant riparian on floodplain reach).

Mainstem RM 10–confluence: The only area for immediate protection is on the mainstem

(approximately RM 10.7–11.7), which has high quality riparian and high quality instream habitat. Areas for restoration are: mainstem RM 11.7–confluence (interplant conifers in riparian, other habitat enhancement projects), and small, perennial streams (interplant conifers in riparian). Areas that could be restored, but the cost is high are: the streams between Cedar and Burton Creeks (replace culverts for fish passage under Trask River Rd.).

North Fork: There are no exceptional areas for immediate protection. Areas for restoration are: entire mainstem of North Fork (interplant conifers in riparian), lower Bark Shanty Ck. (instream habitat enhancement projects, if possible remove natural barrier at RM ~1.5), and small, perennial streams (interplant conifers in riparian).

North Fork of North Fork: The only area for immediate protection is the first two miles of the mainstem above the confluence, which has high quality riparian but needs LWD additions to help retain spawning gravels and increase the number of pools. Areas for restoration are: mainstem from RM 2–headwaters (interplant conifers in riparian, addition of LWD), and small, perennial streams (interplant conifers in riparian, addition of LWD).

Middle Fork of North Fork: The only area for protection is the mainstem from RM 3 to Barney Dam, which has both high quality instream and riparian habitat. Areas for restoration are: Elkhorn, Cruiser Creeks and small, perennial streams (interplant conifers in riparian, and addition of LWD). Areas that could be restored but the cost is high are: Barney Reservoir (add fish ladder to allow fish passage to extensive habitat in upper watershed).

South Fork: The only area for immediate protection is the first seven miles of the mainstem above the confluence, which has both high quality instream and riparian habitat. Areas for restoration are: Edwards (RM 0–2.5), Joyce (RM 0–2), and Bill (RM 0–1.5) Creeks and small, perennial streams (interplant conifers in riparian, and addition of LWD).

The assessment recommends protection of Hoquarten Slough and riparian enhancement of Dougherty Slough. The report identifies riparian restoration along the lower main stem of the Trask as a priority. The report emphasizes the interplanting of conifers into deciduous riparian stands throughout the watershed. Addition of large wood in the upper portions of the watershed is consistently mentioned.

Wilson River Watershed Assessment (2001)

The watershed lacks large wood and has low large wood recruitment. The stream system lacks off-channel habitats and the streams have persistent sources of fine sediment. Sediment sources were identified as road instability, rural roads, and slope instability. Nearly 25% of the culverts assessed pose fish passage limitations. The Wilson River is temperature limited and in the lower river has bacterial contamination. The report has 6 pages of recommendations for additional data gathering, analysis and actions.

Miami River Watershed Assessment (2001)

There is a general lack of large wood in small and medium sized streams. Like the Wilson, the stream system lacks off-channel habitats and has chronic sources of fine sediment. More than 40% of the surveyed culverts limited free fish passage. The lower river is temperature limited and has elevated bacterial content. The assessment has similar recommendations to the Wilson River Watershed Assessment (E&S Environmental Chemistry, 2001b)

Trask River Watershed Assessment (2003)

Priority for conifer establishment should be given to areas in and around core salmonid spawning and rearing habitat, such as the East Fork of the South Fork and Elkhorn Creek subwatersheds. Priority consideration should also be given to tributary systems with low in-stream structural complexity, high stream temperature, high streambank erosion, and those that are important salmonid migration corridors.

Investigate causes of streambank erosion within the Elkhorn and East Fork of the South Fork Trask subwatersheds.

These recommendations should be emphasized in subwatersheds with a high incidence of roads on steep slopes and known road washouts. These include the North Fork Trask subwatershed, which has the highest proportion of road slippage problems. The South Fork and Upper Trask subwatersheds were identified in section 4.1.3.4 as priority areas to address erosion issues (sec 4.1.3.4). The North Fork North Fork subwatershed is also a priority because it has a high incidence of near-stream roads on steep slopes.

Pursue cooperative efforts to improve channel structure on stream segments that have multiple ownerships.

However, Elkhorn Creek and the East Fork South Fork subwatersheds should receive priority because of their status as Salmon Anchor Habitat. Areas that might be considered for emphasis because they are most deficient in LWD include the North Fork of North Fork, Middle Fork of the North Fork, South Fork, and Upper Trask subwatersheds.

Measures to improve salmon anchor habitat on Elkhorn Creek should focus on improving density of key LWD pieces, pool depth, and gravel area. Long-term solutions designed to increase conifers in the inner

riparian zone should be emphasized. For the short term, placement of key pieces of LWD should also be considered.

Measures to improve salmon anchor habitat on the East Fork of the South Fork should focus on improving density of key LWD pieces and increasing the area and frequency of pools. Depending upon site-specific conditions, improvements in LWD may result in improved pool characteristics. Long-term solutions designed to increase conifers in the inner riparian zone should be emphasized. For the short term, placement of key pieces of LWD should also be considered.

Identify opportunities to restore and reconnect off-channel wetlands and other high- flow refugia.

Implement the BLM road and culvert survey recommendations in the Elkhorn and the Middle Fork of the North Fork of the Trask River subwatersheds. Complete a similar type of survey for the rest of the BLM land in the Trask River watershed.

Elkhorn Creek subwatershed is the highest priority BLM area in the Trask River watershed for in-stream and riparian restoration work. Recommended projects in this area include releasing conifers and, where appropriate, planting riparian species in the riparian zone. Another priority project is to remove the section of road 2-5-10 that is directly adjacent to, and adversely affecting Cruiser Creek. This would be accomplished by redistributing the rip-rap, using an excavator, or by using other methods to restore connections with the flood plain and increase sinuosity.

he North Fork of the Trask subwatershed is the second highest priority for in-stream and riparian restoration work. In-stream work could include:

- *Increasing habitat complexity by installing instream structures where LWD is lacking. Mimic natural stream patterns as much as possible. Place key LWD pieces in natural deposition points, such as often occur at tributary junctions and below frequent debris flow sites in medium- to low-gradient streams.*
- *Creating woody debris jams to mimic windthrow in intermittent and small perennial streams.*
- *Planting native tree or shrub species in riparian areas to increase shading and/or long term LWD recruitment; this may require fencing to exclude beavers and other large herbivores.*

Work with the Tillamook Watershed Council and ODEQ to further quantify non-point sources of pollution. Expand the temperature monitoring network and locate stream segments where rapid heating occurs, especially in areas used by salmonids.

Pursue a coordinated effort to inventory culverts for fish passage across the watershed, and then prioritize projects across all land ownerships.

Coordinate with ODF to explore the feasibility of establishing a corridor of late-seral forest habitat that would connect the Nestucca Block LSR with the Trask/Little North Fork of the Wilson/Kilchis Late-Successional block. (See pg. 67 Nestucca Watershed Analysis October 1994).

East Fork of South Fork: The only area for immediate protection is the first seven miles of the mainstem above the confluence, which has both high quality instream and riparian habitat. Areas for restoration are: small, perennial streams (interplant conifers in riparian, and addition of LWD). Areas that could be restored but the probability of success is low are: Bales (RM 0–2), Blue Bus (RM 0–1.5), Scotch (RM 0–1), Pigeon (RM 0–2), Steampot (RM 0–1.5), Miller (RM 0–1.5), Boundary (RM 0–1.5), Headquarters (RM 0–1.5), Stretch (RM 0–0.5), and Rock (RM 0–0.1) Creeks (addition of LWD, and other instream habitat enhancement projects).

Miami Watershed Analysis (2005)

Minich Creek: Potential LWD sites in 0.4 miles of stream from downstream property boundary to the first bridge. This site has good access for ground-based machinery.

SF Miami: Potential LWD sites from mouth approximately 1.1 miles upstream to where the stream becomes constrained by hill slope. Only the lowest 0.25 miles is accessible for ground-based equipment. Evaluate with Engineers to determine access needs and potential problems. Identify whether to accomplish by attaching to a future sale, a service contract, or by district personnel.

Diamond Creek: Potential LWD sites from mouth to the forks approximately 0.35 miles. This site has poor access for most ground-based machinery. A "spider" may be suitable for this site as there are conifers fairly close to the stream.

Stuart Creek: Potential LWD sites in 0.6 miles of stream from downstream property boundary to the first bridge. This site needs additional examination for access options.

Stuart Creek is close to the road but has a steep hillslope between the road and the creek. Wood could still be placed in any of these streams using a cable yarder if they were hanging over the stream or by helicopter. Another option might be to use a "spider".

NF Miami: In most locations, wood placement cannot be performed under the current RGP due to size and slope of stream. Future revisions in the RGP may create additional opportunities. Alternatively, a special permit could be sought for wood placement along this stream.

Miami River mainstem. Wood placement cannot be performed under the current RGP because of stream width. Future revisions in the RGP may create additional opportunities. Alternatively, a special permit could be sought for wood placement along this stream.

Moss Creek: Limited ODF ownership and potential impacts to chum salmon. (Restoration projects could result in gravel scour from chum spawning areas. These projects could also create barriers to chum passage.)

Explore partnering with watershed councils, ODFW, and OWRD to address conditions downstream of ODF lands. Potential conditions to be addressed under this recommendation included the following:

- *Improving habitat complexity*

- *Restoring wetlands at mouth of Miami, Doty, and Vaughn*
- *Hardwood "conversion" to conifer or mixed.*
- *Restoration of low flows*

Water quality monitoring at Moss Creek Bridge for fecal coliform, total suspended solids, and nutrients.

Continue efforts to institute the Watershed Scale Effectiveness Study

A temperature monitoring program that stratifies ODF lands at confluences with major tributaries as well as ownership boundaries.

ODF should consider resurveying those ODFW habitat survey reaches that have not been surveyed since 1996. Additionally, ODF should consider expanding the surveys to include other fish bearing streams not yet surveyed.

Oregon North Coast Salmon Conservation Assessment (2008)

Four emphasis zones are described that deserve the highest conservation focus for salmon at the catchment level: the Miami and Kilchis Rivers, the Little North Fork of the Wilson River.

In the Tillamook System, key areas for coho salmon are:

- *The Little North Fork of the Wilson*
- *The Upper Miami*
- *The Upper Kilchis*
- *Devils Lake Fork of the Wilson*
- *Elkhorn Creek*
- *Ben Smith Creek*

In the Tillamook, key areas for steelhead are:

- *Upper Miami*
- *Little North Fork of the Wilson*
- *Ben Smith Creek*

Key areas for Chinook in the Tillamook system are:

- *Middle Kilchis*
- *Little North Fork of the Wilson*
- *Large reaches of the mainstem Wilson*
- *Large reaches of the mainstem Trask*

Miami and Kilchis systems are the most productive chum producers in the North Coast

Areas that had consistently low support for watershed condition are the Tillamook lowlands

A clustered group of watersheds that includes the Miami, Kilchis, and Little North Fork of the Wilson are consistently strong for several species.

Areas with timber that are more difficult to access due to steep topography (Upper Kilchis) tend to have higher watershed condition scores. These are also strong areas for salmonids.

Summary for Anchor Habitats

North Fork of Kilchis River	*Consistently high coho densities (RBA, 2005-07; ODFW 2000 - 07), consistently high coho spawner counts (ODFW, 2000-07), provides cold water to lower watershed, difficult terrain for timber harvest, part of whole watershed strategy for Kilchis, good water*
Miami River	*Unique area for multiple species. One of the highest chum producers in Oregon (ODFW); steelhead, cutthroat, coho juveniles (ODFW); cutthroat and coho abundance, consistently high (RBA, 2005-07)*
Middle Kilchis River	*Part of whole Kilchis watershed. High coho abundance and densities (RBA, 2005-07); steelhead abundance (RBA, 2005-07); high IP for steelhead; hotspot for Chum (ODFW) and Chinook (ODFW).*
Little North Fork Wilson River	*Highest producer of coho in the Tillamook watershed (RBA, 2005-07). This is a hotspot of abundance and diversity for multiple species. Several datasets back this up.*
Kilchis River	*Opportunity for whole watershed protection. High IP for chum, coho, Chinook. High Chinook spawner counts (ODFW, 1998, 2001); chum spawner counts (ODFW, multiple years), high coho densities and steelhead abundant (RBA, 2005-07), above average cutthroat (RBA)*
East Fork of the South Fork Trask River	*IP for steelhead; above average steelhead juvenile counts (2002 and 2004, ODFW); consistently high coho densities and abundance (RBA, 2005-07); above average steelhead abundance and densities (RBA, 2005-07); above average cutthroat (RBA, 2005-07)*
Ben Smith	*Consistently strong coho juvenile densities (RBA, 2005-07; ODFW, 2000-07), consistently strong coho abundance (RBA, 2005-07); consistently strong steelhead abundance (RBA, 2005-07); moderate support for good watershed condition*
Devils Lake Fork Wilson River	*High IP for coho, high coho juvenile (ODFW (1 year), 2000); consistently above average coho abundance and density (RBA, 2005-07); moderate cutthroat (RBA, 2005-07)*

Lower Devils Lake Fork Wilson River	*High IP for coho, high coho juvenile (ODFW (1 year), 2000); consistently above average coho abundance and density (RBA, 2005-07); moderate cutthroat (RBA, 2005-07)*

Dike Breach Report (1999)

Site Number	*Site Name*	*Tillamook Bay Tributary Regions*	*Contiguous Site(s)*
1	*Garibaldi-Miami River*	*Miami River*	
2	*Vaughn Creek*	*Pacific Ocean*	
3	*Kilchis River*	*Wilson & Pacific Ocean*	
4	*Hall Slough*	*Wilson & Pacific Ocean*	*#5*
5	*Wilson River*	*Wilson & Pacific Ocean*	*#4*
6	*Hall Slough East*	*Wilson*	
7	*Memaloose Point North*	*Pacific Ocean*	*#8*
8	*Memaloose Point South*	*Pacific Ocean & Trask*	*#7,#9*
9	*Nolan Slough*	*Pacific Ocean & Trask*	*#8*
10	*Tomilinson Slough*	*Pacific Ocean & Tillamook*	
11	*Tillamook North*	*Tillamook & Trask*	*#12*
12	*Trask North*	*Trask*	*#11*
13	*Tillamook Central 1*	*Tillamook & Trask*	*#16*
14	*Trask South*	*Tillamook & Trask*	
15	*Tillamook Central 2*	*Tillamook*	
16	*Tillamook Iowa*	*Tillamook & Trask*	*#13*
17	*Tillamook South*	*Tillamook*	

Nine sites are also associated in four contiguous blocks, usually separated by cross dikes, minor roads and/or channels. Because we cannot identify the integrity of the separation between these sites, we cannot preclude that returning tidal inundation to one will not result in flooding of a contiguous site. Combined, they may represent the following, potentially larger and more complex, sites:

- *#4-Hall Slough and #5-Wilson River = 198.2 ha combined*
- *#7-Memaloose Point North, #8-Memaloose Point South, and #9-Nolan Slough =158.9 ha combined*
- *#11-Tillamook North and #12-Trask North = 90.8 ha combined*
- *#13-Tillamook Central 1 and #16-Tillamook Iowa = 52.8 ha*

Tidal Wetland Prioritization (2012)

The largest high-priority sites were along the eastern bay fringe; other high-priority sites were identified along Hathaway, Squeedunk, Hall and Hoquarten Sloughs; and in the upper tidal reaches of the Tillamook River. Twenty-one sites (1809A, about 30% of the wetland area) were ranked "medium-high;" the largest of these were located in the Trask and Tillamook sub-basins. Most of the remaining sites (55 sites, totaling 2911A) were in the medium and medium-low

groups. Only 10 sites (430A) were ranked "low;" these lower-ranked sites should not be considered substantially different from the "medium-low" sites due to the factors listed above.

Many of the prioritized sites were located in sub-basins and other geographic areas prioritized in previous studies of the Tillamook Bay estuary and watershed. For example, the USACE Feasibility Study (USACE 2005) and Project Exodus (NHC and HBH Consulting Engineers 2010) recommended wetland acquisition, restoration and flow management covering several high and medium-high priority sites (Sites 38, 39, 40, 44, 52, and 53, plus parts of several other sites). The large, high-priority tidal marsh sites on the eastern bay fringe were ranked high for juvenile salmonid production potential by Simenstad et al. (1999). The high and medium-high priority sites along the Tillamook River were within sub-basins prioritized for coho intrinsic potential and landowner outreach in the Tillamook Bay Computational Ecological Restoration Prioritization (CERP) tool. Most of the prioritized wetlands were within the lowland floodplain area identified in the Integrated River Management System (Philip Williams and Associates 2002); levee and dike modifications (such as wetland restoration via dike breaching or dike setbacks) were recommended in this area.

This prioritization is a first step in strategic planning for conservation and restoration in the Tillamook Bay estuary. ***In general, the next step in action planning involves outreach to find those landowners interested in restoring or conserving the identified sites.***

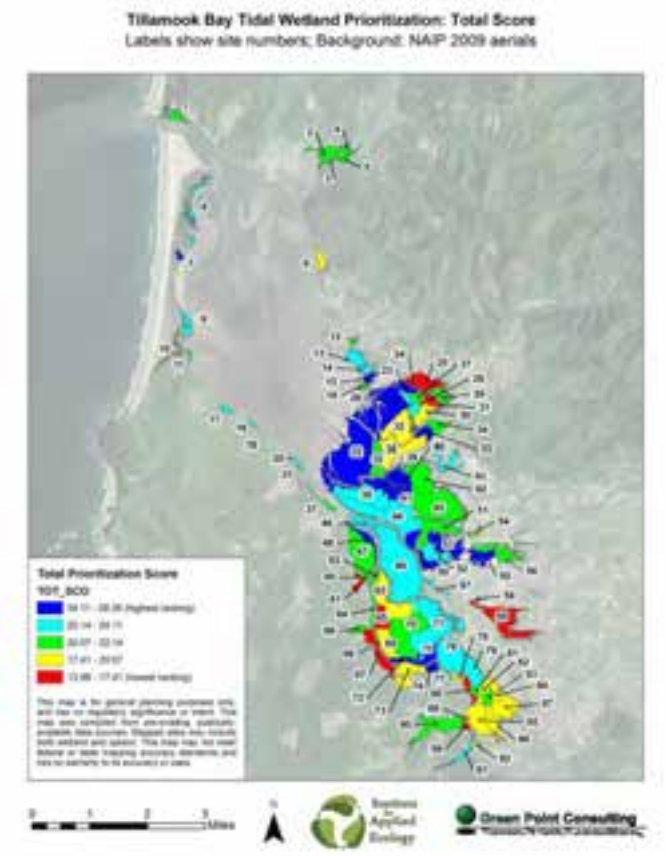

Figure 2: Prioritized Tidal Marsh Restoration Sites from Ewald and Brophy (2012)

Culvert Assessment and Prioritization Plan for Fish Passage in the Tillamook Bay Watershed (2012)

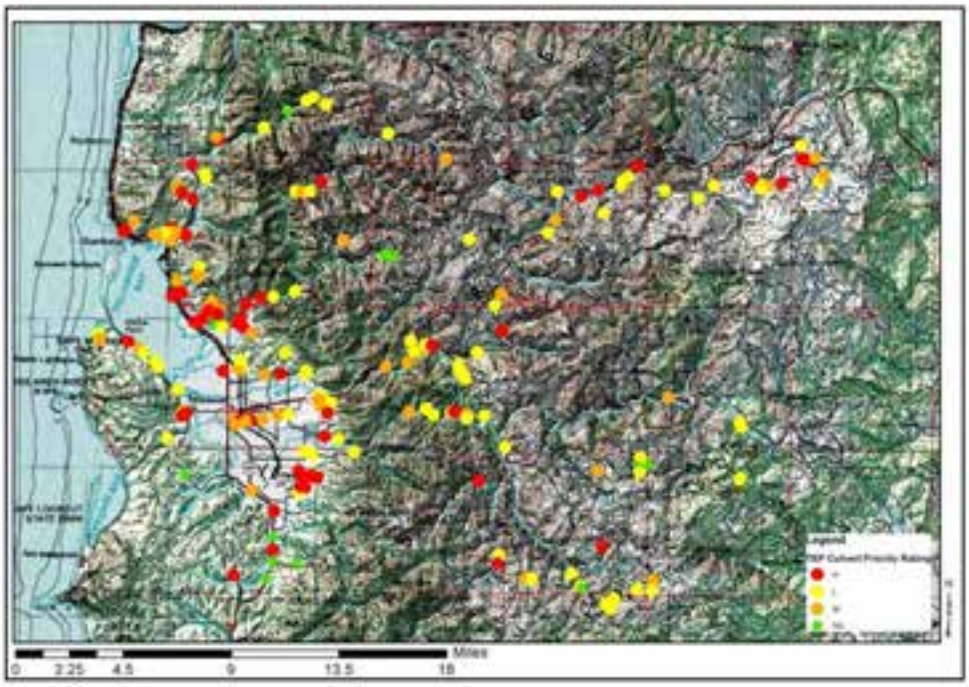
We identified 1,526 potential crossings through the initial GIS-based identification effort discussed above. We did not receive permission to access 362 of the GIS-identified crossing locations that occurred on private lands or required travel on private roadways.

We visited 853 of the 1,526 GIS-identified crossings during field work for this report. In addition, we collected information on 20 crossings not identified by GIS, but which appeared notable to field crews when observed in the field. Therefore, we surveyed a total of 873 crossings for this report. We identified 658 NFC crossings (465 culverts, 190 bridges, two fords, and one hatchery diversion structure) and 215 Fish Culverts: 21 (10 percent) were not barriers to juvenile fish passage (Green), 36 (17 percent) were partial barriers to juvenile fish passage (Gray) and 156 (73 percent) were complete barriers to juvenile fish passage (Red). We lacked sufficient information for two culverts to determine a barrier rating (2 unknown – 1 percent).

Kilchis River Basin - We surveyed 24 fish culverts in the Kilchis River Basin (Table 3). These crossings affected a total of approximately 12.4 miles of upstream habitats (Table 9). There were 10 High Priority culverts in this basin. We rated four culverts in the Kilchis Basin as Medium Priority. Six culverts in this basin received scores that placed them in the Low Priority range. In addition, four culverts in this basin received scores that would have placed them in the Low Priority range, but these did not appear to be barriers to fish passage at the time of our survey.

Miami River Basin - We surveyed 21 fish culverts in the Miami River Basin (Table 4). These crossings affected a t otal of approximately 13.8 miles of upstream habitats (Table 9). There were seven High Priority culverts in this basin. We rated six culverts in the Miami Basin as Medium Priority. Six culverts in this basin received scores that placed them in the Low Priority range. In addition, two culverts in this basin received scores that would have placed them in the Low Priority range, but these did not appear barriers to fish passage at the time of our survey.

Tillamook Bay Tributaries - We surveyed 35 fish culverts on streams that outlet directly into Tillamook Bay or Cape Meares Lake (Table 5). These crossings affected a total of approximately 13.8 miles of upstream habitats (Table 9). There were 13 High Priority culverts on these streams. Notably, 10 of these 13 crossings occur on two streams in the Bay City area: Patterson Creek and Doty Creek. We rated 13 culverts on Tillamook Bay tributaries as Medium Priority. Nine culverts in this basin received scores that placed them in the Low Priority range.



Tillamook River Basin - We surveyed 15 fish culverts in the Tillamook River Basin (Table 6). These crossings affected a total of approximately 35.6 miles of upstream habitats (Table 9). There were five High Priority culverts in this basin. We rated three culverts in the Tillamook Basin as Medium Priority. Two culverts in this basin received Low Priority ratings. Additionally, we surveyed two culverts in this basin that did not appear to be barriers to fish passage at the time of our survey, but received scores that would have placed them in the High Priority range (due

primarily to the quality and quantity of upstream habitats). There were three similar culverts that received scores that would have placed them in the Medium Priority range.

Trask River Basin - We surveyed 64 fish culverts in the Trask River Basin (Table 7). These crossings affected a total of approximately 35.8 miles of upstream habitats (Table 9). There were 17 High Priority culverts in this basin. We rated 11 culverts in the Trask Basin as Medium Priority. Thirty (30) culverts in this basin received Low Priority ratings. Additionally, we surveyed one culvert in this basin that did not appear to be a barrier to fish passage at the time of our survey, but received a score that would have placed it in the High Priority range (due primarily to the quality and quantity of upstream habitats). There were three similar culverts that received scores that would have placed them in the Medium Priority range and two that scored in the Low Priority range.

Wilson River Basin - We surveyed 56 fish culverts in the Wilson River Basin (Table 8). These crossings affected a total of approximately 30.9 miles of upstream habitats (Table 9). There were 12 High Priority culverts in this basin. We rated 10 culverts in the Wilson Basin as Medium Priority. Twenty-eight (28) culverts in this basin received Low Priority ratings. Additionally, we surveyed one culvert in this basin that did not appear to be a barrier to fish passage at the time of our survey, but received a score that would have placed it in the Medium Priority range (due primarily to the quality and quantity of upstream habitats). There are three similar culverts that received scores that would have placed them in the Low Priority range. Finally, two culverts in this basin were on public roads, but we were unable to collect any data on them because we did not have access to the adjacent private property. As a result, we were unable to calculate a prioritization score for these culverts.

Figure 3: Culvert Priority Locations

Tillamook County Nutrient Management (2014)

The Tillamook office of the Natural Resources Conservation Service has adopted a nutrient management program as a Conservation Implementation Strategy for Tillamook County. This effort is to direct federal Environmental Quality Incentive Program (EQUIP) funds to address the issues associated with manure spreading from dairy operations. The program goal is to "*Improve water quality through proper application rates and timing to reduce or eliminate loss of fecal coli forms to surface water adjacent to Tillamook County Pasture and Hay land*." The program is targeted to the lowland portions of the Tillamook Bay basin.

Figure 4: Tillamook County Nutrient Management Conservation Implementation Strategy Area

Tillamook Channel Stability (2012)

This report summarizes a preliminary study of bed-material transport, vertical and lateral channel changes, and existing datasets for the Tillamook (drainage area 156 square kilometers [km2]), Trask (451 km2), Wilson (500 km2), Kilchis (169 km2), Miami (94 km2), and Nehalem (2,207 km2) Rivers along the northwestern Oregon coast. This study, conducted in cooperation with the U.S. Army Corps of Engineers and Oregon Department of State Lands to inform permitting decisions regarding instream gravel mining, revealed that:

Study areas along the six rivers can be divided into reaches based on tidal influence and topography. The fluvial (nontidal or dominated by riverine processes) reaches vary in length (2.4–9.3 kilometer [km]), gradient (0.0011–0.0075 meter of elevation change per meter of channel length [m/m]), and bed-material composition (a mixture of alluvium and intermittent bedrock outcrops to predominately alluvium). In fluvial reaches, unit bar area (square meter of bar area per meter of channel length [m2/m]) as mapped from 2009 photographs ranged from 7.1 m2/m on the Tillamook River to 27.9 m2/m on the Miami River.

In tidal reaches, all six rivers flow over alluvial deposits, but have varying gradients (0.0001–0.0013 m/m) and lengths affected by tide (1.3–24.6 km). The Miami River has the steepest and shortest tidal reach and the Nehalem River has the flattest and longest tidal reach. Bars in the tidal reaches are generally composed of sand and mud. Unit bar area was greatest in the Tidal Nehalem Reach, where extensive mud flats flank the lower channel.

Background factors such as valley and channel confinement, basin geology, channel slope, and tidal extent control the spatial variation in the accumulation and texture of bed material. Presently, the Upper Fluvial Wilson and Miami Reaches and Fluvial Nehalem Reach have the greatest abundance of gravel bars, likely owing to local bed-material sources in combination with decreasing channel gradient and valley confinement.

Natural and human-caused disturbances such as mass movements, logging, fire, channel modifications for navigation and flood control, and gravel mining also have varying effects on channel condition, bed-material transport, and distribution and area of bars throughout the study areas and over time.

Existing datasets include at least 16 and 18 sets of aerial and orthophotographs that were taken of the study areas in the Tillamook Bay tributary basins and Nehalem River basin, respectively, from 1939 to 2011. These photographs are available for future assessments of long-term changes in channel condition, bar area, and vegetation establishment patterns. High resolution Light Detection And Ranging (LiDAR) surveys acquired in 2007–2009 could support future quantitative analyses of channel morphology and bed-material transport in all study areas.
A review of deposited and mined gravel volumes reported for instream gravel mining sites shows that bed-material deposition tends to rebuild mined bar surfaces in most years. Mean annual deposition volumes on individual bars exceeded 3,000 cubic meters (m3) on Donaldson Bar on the Wilson River, Dill Bar on the Kilchis River, and Plant and Winslow Bars on the Nehalem River. Cumulative reported volumes of bed-material deposition were greatest at Donaldson and Dill Bars, totaling over 25,000 m3 per site from 2004 to 2011. Within this period, reported cumulative mined volumes were greatest for the Donaldson, Plant, and Winslow Bars, ranging from 24,470 to 33,940 m3.

Analysis of historical stage-streamflow data collected by the U.S. Geological Survey on the Wilson River near Tillamook (14301500) and Nehalem River near Foss (14301000) shows that these rivers have episodically aggraded and incised, mostly following high flow events, but they do not exhibit systematic, long-term trends in bed elevation.

Multiple cross sections show that channels near bridge crossings in all six study areas are dynamic with many subject to incision and aggradation as well as lateral shifts in thalweg position and bank deposition and erosion.

In fluvial reaches, unit bar area declined a net 5.3–83.6 percent from 1939 to 2009. The documented reduction in bar area may be attributable to several factors, including vegetation establishment and stabilization of formerly active bar surfaces, lateral channel changes and resulting alterations in sediment deposition and erosion patterns, and streamflow and/or tide differences between photographs. Other factors that may be associated with the observed reduction in bar area but not assessed in this reconnaissance level study include changes in the sediment and hydrology regimes of these rivers over the analysis period.

In tidal reaches, unit bar area increased on the Tillamook and Nehalem Rivers (98.0 and 14.7 percent, respectively), but declined a net 24.2 to 83.1 percent in the other four tidal reaches. Net increases in bar area in the Tidal Tillamook and Nehalem Reaches were possibly attributable to tidal differences between the photographs as well as sediment deposition behind log booms and pile structures on the Tillamook River between 1939 and 1967.

The armoring ratio (ratio of the median grain sizes of a bar's surface and subsurface layers) was 1.6 at Lower Waldron Bar on the Miami River, tentatively indicating a relative balance between transport capacity and sediment supply at this location. Armoring ratios, however, ranged from 2.4 to 5.5 at sites on the Trask, Wilson, Kilchis, and Nehalem Rivers; these coarse armor layers probably reflect limited bed-material supply at these sites.

On the basis of mapping results, measured armoring ratios, and channel cross section surveys, preliminary conclusions are that the fluvial reaches on the Tillamook, Trask, Kilchis, and Nehalem Rivers are currently sediment supply-limited in terms of bed material—that is, the transport capacity of the channel generally exceeds the supply of bed material. The relation between transport capacity and sediment is more ambiguous for the fluvial reaches on the Wilson and Miami Rivers, but transport-limited conditions are likely for at least parts of these reaches. Some of these reaches have possibly evolved from sediment supply-limited to transport-limited over the last several decades in response to changing basin and climate conditions.

Because of exceedingly low gradients, all the tidal reaches are transport-limited. Bed material in these reaches, however, is primarily sand and finer grain-size material and probably transported as suspended load from upstream reaches. These reaches will be most susceptible to watershed conditions affecting the supply and transport of fine sediment.

Compared to basins on the southwestern Oregon coast, such as the Chetco and Rogue River basins, these six basins likely transport overall less gravel bed material. Although tentative in the absence of actual transport measurements, this conclusion is supported by the much lower

area and frequency of bars and longer tidal reaches along all the northcoast rivers examined in this study.
Previous studies suggest that the expansive and largely unvegetated bars visible in the 1939 photographs are primarily associated with voluminous sedimentation starting soon after the first Tillamook Burn fire in 1933. However, USGS studies of temporal bar trends in other Oregon coastal rivers unaffected by the Tillamook Burn show similar declines in bar area over approximately the same analysis period. In the Umpqua and Chetco River basins, historical declines in bar area are associated with long-term decreases in flood magnitude. Other factors may include changes in the type and volume of large wood and riparian vegetation (emphasis added)*. Further characterization of hydrology patterns in these basins and possible linkages with climate factors related to flood peaks, such as the Pacific Decadal Oscillation, could support inferences of expected future changes in vegetation establishment and channel planform and profile.*
More detailed investigations of bed-material transport rates and channel morphology would support assessments of lateral and vertical channel condition and longitudinal trends in bed material. Such assessments would be most practical for the fluvial study areas on the Wilson, Kilchis, Miami, and Nehalem Rivers and relevant to several ongoing management and ecological issues pertaining to sand and gravel transport. Tidal reaches may also be logical subjects for indepth analysis where studies would be more relevant to the deposition and transport of fine sediment (and associated channel and riparian conditions and processes) rather than coarse bed material.

Summary

The Importance of the Tillamook Watersheds for Salmon

Five rivers pour into Tillamook Bay, and together they are among Oregon's most important coastal rivers for salmon and steelhead. This is one of a few places where six different fish stocks return each year from the sea. The Tillamook Bay tributaries are known for wild runs of Chum, Coho, Spring and Fall Chinook, Winter Steelhead and Sea-Run Cutthroat Trout. Within these basins are eight crucial Salmon Anchor Habitats, these are identified as critically important areas for spawning and rearing of various anadromous species. Tillamook Bay hosts an average of 30,000 wild fall Chinook alone. Wild Spring Chinook populations, on the other hand have plummeted to extremely low levels.

There has been significant analysis of salmon use, production and habitat conditions of the tributaries to Tillamook Bay. The information points to the fact that the portions of the catchment that are dominated by igneous geology provide the gravel for spawning and low gradient, unconfined portions of the streams are the areas critical for abundant salmon and steelhead production. Anchor habitats have been identified in the Wilson, Trask, Kilchis and Miami Rivers. While the Tillamook does not have habitats that qualified as "anchor habitats, Low gradient streams are important for coho salmon. The underlying geology and geomorphic structure that provides the building blocks for habitat to support strong populations of

salmonids is illustrated in Figure 5. Assuring there is a complexity of tributary and river floodplain habitats and intertidal marshes will allow for multiple life history expressions of each salmon species.

Figure 5: Structural elements that support habitat forming processes for salmon in the Tillamook catchment.

Tillamook as an Altered Landscape

The Tillamook catchment reflects both a result of large-scale natural events (forest fire) and significant human intervention (forest planting, flood control, road building, etc.). Historical changes in the catchment include large scale fires some eight decades ago, increased sedimentation of the estuary, loss of tidal reach through diking and tidegating, reduction of floodplain access by flood control dikes and reduction of stream dynamics by loss of large wood and bank hardening. The historic lowlands were a complex of tidal and non-tidal wetlands

(Figure 6).The catchment has been traversed by roads which present impacts from fine sediment, impedance of fish passage and other effects. Along with over-harvest of anadromous fish, the result is a loss of productivity from the tributary streams. Figure 7 shows the geographic extent of historic fires, human alteration of forest vegetation for agriculture, urban and rural residential development, flood control and conversion of tidelands to pasture and road development. Reversing some of the loss of habitat connectivity and habitat simplification can help to increase aquatic productivity.

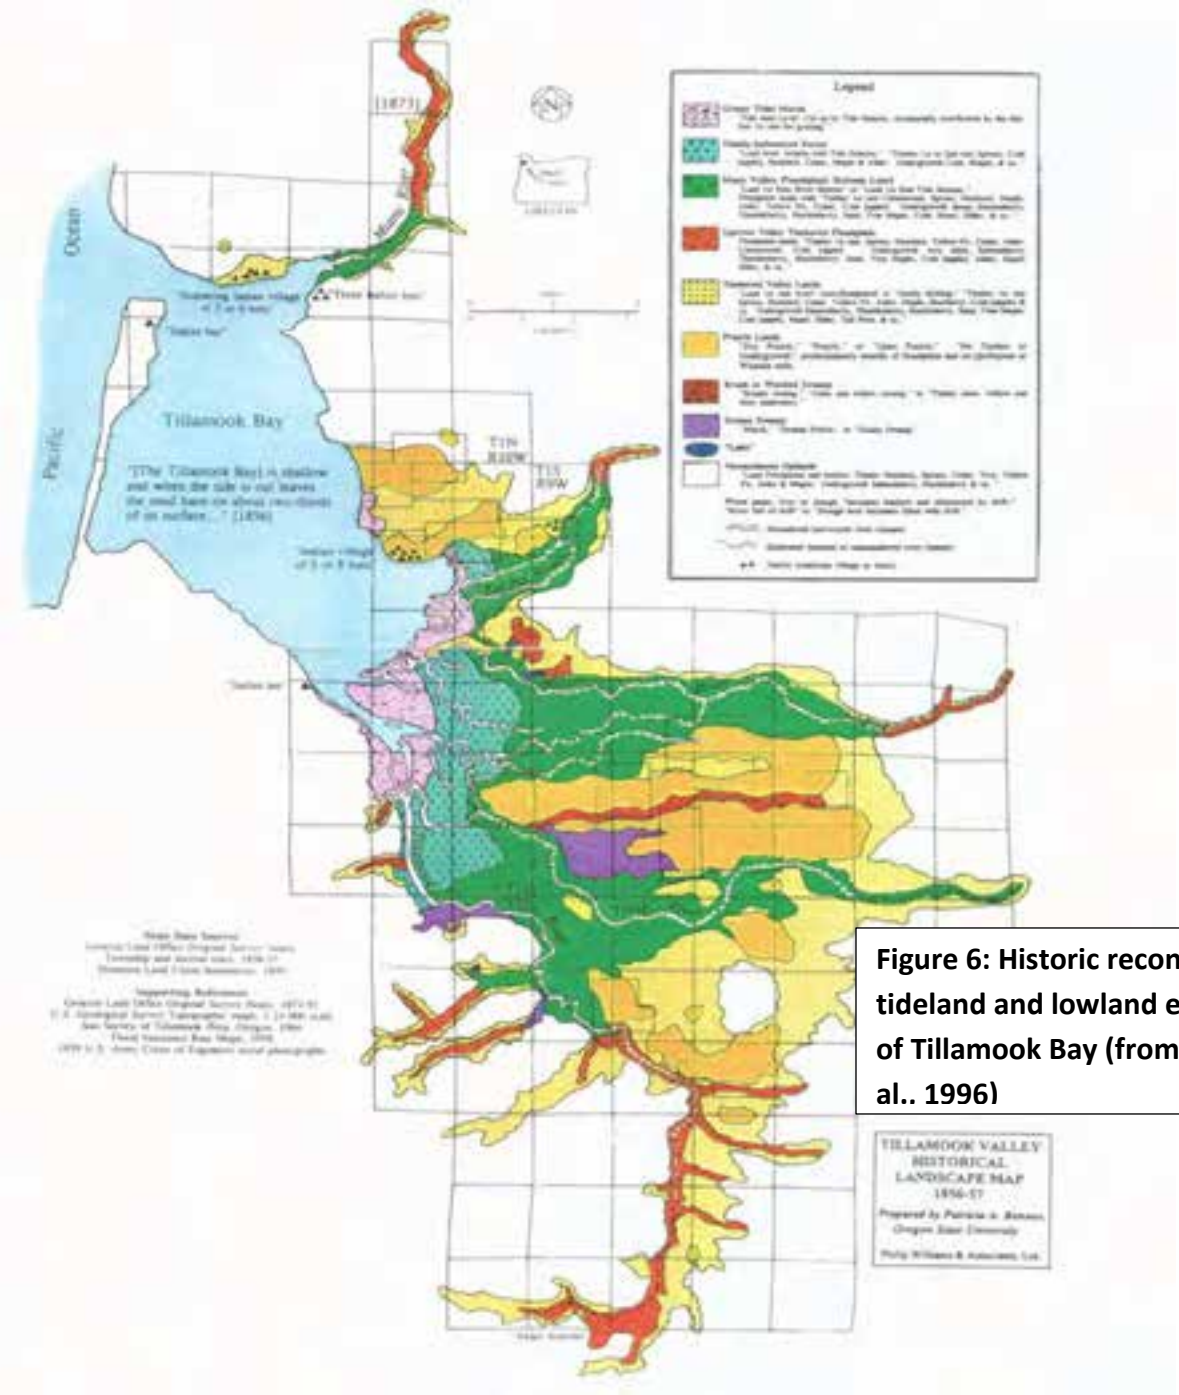


Figure 6: Historic reconstruction of tideland and lowland environments of Tillamook Bay (from Coulton et. al.. 1996)

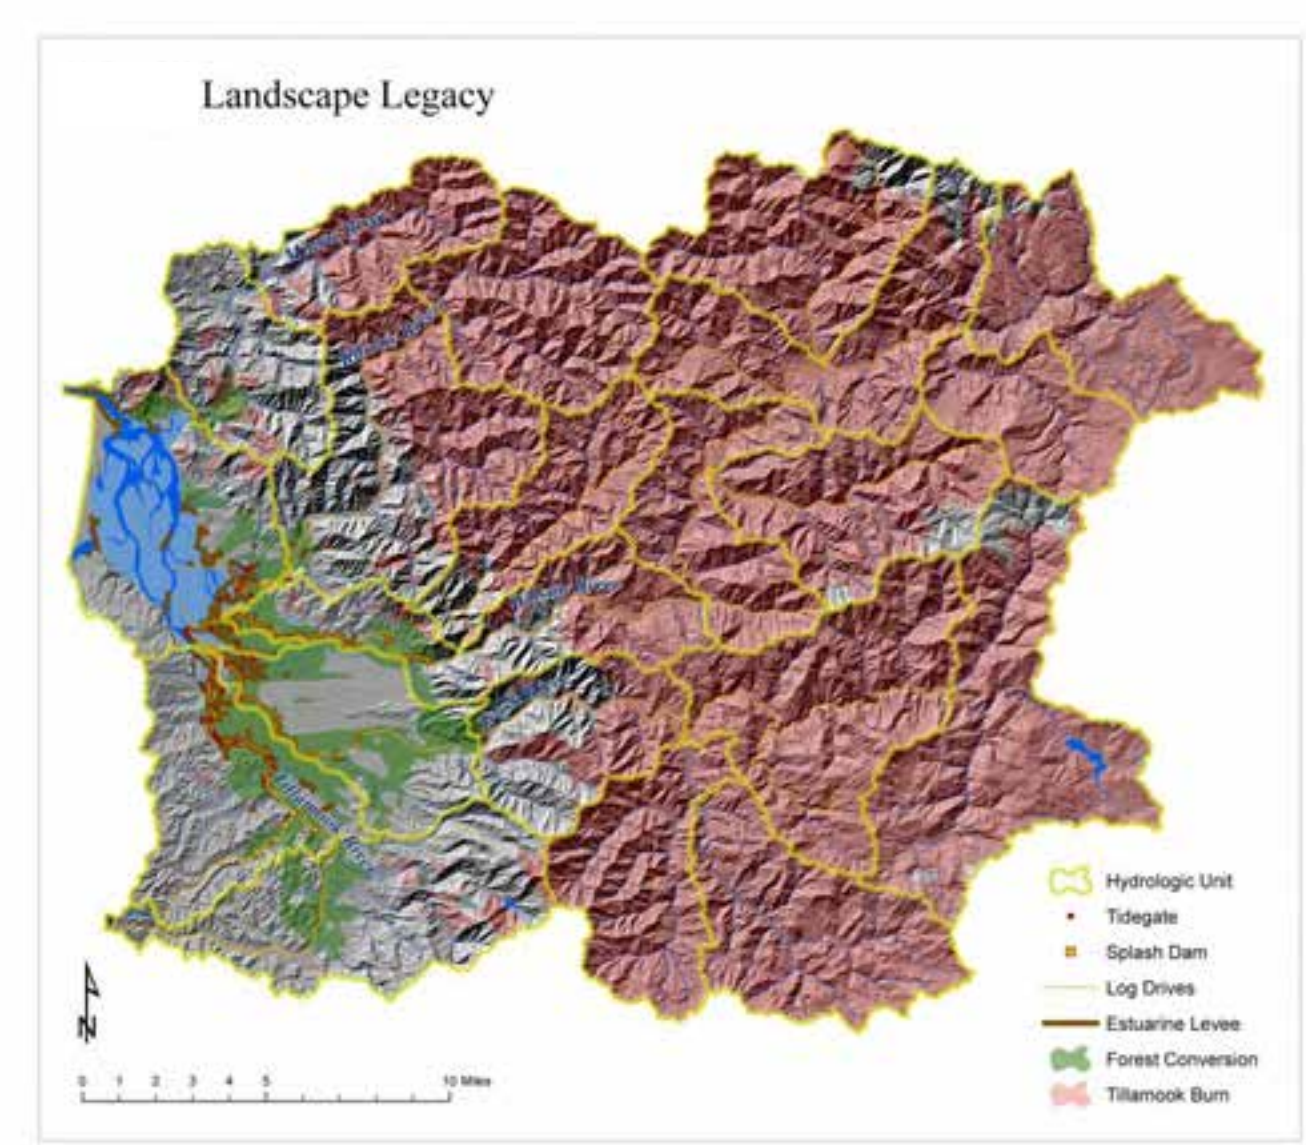

Figure 7: Dominant landscape alterations in the Tillamook catchment.

Current Land Use and Management Emphasis

The history of the Tillamook catchment has a significant effect on current management and land uses. The two dominant forces have been the Tillamook Burn fires and replanting of the forest and subsequent state management of the Tillamook State Forest and the flood control and conversion of tidelands and other wetlands to agricultural uses, especially dairy use.

Forest Lands: The Tillamook basin is unique in the recovery following large-scale fires in the catchment. As the Tillamook State Forest approaches commercial harvest age according to industry standards, there will be significant pressure for reentry and harvest. Management of the Tillamook State Forest will have a significant effect on the catchment that drains to

Tillamook Bay. The Tillamook State Forest is manages using a "structure based management" concept that is intended to provide older stand characteristics on the landscape through time. Structure-based management is designed to emulate many aspects of natural stand development patterns and to produce structural components found in natural stands, but in fewer years. By anticipating future patterns of forest development, foresters predict the potential for individual stands to produce specific characteristics such as a multi-layered canopy. The management also includes terrestrial and aquatic "anchor habitats" that emphasize current high diversity and productivity areas for terrestrial and aquatic species. Oregon Department of Forestry is currently updating their forest management plan.

"The Oregon Board of Forestry concluded in 2012 that the current approach for managing state-managed forestlands was not financially viable. A Board of Forestry subcommittee was formed to address these financial viability issues. Outcomes included directing the State Forests Division to examine alternatives to the current Forest Management Plan (FMP) for Northwest Oregon" (from ODF Staff report of November 5, 2014).

Both the U.S. Forest Service and Bureau of Land Management operate under the Northwest Forest Plan developed in 1995. While neither federal agency has extensive holdings in the Tillamook Bay watersheds, their lands are managed with an emphasis on either Adaptive Management or Late Seral management emphasis. U. S. Forest Service ownership (limited to a small area of the Trask watershed) is managed dominantly for late seral characteristics. The Bureau of Land Management parcels are relatively small and scattered in the lower Trask, Wilson and Kilchis drainages.

Private industrial forests are managed as tree plantations with a relatively short harvest rotation (typically 40 years).

The Garibaldi Forest managed by Ecotrust Forest Management (EFM) is managed for conservation and timber values. Ecotrust is a 501(c) nonprofit organization. Ecotrust Forest Management is a for profit affiliate of Ecotrust that does manage for conservation values but also does harvest timber on Garibaldi Forest under FSC certified practices using variable retention harvest, small openings, longer harvest rotations, no herbicide use in forest production, retention of older trees and forest structure, and other ecological forestry concepts.

Each entity that owns and manages forest resources in the Tillamook Bay catchment will have a different interest and need for assistance in identifying and implementing restoration projects. Care should be taken to recognize the various interests and limitations and challenges they pose. The council will need to build strong relationships with the private forest landowning community and have an understanding of the management directions for each of the different public owners. Forest land ownership patterns and management directions will change with changes in the economy and political changes at the state and federal levels of government.

Evaluating whether broadcast herbicide spraying is entering the aquatic environment could be a monitoring effort if done in conjunction with both industry and state forest landowners.

Agricultural Lands: The lowlands of the Tillamook Bay catchment have been significantly altered historically. An estimated 85-90% of the tidal freshwater and salt marshes in the Tillamook Bay catchment have been converted to other uses. While most of that conversion was done in the past, often with federal assistance there has been little cumulative effects analysis.

Farming produces almost 20 percent of the County's income on only 5 percent (approximately 35,000 acres) of its land. The North Coast Basin Agricultural Water Quality Management Area Plan characterizes the Tillamook catchment as: *"Of the five rivers in the Tillamook watershed, the Tillamook River flows through the most agricultural acres of the five Tillamook coastal plain rivers. It is also the slowest with the most meanders, making its way through the area's poorest drained soils. The other four major rivers emanate from steeper watersheds and move much faster through the system to the bay. Most dairies are in the Tillamook Basin… There are nine drainage districts in Tillamook County, incorporating several hundred acres in tidal lands. It is estimated that at least one-quarter of Tillamook agricultural lands are in these drainage districts."*

There has been a long-term dialog about the effects of habitat restoration on the viability of Tillamook Bay agriculture. Recognition of this perception and consideration of the economic viability of the agricultural industry will be an important factor in the evaluation of potential habitat restoration projects. The concern about loss of productive lands to conservation is not unique to Tillamook. Research in Australia (Aarons, 2011; Aarons & Gourley, 2012; Aarons et.al., 2013) show that the concern over lost productivity has complex considerations.

Managing nutrients from dairy waste has been a long term and chronic issue in Tillamook County. The listing of Tillamook Bay for exceedance of bacterial criteria and the frequent closure of shellfish harvest has resulted in conflict and the development of a TMDL for bacteria. NRCS has dedicated both evaluation (NRCS, 2001) and funding (NRCS and Tillamook SWCD, 2014) to reduce bacterial contamination in Tillamook Bay. While some progress has been made, it has been incremental.

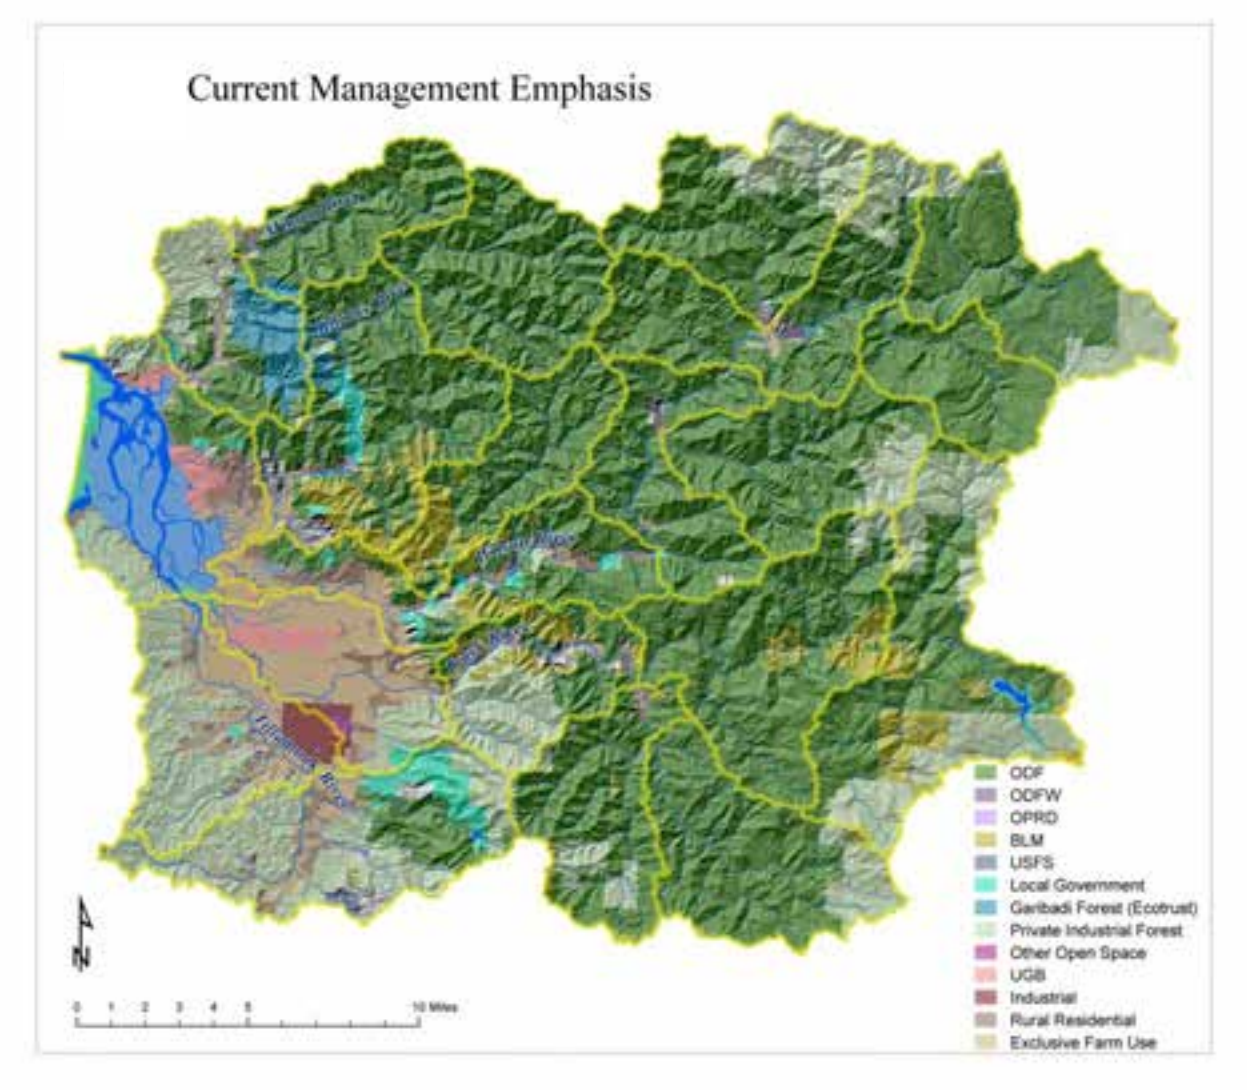

Figure 8: Current Land Ownership and Uses in the Tillamook Bay catchment

Tributary Summaries

From the information in the reports reviewed, the following is a brief summary of the conditions, challenges and opportunities for each tributary to Tillamook Bay (Figure 9). The Watershed summaries are taken mostly from the CERP document (Demeter Design, 2009).

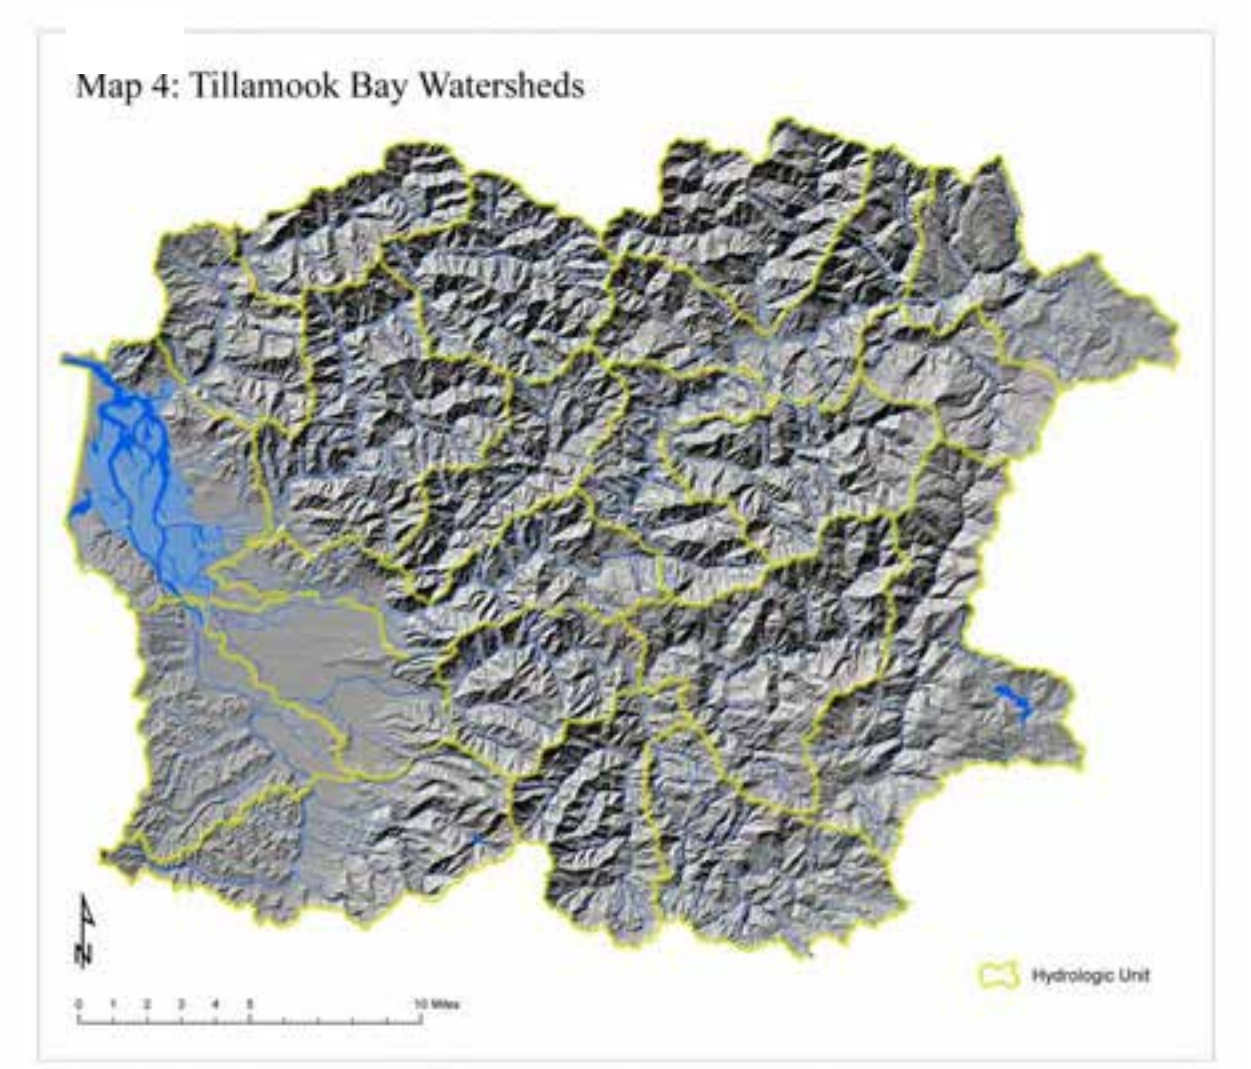

Figure 9: Tillamook Bay Catchment and Tributary Watersheds

Tillamook River

The Tillamook River is the southernmost basin in the TBW. The Western portion of the watershed is underlain by sandstone geology, resulting in low gradient streams with broad floodplains. The eastern portion of the watershed is dominated by a volcanic geology, resulting in higher gradient streams, with larger substrate size and narrower floodplains. Historically the lower portion of the mainstem formed the same interconnected network of sloughs and tidal wetlands as the other four rivers although diking reduces much of this historical network. The

basin is ~60 square miles. The Tillamook River watershed is a heavily altered, relatively low gradient stream with sandstone geology. The Tillamook historically produced coho salmon because of the low gradient and complex channel network. The history of log drives and splash damming has left the Tillamook scoured and simplified. The conversion of the lower river to pasture has left a legacy of altered stream courses and reduced aquatic productivity.

Coho, Steelhead, Cutthroat, Sturgeon, and Chum utilize portions of the Tillamook River Basin. Steelhead populations are largest within the higher gradient, volcanic streams of the Eastern Basin (Killam, Fawcett, Munson, and Simmons). Coho populations are largest in the upper Mainstem and Bewley Creek. The 2008 ***Tillamook River Coho Restoration Strategy; Habitat Assessment and Limiting Factors Analysis*** (Demeter Design, 2008) completed for the TBWC provides significant detail on the historical impacts and factors limiting coho and chum salmon and steelhead production from the Tillamook watershed.

Legacy Impacts: While the Tillamook drainage was generally spared from the Tillamook burn fires, it has been heavily logged, and the lowlands have been extensively altered by dikes and levees. The highly erodible sediments in the bulk of the watershed limit the inherent capacity of the Tillamook River to support a diversity of salmon. The low gradient stream sections are, however, important historical producers of coho and chum salmon.

Current Management Emphasis: The uplands are nearly all in private industrial forest ownership and managed as tree plantations. The lowlands are pastured for dairy and have a significant number of the dairy cows in the Tillamook Bay catchment (Strittholt et.al., undated).

Restoration Challenges/Priorities: Summer temperature is the consistent limiting factor for the Tillamook River. Water quality in the major streams of the Miami River watershed would be considered impaired because of the frequency of exceedence of the evaluation criteria for temperature, nitrogen, and bacteria. A primary issue is the lack of undisturbed stream reaches on mainstem channels. The Tillamook River watershed is not meeting potential conditions and many improvements can be made to increase Coho smolt survival, specifically riparian planting along the mainstem and log placement in the eastern tributaries. There are 5 high priority fish passage barriers identified for the Tillamook River. The 2008 report identifies twenty five high priority restoration projects and four conservation priorities. These projects and priorities remain important for TBWC.

Miami River

The Miami River drains approximately 36.7 sq. mi. of land and is the smallest watershed of the Tillamook Bay drainage. The watershed is characterized by steep forested uplands and flat alluvial lowlands. Much of the higher elevations have been harvested for timber or were burned as a part of the Tillamook Burns and are now second growth forests. The lower Miami River drains agricultural and rural residential areas and enters Tillamook Bay adjacent to the City of Garibaldi. There is a marked contrast between conditions in the uplands where forest and natural resource uses are dominant and the lowlands and valley bottoms where

agricultural, rural residential, and urban uses prevail. In general, aquatic and riparian resources are the most heavily impacted in the lowlands, while conditions are the best in the uplands. Many of the stream reaches in the Miami watershed are low gradient channel types sensitive to disturbance and important habitat for anadromous salmonids.

Cutthroat, Chum, Steelhead, Chinook, and Coho Salmon are present throughout the basin. The Miami was the least productive basin for Coho of the five rivers tributary to Tillamook Bay. The mainstem produces the vast majority of the Coho, with Moss, Illingsworth, Peterson, and Prouty Creeks producing significant numbers of juveniles as well. The lower river has excellent potential for Chum production.

Legacy Impacts: The Tillamook Burn, road building, salvage logging, and timber harvest, conditions has resulted in sediment in the rivers and streams of the Miami River watershed. Roads are the primary source of sediment related to human activity. Levels of in-stream LWD and current and future recruitment from upslope and streamside forests are the primary factor limiting aquatic habitat conditions. Based on aquatic habitat survey data, only two stream reaches are considered to have adequate pieces or volume of large wood on ODF lands.

Current Management Emphasis: The upper watershed is managed by Oregon Department of Forestry. The Garibaldi Forest managed by Ecotrust Forestry is lower in the watershed from Tillamook State Forest lands and is managed for conservation values and timber production.

Restoration Challenges/Priorities: The Oregon Department of Forestry has identified the following restoration activities for the Upper Miami watershed: alternative vegetation management to improve large wood recruitment potential; in-stream enhancement to improve habitat complexity; enhance conditions on lands downstream from ODF lands; and upgrades to further minimize potential road related risks to aquatic and riparian resources. Restoration of riparian vegetation and prevention of livestock grazing near streambanks will lessen sediment contribution from streambank erosion. There are 7 high priority fish passage barriers identified for the Miami. The Miami Watershed Assessment has identified specific stream reaches and priorities for these actions.

Kilchis River

The Kilchis River is the third largest drainage in the TBW. The Kilchis River is dominated by a highly resistant volcanic lithology that forms the high-gradient, confined stream channels found throughout much of the stream network. The lowest reaches of the mainstem consist of an interconnected network of sloughs and tidal wetlands. The watershed encompasses ~65 sq miles and has a peak elevation of 3,294 ft.

The Kilchis River from the Little South Fork to Sharp Creek has high intrinsic potential for coho salmon. The Kilchis river supports populations of Coho, Steelhead, Chinook, Cutthroat, as well as Chum in the lower basin. It is the third largest producer of Coho among the five rivers.

Legacy Impacts: The Cedar Butte fire burned portions of the Kilchis Watershed in 1918. The Tillamook Burn profoundly affected the use of forest lands in the Kilchis watershed. The majority of the uplands of the Kilchis are in the Tillamook State Forest. There is a small acreage of Bureau of Land Management lands and private forest lands. The Kilchis County Park lies along a portion of the mainstem Kilchis River. The Kilchis Park contains a rare remnant pocket of old growth forest and undisturbed river corridor.

Early settlers came to Tillamook beginning in 1851 primarily to farm and they recognized the rich agricultural potential of the lowlands. Within 30 years of the initial settlement, much of the lowland forest was cleared, diked, and drained to increase the amount of land available for agriculture. A significant portion of the lower intertidal and freshwater wetland areas was converted to pasture by the early 1900s (Coulton et al. 1996).

Current Management Emphasis: The upper Kilchis is dominantly State Forest land managed by the Department of Forestry. The lowlands are dominantly dairy pasture.

Restoration Challenges/Priorities: Much like the Miami, Wilson and Trask, the Kilchis uplands have been altered by fire and salvage logging that nearly eliminated large wood from channels and have hardwood dominated riparian areas. There are 10 high priority fish passage barriers identified for the Kilchis.

Wilson River

The Wilson River is the largest drainage in the TBW. The Wilson River is dominated by a resistant, volcanic lithology. This results in relatively high gradient, confined stream channels throughout much of the upper stream network. However, local areas of low gradient, broad floodplain channels are found throughout the upper basins. Devil's Lake Fork is an example of such a segment. The lower portion of the mainstem forms an interconnected network of sloughs and tidal wetlands in conjunction with the Tillamook, Trask, and Kilchis Rivers. The watershed encompasses ~194 sq miles and has a peak elevation of 3,691 ft.

The Wilson is the single largest producer of Coho in the TBW. Additionally, the Wilson supports Steelhead, Chinook, and a small Chum population. The Little North Fork, Devil's Lake Fork, Jordan Creek, and the North Fork Wilson represent the most important destinations for Coho spawning and rearing.

Legacy Impacts: The majority of the Wilson watershed burned during the Tillamook Burn. As a result, the majority of the watershed is composed of relatively young conifers. Douglas Fir is dominant in the upper watershed, although the Swiss Needle Cast virus has motivated conversion of many forestry lands to Western Hemlock. Large portions of the lower watershed are dominated by grasses as a result of dairying. The majority of the riparian corridor

is dominated by Red Alder and riparian shrub species such as Salmonberry. Historically much of the riparian corridor was dominated by large conifers. Knotweed is present up to Idiot Creek.

Current Management Emphasis: The upper portion of the Wilson is predominantly managed for forestry with ODF as the majority landowner. Private Timber companies own industrial timberland in the upper watershed and BLM owns a relatively small portion of the watershed. The Wilson has a broad alluvial floodplain that is used primarily for dairying. The lower mainstem is extensively diked and is prone to flooding. The Wilson river floodplain contains the lowest portion of State Highway 101 that is lined by commercial development.

Restoration Challenges/Priorities: Like most of the Tillamook Burn, large wood was actively removed during the 1970s and naturally occurring logjams are still actively removed to allow for boat passage. The net result is a simplified stream channel throughout much of the stream network resulting in low quality habitat fos salmon and steelhead. The lower river has elevated summer water temperatures that adversely affect juvenile salmonids. There are 7 high priority fish passage barriers on the Miami and tributaries.

Trask River

The Trask River is the second largest drainage in the TBW. The Trask has a mixed volcanic/sedimentary lithology. This results in a complex mix of stream channel types in the upper watershed ranging from high gradient, confined to broad, low gradient reaches. Upon leaving the Coast Range, the Trask enters a broad, alluvial floodplain. The lower portion of the mainstem forms an interconnected network of sloughs and tidal wetlands. The watershed encompasses ~175 sq miles and has a peak elevation of 3442 ft.

The Trask Watershed supports large populations of Coho, Steelhead, and Chinook. The Trask is second to the Wilson in Coho abundance. The primary spawning destinations of Coho are Elkhorn Creek and the East Fork Trask. The mainstem Trask provides important habitat for summer and fall Chinook.

Legacy Impacts: Large wood was actively removed during the 1970s in an effort to improve fish passage and address concerns about low dissolved oxygen. The Tillamook Burn and subsequent salvage logging operations decreased the quantity of wood available for future recruitment to the stream channel. The net result is a simplified stream channel throughout much of the stream network. The lower portion of the watershed has been heavily diked for flood control and conversion to pasture. The mouth of the Trask River as it drains to Tillamook Bay has been relocated.

Current Management Emphasis: The upper Trask is primarily managed for forestry. ODF is the major landowner in the basin with private, and BLM also managing land within the

watershed. The lower Trask River is extensively used for dairying. Holden Creek, one the few urban streams within the watershed, drains into the lower Trask river.

Restoration Challenges/Priorities:

The majority of the watershed is composed of relatively young conifers. Douglas Fir is dominant in the upper watershed, although the Swiss Needle Cast virus has motivated conversion of many lower lying forestry lands to Western Hemlock. Large portions of the lower watershed are dominated by grasses as a result of dairying. Major sub-basins in the lower watershed such as Holden Creek, Gold Creek, and Mill Creek support minimal salmonid populations due to water quality issues and barriers to passage. Water quality in the Trask River is also considered impaired by excess summer temperatures. The Trask River is unique in that the mouth of the mainstem was moved. The artificial mainstem channel is subject to flooding. There are 17 high priority fish passage barriers on the Trask River and its tributaries.

Setting Priorities and Considering Opportunity

There is a growing literature on the role of opportunity and willingness to participate in conservation activities. The consideration of the social and economic factors that limit the application of biological or ecologically identified priorities need to be specifically considered (Smith et. al., 2009; Knight et. al. , 2011; Cowling, et. al., 204; Nuno, et. al. , 2014; Knight and Cowling, 2007; Guerrero et. al. , 2012). This literature suggests the identification of social and economic limitations is as important as identifying biological/ecological priorities. When applied to the Tillamook Bay Watershed it means that specific consideration must be given to the different forest landowner types (federal, state, private), agricultural land uses (primarily dairy) and urban commitment. In Oregon the limits of urban development have been relatively well confined and described (urban growth boundary). The land allocation to agricultural and forest lands have also been relatively clearly proscribed.

These considerations can best be summed up by a quote from Aldo Leopold (1935) "*One of the anomalies of modern ecology is that it is the creation of two groups, each of which seems barely aware of the existence of the other. The one studies the human community as if it were a separate entity, and calls its findings sociology, economics and history. The other studies the plant and animal community and comfortably relegates the hodge-podge of politics to the liberal arts. The inevitable fusion of the two lines of thought will, perhaps, constitute the outstanding advance of the present century."*

It is important to engage the "hodge-podge" to identify effective restoration and conservation opportunities (Knight et.al., 2011). In the Tillamook Bay watershed that means working with the different land users, understanding their limitations and opportunities and building a shared understanding of the social and economic relationships that affect each community. Building the understanding and communication among the different ownership interests and building a better understanding of the benefits and risks of habitat restoration will be a significant challenge for the council. One of the priorities of the council could be to build a

stronger understanding of the social and economic dynamics of the land management stakeholders and explore with greater nuance how they might relate to habitat restoration actions. The work of Knight et.al., (2010) provides one approach to building understanding of the human and social dimensions of conservation opportunities on private lands.

Restoration Rules of Thumb

The extensive biological information available for the Tillamook Bay catchment and the previous prioritization work remains quite valid. The biological priorities as identified for salmon species (Demeter Design, 2008; Bio-Surveys, 2008; Meiwald et.al., 2008) and estuarine habitat restoration (Simenstad et.al., 1999; Ewald and Brophy, 2012) remain appropriate as guides for outreach and exploration of restoration opportunities. Using an approach that recognizes the limitations posed by human institutional factors makes the job of pursuing priorities more complex.

The TBWC was developed to represent the entire catchment and has the mission to "***…build collaborative, voluntary partnership with communities and landowners, to protect, maintain and improve the health of the Tillamook Bay Watershed…***" One of the ways to accomplish this mission is to be open to opportunities that fit within a larger conceptual strategy. To accomplish the mission, the following "rules of thumb" for prioritizing the work of the council are suggested.

Rule of Thumb #1: Work from Strength: Recognize the Inherent Productive Capacity of the Watershed

There are watersheds in the basin that have inherent features that provide better habitat for anadromous fish than others. Watersheds dominated by igneous rock are typically more productive that watersheds dominated by marine sandstones. Reaches of low gradient, unconfined stream conditions have more productive capacity for salmon and steelhead than confined higher gradient stream segments. These areas provide the "skeleton" for salmon habitat in the basin. While salmon and steelhead use nearly all the watershed that they can reach, the areas with more abundant spawning gravel (igneous watersheds) and complex habitats (low gradient, unconfined segments) are the areas that have the greatest capacity to produce healthy runs.

The high production watersheds are those areas identified for potential "anchor habitats. Focal basins should be the Kilchis and Miami Rivers in their entirety. The East Fork of the South Fork of the Trask and the North Fork of the North Fork of the Trask (Elkhorn Creek) and the Devils Lake Fork and Ben Smith Creek watersheds of the Wilson River are important production areas.

Rule of Thumb #2: Create, Maintain, or Enhance a Full Range of Habitats from the Headwaters to the Bay

As you work from the areas of high productivity ensure there is continuity throughout the basin to Tillamook Bay. A number of recent studies have shown that a number of species of salmon have complex life history expressions that reflect the habitats available throughout the basin. As you work in the upper watershed, conduct outreach lower in the basin to landowners providing them with information about the work and explaining how their reach can help to benefit the desired species. Connectivity through elimination of barriers and ensuring a sequence of complex habitats is necessary to maintain resilient populations of salmon and steelhead.

Continuing efforts throughout the Kilchis and Wilson Rivers from forested uplands to the agricultural lowlands will be important. Looking for opportunities along the corridor from the headwaters to the Bay in these basins will be important. Priority lowland marsh habitats in the Hall Slough area should be evaluated.

Rule of Thumb #3: Take Actions Relevant to the Dominant Land Uses in the Basin

There is a pronounced distinction of land uses in the Tillamook Bay catchment. The uplands are dominated by forest management, which varies by ownership. The lowlands are dominated by agriculture and the historical investment in conversion of floodplain and tidal surge plain into dairy pastures. Each land use presents challenges for aquatic habitat restoration and will require different strategies and opportunities for developing both relationships and restoration projects.

Rule of Thumb #4: Encourage the Development of Life History Diversity

Salmon are adapted to diverse habitats that vary both spatially and temporally by life history adaptations. The location of rearing, movement patterns and ocean entrance may vary significantly depending on the availability of different habitats within a river system. Recent research on the Oregon coast has demonstrated at least five life history expressions when a broad range of habitats became available (Jones et.al., 2014). What this guidance suggests is that as projects are evaluated look for the opportunities to create a diversity of habitats throughout a tributary system. Do not focus only on mainstem habitats: look for opportunities to expand the types of habitats throughout the tributary watershed that would allow for diverse life history expression.

Applying the Rules of Thumb

The rules of thumb cannot all be applied to the same project or opportunity. They are suggested as an approach to be used when opportunities are presented to the Council or when the Council wishes to create the opportunity for projects. For example, as the Tillamook-Nestucca Fish Passage Partnership implements their first few projects, the TBWC could follow

up with projects that provide habitat diversity to the tributary systems made accessible by adding large wood, reconnecting off-channel habitats, restoring conifer dominance to riparian habitats, etc. This applies Rule of thumb #4 and #2. Since you would be working in the tributaries affected by barrier removal you likely would not address Rule of Thumb #1 or #2. The primary purpose of the Rules of Thumb is to be intentional about how the opportunities fit into a larger view of how the watershed functions.

Using Existing Priorities

The CERP project (Demeter Design, 2009) developed the following priorities: "• ***Bewley*** *– Listed as outreach priority #1, long-term Coho priority #10.* A Limiting Factors Analysis is taking place within Tillamook River Basin. Coho abundance, intrinsic potential, and land-use data were the primary factors in the outreach determination. Additionally, disturbance scores drove the long-term priority score. Outreach within this basin might focus on long-term actions aimed at restoring Coho populations such as increasing channel complexity and shade. This basin should be part of a broader Tillamook River outreach effort including the mainstem.*

• ***Upper and Lower Tillamook Mainstem*** *– Upper Tillamook Mainstem is #8 on the outreach priorities. Lower Tillamook mainstem is outreach priority # 11, long-term Coho priority #4, long-term Chum priority #3. A Limiting Factors Analysis is taking place within Tillamook River Basin. Outreach activities within this basin might focus on long-term restorative actions aimed at increasing Coho populations such as increasing channel complexity and shade. Additionally, Chum usage in the lower watershed should be evaluated. Immediate actions could include riparian plantings, wood placement, and wetland reconnection.*

• ***Coal Murphy*** *– Listed as outreach priority #2, immediate Chinook restoration #4, immediate Steelhead #3, and Immediate Chinook Conservation #5. There has been one known dam removal within basin. Outreach efforts might focus on large wood placement in mainstem channels and set-asides in large wood supply basins. Discussions of natural wood migration might be important within this basin. Riparian set asides and property purchase should also be considered in minimally disturbed areas. Restoration of tidal wetlands will benefit existing Chinook and Chum populations.*

• ***Lower Trask Mainstem Holden*** *– Outreach priority #5, long-term Coho priority #1, long-term Chinook priority #2, long-term Chum priority #2. There is ongoing water quality testing within the basin. This basin has been severely modified. With the high urban and rural residential development that occurs on the banks of Holden Creek and the significant entrenchment of other tributaries within the basin, any restoration efforts within the basin will take many years to complete. Outreach within this basin might be more effective if conducted in multiple stages with the assumption that properties may change hands within the time it takes to complete restoration projects. Additionally, outreach may be most effective by addressing high and low density areas separately. This basin should be addressed as part of the broader Trask outreach efforts which includes the Middle Trask Mainstem.*

• ***Middle Mainstem Trask*** *– Outreach priority #6, immediate Chinook restoration #6, immediate Chinook conservation #10, long-term Coho priority #8, long-term Chinook priorities #7, long-term Chum restoration #5. Outreach efforts should be consistent with restoring habitat function for all Salmonid species. Additionally, mainstem riparian easements or acquisition should be discussed in Chinook spawning areas.*"

These are appropriate starting points for the Council. The individual efforts should be looked at through the lens of the Rules of Thumb and consider the roles and opportunities of the Council in relation to other restoration partners (Dept. of Forestry, Tillamook Estuaries Partnership, etc.).

Priority Considerations

The following are recommendations that flow from the efforts previously conducted to identify ecological priorities and from experience from successful locally led conservation efforts from across Oregon.

1. Select the high value watersheds (Upper Kilchis, Trask, and Wilson) for emphasis.
2. Consider working with the Tillamook Estuaries Partnership to conduct a process based evaluation of restoration opportunities similar to the work in the Nehalem basin.
3. Become familiar with the landownership and land use patterns of these watersheds.
4. Identify and document where projects have been implemented in these watersheds.
5. Use the Restoration Committee to identify landowners and projects that would have the greatest benefit to aquatic habitats.
6. Develop a consistent approach for outreach and landowner contact so there is a consistent and available approach to address landowner interests when expressed. (Consider the model used by the Mid-Willamette watersheds or North Coast Watershed Council Assistance grant (OWEB #214-1015).
7. Have in mind priority restoration actions by land use that can be a sieve for both outreach and for responding to landowner interest. For example, agricultural lowlands should be looked at in terms of restoring floodplain connectivity, reducing potential bacterial contamination, restoring riparian forest conditions, etc. while forested lands should be looked at to restore stream complexity for overwintering habitat, restoring connectivity by eliminating barriers, restoring stream complexity and reducing road impacts.
8. Explore the utility and value of monitoring temperature in the lower rivers.
9. Use the council to reinforce the priorities and ask them to contact the interests they represent with a specific list of opportunities keyed to land use dominance.

Upper Watershed Emphasis

The bulk of the habitat restoration work in the uplands is similar across the five watersheds, replacement of large wood and restoring a conifer component to the riparian vegetation to promote future large wood delivery.

Lower Watershed/Estuary Emphasis

The lower watershed of the tributaries to Tillamook Bay have been significantly altered by flood control efforts such as diking, tidegating and other actions designed to reduce flood impacts and to expand usable dairy lands. Working with the dairy industry to identify opportunities to remove or relocate dikes and to open blocked channels would improve juvenile salmon rearing

habitat. Assuring riparian forest vegetation is available to provide shade and future large wood is also important in the Tillamook Bay lowlands.

Evaluating Progress

Monitoring the outcomes of the combined actions of the conservation partners in the Tillamook Bay watersheds is important to both learn what it takes to get a "signal" from the actions and to document whether or not the restoration efforts are having a measurable effect. A cooperative monitoring effort among NRCS, OWEB, DEQ, and ODA evaluated the effectiveness of restoration actions in the Wilson River drainage in reducing bacteria.

A unique and important feature of all the streams that enter Tillamook Bay is the relatively high level of juvenile salmon fish usage of the lower rivers for rearing. These areas of the basin could be sentinels of the conditions of each watershed. Consistent temperature measurements over a long period of time at the head of tide, and the main stem above the head of tide, could provide a useful indicator of the cumulative effects of land management and restoration actions throughout the catchment above.

Close cooperation and communication with the agencies monitoring conditions in the catchment could identify a specific role for the TBWC in monitoring effectiveness of restoration and land management actions.

1. INTRODUCTION

The Tillamook Bay Watershed Council (TBWC) is committed to fair, clearly stated, and supportive relationships between the TBWC Board and its staff. The personnel guidelines of the TBWC have been established in order to provide a guide to the personnel practices of the TBWC and to ensure consistency of personnel decisions. It is the intention of the TBWC to administer the personnel programs in a manner which complies with all applicable federal, state and local regulations. This document is designed to provide guidance to employees at the TBWC. It is not a part of any contract between the TBWC and its employees. It is only a set of guidelines for personnel practices. These guidelines may be revised at any time by the Board of Directors of TBWC.

At-Will Employment

All employees of TBWC are "at will employees". There is nothing in these guidelines that should cause an employee to believe otherwise. An "at will employee" means that an employee may be terminated at any time with or without cause and with or without notice without subjecting the TBWC to a claim for breach of an employment contract or any other wrongful termination claim.

Employee Classification

All employees are classified as either regular or temporary. Regular employees are employees hired without a specific termination date. Temporary employees are employees whose position at the time of hire is for a short-term period. Terms of employment will depend on organizational needs, and in no case will a temporary position be construed as being a contract for a definite time. Employees also are classified as either exempt or non-exempt according to provisions of chapter 652 of the Oregon Revised Statutes.

- Regular Full-time Employees are those employees who work 40 hours per week.
- Regular Part-time Employees (without Benefits) are those employees working less than 40 hours per week.
- Temporary Employees are those employees who are paid hourly under a Letter of Agreement for a specified period of time.
- Exempt or Non-Exempt Status: Oregon law provides that certain salaried employees are exempt from overtime and minimum wage requirements. These employees are known as "Exempt" employees. All other employees are considered "Non-Exempt" and are subject to overtime and minimum wage requirements. TBWC carefully analyzes each position to determine the correct classification for the job and employees are notified as to their classification.

2. NONDISCRIMINATION

The policy and intent of the TBWC is to not discriminate in its employment practices against any individual or any other person with whom the individual associates because of an individual's or person's race, color, religion, national origin, marital status, sex (including pregnancy and, childbirth) or age or because of a juvenile record that has been expunged according to law.

Further, TBWC will not discriminate against an individual solely because another member of an individual's family works or worked for TBWC unless that individual would be required to be in a supervisory position or being supervised by such family member.
This policy of nondiscrimination applies to all aspects of employment practices including, but not limited to, recruiting, hiring, placement, promotion, demotion, transfer, training, compensation, benefits, and termination.

3. RECRUITMENT PROCEDURES

The TBWC intends to recruit, hire, and place applicants on the basis of the applicant's relative knowledge, skills, and abilities. The decision to employ an applicant will be based solely on the individual's qualification for the particular position along with other requisite job skills. Minimum qualifications shall be specified in the job description.
Unless otherwise determined by the Administrative Committee, when a new position is established, the Executive Director will prepare a job announcement identifying the position's responsibilities and overall relationship to the TBWC for posting or circulation within the TBWC and for public notification. Posted positions will be open for a minimum application period of 7 days.

4. COMPENSATION

Persons employed by the TBWC will receive a salary or wage as determined at the time of hire. At the time of hire, new employees will receive a letter of hire, a job description, salary and benefits detail and a copy of the personnel policies. The magnitude of the work assignments and the full scope of responsibility for the position will be fully discussed at time of hire. In setting compensation, the TBWC may consider, among other things, external labor market rates, equitable relationship with other jobs within the TBWC and the TBWC's ability to pay. The Board of Directors will determine the Executive Director's salary and the Executive Director will determine the salary of other employees.
TBWC utilizes a monthly pay period, with paychecks issued on the first day of every month for the last month's work completed. If the first day of the month is on a weekend or holiday, the check will be issued the last business day prior to the first.
Each employee is responsible for recording their daily hours worked on a monthly timesheet. Exempt employees are requested to track estimated hours for purposes of grant requirements and governance practices and not for calculating actual hours worked. Days taken off for sick, holiday, or vacation leave must be recorded on the monthly timesheet and given to their supervisor for approval on the last working day of the month. Employees are required to record out of office work hours on their timesheets for Workers Compensation reporting requirements. The supervisor reviews the timesheet for correct recording of hours worked and hours taken as sick, holiday, and vacation leave and initials the completed timesheet to indicate approval. Timesheet addendum must be attached and indicate the number of hours worked by project and grant. The supervisor turns in all approved timesheets to the Bookkeeper in accordance with the procedures established by the fiscal policies of TBWC.
Once the timesheets have been reviewed and corrected, the Bookkeeper fills out a monthly payroll distribution spreadsheet according to the pay rate and hours charged per funding source on the timesheet. Once the paychecks are signed by two appointed signatories, they are given to the Executive Director for distribution to the employees. Employees of TBWC may have the

option of direct deposit of their paychecks if available.
For purposes of this section, the "supervisor" for the Executive Director is the Council Chair or Chair's designee and the "supervisor" for all other employees is the Executive Director.

5. WORK SCHEDULE AND FLEX TIME

The standard full-time work week is comprised of forty (40) hours of work on five days of eight hours each day. The standard week is the seven day period beginning Monday and ending on Sunday. The TBWC is generally open for business during the customary business hours from Monday through Friday. Non-exempt employees will work only 40 hours in a standard week except in the situation where the Executive Director authorizes overtime. The Executive Director may, in his or her discretion, permit an employee to take compensatory time for hours worked during the same week. Exempt employees are permitted to determine the hours they work during each standard week provided that the needs of TBWC are met and in accordance with guidance from the Chair.

6. HOLIDAY SCHEDULE

Official holidays are as follows:

- New Year's Day - January 1
- Martin Luther King Holiday – January
- President's Day - February
- Memorial Day - May
- Independence Day - July 4
- Labor Day - First Monday in September
- Veteran's Day - November
- Thanksgiving Day - Fourth Thursday in November
- Day after Thanksgiving Day - Fourth Friday in November
- Christmas Eve – December 24
- Christmas Day - December 25
- One flex holiday

When New Year's Day, Independence Day, or Christmas Day falls on a Sunday, the following day shall be considered the official holiday. When these holidays fall on a Saturday, the preceding Friday shall be considered the official holiday.

7. PARENTING LEAVE

Although the TBWC is exempt from compliance with any federal and state family or parental leave laws, the TBWC, as a policy, desires to assist new parents in balancing the demands of working and caring for children. The TBWC will provide up to 12 weeks of unpaid family leave to any regular full time employee for the birth or adoption of a child. Leave must be initiated within six weeks of the birth or adoption of the child, unless otherwise approved by the Executive Director, or in the case of the Executive Director, the Chair. The use of the 12 weeks shall be at the discretion of the employee and shall be discussed with the Executive Director, or in the case of the Executive Director, the Chair, as to its impact on ongoing work responsibilities and other employees. Although a maximum of 12 weeks is available, an employee may utilize

accumulated sick leave as well as annual leave to enable either partial payment for or extension of the basic 12 week period. Special circumstances shall be reviewed by the Executive Director, or in the case of the Executive Director, the Chair. Accrual of leave benefits cease during an approved leave. Upon completion of leave, the employee will be allowed to return to the same or a substantially similar position at the same salary as the employee earned prior to the leave.

8. ANNUAL LEAVE (Vacation Time)

Regular employees who work at least 40 hours per week are eligible to accrue vacation days. After six months of continuous employment, an employee's vacation accrual begins retroactively from date of hire. For full time employees the accrual rate per year is as follows:

- 10 hours per month 15 days per year

To be eligible to access vacation credits, an employee must have been employed by the TBWC for six full consecutive months. No vacation credits can be carried into the TBWC's next fiscal year without Administrative Committee approval. Upon termination of employment with the TBWC or retirement, unused, accrued vacation time for the year of termination is paid to the employee.

Employees may use their annual leave as earned if absence from assignment does not unduly provide an impediment for completion of an assigned task or prevent other staff from completion of their work assignments. The Executive Director, or for the Executive Director, the Chair, must approve scheduled absences and the employee should request such leave as soon as possible, with a minimum of two weeks in advance.

Special Leave

Special leaves of absence without pay may be granted an employee at the discretion of the Executive Director, or for the Executive Director, at the discretion of the Administrative Committee.

9. SICK LEAVE

The TBWC will provide up to twelve working days each employment year to each staff person to be utilized for purposes of addressing health needs. Compensation will be based upon the employee's salary rate at the time sick leave is taken. Sick leave may be utilized at the discretion of the employee and is granted for sickness of the individual employee, his or her spouse/partner, children, or other immediate family members. Sick leave can also be used for health needs, e.g. dental or medical appointments. Each staff person of the TBWC should notify the supervisor each day they will be absent from work due to illness, if at all possible.

Accrual of sick leave is at a rate of 8 hours per month for each full month of service. Sick leave may be accumulated up to a maximum of 12 days and may be carried over from one employment year to the next. At no time will compensation for any unused sick leave be made to an employee who is leaving employment.

If requested by the Executive Director, or for the Executive Director, the Chair, the employee will provide documentation from their treating physician explaining their absence.

10. COMPASSIONATE LEAVE

Employees of the TBWC shall be granted up to three working days with pay due to a death in their immediate family (mother, father, sister, brother, spouse/partner, children, in-laws,

grandparent, and grandchildren). The Executive Director, or for the Executive Director, the Chair, will consider special cases on an individual basis.

11. JURY DUTY

Employees should notify the Executive Director, or in the case of the Executive Director, the Chair, when summoned for Jury Duty. The supervisor and the employee will discuss the potential time commitment of jury duty and the needs of TBWC to determine the manner in which to handle the summons. In no event, however, will TBWC discharge an employee or threaten to discharge an employee because of jury duty service.

12. MILITARY LEAVE

TBWC intends to fully comply with Oregon and Federal laws as it relates to service by an employee in the uniformed services or National Guard. Any Employee who is absent on their annual two week reserve or National Guard Duty or called up to active duty in the military should consult with the Executive Director, or in the case of the Executive Director should consult with the Chair to discuss the leave policies applicable to such absence.

13. TRAVEL EXPENSES

TBWC covers reasonable costs of travel (transportation and hotels) related to TBWC business. In order to reduce the cost of travel, staff is urged to book travel sufficiently in advance of the travel dates to get the best rates. Employees may request a travel advance by submitting an approved request in the regular weekly check-writing cycle. The least expensive flight that does not unreasonably delay the traveler must be chosen. Only the cost of coach airfare will be reimbursed.

Costs deemed to be excessive upon review by Executive Director, or for the Executive Director, the Chair will not be fully reimbursed. This applies to all travel costs. TBWC will reimburse employees for expenses they have actually incurred. Generally speaking, expenses for all meals and associated reasonable out-of-pocket costs when traveling on business for TBWC are reimbursable. If a trip begins after breakfast or ends before dinner, the cost of the meal will not be reimbursed. Receipts from restaurants must indicate the total cost of the meal, the date, and the names of the diners. Tips are not reimbursable. Receipts must be provided for hotel costs in order to receive reimbursement.

Once a trip has been completed, an employee must complete an Expense Report that includes all travel related expenses including any travel advances received by the employee. TBWC reimburses for mileage at the IRS rate. Authorization of each Expense Report must be obtained by the Executive Director before payment will be made. The Executive Director must get the Chair to approve his or her Expense Report.

14. HARASSMENT POLICY

It is the TBWC's belief that the employees of the TBWC are the primary means by which the goals and objectives of the TBWC will be met. To that end, the rights of all employees must be respected. All employees of the TBWC must understand its position on harassment. By definition, harassment is any unwanted attention or action prohibited by law by someone in the workplace that creates an intimidating, hostile, or offensive work environment, including sexual harassment. The procedure for reporting and dealing with this very sensitive issue is as follows:

- If a person's behavior makes an employee uncomfortable, the employee should feel free to immediately advise the person that, in the employee's opinion, the behavior is inappropriate and that the employee would like it stopped.

- If the employee is not comfortable discussing the issue with the person, or if the person fails to respect an employee's request, the employee should report the incident to the Executive Director or if the situation involves the Executive Director, to the Chair.

- In all instances, a prompt, thorough, and fair investigation will take place, giving careful consideration to protect the rights and dignity of all people involved. The TBWC will take those steps necessary to resolve the problem, which may include verbal or written reprimand, suspension or termination.

No retaliation of any kind will occur because an employee has reported an incident of suspected harassment. The Executive Director, or if the situation involves the Executive Director, the Chair, to whom the complaint was made, will work to establish mutually agreed upon safeguards against retaliation while attempting to mediate any sexual harassment complaint.

15. SUBSTANCE ABUSE

The TBWC is a drug-free workplace. Employees needing help with a substance abuse problem are encouraged to contact the Executive Director, Chair or a treatment facility. Early recognition and treatment are critical to any program to curb abuse and to enhance the employee's ability to perform satisfactorily. The TBWC finds that both the employee and the TBWC will benefit greatly from early substance abuse recognition and treatment. No person will be penalized for seeking or accepting counseling or treatment for a substance abuse problem.

16. BENEFITS

The TBWC is unable to provide fringe benefits, other than holiday and leave days as provided specifically in these guidelines, and cannot guarantee salary increases for merit or inflation.

17. COORDINATOR/DIRECTOR OVERSIGHT

The Council Chair will be responsible for Coordinator/Director oversight, including holding a weekly meeting to discuss pending deadlines for grants, monitoring reports, permits, accounts payable, and Council taxes. The Chair will also provide the Board with a monthly report on Coordinator progress related to Council projects and deadlines.

18. PERFORMANCE REVIEWS

Evaluations are used as a communications tool to discuss an employee's strengths and areas needing improvement as well as matters related to the operations of TBWC. A performance evaluation does not necessarily generate a change in compensation.
An employee's job performance will be reviewed and evaluated on a regular basis. Interim evaluations may occur at the initiation of the Executive Director, or for the Executive Director, the Chair, or initiated by the employee.

19. EMPLOYMENT REFERENCES

When the TBWC receives a request for information from another person or entity about an

employee, either during employment or after the employee's employment has ended, it is the TBWC's policy to provide only the following:

- dates of employment
- last job title

In general, TBWC policy is not to furnish any other information about work performance or employment, unless the employee specifically directs it to do so. If an employee does not authorize the TBWC to furnish any additional information, it will advise the requesting person or entity that TBWC's policy is to provide only the information above.

20. TERMINATION

Resignation

Any employee of the TBWC may resign by submitting a letter of resignation to the Executive Director or in the case of the Executive Director, the Board of Directors, at least ten working days prior to the effective date of the resignation.

At the time of the effective date of the resignation, the employee shall be able to use any accrued annual leave or the employee shall be paid for all unused accrued annual leave. If the employee has used all annual leave due prior to resignation, all hours used in excess of those earned shall be deducted from the employee's final paycheck at the rate of salary paid at the time of resignation. No employee shall be compensated for any unused sick leave at the time of resignation.

Other Discharges

TBWC has the right, according to its "employee at will" practices described in these guidelines to terminate the employment relationship with or without cause and with or without notice just as an employee can resign in the same way notwithstanding the request of TBWC for notice. TBWC, however, may choose to discipline and/or discharge an employee for many reasons. Unsatisfactory performance means failure of an employee to meet performance standards, to complete tasks in a timely, competent way, or to maintain an adequate attendance record. Uncooperative behavior or negative attitudes that affect the work or morale of others may result in termination.

21. CONFLICT RESOLUTION PROCEDURES

It is a fundamental policy of the TBWC to have a workable system for employees to get questions answered and work-related problems resolved. Many conflicts can be resolved using the following approach:

1. First an employee could try to work out the problem directly with the person involved.

2. If an employee cannot resolve the problem or is uncomfortable dealing directly with the other person, an employee should inform the Executive Director, or for the Executive Director, inform the Chair.

3. If the employee and the Executive Director are unable to resolve the problem after a serious attempt, or the issue directly involves the Executive Director, or for the Executive Director, the Chair, the employee should make an appointment with the Administrative

Committee, who after hearing all sides, conducting any necessary investigations, will make a recommendation for the employee's consideration.

4. If the problem remains unresolved, an employee or the Administrative Committee may present the issue to the full board of directors for consideration. The board of directors will have final decision-making authority for employment related conflicts.

5. Employees are not required or expected to tolerate any form of unlawful conduct, such a sexual harassment. All such conduct should be reported as provided in Section 14 and this section of these guidelines.

22. REGULATORY ACTIVITY

The Council does not participate in regulatory activity, and does not report issues to regulatory agencies. When Council staff is confronted with potential water or land use violations they will refer those issues to the Board and/or the Tillamook County Soil and Water Conservation Service.

23. WORK PRODUCTS AND FILES

All supplies, materials, and work products of an employee if compensated for or purchased by TBWC shall remain the property of the TBWC during an employee's employment and after resignation or termination of that employee. The employee may retain any personal files, but work files and other papers shall remain with the TBWC.

24. COMPUTERS AND ELECTRONIC MAIL

Computers and electronic mail are provided to employees to assist them in the performance of their job duties. Computers and electronic mail are the property of TBWC and may be accessed by the TBWC in the ordinary course of business. Employees should have no expectation of privacy in the information contained in their computers or electronic mail. Computers and electronic mail are to be used for TBWC business. Personal use must be limited and not abused. No commercial, discriminatory, offensive, harassing or disruptive messages may be sent by electronic mail. Computers must not be used for any purpose that is illegal, against policy, or causes discredit to the TBWC.

25. CONSULTANT FEES, HONORARIA AND GIFTS

All employees are encouraged to participate in a variety of community and professional activities. In those instances where an employee's activities are part of their regular duties and responsibilities, any payment will be turned over to the TBWC. All fees derived from TBWC reports, activities, events, or speaking engagements while employed by the TBWC shall also be turned over to the TBWC. Employees shall not accept any gratuity or favor from any commercial firm or individual doing or seeking to do business with TBWC.
In some instances, an individual may do work that is based on activities or experiences prior to or separate from their regular duties and responsibilities at the TBWC. To avoid actual or appearance of conflict of interest, any employee who engages in any remuneration activity in any field directly related to TBWC programs must have prior approval by the Executive Director. The Board will review these issues for the Executive Director. No employee may formally

represent himself/herself as a spokesperson for TBWC without prior approval of the Executive Director.

26. CONFLICT OF INTEREST

The Executive Director is the only employee of TBWC in a position to award and/or administer contracts, hire sub-contractors, or engage in procurement activities and must disclose to the Chair if there is a personal or familial relationship, the disclosure or non-disclosure, of which, might call into question the impartiality of the Executive Director. If such a relationship exists, the Administrative Committee must review and approve, in writing, the transaction or contract before it is executed. Violation of this policy will at a minimum result in a written performance warning and, notwithstanding all other provisions of the TBWC Personnel Guidelines, could constitute grounds for termination.

Employee Acknowledgement

I acknowledge that I have read, understood, and will operate within the guidelines outlined in this copy of the TBWC Personnel Guidelines. I understand that these guidelines provide only a general reference and are not a full statement of TBWC's procedure nor are they a contract. I will update these policies as I am provided with new materials from the Executive Director or the Chair of the Council. I further understand that I am an "employee at will" as describe in these guidelines.

BEFORE THE BOARD OF COUNTY COMMISSIONERS

FOR TILLAMOOK COUNTY, OREGON

[redacted]) [redacted]
[redacted])
[redacted])

This matter came before the Tillamook County Board of Commissioners on June 23, 2021, at the request of the Rachel Hagerty, Chief of Staff. The Board of Commissioners, being fully apprised, finds as follows:

1. ORS 541.890(14) defines a watershed council as a voluntary local organization, designated by a local government group convened by a county governing body, to address the goal of sustaining natural resource and watershed protection, restoration, and enhancement within a watershed.

2. Tillamook Bay Watershed Council (TBWC) members should represent a balance of interested and affected people in the watershed.

3. The work of the TBWC is to foster partnerships and prepare and implement a watershed action plan that identifies issues and sets goals and priorities for actions to protect and enhance the watershed.

NOW, THEREFORE, IT IS HEREBY ORDERED THAT:

4. The Tillamook County Board of Commissioners designates the TBWC as a watershed council, as defined in ORS 541.890(14), for two years.

5. The TBWC shall demonstrate continual progress in meeting OWEB's Council Capacity Eligibility and Merit Criteria. The Board of Commissioners' designation is contingent upon this progress and OWEB's evaluation of such progress.

6. The Board of Commissioners support the TBWC's commitment and effort to collaborate with watershed stakeholders to establish sound governance, bylaws, procedures, partnerships, and a strategic plan.

7. The Board of Commissioners shall review this designation no later than May 2022.

//

//

//

//

DATED THIS 23rd day of June 2021.

THE BOARD OF COMMISSIONERS
FOR TILLAMOOK COUNTY, OREGON

	Aye	Nay	Abstain/Absent
[illegible] Bell, Chair	✓	___	____/____
David [illegible]	___	✓	____/____
[illegible] Commissioner	___	___	____/____

[illegible]

APPROVED AS TO FORM:

Joel W. Stevens, County [illegible]

[redacted]

[redacted]

To Whom it May Concern:

The Tillamook County Board of Commissioners (BOC) is pleased to write this letter of support for the Tillamook Bay Watershed Council (TBWC) application for Council Capacity. The BOC formally recognized TBWC in June of 2021 for a two-year period as it worked toward meeting OWEB's Council Capacity Eligibility and Merit Criteria. The Commissioners are pleased with the progress of TBWC toward this goal and hope that OWEB will agree and provide much needed funding for them to continue this work.

Tillamook County Commissioners
201 Laurel Ave.
Tillamook, OR 97141

Commissioners:

The Bureau of Land Management (BLM), Tillamook Field Office has worked with the Tillamook Bay Watershed Council (TBWC) on past restoration actions including fish passage, riparian planting, fish habitat enhancement and active monitoring. The BLM supports TBWC and its partners in working towards the enhancement of stream form and function, habitat access, and riparian planting to better provide for the habitat for the federally threatened Oregon Coast Coho salmon, as well as populations of chum, chinook, steelhead, and cutthroat trout.

The TBWC in coordination with multiple partners (i.e., Oregon Department of Fish and Wildlife, Tillamook Estuaries Partnership, Oregon Department of Forestry, BLM, and private landowners) and funding from Oregon Watershed Enhancement Board has been a great contributor to past restoration projects. Due to the BLM's checkerboard ownership, collaboration with private landowners, watershed councils, and local government is essential to completing the whole-watershed restoration work necessary to recover populations of native fishes. The BLM is pleased to support the TBWC in their efforts to improve fish habitat in the five rivers that make up the Tillamook Bay Watershed.

Access to cold-water refugia, spawning and overwintering habitat can be limiting factors for rearing salmonids. Future projects that address these habitat elements are anticipated. BLM staff are committed to provide technical support and believe that this partnership will be comprehensive and subsequently successful.

Please give the Tillamook Bay Watershed Council the opportunity to continue its good work and do not hesitate to contact Grace Stone, Hydrologist (glstone@blm.gov) or Karen Schank, Tillamook Field Manager (kschank@blm.gov) with any questions.

Sincerely,

Karen M. Schank
Field Manager

January 20, 2023
Tillamook Board of County Commissioners
201 Laurel Avenue
Tillamook, OR 97141

Dear County Commissioners:

Bay City is writing this letter in support of the Tillamook Bay Watershed Council (TBWC) for your support in its efforts to get reestablished with the Oregon Watershed Enhancement Board.

I have personally worked along side the TBWC on some of its efforts and include several years leading cleanup of our waterways including at Hoquarton Park in downtown Tillamook. TBWC has removed invasive plants, removed garbage, and was instrumental in designing, constructing, and maintaining the viewing platforms at this wonderful park along the Hoquarton Slough. This park and the viewing platforms are jewels to our community.

Bay City is planning a Patterson Creek restoration project, which is partially funded by Tillamook County TLT funds. TBWC hosted planning sessions with restoration specialists and Bay City to kick off the Patterson Creek Restoration Project. TBWC led a macroinvertebrate study of Patterson Creek, that runs through the Al Griffin Memorial Park in Bay City. Working with TBWC on analysis and monitoring of the heath of the creek before the restoration project and after will help us understand the relationship between restoration and the health of our waterways.

TBWC adds significant value to our community in our quest for healthy watersheds, leading to restoration of our fisheries, and community values. TBWC partners with on-going efforts with the Salmon Superhighway and the Tillamook Estuaries Partnership. TBWC has been very effective at reaching out to Bay City and other landowners to help in restoration projects.

Bay City strongly supports the Tillamook Bay Watershed Council's efforts to reestablish their funding from the Oregon Watershed Enhancement Board through the County's support.

Sincerely,

Liane Welch

My name is Patrick Zweifel and my wife and I own Oregon Coastal Flowers and the Hydrangea Ranch, and we recently purchased Alderbrook Golf Course with some partners. Because our farm is on the Kilchis River, we're always looking to balance making a living and being good stewards of the environment.

Over the years I've heard of and worked with the Watershed Council on several projects. They do good work and are an important part of helping with special water related projects in Tillamook County. They make a difference.

There are some projects on Alderbrook Golf Course that we need help with and I look forward to working with the TBWC to balance our needs with the needs of the environment.

TBWC needs help with funding to continue doing good work in Tillamook County. Thank you for your consideration and full support.

Sincerely,

Patrick Zweifel

Tillamook County Commissioners'
Erin Skaar - Chair
201 Laurel Avenue
Tillamook, Oregon 97141

RE: Tillamook Bay Watershed Council

January 18, 2023

Dear Chair Skaar,

Hampton has operated a sawmill in Tillamook since 1986 and managed timberlands in northwest Oregon for nearly 80 years. As you can imagine, we appreciate the value of a well-functioning watershed. Although our forest ownership in the county is small, we operate in a manner that protects the environment and human health while remaining committed to the enhancement of environmental conservation, safety, public awareness and quality of life in our communities.

Throughout our history, Hampton has worked with a number of watershed councils to improve habitat and water quality and provided advice, materials, donations and volunteer hours. The success of these past efforts was due to a shared sense of stewardship and strong, collaborative relationships among all those involved.

Tillamook County would greatly benefit from a watershed council that embodied the cooperative and practical spirit that has made other councils in our region so effective. We believe that the Tillamook Bay Watershed Council, under new leadership that embraces the values of cooperation and community, could be a valuable resource in maintaining and enhancing the health of local watersheds. Large scale projects can and should be implemented across multiple ownerships in order to meet goals for watershed health and aquatic species protection in our area. The Tillamook Bay Watershed Council could fill a critical role in coordinating such efforts through partnerships with landowners, community members and other organizations.

Hampton supports seeking recognition and funding for the Tillamook Bay Watershed Council and looks forward to working with its leadership and other community members to advance our shared goals.

Sincerely,
HAMPTON TREE FARMS

January 3, 2023

To Whom it May Concern,

I am writing to show support for the Tillamook Bay Watershed Council. As the Agriculture Teacher at Tillamook High School, I understand the importance of collaboration and community engagement, which is a function of said council. I have personally been engaged as a student, community member, and a teacher in the previous work of the watershed council and think that it is a worthy investment of resources.

The Council's mission is to build collaborative, voluntary partnerships with communities and landowners, to protect, maintain and improve the health of the Tillamook Bay Watershed through on-the-ground restoration projects, educational outreach programs, and other community engagement activities. Such programs and outreach are vital in continuing the collaborative tradition of Tillamook stakeholders.

A watershed council would bring essential tools to Tillamook County to be used for implementing large projects across multiple ownerships. Examples of this would include working with the Oregon Coast Coho Conservation Plan and the Coho Strategic Action Plan. It would also provide a means of local private and public landowner collaboration.

The new energy this council would bring in terms of leadership will prove to be incredibly important in this endeavor. Recognizing this effort and re-recognizing this group as a watershed council would be of utmost benefit to Tillamook County and the Oregon Watershed Enhancement Board. Work still needs to be done in terms of updating policies and procedures, but any healthy group should revise those from time-to-time.

Please consider this request to re-recognize the Tillamook Bay Watershed Council, allowing them to do the important collaborative work that needs to be done.

Sincerely,

Hayden Bush

RE: Letter of Support for Tillamook Bay Watershed Council

Commissioners,

The purpose of this letter is to offer our support for the Tillamook Bay Watershed Council (TBWC) to receive local designation. Oregon Department of Forestry (ODF) manages the Tillamook State Forest and is the largest landowner in the Tillamook Bay basin. In addition, we implement the Forest Practices Act on private forest land.

Tillamook Bay Watershed Council has gone through extensive reorganization and re-establishment of their board and governance over the last two years. ODF has participated in some of the processes and provided input to assist in the re-establishment of the watershed council framework. ODF has enjoyed a long history of working collaboratively with TBWC.

State Forest management is currently guided by the 2010 Forest Management Plan. At this time, we are drafting a new Management Plan that is compatible with the draft Western Oregon Habitat Conservation Plan. In addition, the Forest Practices Act recently went through significant rule revisions to reflect the work known as the Private Forest Accord. All of these efforts and documents are focused on the protection and improvement of aquatic species habitat. There is no better time than now to recognize the work TBWC can do to help accomplish our common goals through outreach to small landowners, leverage future dollars, and building more effective work on-the-ground.

ODF will continue to support Tillamook Bay Watershed Council through in-kind contributions by participating in public meetings and will participate on a technical team as it develops. In addition, ODF will actively assist TBWC in connecting with possible partners, landowners and working on high priority State Forest projects to accomplish all of our goals in a shorter timeframe.

Sincerely,

Kate J. Skinner

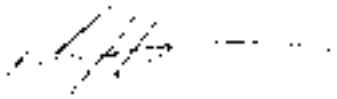
January 17, 2023

Re: Support for formation on Tillamook Bay Watershed Council

To Whom it May Concern:



The Oregon Department of Fish and Wildlife supports the reestablishment of the Tillamook Bay Watershed Council. Watershed Councils play a crucial role in engaging local communities to prioritize and implement restoration actions to address impaired and degraded habitat. These efforts are critical in the conservation and recovery of numerous fish and wildlife species, some of which, such as coho salmon, are listed as Threatened under the Endangered Species Act.

ODFW continues to provide technical support and guidance for planning and implementation of restoration projects on the north Oregon coast. For many of these projects, ODFW partners with watershed councils to get this critical work planned, funded, and ultimately completed. However, much-needed efforts in the Tillamook Bay basin are notably lacking due to the absence of the Tillamook Bay Watershed Council. This not only limits the amount of restoration occurring in the Tillamook Bay Watershed, but also has the potential to significantly impact future efforts that will be identified through planning processes such as the Tillamook Coho Strategic Action Plan.

ODFW asks that local government representatives support reestablishment of the Tillamook Bay Watershed Council to fulfill the critical and important need stated above. Additionally, we ask that OWEB consider providing the Tillamook Bay Watershed Council capacity funding when all necessary requirements are met.

Thank you for your consideration.

Sincerely,

Chris Knutsen
District Manager
ODFW – North Coast Watershed District

STIMSON LUMBER COMPANY
6115 Hangar Rd , Tillamook, OR 97141
(503) 842-4007

Tillamook Board of Commissioners
201 Laurel Avenue
Tillamook, OR 97141

January 26, 2023

Dear Commissioners,

My name is Jon Wehage, and I am the Coast unit Manager for Stimson Lumber Company. I manage 75,000 acres of commercial timberland in Tillamook County of which 50,000 acres is within the Tillamook Bay Watershed. Additionally, I am a board member on the Nestucca, Neskowin, Sand Lake Watershed Council and sit on the Tillamook Bay Coho Strategic Action Plan Committee.

I am writing this letter in support of the Tillamook Bay Watershed Council (TBWC) to receive local designation by Tillamook County to facilitate funding opportunities from the Oregon Watershed Enhancement Board.

Stimson has a long history of working with the TBWC and others to improve stream habitat in Tillamook County. The Bewley Creek, Coast Range Road and the Killam Creek projects are great examples of collaboration between private industry and Watershed Councils. These projects executed by the TBWC were partnerships that placed large wood debris, removed legacy road hazards and restored channel width to Core Salmon Streams. Additionally, the Killam Creek project has been used by Clair Thomas as a student laboratory to study log placement movement and many other watershed topics. There has also been many culvert and bridge replacements on private and public roads which are typically lower in the watersheds. All of these projects facilitate fish passage from the bays up to forest lands where Stimson and other landowners have been updating fish passage structures and doing restoration projects for over 20 years.

Looking to the future there are many projects on and around Stimson property that we would be willing to work with the TBWC to accomplish. Tillamook county has a long rich history of using collaborative relationships to accomplish its goals. I believe recognizing TBWC is a win for Tillamook County.

Sincerely,

Jon Wehage
Coast Unit Manager
Stimson Lumber Company

Dear Tillamook County Board of Commissioners,

The Tillamook County Creamery Association (TCCA) is proud to hold six stewardship commitments, one of which is *enduring ecosystems*. We strive to execute common sense sustainability strategies, advance our stewardship commitments, and support our local community in economic, natural resource enhancement and protection endeavors. We work directly with local non-profits and government organizations because we know that a robust network of effective partners is vital to maximizing investment in and protection of the natural environment. In this unprecedented time of government investment in natural resource protection through grants and other funding initiatives, it is imperative to have community organizations ready to take advantage of these opportunities and execute them impactfully.

TCCA supports the efforts of the Tillamook Bay Watershed Council (the Council) to become relevant in our community and to receive formal designation as a watershed council. We support the Council's mission to build a collaborative organization that supports landowners and the community at large in protecting, maintaining, and improving the health of the Tillamook Bay watershed through on-the-ground restoration projects, outreach programs and community engagement.

TCCA also supports the Council's expressed commitment to community relationship building. TCCA is engaged with the Coho Strategic Action Plan and would welcome the Council's engagement and participation in this and other regional conservation and restoration partnerships.

We encourage the Council to maintain its newfound energy and passion to win grants from the Oregon Watershed Enhancement Board (OWEB), the Oregon Department of Fish and Wildlife (ODFW), and other funding sources to make a difference in our region's waterways and ecosystems. We are optimistic about the Council's efforts to re-engage with the community to build trust and mutual respect. Still, we understand this process is ongoing and appreciate that this will continue to take significant effort on the Council's part.

We look forward to working with the Council on stewardship efforts, community outreach, and capacity building. We appreciate the Commissioners' time in considering our recommendation to recognize the Council to help them reach relevancy in our community.

Sincerely,

Paul Snyder

TILLAMOOK ESTUARIES PARTNERSHIP

Healthy watersheds for a thriving community

02 January 3, 2023

To the OWEB Grant Review Committee,

Tillamook Estuaries Partnership (TEP) has been a long-time partner of the Tillamook Bay Watershed Council (TBWC). This letter is to express our support of the Tillamook Bay Watershed Council's application for council capacity funding through OWEB.

TEP has worked with TBWC on numerous restoration projects, environmental education programs, outreach events, as its fiscal administrator, and much more. TEP's Executive Committee has met with TBWC's Board of Directors to offer our support during their restructuring efforts and I participated in several of their monthly meetings in 2022. TBWC has put forth significant and meaningful effort in its revitalizing its governance policies, Board composition, and stakeholder relationships. I believe they have reached the stage where they ready and deserving of regaining recognition by the Tillamook County Commissioners and receiving funding from OWEB to hire a Watershed Council Coordinator for Tillamook. TEP and our other partners lack the capacity to fill the gap that exists without that role.

TEP utilizes its 10-year action agenda, the Comprehensive Conservation and Management Plan (CCMP), to guide our water quality, habitat restoration, and community engagement efforts. Built into the CCMP is the need for involvement by partners, such as TBWC, to serve the five estuaries and six watersheds that comprise our focus area. With OWEB's support, TBWC could once again be involved in many of TEP's efforts:

- **Landowner Contacts** essential to the BackYard Planting Program;
- **Native Plant Propagation** (TBWC staff and Board members volunteer for seed collection, sowing, transplanting, and many other activities in exchange for discounted costs of native plants for their restoration projects);
- **Water Quality Monitoring** (TBWC staff and Board members have collected samples for bacteria analysis to monitor the health of waterways within Tillamook); and
- **Community Engagement** through leading tours in the Explore Nature program to connect the restoration work we do with the recreation that residents and visitors enjoy.

TEP would similarly partner with TBWC by participating on technical teams, sharing monitoring protocols, attending strategic planning sessions, making equipment and technology available (e.g. drones, GIS), etc.

TEP strongly supports TBWC and looks forward to seeing them add a Watershed Council Coordinator to their organization. Please consider funding their application; it will benefit the entire community.

Sincerely,

Kristi Foster, Executive Director

Oregon Council

January 26, 2023

Tillamook County Commissioners
201 Laurel Ave
Tillamook, OR 97141

Dear County Commission:

The Oregon Council of Trout Unlimited would like to add our voice in strongly supporting the re-certification of the Tillamook Bay Watershed Council.

The Tillamook Bay Watersheds are the cornerstone of the North Oregon Coast Salmon and Steelhead habitat. These watersheds also provide critical drinking water resources to the citizens of Tillamook County. A fully functioning watershed council will help build collaborative voluntary partnerships with communities and landowners. This is accomplished through on the ground restoration projects, educational outreach and other community engagement activities

Over 300 miles of stream habitat across five rivers pour into Tillamook Bay, and together they are among Oregon's most important coastal rivers for salmon and steelhead. This is one of a few places where six different fish stocks return each year from the sea. The Tillamook Bay tributaries are known for wild runs of Chum, Coho, Spring and Fall Chinook, Winter Steelhead, Sea-Run Cutthroat Trout, as well as lamprey.

The added capacity a watershed council would bring to Tillamook County is essential for implementing large projects across multiple ownerships and filling the unique niche only a watershed council can in the restoration community, and community-at-large.

Please support the recertification process for the Tillamook Bay Watershed Council.

Terry Turner

Trout Unlimited
Salmon SuperHwy

Tillamook County Commissioners
201 Laurel Ave
Tillamook, OR 97141

January 30th, 2023

Dear County Commission,

I am writing to express the support of Trout Unlimited and the Salmon SuperHwy partnership for the re-certification of the Tillamook Bay Watershed Council.

The Salmon Superhighway (SSH) is a collaborative partnership of fifteen local, state, and federal agencies, NGOs and watershed councils with the goal of reconnecting 180 miles of blocked habitat in six major salmon and steelhead rivers of the Tillamook Nestucca sub-basin on Oregon's North Coast. To accomplish this impressive portfolio of work, the SSH partnership relies heavily on Oregon's network of watershed councils to develop private landowner and community support for the fish passage projects, to coordinate design of the passage projects, to help secure project funding, and to implement the projects on the ground.

I am aware of the challenges faced in recent years by the TBWC in implementing its mission. We would like to emphasize the importance of a strong watershed council that enjoys broad community support and confidence for serving the Tillamook Bay watershed. This added compacity would greatly help us in achieving our goal.

I recognize you, our County Commissioners, play a critical role in our mission by providing oversite, and expertise to assure the strength and capacity of our watershed council partners. I encourage you to support the TBWC. A strong watershed council in the Tillamook Bay geography would enhance the SSH's ability to promote the recovery of fisheries in this region and achieve the communities' flood resiliency goals.

I thank you for your continued support of SSH projects and our fish passage objectives.

Sincerely,

Liz Ransom
Salmon Super Highway Director
Trout Unlimited

February 2, 2023

Tillamook County Commissioners
201 Laurel Ave
Tillamook, OR 97141

Dear Commissioners,

I am writing on behalf of The Wild Salmon Center (WSC) to express our support for the Tillamook Bay Watershed Council (TBWC) to be re-recognized by Tillamook County and the Oregon Watershed Enhancement Board (OWEB). The mission of WSC is to promote the conservation and sustainable use of wild salmon ecosystems across the Pacific Rim. WSC has dedicated significant resources (including recently adding my full-time staff position) to supporting local communities on the northern Oregon coast. The Tillamook Bay watershed encompasses over 300 miles of stream habitat across the five rivers that pour into Tillamook Bay, and collectively they are among Oregon's most important coastal rivers for salmon and steelhead.

WSC is working closely with local stakeholders in the Tillamook Bay watershed to complete a Strategic Action Plan (SAP) that prioritizes the protection and restoration of critical Coho salmon habitats. The SAP will lay out a long-term (multi-decadal) plan for the watershed processes that must be restored to ensure the viability of the Tillamook Bay Coho population. In addition, the plan lays out a list of site-specific, near-term (<5 years) projects that advance these long-term priorities. The process to develop the SAP is science-driven and collaborative, and local partners are enthusiastic to put the plan on the ground. Similar SAPs have been completed in the Siuslaw and the Coos Bay watersheds, resulting in OWEB's recent commitment of $23M to their implementation.

The ongoing restoration and recovery effort underway in the Tillamook Bay watershed would benefit greatly from the added capacity to engage landowners in SAP implementation and leverage the extraordinary federal funding opportunity that now exists. Support for the TBWC will ensure a greater opportunity for more resources to be captured for Tillamook County and for the community that lives and works in the watershed.

The TBWC has new leadership that is working towards their goal of being re-recognized by Tillamook County and OWEB. To that end, the Council has been actively working to update policies and procedures, engage and collaborate with the broader community, and rebuild existing relationships. The WSC believes the TBWC has tremendous potential to work cooperatively with both landowners and key stakeholders to advance high priority conservation activities which enhance watershed and community health. We are dedicated

INTERNATIONAL HEADQUARTERS
721 NW Ninth Avenue, Suite 300 • Portland, Oregon 97209 USA • tel: 503.222.1804 • fax: 503.222.1805
info@wildsalmoncenter.org • www.wildsalmoncenter.org

to being a committed partner to this new organization and to providing technical support for it, including the production of the Tillamook Bay Watershed SAP for Coho Recovery and by leveraging federal funding to accelerate project implementation.

Thank you for your serious consideration of the TBWC's request to be re-recognized by Tillamook County and OWEB. If I can provide further information on WSC's long-term commitment to the Council, please don't hesitate to contact me.

Best Regards,

Cyndi Curtis

Cyndi Curtis
North Coast Manager

FISCAL POLICIES & PROCEDURES

Tillamook Bay Watershed Council

Adopted: January 31, 2006

Amended: June 27, 2006

Amended: May 29, 2007

I. PURPOSE OF THE MANUAL

This manual has been designed as a reference for the staff and members of the Tillamook Bay Watershed Council (TBWC). TBWC was incorporated in 2005 in the state of Oregon as a non-profit corporation. The organization received its 501(c)(3) status with the Internal Revenue Service in September 2006.

The manual includes fiscal policies established by the members and Coordinator and fiscal procedures designed to implement those policies and provide simple methods to transact the organization's business affairs. The manual will be updated periodically to reflect changes and clarifications in policies and procedures. Upon full review of the Council, the Coordinator will ensure that copies of the manual in use are updated and outdated policies and procedures are removed.

II. FISCAL MANAGEMENT POLICIES

A. GAAP: Except when noted, TBWC follows Generally Accepted Accounting Principles for nonprofit organizations.

B. Adherence to Federal Standards: By reference, the TBWC incorporates all provisions of OMB Circular A-122, "Cost Principles for Non-Profit Organizations" as pertains to federal funds.

C. Accrual Accounting: TBWC utilizes the accrual basis of accounting in which revenues are recorded in the period in which they are earned and expenses are recorded in the period in which they are incurred regardless of when cash is received or disbursed. Income from restricted grants and contracts is recorded in the period in which the restrictions have been met through proper expenditure of the funds and/or the required services have been provided.

D. Deferred Revenue: TBWC records Deferred Revenue when restricted funds are received in advance of the provision of the services or incurring of expenses for which the funds are provided. Deferred revenues may be reclassified as Temporarily Restricted Revenues on the audited financial statements, which are presented in accordance with FASB 116 and FASB 117.

E. Equipment, Furnishings, and Real Property: TBWC records equipment with a useful life of more than one year and cost of more than $5000 as an asset. Equipment with useful life under one year or cost of $5000 or less is recorded as a supply expense.

Equipment purchased with restricted grant funding is coded to the expense account Equipment in the fund providing the money during the fiscal year, so that

the purchase may be easily tracked for reporting to the funder. At fiscal year end, a journal entry is made which records the purchase as an asset in the equipment account in the Unrestricted fund and credits it out of the equipment purchases account and debits it out of the fund balance account in the restricted fund.

Depreciation expense and an allowance for depreciation is recorded for all equipment, furnishings, and real property owned by TBWC.

F. Donated Materials, Equipment, and Services: TBWC records in-kind gifts of equipment as in-kind contributions, a revenue account, and as equipment, an asset account. Donated equipment is recorded at the fair market value on the date of donation. Fair market value is the price at which the item would be sold by a willing buyer to a willing seller.

Donated material which does not meet the definition of equipment is not recorded as "in-kind supplies expense" and "in-kind contribution" in accordance with FASB 116. Volunteer time of professionals in their professional capacity is recorded as "in-kind revenue" and "in-kind expense." Other volunteer time is not recorded in accordance with FASB 116. There is no net effect of recording in-kind labor and its associated in-kind contribution income. The recording of in-kind contribution income for the value of donated equipment results in an increase in net income because the value of the donated equipment is recorded as an asset not as an expense.

G. Inventory: The TBWC maintains an inventory of fixed assets valued at $5000 and above and inventory of supplies and equipment valued at $1000 or above. The inventory shall be updated biennially and shall include a description or name of the item, model or serial number, date purchased, value or cost at purchase, current appraised value if known, and location within the TBWC office. Security inventory numbers shall be affixed to all supplies that cost more than $1000 at the time of purchase on all furniture and equipment. The Coordinator will review and confirm the inventory biennially.

Equipment procured with federal funds shall be disposed of in accordance with 40 CFR 30.34 (f).

H. Cost Allocation: TBWC will develop an annual written cost allocation plan to fairly allocate shared costs among the various functions performed by the organization. The written cost allocation plan will be utilized as the basis of negotiation of costs with funding sources. The cost allocation plan will be applied consistently to all programs.

I. Restricted Funds: Grants and contracts from grantors who restrict the use of funds are recorded in separate funds during the year. The use of restricted gifts is

linked to the purpose specified by the donor/grantor. A separate fund is established for each restricted funding source which utilizes line item budgets. Expenses which fulfill the restrictions of the donor/grantor are recorded in that donor/grantor's fund. Separate bank accounts are not required for each restricted funding source. Internal financial statements are presented using a fund accounting format; year end audited financial statements are presented on a Net Assets basis, using Unrestricted, Temporarily Restricted, and Permanently Restricted classes of Net Assets in accordance with FASB 117.

J. Functional Expense: TBWC will utilize distinct cost centers to record costs of its distinct program and management functions as its operations diversify. When implemented, each cost center will contain the specific expense account line items needed to record the specific expenses of performing its respective functions.

K. General Ledger: TBWC maintains a complete double-entry General Ledger reflecting the complete chart of accounts and segregating costs by function and by restricted funding source requirements.

L. Budget: The Council adopts a comprehensive organization-wide budget for each fiscal year. The budget reflects all anticipated revenues from all sources and all anticipated expenses. Board adoption of the budget constitutes authorization for staff to incur budgeted expenses as explained under Section 12: Procurement and Section 3: Purchases and Disbursements.

M. Financial Statements: The Council receives a balance sheet and statement of support revenue, and expense for each month during the month following the month for which the statements are prepared. The statements are presented to the Council by the Treasurer, who has reviewed them with the Bookkeeper. The financial statements facilitate identification of restricted and unrestricted funds and comparison of actual revenues and expenses to budget.

O. Audit: TBWC funds and bank statements are reviewed and reconciled quarterly by the Tillamook Estuaries Partnership Accounting Manager. Council support and other OWEB grants are strictly audited when requests for reimbursement are submitted.

The Council will select an independent CPA to conduct an audit of all TBWC funds every two years. The auditor is required to present the results of the audit to the Council or a designated Council committee. If more than $500,000 in federal funds is expended during the fiscal year then an audit in accordance with OMB Circular A-133 will be requested from the independent CPA firm hired to conduct an annual audit of TBWC funds.

P. Interest Bearing Accounts: TBWC places funds in interest bearing accounts

whenever practical and permissible by funding source agreements.

III. PURCHASES AND DISBURSEMENT PROCEDURES

A. Purchases: Authorization by the Administrative Committee is required prior to all purchases exceeding $100. Standing authorization for routine expenditures such as utilities, office supplies and copier maintenance is provided by Council approval of the annual budget. Employees desiring to make purchases outside the standing authorization items must submit the request in writing, describing the item briefly, its cost, and the project to which it is to be charged. The request will be coded to the appropriate fund and cost center, and given to the Administrative Committee for approval. Once the Administrative Committee approves the purchase, the Treasurer cuts the check. Alternatively, with prior and specific approval of the supervisor, an employee may purchase the item with her/his own funds and submit a written request for payment, complete with receipt, to the Treasurer who will prepare a reimbursement check.

The Coordinator is required to be familiar with the terms and conditions dictated by each grant and must determine, before giving approval that expenses are reasonable, allocable and allowable per the terms of the grant and the cost principles of the granting organization. Similarly, the Bookkeeper will be responsible for knowing these same rules and will determine the reasonableness, allocability and allowability of costs before the allocations are made. In the case of Federal grants, the Coordinator and Bookkeeper must specifically be familiar with the guidelines established in OMB Circular A-122.

B. Processing Invoices: All invoices/statements from outside vendors will be routed to the Bookkeeper who will review them to determine whether they are covered by a standing authorization or whether a written request has already been submitted for the item. The Bookkeeper supplies the account code. The Bookkeeper assembles invoices and bills and will process them in accordance with each invoice's due date or discount date. Payments will not be made from statements without corresponding receipts or invoices.

The Treasurer and one other Administrative Committee member will come to the Council's office to prepare and sign checks twice a month. The Treasurer will prepare checks for invoices which have an approved request or standing authorization available. The Treasurer will then sign checks and return the signed checks to the Bookkeeper. A second signature will be required for all payroll checks, checks to the US Treasury Department and Oregon Department of Revenue, and all checks over $2500. (See section III D) If the Treasurer is unavailable, the TBWC Chair has check signing authority. The Bookkeeper then mails the checks and records any backup information, such as an invoice, packing slip, etc., on to the account coding sheet and files the document by vendor in the

vendor files. A copy of check and back-up documentation also is filed in the appropriate grant file if applicable.

C. Check Preparation: A copy of the original check document will be attached to the invoice for filing. Void checks are marked VOID. The original check is retained in the VOID check file.

D. Check Signatures: The Council authorizes check signers. The Chair and Treasurer have check signing ability, as do two Executive Committee members. Council members responsible for signing checks will come by the Council's office at the beginning and middle of the month. Checks for under $2500 require one signature. A second signature will be required for all payroll checks, checks to the US Treasury Department and Oregon Department of Revenue, and all checks over $2500. It is preferred that the Treasurer be the primary check signer. All check signers must review the documentation attached to the checks prior to signing the checks.

E. Distribution of Checks: Once checks are signed, the Bookkeeper removes the attached documentation for filing and places the check in envelope for mailing. Checks for staff reimbursements or purchases are released to the approved staff member.

F. Filing Paid Invoices: Once checks have been separated from paid invoices, the invoice, written check request, account coding form check copy are then taped and/or stapled together by the Bookkeeper. These documents are filed by vendor chronologically, i.e. the most recent invoice placed at the top of the file. Reimbursements to employees are filed by employee in the vendor files, treating employees as vendors. When applicable, copies of invoices will also be placed in appropriate grant files.

G. Employee Travel Expense Procedures: Employees may submit their actual travel expenses with a travel voucher form for reimbursement after the travel. TBWC will not pay for personal items or services while traveling.

Staff mileage reimbursement, using the standard IRS rate, includes the cost of gasoline and wear/tear. Separate gasoline costs will not be reimbursed.

H. Reimbursement Policy for Council Members: Council members' participation in Council projects is voluntary and unpaid. However, when the Council uses Council member equipment on a project, the Council member may be reimbursed for equipment use. A written reimbursement estimate must be received by the Administrative Committee prior to project implementation for approval. After the project is complete, the Administrative Committee will review the equipment expenses and approve payment. If expenses are higher than anticipated, the

Administrative Committee will have discretion to approve reimbursement up to 50% above the original estimate.

IV. PROCEDURES FOR RECEIPT AND DEPOSITS FOR CASH AND CHECKS

A. Funds Received at the Office: The Coordinator sorts mail and logs all checks received in the mail prior to giving them to the Bookkeeper.

The information received with grant checks from funders, including any check stub or correspondence, is passed on to the Bookkeeper who files the information in the revenue section of the filing system, which is organized by General Ledger revenue account. When cash payments are received in the office, the employee assigned to maintain the receipts log records the cash receipt in the log.

B. Cash and Checks Received Outside the Office: Occasionally employees will be given cash and checks at meetings or events held outside the office. Any checks and cash received outside the office are brought back to the office and given to the Coordinator who logs them into the receipts log.

The receipts log is totaled monthly by the Coordinator, and proofed to the cash receipts/accounts receivable journal by the Bookkeeper.

C. Maintaining the Cash Receipts/Accounts Receivable Journal: The Bookkeeper maintains a manual cash receipts/accounts receivable journal. The journal lists the date received, payer, invoice number where applicable, amount of each receipt. Amounts received through out-of-office collections procedures are entered in the cash receipts/accounts receivable journal with appropriate receipt number references. Cash receipts which lack a receipt number are entered with the words, "Cash sale," or "Cash Donation." Each receipt entered in the cash receipt/accounts receivable journal is then spread to the appropriate column on the journal to indicate accounts receivable payment, direct mail donation, sale of curriculum, workshop registration, etc. The Bookkeeper adds and proofs the pages of the journal, and indicates deposits by skipping a line in the journal and writing the date and the deposit total in the journal.

D. Bank Deposits: The Bookkeeper will prepare all bank deposits with duplicate deposit slips. Each deposit ties out to the cash receipts/ accounts receivable journal.

The Bookkeeper lists the total cash deposited on the bank deposit slip and on the copy of the deposit slip. The Bookkeeper compares the bank deposit total to the cash receipts/accounts receivable journal total and reconciles any differences before deposit. The Bookkeeper writes the deposit total in the accounting system.

V. PROCEDURES FOR ACCOUNTS RECEIVABLE

Payments from grantors: Payments from grantors received in the mail are opened by the Coordinator, who routes them to the Bookkeeper. The Bookkeeper codes the receipt to the correct fund and account. If it is a cost reimbursement on a grant or contract, the payment is credited against the Grants receivable account in the appropriate fund. Grants and contracts which send an equal monthly payment are treated in the same way as cost reimbursable grants and contracts: payments are credited against Grants receivable, and revenue is recorded based on actual expenses incurred. Grant payments received in advance of the grant period are coded to a deferred revenue account in the appropriate fund. (These funds may be reclassified as Temporarily Restricted revenue by the auditor for the year end audited financial statements.)

VI. BILLINGS, REQUEST FOR PAYMENTS AND FISCAL REPORTS TO FUNDERS

All financial reports to funders are to be prepared directly from the General Ledger/receipts of TBWC by the Bookkeeper. Staff responsible for supervision of grant/contract funded activities will prepare all required narrative portions of funder reports and review all fiscal portions prepared by the Bookkeeper prior to submission.

Whenever feasible, the General Ledger amounts will be established to correspond to funder fiscal report categories. When this is not feasible, the Bookkeeper will prepare worksheets for each fiscal report documenting the source of all information reported by General Ledger account number and funder report line number or caption.

With the exception of OWEB advances for Council Support, Small Grants, Restoration Grants, and restricted monitoring funding, TBWC's standard procedure for receiving payment from federal and state agencies is to request payment after TBWC has incurred the expense. This minimizes the time elapsing between the transfer of funds to the recipient from the funder and the issuance or redemption of checks, warrants or payments by other means for the purposes of the program.

TBWC's general policy for advances will be to estimate costs that will be incurred for the next 90 days. A request for that amount will be made. At the end of that 90-day period, the requested amount will be compared to the actual amount and the request for the next 90 days will adjust for that amount. State or private foundation funds will adhere to the appropriate grant conditions in which they were awarded.

VII. PAYROLL PROCEDURES

A. Pay Periods: TBWC utilizes a monthly pay period, with paychecks issued on the first day of every month for the last month's hours. If the first day of the month is on a weekend or holiday, the check will be issued the last business day prior to the

first.

B. Processing of Monthly Timesheets: Each employee is responsible for recording their daily hours worked on a monthly timesheet. Days taken off for sick, holiday, or vacation leave must be recorded on the monthly timesheet and given to their supervisor (Council Chair) for approval on the last working day of the month. Employees are required to record out of office work hours on their timesheets for Workers Compensation reporting requirements. The supervisor reviews the timesheet for correct recording of hours worked and hours taken as sick, holiday, and vacation leave and initials the completed timesheet to indicate approval. Timesheet addendum must be attached and indicate the number of hours worked by project and grant. The supervisor turns in all approved timesheets to the Bookkeeper no later than two days prior to the first Friday of the month.

The Bookkeeper verifies the totals of hours worked and used as sick, vacation, or holiday leave on each timesheet. The Bookkeeper compares the sick and vacation leave to the employee's master record of sick and vacation leave available to verify that hours taken as paid leave were available. The Bookkeeper initials any lines on the timesheet she/he has changed as part of the review process, and adjusted timesheets must be re-signed by the employee and supervisor. The Bookkeeper then completes the vacation and sick worksheets for each employee for that month.

Once the timesheets have been reviewed and corrected, the Bookkeeper fills out a monthly payroll distribution spreadsheet according to the pay rate and hours charged per funding source on the timesheet.

C. Review and Distribution of Paychecks: The Bookkeeper reviews the payroll documents and initials the payroll journal indicating her/his review, she/he gives the journal to the Treasurer on the 1st of the month. The Treasurer spot checks the payroll, and satisfies her/himself that all employees being paid are bonafide employees and that no payroll amounts appear unreasonable. The Treasurer then prepares and signs the paychecks. A second signature is required on all paychecks.

Once the paychecks are signed by two appointed signatories, they are given to the Coordinator for distribution to the employees. Employees of TBWC may have the option of direct deposit of their paychecks if available.

D. Payroll Tax Deposits: The Bookkeeper computes all federal and state payroll tax deposit requirements and the quarterly unemployment amounts. The Bookkeeper prepares deposit coupons and checks, and gives them to the Treasurer and the second signatory for signature.

E. Recording the Payroll Checks in the Checkbook : The Bookkeeper records the total net amount of checks and directly deposited checks in the accounting system with the date, and the words "Net Payroll" or "Net Direct Deposit Payroll" for description. The checks prepared by the Bookkeeper for payroll tax deposits are recorded in the checkbook with all other checks issued by the TBWC that day.

F. Payroll Records: The TBWC maintains files for the payroll journals and payroll tax reports according to appropriate federal and state guidelines.

G. Benefit and Miscellaneous Payroll Payments: The Bookkeeper generates checks for health and investment benefits and for any wage garnishments.

H. Allocation of staff time: The Bookkeeper uses the timesheet records for the month to update the spreadsheet of staff time allocations so that it accurately reflects actual time spent.

I. Workers compensation reports: The Bookkeeper prepares annual Workers Compensation reports. S/he prepares a worksheet for breaking out hours worked into clerical (for in-office) and out of office classification, and for recording vacation hours. This worksheet is the basis for the final Workers Compensation report.

VIII. DAILY CASH BALANCE

The Bookkeeper maintains a checkbook for the checking account (Excel file). When processing receipts, disbursements, and payroll, the Bookkeeper enters all disbursements into the automated checkbook for the checking account by entering each check on a line including date of check, payee, check number, and amount. On days which include payroll, the automated checkbook will have an additional line for payroll, with the date and total net amount of the payroll.

The Bookkeeper also enters the amounts deposited by date into the checkbook. Deposit entries are made for totals only, showing date and amount. If no deposit is made on a day, no entry is made.

The Bookkeeper computes the daily cash balance in the automated checkbook by adding deposits made to the previous balance and subtracting checks written. The automated checkbook is reconciled to the monthly bank statements. Any bank charges or other bank entries must be recorded in the automated checkbook as soon as notification is received from the bank.

The checkbook is used to determine whether funds are available for disbursements. The Bookkeeper is responsible for projecting cash needs and evaluating whether sufficient cash will be available when needed.

When the Bookkeeper identifies potential cash flow problems, s/he notifies the Coordinator and Administrative Committee. The Coordinator is responsible for resolving cash flow problems.

IX. GENERAL LEDGER

A. Monthly General Ledger preparation: The Bookkeeper is responsible for preparing the General Ledger each month. S/he is also responsible for initial review of the computer processed General Ledger, and for maintaining files of the printed General Ledgers.

B. General Ledger entries: TBWC's General Ledger is maintained by the Bookkeeper.

The Bookkeeper enters all disbursements into the computerized General Ledger, maintaining one set of journals for cash disbursements and one set for payroll cash disbursements. S/he proofs the cash receipts/accounts receivable journal and verifies month end totals, and enters all deposits into the General Ledger using a revenue receipts journal. She prepares a set of General Journal entries from the information provided, recording:

- Accounts receivable sales
- Accounts payable
- Prepaid expenses
- Salary reduction plan adjustments to employee benefits (from the payroll journal)
- Payroll taxes (from a worksheet she prepares based on the payroll journal)
- Vacation time accrued by employees
- Vacation time used by employees
- Interest earned on bank accounts (from the bank statements)
- Any other bank account activity not recorded through cash receipts or cash disbursements (such as electronic drawdowns or bank charges)
- Any adjustments to accounts receivable (from the accounts receivable reconciliation)
- Any adjustments to prior months (these are coded into the current month)

After posting these entries, the bookkeeper reconciles the Cash in Checking account to the bank statement, verifies balances in the accounts payable, accounts receivable, prepaid expense, and payroll liability accounts, and prepares a second set of General Journal entries. These entries correct any errors in posting and record:

- Grants and contracts receivable and revenue earned for the month, based on

expenses incurred in the month for each reimbursable grant or contract (this procedure is followed even if the grantor sends equal monthly payments)

- Deferred revenue recognized/grant revenue earned, based on expenses incurred in the month for each grant which has advanced TBWC money

After posting these entries and proofing the financial statements, she prints out a full set of financial statements and the month's General Ledger in detail, and prepares an updated list of accounts payable.

C. Review of the General Ledger and Financial Statements: The Bookkeeper then makes photocopies of the statements for the Board, files the financial statements and the General Ledger printouts. If the Bookkeeper notes any questionable variances in comparing actual to budget, she meets with the appropriate program manager and/or project director to determine what happened and whether further action is needed to correct the problem.

X. FINANCIAL STATEMENTS

The monthly financial statements include both a Balance Sheet and a Statement of Support, Revenue, and Expenses. The revenue and expense statement includes both the current month and the year to date amounts and a comparison to budget. Separate revenue and expense statements by grant and contract (fund) are prepared to facilitate monitoring the various grants, and statements which break out costs by cost center (functional statements) are also provided.

The Bookkeeper has primary responsibility for monitoring the financial statements and alerting Council members to financial choices or issues. The Coordinator is responsible for assuring overall compliance with grant and contract agreements, and consequently must monitor the financial activity for each grant/contract and take corrective action if issues occur.

XI. BUDGET PREPARATION AND REVISION PROCEDURES

The Bookkeeper and Administrative Committee will prepare TBWC's organizational budget for each fiscal year, by fund, cost center, and line item. The budget is reviewed with the Coordinator and the Treasurer, who present it to the full Council for discussion and approval.

Revisions to the annual budget are necessary when new funding sources are received mid-year. The Bookkeeper prepares budget revisions, including both the new funding source budget and any changes to other budgets caused by changes in cost allocations. The revisions are reviewed by the Coordinator and the Treasurer, who then present the

revisions to the full Council for approval.

XII. PROCUREMENT POLICY AND PROCEDURES

A. Policy. It is TBWC's policy to consistently seek contractors, consultants, and suppliers whereby all factors including cost; technical competence; ability to make timely deliveries; and the quality and performance of their products and services are evaluated and approved by staff and/or the TBWC Administrative Committee. If any contractors, consultants and suppliers are members of the Council or are considered "disqualified persons" as defined by Internal Revenue Code section 4958 and described in paragraph E, the conflict of interest provisions of paragraph E shall be followed.

Notwithstanding any provision of this policy, applicable federal and state laws, rules, and regulations shall govern in any case where federal or state funds are involved and conflict with any of the provisions of this policy and/or require conditions not authorized by this policy.

B. Procurement of Goods. For the purchase of an item costing more than $500, staff documents in writing that two other comparable items were evaluated in addition to the one purchased. For the purchase of an item valued at over $2,000, TBWC staff will receive approval from the Administrative Committee prior to making the purchase.

C. Contracts for Services. A TBWC "contract" is defined as a written agreement drafted on a Council-approved template authorizing in-kind or cash payment for services. TBWC negotiates and executes contracts subject to the following procedures:

1. Competitive Bidding. Competitive bidding is not required for the procurement of services valued at less than $3,500. However, for services valued at greater than $500, staff documents in writing that two other service providers were evaluated in addition to the one selected.

   Services estimated at a value between $3,500 and $40,000 require a minimum of three *formal or informal* quotations or bids* from potential contractors.

   A minimum of three *formal* bids* shall be obtained for all contracts valued at $40,000 or more.

   * Note: Formal bids are those which contain a detailed scope of work, budget, timeline, and statement of qualifications/competence. Informal bids may be written in any form (email, fax, memo

etc) and may or may not contain a detailed scope of work and budget. In the event that the TBWC is unable to obtain three bids despite reasonable efforts to do so, the selection and hiring of contractors will proceed according to the rules established in Section C3 - "Review and Execution" below.

2. Direct Appointment of a Single Contractor. The TBWC will enter in contracts without competitive bidding only if the contractor is not a member of the Council or considered a disqualified person as defined by Internal Revenue Code section 4958 and described in paragraph D and one of the following conditions is met:

   - The contractor has a specialized background or expertise that cannot reasonably be expected to be found elsewhere in the marketplace.

   - A condition exists in which the project cannot be undertaken if competitive bidding requirements are met.

   - The TBWC acts as project sponsor or fiscal agent for a contractor in accordance with the TBWC Grant Sponsorship Policy.

3. Bid Selection and Contract Execution. TBWC staff execute contracts only after consultation with and approval from the Administrative Committee. Contracts valued at more than $ 20,000 require prior approval from the Council before execution.

D. Salary rate limits for Contractors: Contractors and subcontractors will not be paid a maximum daily rate (excluding overhead) exceeding rates outlined in 40 CFR 30.27 (b). This limitation applies to individuals with specialized skills who are paid at a daily or hourly rate. This rate does not include normal travel reimbursements.

E. Conflict of Interest: Awards of funds in any amount may be made to Council members, member organizations of the Council or disqualified persons as defined in Internal Revenue Code section 4958 and described below that have a financial or non-financial interest in the award or project only if the award was made through a "competitive process", described below, and the member recused him/herself from all deliberations and decisions relevant to the award. No sole source contracts in any amount shall be let to any employee of TBWC, Council member, other persons related to those parties, or disqualified persons as defined in Internal Revenue Code section 4958 and described below . Awards of federal funds shall adhere to OMB Circular A-122. No vendor may be employed or used by the TBWC for which there exists a conflict of interest, real or perceived, between any member of the staff or the Council and the contractor except as provided herein. All members of the staff and Board shall declare such conflict if

it exists.

"Competitive process" means that the procedures for procurement of goods in Subsection B and contracts for services in Subsection C are followed. All conflict of interest transactions shall be approved by a majority of all the members of the board who have no direct or indirect interest in the transaction. If a majority of directors vote to approve the transaction or arrangement, a quorum is present for the purpose of taking action, except that such transaction or arrangement cannot be approved by a single director. All conflict of interest transactions shall be documented to include the names of the persons who had a conflict of interest, the nature of the financial interest, a summary of the discussion to determine whether a conflict was present, the names of the directors present for the discussion and vote related to the transaction or arrangement, a summary of the discussion, and a record of the vote taken.

"Disqualifed persons" are defined by Internal Revenue Code (IRC) section 4958 and generally include directors, past board members, Executive Director substantial contributors and those related to these individuals. A "disqualified person" is generally any person who exercises substantial influence over the corporation within a five year period ending on the date of the transaction in question and this person's family members or others connected to this person through business and/or investment (certain 35% controlled entities). Related parties are defined by the IRC to include spouse, siblings, spouses of siblings, ancestors, children, grandchildren and great-grandchildren and spouses of all such children.

Tillamook Bay Watershed Council Monthly Meeting
Bay City Arts Center
November 28, 2022, 6PM

- Call to Order 1806

- Roll Call
  a. Harold Stevens-Chair
  b. Haakon Smith-Vice Chair
  c. Nathan Atchison-Secretary
  d. Charlie Wooldridge-Treasures
  e. Joe Travers- ODF Liaison
  f. Mark Harvey
  g. Erin Skaar
  h. Melyssa Grasper- Technical Advisor

- Approval of previous minutes
  a. September minutes, Wooldridge motioned for approval of August minutes, Smith seconds - none opposed

- Treasurer's Report-Wooldridge
  a. Budget Outlook- Current Balance $8517.66

- Old Business
  a. Reviewed updated bylaws from Subcommittee
     - Policies and procedures will be reviewed later
     - **OWEB has reviewed the updated bylaws and didn't have any issues.**
     - **Vote on Bylaws at the next meeting in December?**
       - **Also create a board member packet/contract?**
  b. **COMPLETED** South Fork Trask PISR Photos
  c. **SUBMITTED Tomlinson Creek Fish Passage –due October 19, 2022 (Zavissler)**
  d. OWEB at Tillamook Bay Community College October 25, 26
  e. Zach Rolfe added to the TBWC board, Atchison motioned for approval, Smith seconds, all in favor, none opposed
- New Business/Discussion
  a. **Harold Stevens is stepping down as council chair with a written statement. Vice Chair Haakon Smith will be stepping in as interim Chair for the rest of 2022.**
  b. **Officer elections 2023 year**
     - **Stevens motioned for approval of Smith as Chair, Harvey as Vice Chair, Atchison as Secretary, Wooldrige as Treasure, Haakon seconds - none opposed**
  c. **Smith motioned for approval to remove all persons from the bank account authorization except Wooldridge and Smith, Wooldridge seconds - none opposed**
  d. Mill Creek Habitat - due December 30, 2022 address at next meeting.
     - Smith will take on the task to get photos maybe after Dec 15th.
  e. Letters of Support from partners
     - Talking points needed for letters, outreach, due January 24th from partners for February 8th commissioners meeting.
     - Commissioners meet every wednesday and will need to submit friday before the meeting to approach the board for the second meeting of February 8th?
  f. Computer replacement, pricing
     - Possibly replace for: $500-$1000
     - **Atchison mentioned approval for new computer purchase below $1000 dollars Second Stevens - no opposed**
  g. OWEB Council Support Application
     - Apps in December, due in March 2023
- Action Items

a. **UO Not providing support this year.** Complete application for The University of Oregon's non-profit review program before November
b. Mill Creek Monitoring Report due December 30, 2022 – complete end of October, mid-November
c. Adopt new by-laws before end of year
d. Request Letters of Support from partners, stakeholders during January due January 24th 2023.
e. Approach Tillamook County Commissioners in February 2023 to receive recognition
f. Complete OWEB Council Capacity Application in March
g. Bank Account Authorizations
h. **Bay city arts center fundraiser December 10th 6PM**

- Calendar
  a. ***Next Meeting – December 28th @ 6PM, BCAC, Bay City***
  b. Meeting Adjournment 19:07

Signed (Chair) _____ Date 12/22/2022

Signed (Secretary) _____ Date 12/22/2022

Match Funding Form

Document the match funding shown on the budget page of your grant application.

OWEB accepts all non-OWEB funds as match. An applicant may NOT use another OWEB grant to match an OWEB grant; this includes ODA Weed Board projects because they are funded through OWEB grants. However, an applicant who benefits from a pass-through OWEB agreement with another state agency, by receiving either staff expertise or a grant from that state agency, may use those benefits as match for an OWEB grant. (Example: A grantee **MAY** use as match the effort provided by ODFW restoration biologists because OWEB funding for those positions is the result of a pass-through agreement).

At the time of application, match funding for OWEB funds requested does not have to be secured, but you must show that **at least 25% of match funding has been sought**. On this form, you do not necessarily need to show authorized signatures ("secured match"), but the more match that is secured, the stronger the application. Identify the type of match (cash or in-kind), the status of the match (secured or pending), and either a dollar amount or a dollar value (based on local market rates) of the in-kind contribution.

If you have questions about whether your proposed match is eligible or not, see Allowable Match document in OGMS https://apps.wrd.state.or.us/apps/oweb/fiscal/nologin.aspx under Technical Assistance application or contact your local OWEB regional program representative (contact information available in the instructions to this application).

Project Name: TBWC Capacity Grant 2023-25

Applicant: Tillamook Bay Watershed Council

Match Funding Source	Type	Status*	Dollar Value	Match Funding Source Signature/Date*
TBWC	cash	secured	$1	3/15/23
	(select)	(select)		
	(select)	(select)		
	(select)	(select)		
	(select)	(select)		
	(select)	(select)		
	(select)	(select)		

*** IMPORTANT:** If you selected "secured" in the Status column for any match funding source, you must provide either the signature of an authorized representative of the match source in the Match Funding Source Signature/Date column, or attach a letter of support from the match funding source that specifically mentions the dollar amount you show in the Dollar Value column.

Budget Summary:
OWEB Amount Requested: $131,465
Total Project Amount: $168,505

Administrative Information

Abstract

Provide an abstract statement for the project. Include the following information: 1) Identify the project location; 2) Briefly state the project need; 3) Describe the proposed work; 4) Identify project partners.

Project will provide funding for the Coordinator/Executive Director, and operations of the Elk Creek Watershed Council in the northern part of Douglas County. The Council will work with local landowners and state and federal agencies to plan, develop, and implement on-the-ground projects to benefit fish and wildlife, and water quality in the Elk Creek Watershed, and in the Umpqua Basin. Key partners are local landowners, Douglas and Umpqua SWCD, ODFW, Roseburg District BLM, ODA, and others.

Location Information

Current Location:

What is the ownership of the project site(s)?

✓ *Public land (any lands owned by the Federal government, the State of Oregon, a city, county, district or municipal or public corporation in Oregon)*

What agency(ies) are involved?

Roseburg District BLM

✓ *Tribal lands (any lands owned/managed by a Tribal government)*

✓ *Private (land owned by non-governmental entities)*

Please select one of the following Landowner Contact Certification statements:

❍ I certify that I have informed all participating private landowners involved in the project of the existence of the application, and I have advised all of them that all monitoring information obtained on their property is public record.

● I certify that contact with all participating private landowners was not possible at the time of application for the following reasons: Furthermore, I understand that should this project be awarded, I will be required by the terms of the OWEB grant agreement to secure cooperative landowner agreements with all participating private landowners prior to expending Board funds on a property.

Please List your reasons

Landowner permissions will be obtained for any work done on private lands. Oregon Dept. of Agriculture will secure permissions for noxious weed control treatments on BLM or Cow Creek Tribal lands.

❑ *Not applicable to this project*

❑ *This grant will take place in more than one county.*

Permits

Other than the land-use form, do you need a permit, license or other regulatory approval of any of the proposed project activities?

❍ Yes
● No

Racial and Ethnic Impact Statement

Racial and Ethnic Impact Statement

❍ The proposed grant project policies or programs could have a disproportionate or unique POSITIVE impact on the following minority persons. (indicate all that apply)

❍ The proposed grant project policies or programs could have a disproportionate or unique NEGATIVE impact on the following minority persons. (indicate all that apply)

● The proposed grant project policies or programs WILL HAVE NO disproportionate or unique impact on minority persons.

Insurance Information

If applicable, select all the activities that are part of your project - These require a risk assessment tool unless otherwise noted (check all that apply).

❑ *Working with hazardous materials (not including materials used in the normal operation of equipment such as hydraulic fluid)*

❑ *Earth moving work around the footprint of a drinking water well*

❑ *Removal or alteration of structures that hold back water on land or instream including dams, levees, dikes, tidegates and other water control devices (this does not include temporary diversion dams used solely to divert water for irrigation)*

❑ *Applicant's staff or volunteers are working with kids related to this project (DAS Risk assessment tool not required, additional insurance is required)*

❑ *Applicant's staff are applying herbicides or pesticides (DAS Risk assessment tool not required, additional insurance is required)*

✓ *Insurance not applicable to this project*

Additional Information

❑ *This project affects Sage-Grouse.*

Problem Statement

Does the watershed council have a fiscal sponsor?
❍ Yes
● No

Is the council a membership organization?
❍ Yes
● No

The council is a group of councils operating collectively.
❍ Yes
● No

Is the applicant a group of councils operating independently?
❍ Yes
● No

● Yes
❍ No

Describe how your board membership includes a diverse range of geographic areas and community interests in the watershed.
The Elk Creek Watershed's geographic areas can best be defined as lowland valley bottoms, where land use is predominantly agricultural, with a small number of rural residential properties; and forested uplands which are manged for timber production on both public and private lands.

Several representatives on the Council Board include both agricultural and small woodland landowners that manage their properties to support themselves and their families economically. Rural residential landowners that value the quality of life in a rural environment are also represented. One member is also a member of Umpqua Watersheds, an active environmental organization in the Umpqua Basin.

Urban areas in the watershed are extremely small. The Cities of Drain and Yoncalla each have populations of about 1,000, and the City of Elkton has a population of about 200, and only a small part of the city is actually in the Elk Creek Watershed. Both the Cities of Drain and Yoncalla are represented on the Board.

A local contractor represents the business interests in the watershed, and another Board member supports the environmental community.

Describe any board membership and recruitment challenges and actions being taken to address those challenges.
The Elk Creek Watershed is very sparsely populated and recruiting members that clearly represent specific interest groups is difficult. Most members fall into several categories and can easily represent rural residential landowners, small agricultural producers, or small woodland operators. All these tend to support the economic interests of land management.

The Council's biggest challenge has been to represent the environmental community on the Council. The addition of Susan Applegate to the Board has brought a new level of diversity.

The other major interest is industrial timber. Though the Council has not been able to get an industrial timber landowner to commit to joining the Board, the Council has expanded its relationships with several industrial timber landowners, and has been working on developing restoration projects that include industrial timberland.

Are projects of the council, including those identified in the work plan, identified in a council action plan or strategic plan?

● Yes
❍ No

Provide the name and date of the most recent action plan or strategic plan.

Elk Creek Watershed Council Action Plan - May 2022
Strategic Restoration Action Plan - June 2019

Is the work of the council specifically designed to benefit salmon or steelhead?

● Yes
❍ No

✓Oregon Coast - Steelhead
✓Oregon Coast - Coho Salmon
✓Oregon Coast - Chinook Salmon

Describe how the resulting council capacity grant will benefit salmon or steelhead or their habitat?

Instream habitat restoration is the highest priority of the Elk Creek Watershed Council. The Elk Creek Watershed contains more than 300 miles of stream habitat for coho and Chinook salmon, steelhead, and lamprey within the Council boundaries. 172 miles are high intrinsic potential, more than any other 5th-field in the Umpqua Basin.

The council's 2022 Action Plan focuses largely on fish habitat improvement. The Council is finishing up the monitoring of the Jack and Hardscrabble Creeks Restoration project, which installed over 300 logs to more than 3 miles of coho habitat, replaced five (5) fish passage barriers , and installed more that 1.3 miles of livestock exclusion fencing. Work is underway to place nearly 300 logs in more than 2 miles of Parker Creek in 2023, and funding is being sought to implement the Ellenburg Creek Restoration Action Plan.

In the past 2 years the council has assisted with the development of eleven restoration projects that address salmon and/or steelhead and their habitats. The coordinator will utilize watershed assessments, action plans and relevant Recovery Plans to develop a prioritized list of future restoration and monitoring projects.

Input the total acres encompassed by this watershed.

187090

Input the Federal Recovery plan applicable to your watershed council.

Final ESA Recovery Plan for Oregon Coast Coho Salmon, National Marine Fisheries Service Northwest Region, 2016.

Input the description of the plan implemented that outlines the need for this activity

This project supports local watershed councils by providing capacity to engage in salmonid recovery planning and coordination. The Recovery Plan(s) indicate state and local collaboration and partnerships, especially in the form of watershed councils, are needed to successfully implement Recovery Plan actions and refer to the Oregon Plan. The Oregon Plan for Salmon and Watersheds (1997) provides the governance structure for implementing restoration in Oregon.

Proposed Solution

Community Engagement

Briefly describe the council's stakeholder engagement accomplishments from the 2021-2023 biennium.

The Council has contacted the landowners in the watersheds where instream restoration projects are currently being planned or implemented: Jack Creek, Johney Creek, Hardscrabble Creek, Ellenburg Creek. Two new projects are in development and the Council is working with two new landowners in Parker Creek, and two new landowners on Pheasant Creek.

Since 2018, the Council has partnered with ODA to administer the Distaff Thistle/Paterson's Curse eradication program in Douglas County. There are more than 50 landowners that are engaged in this program. Landowners are contacted to get landowner permissions to work on their lands, and are given technical assistance in treating noxious weeds on their properties.

In 2023, the Council began an effort to revitalize the Cox Creek Cooperative Weed Management Area. This will involve contacting and organizing all the landowners in the Cox Creek and Lees Creek Watersheds where there is an outbreak of Portuguese Broom.

The Council is working on a brochure/mailing that will be sent to all the landowners in the the Elk Creek Watershed. The goal is to identify landowners that would like to work with the Council to develop restoration projects, especially instream habitat improvements, on their lands.

The Council has provided technical assistance to private landowners throughout the Watershed, and to the cities of Drain, Elkton, and Yoncalla that are working on their DEQ TMDL implementation Plans.

Briefly describe the council's stakeholder engagement challenges from the 2021-2023 biennium

Due to the Covid pandemic, the Council's annual landowner "Free Lunch" was cancelled in 2020 and 2021, and there was still some hesitancy to resume the program in 2022. The Council is currently working with the Sunnydale Grange, who have provided the chicken dinners for the program, to see if they will be able to continue the program.

The Council has been trying to find a person to focus on contacting landowners and developing new projects in priority sub-basins the Watershed.

Briefly describe the council's stakeholder engagement plans for the 2023-2025 biennium.

The Council's informational brochure should be completed in early 2023. This will be mailed to all the landowners outside the city limits in the Elk Creek Watershed. The goal is to highlight the restoration projects the Council has completed, and to identify landowners that would like to work with the Council to develop restoration projects on their lands.

The most focused landowner engagement effort will the the re-organization of the Cox Creek Cooperative Weed Management Area. All the landowners within the area that is part of the Portuguese Broom outbreak will be contacted. Based on the response from these landowners, the Council will begin developing a treatment plan to control the spread of this noxious weed.

The Council is beginning talks with the Sunnydale Grange to see if they would like to restart the Council's annual "Free Lunch" program.

The Council is considering a contract with a local technical provider to update and maintain the Council's website.

Describe the council's efforts to engage with local tribes present in the council's geography.

There are no tribes actively involved in the geographic area of the Elk Creek Watershed, however the Council has engaged with the Cow Creek Band of the Umpqua Indians through the Council's administration of the Oregon Weed Board grant. That grant treats a Paterson's Curse infestation on tribal land in Douglas County. The Tribe has contributed matching funds for the grant.

The Confederated Tribes of the Coos, Lower Umpqua, and Siuslaw Indians are part of the Umpqua Basin Small Grant Team, which is administered by the Elk Creek Watershed Council.

Douglas County Natural Resources Dept. is currently reorganizing the Douglas County Weed Advisory Board to help combat the spread of noxious weeds in the County. The Tribe has been an active partner in this effort, and the Elk Creek Watershed Council will also be part of that effort.

Describe the council's efforts to engage with non-traditional partners.

There have been no specific efforts to engage with non-traditional partners. Non-traditional partners are not actively involved in the local community.

Restoration

Provide a brief summary of the council's 2021-2023 restoration accomplishments.

The Council continued work on the Jack and Hardscrabble Creeks Restoration project. While the instream habitat structures were placed in 2019, the riparian improvement parts of the project continued in the 2021-2023 biennium. The project installed more than 1.3 miles of fencing along both sides of Jack Creek to exclude livestock from more than 12.5 acres of riparian area. Planting of native trees and shrubs was completed in early 2020, and monitoring continues.

The replacement of two undersized culverts on Johney Creek, completed in late 2021, improved fish passage into the upper reaches of the creek, and prevented fine sediments from impacting fish habitat and water quality downstream.

The Council completed a two-year project to improve habitat for Western Pond Turtles in a 1.5-acre farm pond adjacent to Elk Creek.

The Council signed cooperative agreements with landowners on Parker Creek, and has secured funding to improve instream habitat on more than two (2) miles of high intrinsic potential coho habitat. The Council worked with ODFW to complete the designs for 29 instream structures, has started looking for a source of logs for the project, and hopes to implement in summer of 2023.

The 2-year monitoring reports for two livestock water improvement projects were completed.

OWEB did not fund the Oregon Weed Board projects in 2021. The Elk Creek Council was able to secure other funding so that this long-term, ongoing noxious weed eradication project was able to continue uninterrupted. OWEB funding resumed in 2022, and the Council administered this grant and provided matching funds for this project. The Council has matching funds secured for the 2023 season.

Briefly describe the council's restoration challenges from the 2021-2023 biennium

The effects of the Covid pandemic limited face-to-face interactions with local landowners, and these effects continued into the 2021-2023 biennium. Most of the restoration work that the Council does relies on personal relationships that have been built up over years, and are maintained with personal contact. These relationships

suffered in the 2021-2023 biennium.

Provide a brief summary of the council's restoration plans for 2023-2025.

The Council plans to continue its restoration program, especially instream habitat improvement projects, in the 2023-2025 biennium. Funding for a large project on Parker Creek has been secured, and implementation is scheduled for summer of 2023. Most, but not all, of the necessary funding for a habitat improvement project on Ellenburg Creek has been secured.

The Council has contracted with Cascade Environmental to develop a Restoration Action Plan for the Big Tom Folley Watershed based on the bioassessment survey that was conducted in the summer of 2019.

The completion of the the Council's landowner mailing should identify a new group of landowners that would like to begin planning for restoration work on their properties. These contacts should provide new opportunities to develop restoration projects in other sub-basins.

Control of noxious weeds has always been a Council priority, and the Council is developing a working partnership with the Douglas SWCD to revitalize the Cox Creek Cooperative Weed Management Area. The goal is to get all the landowners in the area to sign on to the CWMA, and to secure funding to begin treatment of the infestation of Portuguese Broom. Portuguese Broom is confined to a small area between Cox Creek and Lees Creek in the Elk Creek Watershed, but it has not been treated since 2018, when the Weed Board stopped funding to this project.

Planning

Describe how the council uses planning documents to identify and implement on-the-ground watershed restoration and stakeholder engagement projects.

The Council has completed bioassessment surveys of many of the highest priority sub-basins in the Elk Creek Watershed: Jack Creek, Johney Creek, Hardscrabble Creek, Ellenburg Creek, Big Tom Folley Creek. The data from the bioassessments has been used to guide Restoration Action Plans for these sub-basins.

These Restoration Plans have been used to develop and implement restoration projects on Jack Creek, Johney Creek, and Hardscrabble Creek. The planning has been completed, and funding is being sought for instream restoration work in Ellenburg Creek.

The bioassessment survey has been completed on Big Tom Folley Creek, and the Council has contracted with Cascade Environmental Group to draft the Restoration Action Plan for the Big Tom sub-basin.

Are projects of the council identified in a council action plan or strategic plan?

● Yes
❍ No

Provide the name and date of the most recent action plan or strategic plan.

Provide context and justification for how your budget was developed. Explain how project costs and/or rates were determined.

Executive Director and Project Development Coordinator services are provided through personal services contracts. Costs associated with delivering these services, which would include such items as salary, benefits, insurance, and indirect costs for an employee, are the responsibility of the contractor, and are included in the

Contracted Services line item..

Contracted Services:

Executive Director: $50,000/year (Estimated @ .75 FTE)

Project Development: $25,000/year (Estimated @ .5 FTE)

Board of Directors: Average of 8 Directors per meeting; 11 meetings per year; 2 hours per meeting; $20.00 per hour.

Does the budget identify a contingency amount for specific line item(s) within the Contracted Services and/or Material and Supplies budget category?

Elk Creek Watershed Council
Bylaws

As amended 11/19/2013

1. ARTICLE 1 - DEFINITIONS, INTERPRETATION, AND CONSTRUCTION

1.1. DEFINITIONS: As used in these Bylaws:

1.1.1. "Applicable Laws" means statutes, regulations, rules, ordinances, and other legal requirements of Governmental Agencies that affect the Council, or these Bylaws.

1.1.2. "Alternate" means an individual appointed to perform the duties of a Director when that Director is unable to do so.

1.1.3. "Board" means the Board of Directors of this Council.

1.1.4. "Council" means the Elk Creek Watershed Council, Inc.

1.1.5. "Director" means an individual appointed by the Board, as a Member of the Board.

1.1.6. "Entity" includes but is not limited to any corporation, unincorporated association, estate, partnership, trust, limited liability company, joint venture, Governmental Agency, and other juristic person.

1.1.7. "Government Agency" includes but is not limited to the State of Oregon and any commission, department, agency, official, or instrumentality of the State of Oregon; the United States and any commission, department, agency, official, or instrumentality of the United States; a county, city, district, authority, or any other municipality or unit of local government.

1.1.8. "Individual" means any natural person.

1.1.9. "Member of the Board" means a Director or an Alternate who is serving on the Board in the absence of the Director represented by that Alternate.

1.1.10. "Person" includes an Individual or Entity.

1.1.11. "Third-Party Claims" includes any demands, claims, legal actions, arbitration, administrative proceedings, criminal proceedings, and other adversarial proceedings that are asserted, filed, prosecuted, or appealed and any resulting expenses and liabilities, including damages, judgments, attorney fees, arbitration costs, and penalties.

1.1.12. "Elk Creek Watershed" and "Watershed" means the entire land area drained by the Elk Creek and its tributaries.

1.1.13. "Statistically Valid Sciences" refers to hypotheses that have been posted, data collections made using standard methodology, with results of the data measurements objectively assessed using an analysis of the data described in the science of statistics.

1.2. STATUTORY DEFINITIONS: Words and phrases that are not defined in these Bylaws will have the definition stated in ORS 65.001, ORS 541.351, or other Applicable Laws. For purposes of interpretation of these Bylaws, the definitions stated in Section 1.1 of these Bylaws supersede definitions contained in Applicable Laws.

1.3. INTERPRETATION: Generally, unless particular provisions of these Bylaws state otherwise or unless the content indicates otherwise, the following provisions apply to interpretation of these Bylaws:

1.3.1. Verbs in the present tense include the future and vice versa.

1.3.2. Nouns include the singular and plural forms.

1.3.3. "Shall", "will", and "must" denote acts or obligations that are mandatory.

1.3.4. "May" signifies a discretionary or permissive act.

1.3.5. "Means" denotes an exhaustive definition.

1.3.6. "Includes" denotes a partial definition. The phrase "without limitation" will be deemed to follow the words "includes" and "including" when referring to a list class or group of Persons, things, conditions, events, obligations, rights, powers, or liabilities.

1.3.7. Words and phrases that are defined by these Bylaws or Applicable Laws are capitalized.

1.3.8. References to sections and subsections of these Bylaws are capitalized.

2. ARTICLE 2 – PURPOSE, GOALS, AND PRINCIPLES IRC 501(C)(3)

PURPOSES This Council is organized and will be operated exclusively for charitable, scientific, and educational purposes.

2.1.2. The purpose of this Council will be to engage in lawful activities, none of which are for profit, for which nonprofit corporations may be organized under the laws of the State of Oregon and 501(c)(3) of the Internal Revenue Code.

2.2. PRIMARY PURPOSES: The primary purposes for which this Council is organized are:

2.2.1. To prepare and implement a Watershed action program for the Elk Creek Watershed pursuant to ORS 541.388;

2.2.2. To improve environmental integrity and economic stability in the Elk Creek Watershed;

2.2.3. To foster community understanding and appreciation of Watershed processes; and

2.2.4. To develop, implement, and monitor practices beneficial to the Watershed health, recognizing that human and livestock use is an important part of the equation.

2.3. GOALS: This Council will endeavor to fulfill the primary purposes stated in Section 2.2 by pursuing the following goals:

2.3.1. Provide public participation in the implementation of ORS 541.351 to 541.426;

2.3.2. Encourage landowners to recognize and accept responsibility for that portion of the Watershed under their stewardship and to take voluntary action in the interest of the Watershed;

2.3.3. Foster public awareness of Watershed processes, activities, and opportunities to take responsibility for, and contribute positively to, the Watershed;

2.3.4. Foster scientific understanding through a program of Watershed information and activities;

2.3.5. Serve as a clearinghouse for Watershed information and activities;

2.3.6. Operate in a manner which supports economic stability and environmental integrity (using Statistically Valid Sciences) within the Elk Creek Watershed; and

2.3.7. Encourage cities and their residents to recognize and accept responsibility for their individual and collective impacts on the Watershed.

2.4. PRINCIPLES: This Council and the Directors ascribe to the following statements of principle:

2.4.1. It is possible to achieve both economic stability and environmental integrity within the Elk Creek Watershed and Douglas County using Statistically Valid Sciences.

2.4.2. The natural product and process of the Watershed are indicators of Watershed health and are important to the economy and vitality of communities.

2.4.3. The actions of Persons residing or working within Douglas County can affect the stability of the Watershed and related economy (livestock, logging, farming, etc.).

2.4.4. Land management and other human activities have a legitimate place in the Watershed.

2.4.5. Coordinated planning and action for Watershed health are important, and are most effectively achieved by the Persons who reside and work within the Watershed.

2.4.6. Watershed-scale perspective improves the ability of Persons to sustain the health of the Watershed and related economic activities.

2.4.7. Fish are important to the economic, recreational, ecological, and cultural values of Persons and communities within the Watershed.

2.4.8. This Council shall respect private property rights during the implementation of projects designed to improve Watershed productivity and health. This Council will participate in a project only with the voluntary cooperation of the owner of the land on which the project is located.

2.4.9. This Council shall have no regulatory authority over any private property or publicly owned or managed lands.

3. ARTICLE 3 – DIRECTORS

3.1. NUMBER: This Council will have eleven (11) regular Directors.

3.2. APPOINTMENT AND ELECTION: Eleven (11) Directors will be appointed by the Board.

3.3. QUALIFICATIONS: Directors must be of the age of majority in State of Oregon and must own land within the Elk Creek Watershed.

3.4. COMPOSITION: The composition of this Watershed Council will represent a balance of interested and affected persons within the Elk Creek Watershed and assure a high level of citizen involvement in development and implementation of a watershed action program.

3.5. TERMS: Except as provided in subsection 3.6.2, Directors appointed by the Board shall serve terms of two years that will begin on March 1 of the year of appointment.

3.6. VACANCIES

3.6.1. A vacancy on the Board will exist upon the death, resignation, or removal of a Director.

3.6.2. If a position held by the elected Director is vacant, the Board will appoint a replacement. This Director shall serve for the remainder of the term of the one being replaced.

3.7. REMOVAL AND RESIGNATION

3.7.1. Any Director who is appointed by the Board may be removed by written order of the Board, with or without cause, in accordance to ORS 65.331. A copy of any order for removal will be kept in the records of the Council.

3.7.2. Any Director may resign by giving written notice in accordance with ORS 65.321.

3.8. ALTERNATES

3.8.1. Each Director of the Board may appoint one Alternate who will attend and participate in the meetings of the Board when the Director is unable to attend. All appointments of Alternates will be subject to the written approval of the Board, which will not be unreasonably withheld.

3.8.2. When a Director dies, resigns or is removed from office, or when a Director's term expires, his or her Alternate appointment will be terminated.

3.8.3. When attending and participating in meetings of the Board on behalf of a Director, an Alternate will have all the powers and duties of a Director.

3.8.4. If an Alternate's position is vacant, a replacement will be appointed in accordance with Subsection 3.8.1.

3.8.5. Any Alternate approved by the Board can serve as Alternate for more than one Director, but may only represent one Director at a meeting.

3.9. POWERS: Subject to Applicable Laws and limitations of these Bylaws, the activities and affairs of this Council will be conducted and all powers will be exercised under the direction of the Board.

3.10. DUTIES OF THE BOARD

3.10.1. The Members of the Board shall perform any and all duties imposed on them individually or collectively by Applicable Laws, or these Bylaws.

3.10.2. In addition to other duties imposed by Applicable Laws, and these Bylaws, the Board shall:

1. Appoint and remove, employ and discharge, and except as otherwise provided in these Bylaws, prescribe the duties and fix the compensation, if any, of all officers, agents and employees of the Council.
2. Supervise all officers, agents and employees of the Council to assure their duties are performed properly.
3. Develop such policies, procedures, and rules that the Board deems necessary for exercising the powers granted by these Bylaws, including rules regarding meetings of the Board and committees; policies regarding entry upon private land; policies regarding confidentiality of information provided this Council by Persons; procedures of financial transactions; and rules governing committees.

3.11. COMPENSATION: Directors and Alternates will serve without compensation for their services, but they will be allowed reasonable advancement or reimbursement of expenses incurred in performance of their duties as approved by the Board.

3.12. TIME AND PLACE OF MEETINGS

3.12.1. Meetings of the Board will be held at the Sunnydale Grange Hall unless otherwise provided by the Board.

3.12.2. Regular meetings will be held on the 3rd Tuesday of each month at 7:00 PM. If the regular meeting day falls on a legal holiday, an alternate meeting date and time may be selected by the Board.

3.13. NOTICE OF MEETINGS

3.13.1. No notice is required for any regular meeting of the Board.

3.13.2. Except as provided in Subsection 3.13.3, the Secretary of the Council shall give each Director notice of a special meeting of the Board at least seven (7) days before the meeting is held. Such notice may be oral or written. Oral notice may be given personally or by telephone, and a written record of the notice must be made. Written notice may be given by personal delivery, deposit in the U.S. mail, facsimile transmission, telegraph, or e-mail.

3.13.3. If emergency circumstances require immediate action by the Board, notice may be given personally, or by telephone, facsimile transmission, or email not less than twenty four hours before the time of the meeting.

3.13.4. The notice of a special meeting must state the place, date, and time of the meeting and the matters proposed to be acted upon at the meeting. If an emergency meeting is called, the notice must describe the nature of the emergency.

3.13.5. If the Secretary learns that a Director will not be able to attend a special meeting, or if the Secretary cannot after diligent effort locate a Director to give notice, the Secretary shall give notice to the Alternate for that Director. If a Director learns that he or she cannot attend a regular or special meeting, the Director will notify both the Secretary and the Director's Alternate personally, by telephone, by facsimile transmission, or by e-mail.

3.13.6. Whenever notice of a meeting is required to be given to a Director, a written waiver of notice signed by the Director, before or after the time of the meeting, will be equivalent to giving such notice.

3.14. QUORUM FOR MEETINGS:

3.14.1. Six (6) voting Members of the Board constitute a quorum for the Board. An Alternate will be counted for purpose of a quorum only if the Director represented by the Alternate is not present at the meeting.

3.14.2. No final action will be taken by the Board at any meeting at which the required quorum is not present.

3.15. DECISIONS OF BOARD: The decisions of the Board will be made by a majority vote.

3.16. CONDUCT OF MEETINGS:

3.16.1. The Chairman of the Council will preside over meetings. If the Chairman is absent, the Vice-Chairman will preside over a meeting. If Chairman and Vice-Chairman are absent, the Board may designate a temporary Chairperson to preside over the meeting.

3.16.2. Minutes of meetings will be kept by or under the direction of the Secretary of the Council.

3.16.3. Meetings will be governed by rules of order determined by the Board that are consistent with these Bylaws and Applicable Laws.

4. ARTICLE 4 – OFFICERS

4.1. QUALIFICATIONS: Any individual Director of the Council may serve as officer of this Council.

4.2. ELECTION AND TERM OF OFFICE: Officers will be elected by the Board annually between March 1 and March 31.

4.3. RESIGNATION: Any officer may resign at any time by giving written notice to the Board or to the Chairman or Secretary of the Council. Any resignation will take effect the date of receipt of such notice or at any later date specified therein, and, unless otherwise specified therein, the acceptance of such resignation will not be necessary to make it effective.

4.4. VACANCIES: A vacancy caused by death, resignation, or removal of an officer will be filled by the Board. A vacancy in any office other than the Chairman may be filled temporarily by appointment by the Chairman until the Board fills the vacancy. Vacancies occurring in offices of officers created at the discretion of the Board may or may not be filled as the Board determines.

4.5. DUTIES OF THE CHAIRMAN

4.5.1. The Chairman will be chief executive officer of the Council and shall, subject to the control of the Board, supervise and control the affairs of the Council and the activities of the officers.

4.5.2. The Chairman shall preside at all meetings of the Council.

4.5.3. Except as otherwise provided in Applicable Laws or the Bylaws, the Chairman shall, in the name of the Council, execute deeds, mortgages, bonds, contracts or other instruments when authorized by the Board.

4.6. DUTIES OF THE VICE-CHAIRMAN: The Vice-Chairman will perform all duties of the Chairman when the Chairman is absent or is unable or unwilling to perform those duties. When acting as Chairman the Vice-Chairman will have the powers and responsibilities of the Chairman.

4.7. DUTIES OF THE SECRETARY

4.7.1. The Secretary shall:

1. Certify and keep the original, or a copy, of these Bylaws as amended;
2. Keep minutes of all meetings of the Board and committees.
3. Assure that all notices are duly given in accordance with these Bylaws or as required by Applicable Laws; and
4. Be custodian of the records of the Council.

4.7.2. Clerical tasks assigned to the Secretary may be performed by others under the direction of the Secretary.

4.8. DUTIES OF THE TREASURER

4.8.1. The Treasurer shall:

1. Have charge and custody of, and be responsible for, all funds and securities of the Council and deposit all funds in the name of the Council in banks or other depositories selected by the Board;
2. Receive, and give receipt for, monies due and payable to the Council;
3. Disburse, or cause to be dispersed, the funds of the Council as may be directed by the Board, taking proper vouchers for such disbursements.
4. Keep and maintain adequate and correct accounts of the Council's properties and business transactions, including accounts of its assets, liabilities, receipts, disbursements, gains and losses.
5. Render to the Chairman and Board, whenever requested, an account of any or all of his or her transactions as Treasurer and of the financial condition of the Council; and
6. Prepare, or cause to be prepared, and certify, or cause to be certified, the financial statements to be included in the required reports.

4.8.2. Clerical and bookkeeping tasks assigned to the Treasurer may be performed by others under the direction of the Treasurer.

4.9. ADDITIONAL DUTIES: In addition to the duties listed, each officer shall perform other such duties as may be required by Applicable Laws, or by other provisions of these Bylaws, or which may be assigned from time to time by the Board.

5. ARTICLE 5 – COMMITTEES

5.1. FORMATION OF COMMITTEES: The Board or the Chairman may establish standing committees and ad hoc committees to assist and advise the Board. The authority of each committee will be determined by the Board or the Chairman and may be modified or revoked by the Board or the Chairman at any time.

5.2. MEETINGS AND ACTIONS OF MEETINGS:

5.2.1. Committees will be subject to the control of the Board and may only perform functions and take actions that are authorized by the Board.

5.2.2. The committees will determine the time and place of committee meetings, unless directed otherwise by the Board. Notice of committee meetings will be given to committee members in the same manner as notice of Board meetings is given to Members of the Board.

5.2.3. The Board may designate the Chairperson of a committee who will preside over meetings of the committee, but if the Board does not do so, the committee may designate the Chairperson.

5.2.4. Meetings and decisions of committees will be governed by rules determined by the Board that are consistent with these Bylaws and Applicable Laws.

5.2.5. Each committee shall report on its actions to the Board at the next regular Board meeting.

6. ARTICLE 6 – EXECUTION OF INSTRUMENTS, DEPOSITS AND FUNDS

6.1. LIABILITY FOR COUNCIL OBLIGATIONS: The Directors, Alternates and officers will not be personally liable for the debts, liabilities, or other obligations for the Council.

6.2. INDEMNIFICATION BY COUNCIL OF DIRECTORS AND OFFICERS: The Directors, Alternates, officers, and other agents of the Council who are acting on behalf of the Council in accordance with these Bylaws will be indemnified from Third-Party Claims by the Council to the fullest extent permissible under Applicable Laws.

6.3. INSURANCE FOR COUNCIL AGENTS: The Board may, by resolution, authorize the Council to purchase and maintain liability insurance for any agent of the Council (including a Director, Alternate, officer, employee, or other agent of the Council) against Third-Party Claims arising out of the agent's acts or omissions that occur while the agent is acting on behalf of the Council in accordance with the Council Bylaws.

7. ARTICLE 7 – LIABILITIES AND THIRD-PARTY CLAIMS

7.1. EXECUTION OF INSTRUMENTS: The Board, unless as otherwise provided in the Bylaws, may by resolution authorize any officer or agent of the Council to enter into any contract or execute and deliver any instrument in the name of and on behalf of the Council, and such authority may be general or confined to specific instances. Unless so authorized, no officer, agent, or employee will have any power or authority to bind the Council by any contract or engagement or to pledge its credit or to render it liable for any purpose or in any amount.

7.2. CHECKS AND NOTES: Except as otherwise provided in these Bylaws, or as otherwise required by Applicable Laws, checks, drafts, promissory notes, orders for payment, and other evidence of indebtedness of the Council must be signed by two officers of the Council.

7.3. DEPOSITS: All funds of the Council must be deposited in a timely manner to the credit of the Council in banks or other depositories selected by the Board.

7.4. GIFTS: The Board may accept on behalf of the Council any contribution, gift, bequest or devise for the nonprofit of this Council.

8. ARTICLE 8 – COUNCIL RECORDS

8.1. MAINTENANCE OF COUNCIL RECORDS: The Council shall keep all Council records at its principle office, including:

8.1.1. A copy of the Bylaws as amended to date;

8.1.2. Minutes of each meeting of the Board, any committee appointed by the Board, which indicate:

1. The time and place of the meeting;
2. Whether the meeting was regular or special;
3. How the meeting was called;
4. The notice given for the meeting;
5. The names of those present; and
6. The business transacted at the meetings;

8.1.3. Adequate and correct books and records of accounts, including accounts of its properties and business transactions and accounts of its assets, liabilities, receipts, disbursements, gains and losses; and

8.1.4. Any records required by Applicable Laws.

8.2. INSPECTION OF RECORDS: Every Director will have the absolute right at any reasonable time to inspect and copy all books, records, and documents of every kind and to inspect the physical properties of this Council as may be required under these Bylaws and Applicable Laws.

8.3. PERIODIC REPORT: The Board shall cause any annual or periodic reports required by Applicable Laws to be submitted to the Secretary of State.

9. ARTICLE 9 – IRC 501(C)(3) TAX EXEMPT PROVISIONS

9.1. LIMITATION ON ACTIVITIES

9.1.1. No substantial part of the activities for this Council will be the carrying on of propaganda, or otherwise attempting to influence legislation, except as otherwise provided in Section 501(h) of the Internal Revenue Code, and this Council will not participate in, or intervene in (including the publishing or distribution of statements), any political campaign on behalf of, or in opposition to, any candidate for public office.

9.1.2. Notwithstanding any other provisions of these Bylaws, this Council will not carry on any activities not permitted to be carried on by a corporation exempt from federal income tax under Section 501(c)(3) of the Internal Revenue Code, or by a corporation, contributions to

which are deductible under Section 170(c)(2) of the Internal Revenue Code.

9.2. PROHIBITION AGAINST PRIVATE INUREMENT: No part of the net earnings of this Council will inure to the benefit of, or be distributable to, its Members, Directors or trustees, officers, or other private Persons, except that the Council will be authorized and empowered to pay reasonable compensation for services rendered and to make payments and distributions in furtherance of the purposes of this corporation.

9.3. DISTRIBUTION OF ASSETS: Upon dissolution of this Council, its assets remaining after payment of all debts and liabilities of this Council will be distributed for one or more exempt purposes within the meaning of Section 501(c)(3) of the Internal Revenue Code or will be distributed to the federal government, or to a state or local government, for a public purpose. Such distribution will be made in accordance with all Applicable Laws.

10. ARTICLE 10 – AMENDMENT OF BYLAWS

10.1. AMENDMENTS IN GENERAL: Subject to the powers of the Members under Section 10.2 and except as otherwise provided by the Articles of Incorporation and Applicable Bylaws, these Bylaws may be amended by approval of the Board.

10.2. AMENDMENTS TO ARTICLE 2: Amendments to Article 2 of these Bylaws concerning purposes, goals and principles of this Council may be approved by 60% of the Board as determined by the “Director’s List” 30 days prior to the vote on the proposed change.

BEFORE THE BOARD OF COUNTY COMMISSIONERS
OF DOUGLAS COUNTY

AN ORDER ESTABLISHING THE ELK CREEK WATERSHED COUNCIL AND APPROVING ITS STEERING COMMITTEE MEMBERS	)))))	ORDER

This matter comes before the Board of County Commissioners on February 6, 2002, and the Board finds:

1. The Oregon Legislative Assembly has encouraged local government groups to form voluntary local watershed councils to protect and enhance the quality of the watershed;

2. Management techniques and programs for the protection and enhancement of the Elk Creek watershed are most effective and efficient when voluntarily initiated at the local level;

3. Cooperative partnerships between affected private individuals, interested citizens, and representatives of local, state and federal agencies may improve opportunities to address the goals of sustaining natural resource values and watershed protection and enhancement within the Smith River Basin Watershed.

4. A watershed council is most effective when it includes a balance of interested and affected persons within the watershed and assures that all parties and persons with interests in the watershed are afforded opportunities to be involved in watershed protection and enhancement.

NOW, THEREFORE, IT IS HEREBY ORDERED:

1. The *Elk Creek Watershed Council*, comprised of the residents of Douglas County to protect and enhance the Elk Creek Basin Watershed, is hereby created.

2. Membership in said watershed council shall be open to any person, party, or entity interested in and/or affected by activities in the Elk Creek basin watershed;

3. The watershed council shall be advisory to the Douglas County Board of Commissioners.

4. The watershed council shall have no regulatory authority over any private property or publicly owned or managed property within Douglas County.

///
///
///

5. The Elk Creek Watershed Council shall be managed by a steering committee made up of interested and affected persons who are representative of the following interests:

Agriculture, Livestock, Ranching
Timber, Mining and Aggregate
Fishing, Recreation, Conservation
Municipalities, Local Conservation Districts
Douglas County Commissioners
Member at Large

6. The steering committee's members shall be appointed by the Board of Commissioners, and the individuals as listed on the attached **Exhibit A** shall make up the membership of the initial steering committee.

7. The terms of the original members shall be staggered and shall be selected by lottery drawing among each interested group; one-half for an initial two year term, and one-half for an initial three year term. Terms shall commence the first day of March of the year appointed. After the initial term, each appointment shall be for a term of two years. At the expiration of a member's term, the Board of Commissioners shall appoint a new member or may reappoint the member whose term expired for no more than one additional two year term. If a member resigns from the committee, the board shall appoint a replacement who shall serve for the remainder of the term of the member being replaced. The committee shall appoint its own chair, and each committee member shall select one alternate to serve in his/her absence.

8. The watershed council's steering committee shall operate on a consensus approach.

9. The Douglas County Board of Commissioners shall evaluate the watershed council on a two year cycle; at which time changes, deletions, additions or other modification may be made.

10. The boundaries of the Elk Creek Watershed Council are the Elk Creek watershed boundaries within Douglas County.

11. The boundaries of the Umpqua Basin Watershed Council are hereby modified to exclude the Elk Creek watershed. The Elk Creek watershed is not within the geographic area of the Umpqua Basin Watershed Council.

///
///
///
///
///
///

12. Any watershed council conducting projects, managing projects, seeking grants or otherwise operating outside its own watershed boundaries and within the boundaries of another watershed council shall notify the watershed council in the affected area of the project, grant application or operations.

DATED this 13th day of February, 2002.

BOARD OF COUNTY COMMISSIONERS
OF DOUGLAS COUNTY, OREGON

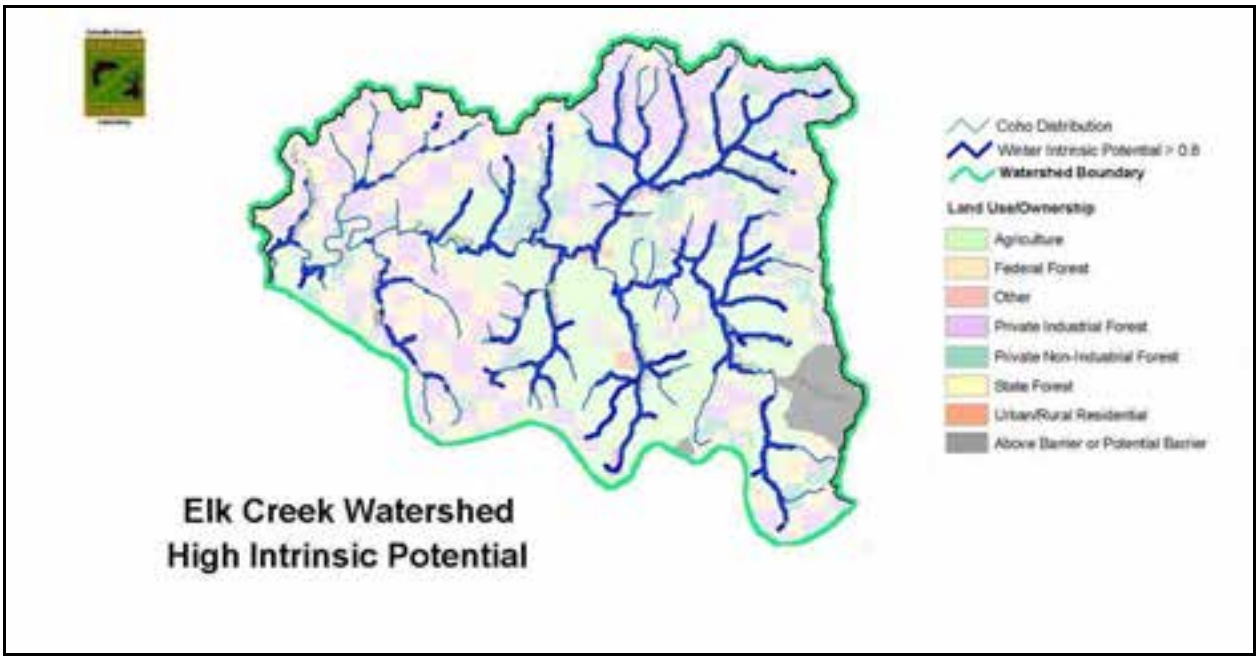
DOUG ROBERTSON, CHAIR

MICHAEL J. WINTERS, COMMISSIONER

Commissioner Morgan voted against
JOYCE MORGAN, COMMISSIONER

Elk Creek Watershed Council

Policies and Procedures



Spawning Coho - Cox Creek

[As Amended: 17 January 2023]

THE ELK CREEK WATERSHED

The Elk Creek Watershed comprises 187,000 acres in North Douglas County. The watershed is sparsely populated, with a population of approximately 5,000. There are two (2) incorporated cities within the watershed, Drain and Yoncalla, each with a population of approximately 1,100. The majority of the land in the watershed is privately owned (76%), the other 24% is O&C land managed by the Roseburg District BLM. The primary land use is forestry (73%), and of this forest land, 46% is industrial timber and 54% is small woodland owners. The remainder of the land (27%) is used for agriculture, predominately for raising cattle and sheep.

The Elk Creek Watershed is important habitat for coho salmon. The watershed contains more miles of High Intrinsic Potential coho habitat than any other fifth-field watershed in the Umpqua Basin. Of the 248 miles of anadromous fish habitat in the watershed, 172 miles are High Intrinsic Potential for coho. The majority of this habitat is in the lower reaches of the tributaries on privately owned agricultural land.

THE ELK CREEK WATERSHED COUNCIL

The Elk Creek Watershed Council is a 501(c)(3) non-profit corporation. The council was formed in 2002 to engage and inform landowners in the watershed about conditions in the watershed, and about how their land management actions affect the watershed, and especially the habitat of anadromous fish. The council is actively engaged in developing and implementing voluntary watershed restoration and improvement projects with willing landowners.

PURPOSE

The primary *purposes* of the Elk Creek Watershed Council are:

- To prepare and implement a watershed action program for the Elk Creek Watershed pursuant to ORS 541.388;
- To improve environmental integrity and economic stability in the Elk Creek Watershed;
- To foster community understanding and appreciation of watershed processes; and
- To develop, implement, and monitor practices beneficial to the watershed health, recognizing that human and livestock use is an important part of the equation.

Elk Creek Watershed Council Bylaws (Amended: 11/19/2013)

GOALS

The primary *goals* of the Elk Creek Watershed Council are:

- To provide public participation in the preparation and implementation of a watershed action program for the Elk Creek Watershed;
- To encourage landowners to recognize and accept responsibility for that portion of the watershed under their stewardship and to take voluntary action in the interest of the watershed;
- To foster public awareness of watershed processes, activities, and opportunities to take responsibility for, and contribute positively to, the watershed;
- To foster scientific understanding through a program of watershed information and activities;
- To serve as a clearinghouse for watershed information and activities;
- To operate in a manner which supports economic stability and environmental integrity (using statistically valid science) within the Elk Creek Watershed; and
- To encourage cities and their residents to recognize and accept responsibility for their individual and collective impacts on the Watershed.

Elk Creek Watershed Council Bylaws (Amended: 11/19/2013)

PRINCIPLES

The primary *principles* of the Elk Creek Watershed Council are:

- It is possible to achieve both economic stability and environmental integrity within the Elk Creek Watershed and Douglas County using statistically valid sciences;
- The natural product and process of the Watershed are indicators of Watershed health and are important to the economy and vitality of communities;
- The actions of persons residing or working within the Elk Creek Watershed can affect the stability of the watershed and related economy (livestock, logging, farming, etc.);

- Land management and other human activities have a legitimate place in the Watershed;
- Coordinated planning and action for watershed health are important, and are most effectively achieved by the persons who reside and work within the watershed;
- Watershed-scale perspective improves the ability of persons to sustain the health of the watershed and related economic activities;
- Fish are important to the economic, recreational, ecological, and cultural values of persons and communities within the watershed;
- This council shall have no regulatory authority over any private property or publicly owned or managed lands; and
- This council shall respect private property rights during the implementation of projects designed to improve watershed productivity and health. This council will participate in a project only with the voluntary cooperation of the owner of the land on which the project is located.

Elk Creek Watershed Council Bylaws (Amended: 11/19/2013)

POLICIES

I.) ORGANIZATIONAL POLICIES:

In the conduct of its business, it shall be the *policy* of the Elk Creek Watershed Council to:

- Encourage the public to attend council meetings, and to participate in council activities.
- Conduct the business of the council in an open and transparent manner. This shall include public announcements of regularly scheduled council meetings and access to agendas and minutes of council meetings.
- Include a broad representation of community interests on the governing board of the council. These interests shall include representatives of the primary land uses in the watershed, *i.e.* agriculture, forestry, and urban.
- Include representatives of state and federal land management agencies that operate within the watershed in all activities and decisions of the council, *i.e.* Douglas Soil and Water Conservation District, Oregon Department of Fish and Wildlife, and Roseburg District Bureau of Land Management.
- Respect private property rights during the implementation of projects designed to improve watershed productivity and health. The council will participate in a project only with the voluntary cooperation of the owner of the land on which the project is located.
- Not use litigation as a means to achieve the council's ecological goals. The Elk Creek Watershed Council is *not* a regulatory agency, and has *no* regulatory authority.

II.) CONFLICT OF INTEREST POLICIES:

- Statement of Potential Conflict of Interest: Occasionally, the council will consider a decision that involves a member of the Board of Directors. If the Board's decision may have a financial impact, either on the Board Member, his/her immediate family, or on a company that the Board Member or his/her family has a financial interest in, there may be a conflict of interest. If a Board Member feels that there may be a potential conflict of interest, he/she shall immediately bring the potential conflict to the attention of Board of Directors. The Board Member will disclose to the Board all details of the potential conflict of interest.
- Conflict of Interest: If a member of the Board of Directors declares that there may be a conflict of interest, the Board Member with the conflict will not participate in any further discussion, or any votes on the matter being considered by the Board. The remaining Board members will consider the potential conflict of interest, and determine whether the conflict of interest warrants exclusion of the Board member from discussion or voting on the matter at hand. The Board member with the potential conflict may request a vote. The final decision will be made by a majority vote of the remaining Board members.

III.) FISCAL POLICIES:

It shall be the *policy* of the Elk Creek Watershed Council to:

- Ensure that the highest standards of accountability are maintained, and that internal controls over financial records reflect generally accepted accounting procedures (GAAP);
- Maintain council financial records in a QuickBooks accounting system. The system shall be available for review by any member of the Board of Directors upon request;
- Require that all council expenditures be reviewed and approved by a majority vote of the Board of Directors. Approval may be by a vote at a regularly scheduled council meeting, or by a phone poll of the Board;
- Require that all council checks be reviewed and signed by two (2) officers of the Board of Directors.
- Duties of the Executive Director:
  - Enter bills (accounts payable) and checks (accounts receivable) into the QuickBooks system;
  - Reconcile the monthly bank statement with the QuickBooks system and submit the reconciliation report to the Treasurer;
  - Prepare and submit a report of accounts payable and accounts receivable to the Treasurer before each monthly meeting.

- Duties of the Treasurer:
  - Review the monthly reconciliation report, accounts payable, and accounts receivable, and prepare a written report for the Board of Directors before each monthly meeting;
  - Present the Treasurer's report, including bank reconciliation, accounts payable, and accounts receivable to the Board of Directors at each monthly meeting. The Treasurer's report will be accepted by a majority vote of the Board of Directors.

IV.) CONTRACTOR POLICIES:

- Contracted Services: It is the policy of the Elk Creek Watershed Council to secure the services necessary for managing the operations of the council, and for managing the projects and programs of the council, through contracts with qualified, independent contractors.
- Contract Review: The Elk Creek Watershed Council will complete a review of the Council Coordinator/Executive Director at least every biennium. The evaluation will be reviewed by the Executive Committee and the schedule of the review will be announced at the regular monthly council meeting. All Directors will be invited to attend.

V.) COUNCIL ACTION PLAN:

- Watershed Council Action Plan: It is the policy of the Elk Creek Watershed Council to review and update its Action Plan at least every two (2) years. The Action Plan will be reviewed by the Executive Committee and the schedule of the review will be announced at the regular monthly council meeting. All Directors will be asked for input and invited to attend. Recommendations of the Executive Committee, and a draft of the updated Action Plan, will be presented at the next monthly meeting. Acceptance of the Action Plan will be by a majority vote of the Board of Directors.
- Self-Evaluation: The OWEB Council Support Grant requires that the council complete a self-evaluation at least every two (2) years. The self-evaluation will be part of the process to review and update the council's Action Plan. The self-evaluation will be reviewed by the Executive Committee and the schedule of the review will be announced at the regular monthly council meeting. All Directors will be asked for input and invited to attend. Recommendations of the Executive Committee will be included in the draft of the updated Action Plan. Acceptance will be by a majority vote of the Board of Directors.

Elk Creek Watershed Council

2022 Action Plan

Johney Creek Culvert Replacement - August 2021

May 2022

PURPOSE

The primary purposes of the Elk Creek Watershed Council are:

- To prepare and implement a Watershed action program for the Elk Creek Watershed pursuant to ORS 541.388;
- To improve environmental integrity and economic stability in the Elk Creek Watershed;
- To foster community understanding and appreciation of watershed processes; and
- To develop, implement, and monitor practices beneficial to the watershed health, recognizing that human and livestock use is an important part of the equation.

Elk Creek Watershed Council Bylaws (Amended: 11/19/2013)

GOALS

The primary goals of the Elk Creek Watershed Council are:

- To provide public participation in the implementation of ORS 541.351 to 541.426;
- To encourage landowners to recognize and accept responsibility for that portion of the watershed under their stewardship and to take voluntary action in the interest of the watershed;
- To foster public awareness of watershed processes, activities, and opportunities to take responsibility for, and contribute positively to, the watershed;
- To foster scientific understanding through a program of watershed information and activities;
- To serve as a clearinghouse for watershed information and activities;
- To operate in a manner which supports economic stability and environmental integrity (using statistically valid science) within the Elk Creek Watershed; and
- To encourage cities and their residents to recognize and accept responsibility for their individual and collective impacts on the Watershed.

Elk Creek Watershed Council Bylaws (Amended: 11/19/2013)

Elk Creek Watershed Council

Strategic Restoration Action Plan

June 2019

The Elk Creek Watershed Council 2022 Action Plan is based on the priority subwatersheds, and priority restoration actions, developed in the Council's long-range Strategic Restoration Action Plan - June 2019.

Subwatershed	Total Stream Channel Miles Surveyed	Poor Summer Habitat %	Poor Winter Habitat %	Poor Winter / Summer Overlap %	% Private Industrial Forest	TOTAL POINTS	PRIORITY RANKING
Middle Elk Creek	11.30	59%	72%	59%	30%	**13**	**HIGHEST**
Lower Pass Creek	29.78	65%	80%	46%	45%	**12**	**HIGHEST**
Big Tom Folley Creek	15.23	39%	61%	31%	47%	**12**	**HIGHEST**
Brush Creek	13.50	44%	96%	44%	45%	**11**	**NEXT HIGHEST**
Billy Creek	17.31	69%	55%	40%	42%	**11**	**NEXT HIGHEST**

Upper Pass Creek	12.37	65%	37%	25%	38%	**7**	**LOWEST**
TOTAL	**148.49**						

2022 ACTION PLAN

GOAL 1: WATERSHED RESTORATION:

Plan and implement projects in the Elk Creek Watershed that restore or improve habitat for fish and wildlife, especially endangered coho salmon; that restore or improve riparian habitat and function; and that restore or improve upland habitat and function.

A. Strategy 1: Improve or Restore Instream Habitat

Priority Actions:

- Improve coho summer and overwinter habitat
- Improve complex instream habitat for juvenile coho
- Restore floodplain connectivity

Priority Watersheds:

- Middle Elk Creek 6th-Field
- Lower Pass Creek 6th-Field
- Big Tom Folley Creek 6th-Field

Current Projects:

Action 1: Jack-Hardscrabble Creek Habitat & Riparian Improvement [High Priority]
Action 2: Parker Creek Habitat Improvement [High Priority]

Projects in Development:

Action 1: Ellenburg Creek Habitat Improvement [High Priority]
Action 2: Upper Ellenburg Creek Habitat Improvement [Medium Priority]

B. Strategy 2: Improve or Restore Instream Connectivity

Priority Actions:

- Restore or improve anadromous fish passage

Priority Watersheds:

- Middle Elk Creek 6th-Field
- Lower Pass Creek 6th-Field
- Big Tom Folley Creek 6th-Field

Current Projects:

Action 1: Johney Creek Culvert Replacements [High Priority]
Action 2: Ellenburg Creek Fish Passage Improvement [High Priority]

Projects in Development:

Action 1: Upper Ellenburg Creek Culvert Replacement [Medium Priority]
Action 2: Big Tom Folley Culvert Replacement [Medium Priority]

C. <u>Strategy 3</u>: Improve or Restore Riparian Habitat and Function

Priority Actions:

- Install livestock exclusion fencing
- Replace invasive species with native trees and shrubs
- Plant willows to reduce streambank erosion and encourage beaver expansion

Priority Watersheds:

- Middle Elk Creek 6th-Field
- Lower Pass Creek 6th-Field
- Big Tom Folley Creek 6th-Field

Current Projects:

Action 1: Jack-Hardscrabble Creek Habitat & Riparian Improvement [High Priority]
Action 2: Clover Creek Tributary Fencing [Medium Priority]
Action 3: Johney Creek Riparian Improvement [Medium Priority]

Projects in Development:

Action 1: Parker Creek Riparian Improvement [Medium Priority]

D. <u>Strategy 4</u>: Improve or Restore Upland Habitat and Function

Priority Actions:

- Reduce erosion from upland sources
- Reduce runoff from agricultural lands

Priority Watersheds:

- Middle Elk Creek 6th-Field
- Lower Pass Creek 6th-Field
- Yoncalla Creek

Current Projects:

Action 1: Kennerly Stream Protection [High Priority]
Action 2: Turkey Crick Livestock Water [High Priority]
Action 3: Clover Creek Livestock Water [High Priority]

Projects in Development:

Action 1: Van Epps Livestock Water [Medium Priority]
Action 2: City of Elkton Stormwater Erosion Control [High Priority]
Action 3: Branscomb Upland Habitat Improvement [High Priority]

GOAL 2: WATERSHED MONITORING:

Plan and implement projects that monitor the condition of water quality, and fish and wildlife habitat in the Elk Creek Watershed.

A. Strategy 1: Watershed Assessment

Priority Actions:

- Using the rapid bioassessment protocols developed by the Elk Creek Watershed Council and Cascade Environmental, collect data on anadromous fish numbers and distribution, and on habitat conditions, in priority sub-basins in the watershed

Priority Watersheds:

- Middle Elk Creek 6th-Field
- Lower Pass Creek 6th-Field
- Big Tom Folley 6th-Field

Current Projects:

Action 1: Jack Creek Bioassessment [High Priority]

Projects in Development:

Action 2: Sand Creek/Rock Creek Bioassessment [Medium Priority]

B. Strategy 2: Water Quality Monitoring

Priority Actions:

- Monitor water quality in the Elk Creek Basin

Priority Watersheds:

- Yoncalla Creek
- Billy Creek
- Jack Creek

Projects in Development:

Action 1: Elk Creek Temperature Study [Medium Priority]

GOAL 3: COMMUNITY OUTREACH AND EDUCATION:

Provide information and technical assistance to landowners that increases their understanding of watershed processes, and fosters land management actions that improve conditions in the watershed.

A. Strategy 1: Improve awareness of watershed processes and fish life cycles:

Priority Actions:

- Provide technical assistance to landowners and land managers requesting assistance
- Provide educational opportunities to the general public

Current Projects:

Action 1: Elk Creek Watershed "Free Lunch" Program [High Priority]
Action 2: Elk Creek Watershed Council web site [High Priority]
Action 3: Elk Creek Watershed Council Education Program [Medium Priority]

Projects in Development:

Action 1: Expand the Elk Creek Watershed Council website [High Priority]
Action 2: Develop Elk Creek Watershed Council brochure [Medium Priority]

B. Strategy 2: Increase public awareness of the council and its activities:

Priority Actions:

- Provide the general public information about the council and its activities

Current Projects:

Action 1: Elk Creek Watershed "Free Lunch" Program [High Priority]
Action 2: Elk Creek Watershed Council web site [High Priority]
Action 3: Elk Creek Watershed Council Education Program [Medium Priority]

GOAL 4: ORGANIZATIONAL IMPROVEMENT:

Improve the organizational effectiveness of the Elk Creek Watershed Council to carry out its mission, and to be a leader in the management of natural resources in the watershed.

A. Strategy 1: Update the Council's Work Plan goals for the 2021-2023 Biennium:

Priority Actions:

- Complete a Council self-evaluation using the OWEB self-evaluation tool

B. Strategy 2: Develop Collaborative Partnerships with Other Organizations:

Priority Actions:

- Develop and maintain Watershed Council collaborative efforts with other natural resource agencies and organizations within the Elk Creek Watershed and the Umpqua Basin

Current Projects:

Action 1: Continue Watershed Council participation and involvement in current Umpqua Basin partnerships and working groups [High Priority]

- Douglas County/Umpqua Basin CREP Partnership
- Douglas County Noxious Weed Control Program
- Umpqua Basin Collaborative (Focused Investment Partnership
- Umpqua Basin Beaver Workgroup
- NRCS Local Workgroup

Projects in Development:

Action 1: Explore opportunities to develop new partnerships, and to collaborate with other natural resource agencies and organizations, to encourage conservation and land use practices that promote environmental integrity and economic stability in the Elk Creek Watershed and the Umpqua Basin [High Priority]

GOAL 5: WATERSHED PLANNING:

Develop restoration plans at appropriate scales and time frames to guide watershed restoration in the Elk Creek Watershed.

A. Strategy 1: Develop sub-watershed-scale restoration action plans

Priority Actions:

- Develop restoration action plans for priority sub-basins in the Elk Creek Watershed

Current Projects:

Action 1: Big Tom Folley Restoration Action Plan [High Priority]

APPROVED:

The Elk Creek Watershed Council 2020 Action Plan is hereby accepted and adopted by the Board of Directors of the Elk Creek Watershed Council.

James Mast - Chairman May 17, 2022

MATCH FUNDING FORM

Document here the match funding shown on the budget page of your grant application

OWEB accepts all non-OWEB funds as match. An applicant may not use *another OWEB grant* to match an OWEB grant; this includes ODA Weed Board projects because they are funded through OWEB grants. However, an applicant who benefits from a pass-through OWEB agreement with another state agency, by receiving either staff expertise or a grant from that state agency, may use those benefits as match for an OWEB grant. (Example: A grantee may use as match the effort provided by ODFW restoration biologists because OWEB funding for those positions is the result of a pass-through agreement).

At the time of application, match funding for OWEB funds requested does not have to be *secured*, but you must show that at least 25% of match funding has been *sought*. On this form, you do not necessarily need to show authorized signatures ("secured match"), but the more match that is secured, the stronger the application. Identify the type of match (cash or in-kind), the status of the match (secured or pending), and either a dollar amount or a dollar value (based on local market rates) of the in-kind contribution.

If you have questions about whether your proposed match is eligible or not, see Allowable Match document in OGMS http://apps.wrd.state.or.us/apps/oweb/fiscal/nologin.aspx under Technical Assistance application or contact your local OWEB regional program representative (contact information available in the instructions to this application).

Project Name: Elk Creek Council Support

Applicant: Elk Creek Watershed Council

Match Funding Source	Type (√ one)	Status (√ one)*	Dollar Value	Match Funding Source Signature/Date*
Elk Creek Watershed Council	☒ cash ☐ in kind	☒ secured ☐ pending	$30,000.00	
	☐ cash ☐ in kind	☐ secured ☐ pending		
	☐ cash ☐ in kind	☐ secured ☐ pending		
	☐ cash ☐ in kind	☐ secured ☐ pending		
	☐ cash ☐ in kind	☐ secured ☐ pending		
	☐ cash ☐ in kind	☐ secured ☐ pending		
	☐ cash ☐ in kind	☐ secured ☐ pending		
	☐ cash ☐ in kind	☐ secured ☐ pending		
	☐ cash ☐ in kind	☐ secured ☐ pending		

* **IMPORTANT:** If you checked the "Secured" box in the Status Column for any match funding source, you must provide either the signature of an authorized representative of the match source in the final Column, or attach a letter of support from the match funding source that specifically mentions the dollar amount you show in the Dollar Value Column.

Board of Directors - Elk Creek Watershed Council - 21 February 2023

Board of Directors Meeting – Minutes

February 21, 2023

Board Attendance:

× Marvin Akins	× Kittie Coons	✓ James Mast
✓ Susan Applegate	✓ Linda Galetti	✓ Rick Reinhart
× Harold Burris	✓ Cindy Johnsrud	× Bob Rundell
✓ Brad Chapman	× John Kittelman	✓ Gene Zuiches
× Joe Coons		

Others in Attendance: Lee Russell, Rich Galetti.

Minutes:

The Council approved the January minutes.

Treasurer's Report:

The Council approved the February Treasurer's Report.

Beginning Balance: 1 January 2023		$130,924.47
Deposits:	$.54	
Checks:	$13,574.51	
Ending Balance: 31 January 2023		$117,350.50

Outstanding Deposits	$10,982.38
Outstanding Checks	$457.66
Bank Balance:	$127,875.22

Accounts Receivable	$48,790.00	
Accounts Payable	$222.16	
Fund Balance:		$176,443.06

Executive Committee – James Mast

- James Mast reported on the updates to the Council's Policies and Procedures document.
- James Mast asked about progress on the Parker Creek project.

Douglas SWCD – Cindy Bright

Cindy Bright was unable to attend due to snow.

Bureau of Land Management – Jeff McEnroe

No Report.

Oregon Department of Fish and Wildlife – Eric Himmelreich

No Report.

Project Development Report – Walt Barton

Walt was unable to attend due to snow.

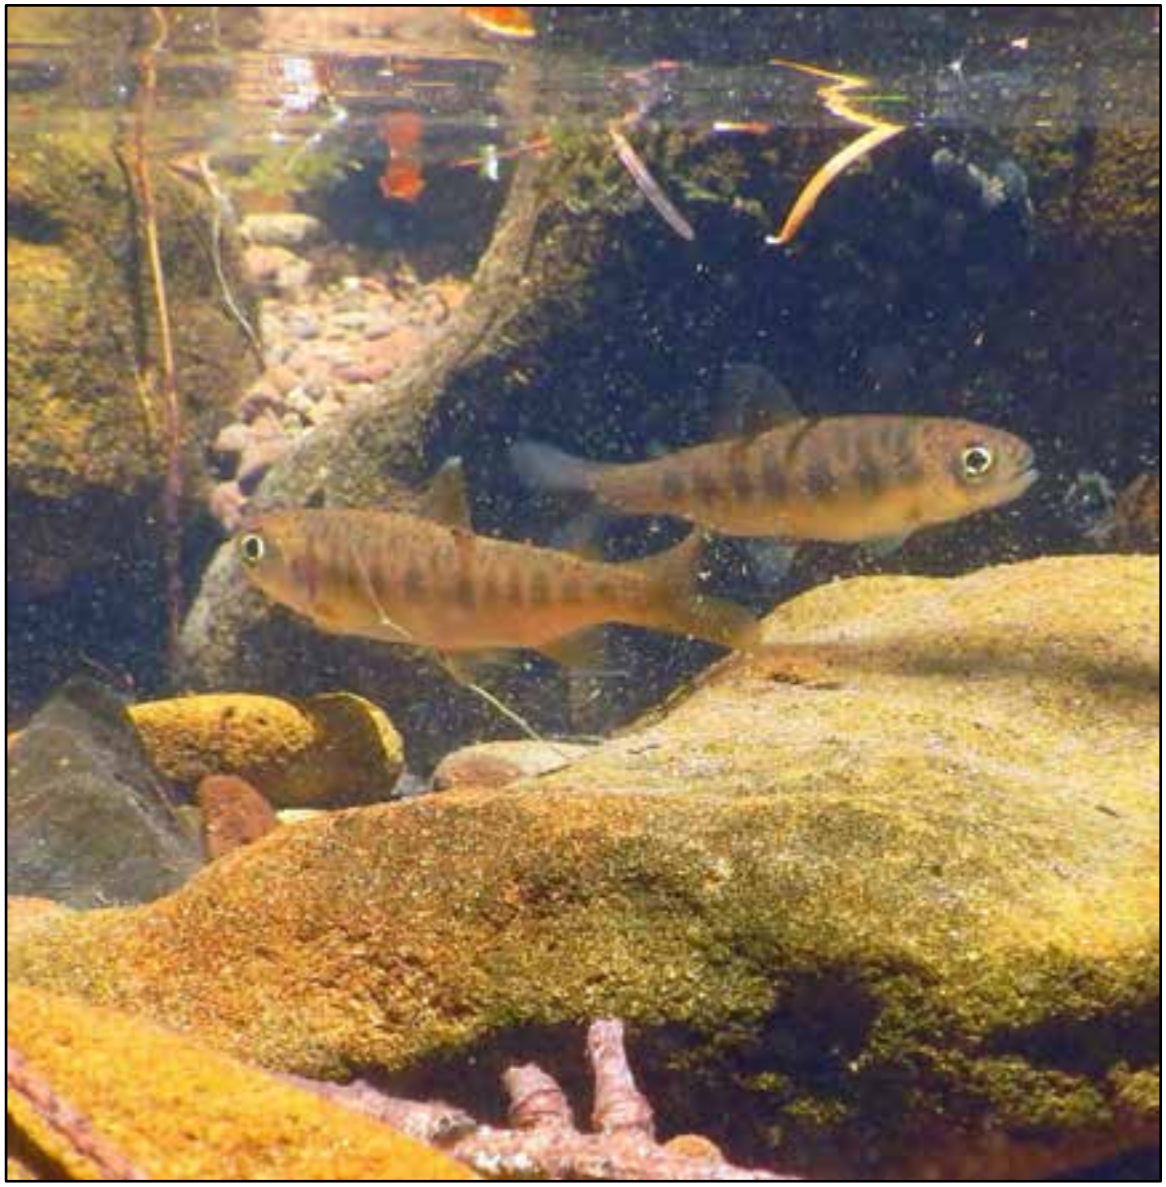
Old Business:

- The Board approved a motion (Zuiches/Chapman) to extend the terms of the current Officers of the Board of Directors for another year.
- The motion passed unanimously.

New Business:

- The Board approved a motion (Zuiches/Chapman) to develop a Memorandum of Agreement with the Douglas SWCD to begin landowner outreach to reestablish the Cox Creek Cooperative Weed Management Area..

Executive Director Report:



- Lee Russell reported on the Council's ongoing projects and project funding. [See attached report]

Director's Reports:

DRAFT

Introduction

The Elk Creek Watershed is a priority area for restoring Oregon Coastal coho salmon habitat. Historically Elk Creek and its tributary streams contained some of the highest quality coho salmon habitat in the Umpqua River Basin. Today, as a result of a variety of actions, stream habitats in the watershed have been degraded. There are extensive opportunities to restore habitat to benefit coho populations.

The Elk Creek Watershed Council

The Elk Creek Watershed Council (Council) is a non-regulatory, non-government organization that works with cooperating landowners to restore stream habitat, and to improve water quality, throughout the Elk Creek Watershed. The Douglas County Commissioners officially recognized the Council in 2002, and since its founding, the Council has worked collaboratively with local landowners, industrial timber companies, the Bureau of Land Management (BLM), and the Douglas Soil and Water Conservation District on restoration projects, funding efforts, watershed monitoring, and community outreach activities.

To date, the Council has implemented stream restoration projects that have removed fish passage barriers; added large wood and boulders to streams to create pools and complex habitat for fish; and planted streamside vegetation to provide shade and reduce summer water temperatures to improve juvenile coho survival.

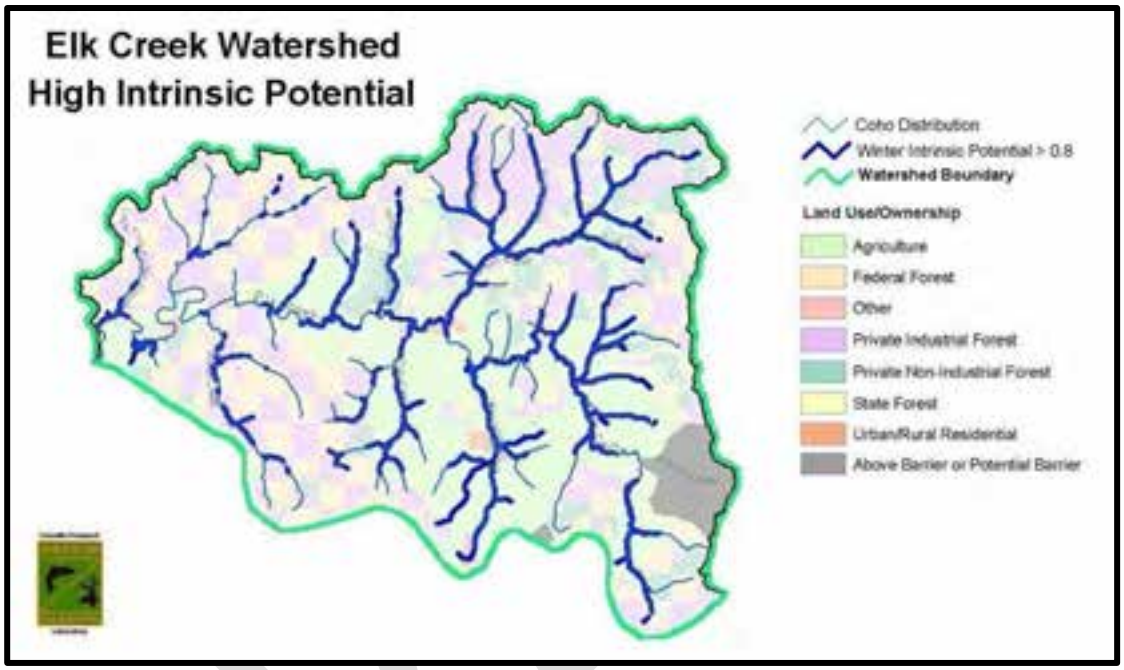
Elk Creek Watershed Council Strategic Restoration Plan

The Council developed this Strategic Restoration Action Plan (Strategic Plan) to guide landowner outreach and restoration actions designed to improve stream habitats and the processes that sustain coho salmon and other native fish populations. The Strategic Plan's geographic area (Plan Area) encompasses Elk Creek and all tributaries from its headwaters to the Umpqua River.

One of the primary goals of this planning effort was to establish objective criteria that would utilize available scientific data to prioritize those sixth-field hydrologic units with the highest likelihood for successful restoration actions. Since the primary premise of the ESA Recovery Plan for Oregon Coast Coho Salmon is that recovery of salmon populations will be achieved through the improvement of freshwater habitats that are critical to juvenile salmon survival, this plan compares available reach-scale habitat data to established ODFW benchmarks and identifies those reaches with the highest probability to respond positively to restoration actions.

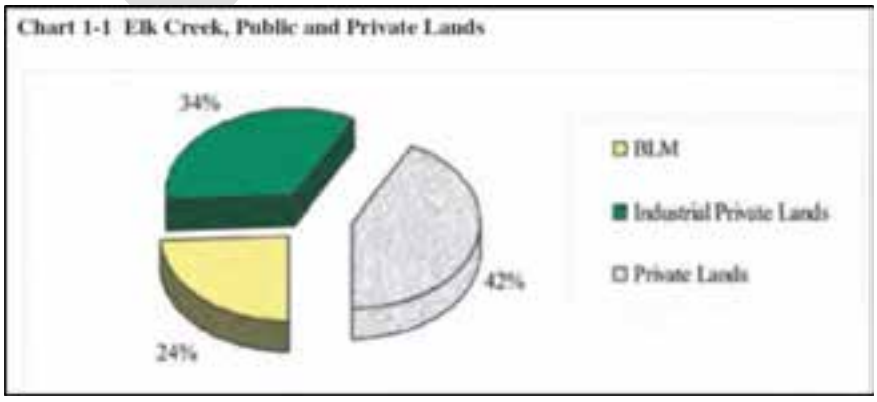
The Strategic Plan's comprehensive, watershed-wide restoration approach will accelerate the Council's implementation of actions designed to enhance stream, riparian, and floodplain habitats and provide the largest benefits to coho and other native fish populations.

These actions will contribute to the recovery of ESA-listed coho salmon and improve the environment that sustains fish and wildlife populations, water quality, and the area's quality of life.



Elk Creek Watershed coho are listed under the federal and State of Oregon Endangered Species Acts

"This plan calls for continued action to repair the ecosystem processes that influence the health and stability of the rearing habitats for juvenile coho salmon."



The Elk Creek Watershed - Overview

The Elk Creek fifth-field watershed is important spawning and rearing habitat for coho salmon, as well as Chinook, steelhead, cutthroat trout, and Pacific Lamprey. It was designated a Tier 1 Key Watershed by the Roseburg District BLM in the Northwest Forest Plan (1994), and ranked #1 by the Umpqua Basin Watershed Council when it prioritized the subwatersheds of the Umpqua Basin for restoration priority using the Bradbury Process (1998). ODFW's Oregon Coast Coho Conservation Plan identifies the Elk Creek Watershed as having the "highest winter intrinsic potential" (>0.8).

The Elk Creek Watershed encompasses 186,620 acres, and ranges in elevation from 200 feet at the mouth near the city of Elkton, to over 3,000 feet at the headwater ridges. Nearly all of the watershed's precipitation comes from rainfall. The most significant quantities of rainfall occur between October and May; very little precipitation occurs during the summer and early fall when stream flows are at their lowest.

More than 76% of the watershed's area is in private ownership, including 34% in industrial timber lands and 42% in non-industrial private ownership. Land use is predominantly forestry (72%). Early and mid-seral forests dominate the majority of the watershed. Much of the low gradient land, and historical floodplains along the creeks, have been converted to pasture, and are used primarily for grazing of cattle and sheep. The watershed includes two small communities, Drain and Yoncalla, each with a population of about 1,000.

Ten subwatersheds contribute to Elk Creek (see table below). The main subwatersheds include the headwaters of Elk Creek, Pass Creek, Yoncalla Creek, Big Tom Folley Creek, Billy Creek, Brush Creek, and other smaller tributaries.

	BLM		Private Industrial Forest		Other Private		TOTAL
Subwatershed	Acres	%	Acres	%	Acres	%	Acres

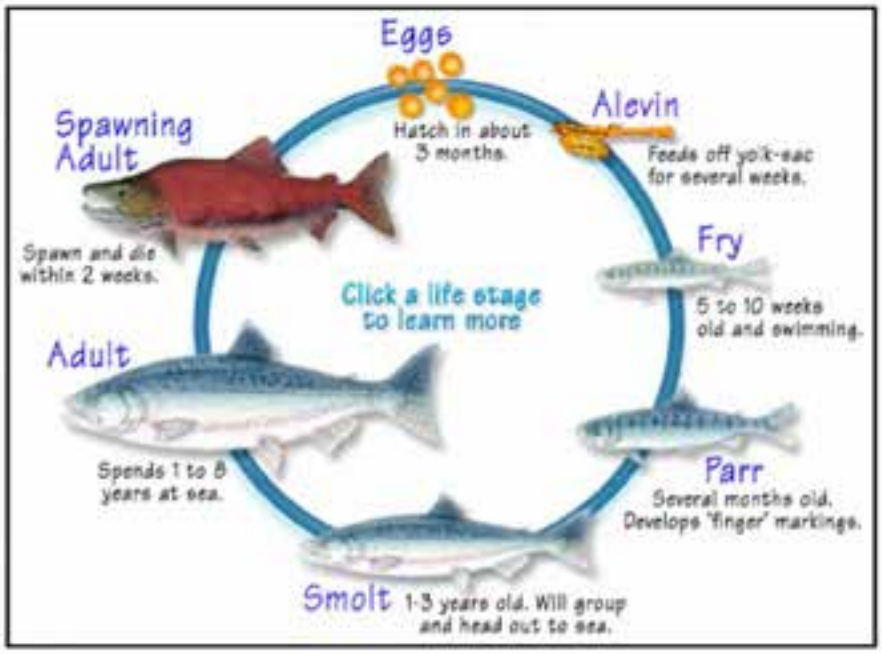
Restoration Need: Restoring Endangered Coho Salmon Populations



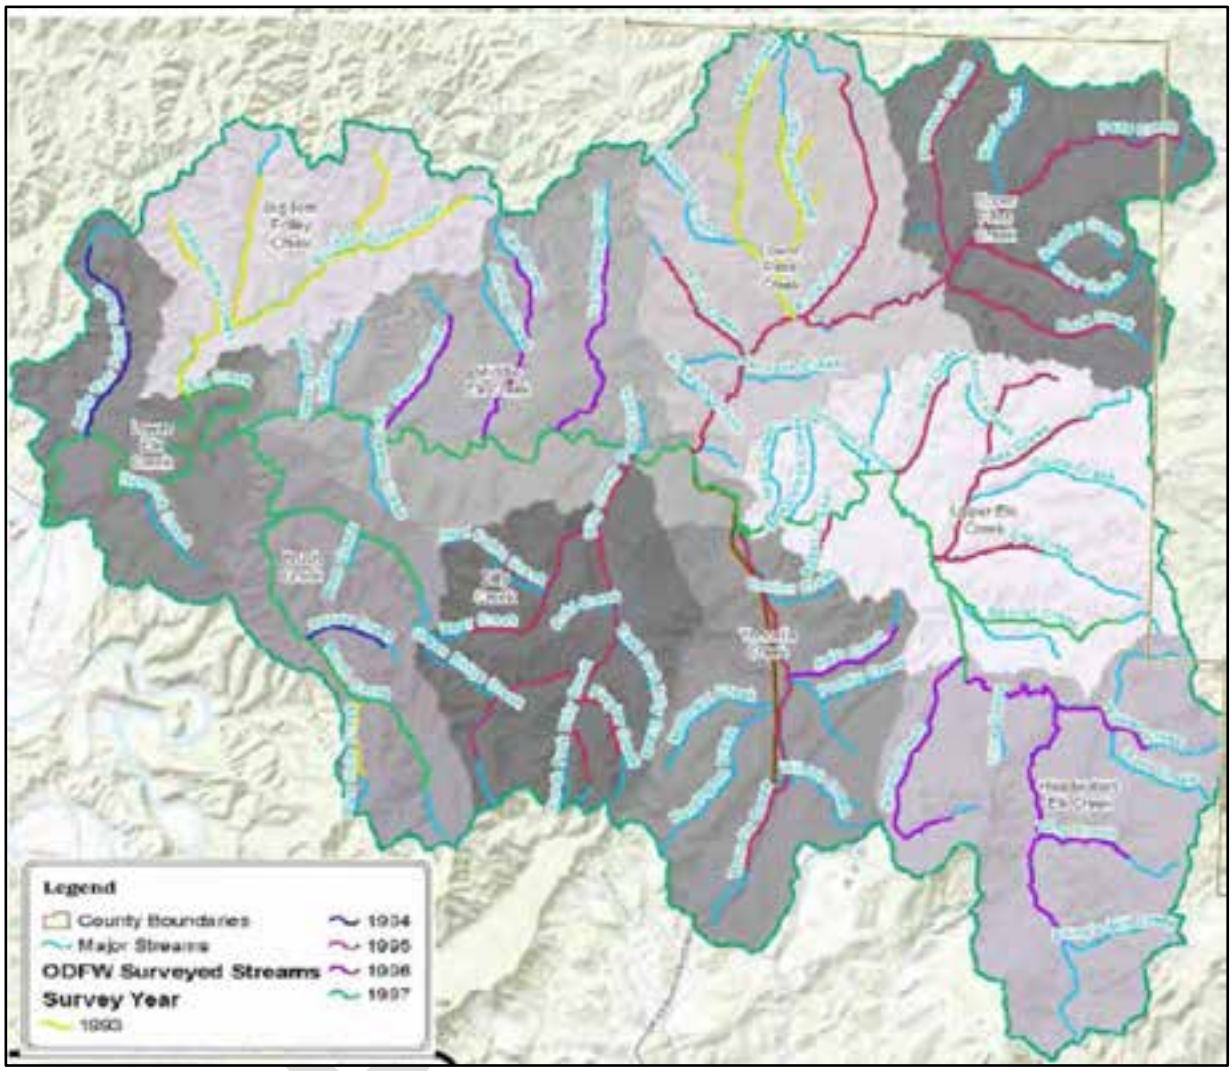
Coho salmon numbers have dramatically declined from historical levels. The Elk Creek and other Umpqua River Basin coho populations are listed under the state and federal endangered species acts. A number of factors, including fishing, sea lions and other predators, as well as ocean conditions, have contributed to population declines. Another major factor affecting coho salmon populations is stream habitat quality. Adult coho salmon require healthy streams with clean gravels for spawning; juveniles require deep pools with complex habitat for summer rearing, and side channels and other off-channel habitats to escape high winter flows.

Juvenile coho spend up to two years rearing in freshwater streams before they migrate to the ocean. With this long period in freshwater, juveniles are very vulnerable to degraded stream habitat. A primary factor limiting Elk Creek coho populations is the loss of habitats that coho need to feed and survive through winter floods. Optimal winter habitat includes complex pools with lots of large wood, and access to off-channel and floodplain areas where the fish can rest and feed during high water events. Juvenile coho also prefer complex stream habitats for feeding and growing during the summer months. Optimal summer habitats are characterized by streams with abundant pools, large wood, shade, and cool water.

Past land use practices have degraded much of the habitat in the watershed, especially in the lower gradient reaches which contain most of the best coho habitat. Incised channels are widespread. Many have been reduced to bedrock by splash dams, by channel straightening, and by "stream cleaning," a required forest practice in the 1960s and '70s which removed most of the large woody debris from the channel.

"Large Woody Debris is extremely important in low gradient streams that contain an abundant source of fine sediment. Log Jams, and to a lesser extent, individual pieces of large wood, act as a source of roughness that traps sediment and helps to moderate its progression down a given stream channel. In streams with extremely high sediment loads, the few areas of quality spawning gravel are often only found in association with these wood formations." (East Elk Watershed Assessment Unit, Roseburg District BLM, 1996)

Coho Life Cycle



Juvenile coho salmon in Jack Creek, a tributary to Elk Creek

1990s ODFW Stream Habitat Inventories

Between 1992 and 1998, the Oregon Department of Fish and Wildlife (ODFW) inventoried fish habitat for streams throughout the Elk Creek Watershed. The inventories measured a variety of habitat characteristics, including data on pools, large wood, and channel substrate (gravels, cobbles, etc.). The stream habitat inventories provide a baseline for habitat conditions, and a way to measure habitat improvements over time.

ODFW Stream Inventory Extent and Year Completed

Evaluating 1990s Coho Habitat Inventories

The Council is characterizing coho habitat with ODFW's HabRate model. The HabRate model determines coho habitat quality based on ODFW stream inventory data such as channel substrate, pool characteristics, quantities of large wood, and other information. The model evaluates habitat quality based on specific ODFW benchmarks for summer and winter juvenile rearing habitat needs. The benchmarks set quantitative goals for optimal coho stream habitat – substrate, pools, large wood, and other characteristics. Based on the benchmarks for summer and winter coho habitat, streams are rated in one of three categories: Good, Fair, or Poor (see the figure below). The HabRate model evaluation is valuable because it (1) rates the quality of coho winter and summer habitat, (2) provides a framework for tracking changes in stream habitat quality over time, and (3) sets benchmarks that establish specific, quantitative criteria for restoring coho habitat.

The HabRate model evaluated more than 140 miles of Elk Creek watershed tributary streams. Most of the streams in the Elk Creek Watershed are poor habitat for juvenile coho salmon based on the HabRate model findings: 60% of the stream miles are poor summer habitat, 72% are poor winter habitat, and 45% have overlapping poor winter *and* summer habitat (see table and maps on the following pages). While most HabRate model evaluations are based on 1990s stream inventory information, current habitat inventories are confirming that most habitat remains in poor condition.

ODFW habitat benchmarks for summer juvenile coho habitat quality
Categories: Good, Fair, and Poor

Summer Rearing 0+	Good	Fair	Poor
Fines (%)	≤ 10	10 to 30	> 30

Map illustrating Elk Creek Watershed streams with HabRate model rating categories for juvenile coho winter habitat quality: Good, Fair, Poor

Evaluating Current Habitat and Juvenile Coho Abundance and Distribution

To improve watershed conditions, the Council has implemented a variety of watershed restoration projects designed to enhance coho habitat. Despite limited data, the Council has made progress toward addressing key limiting factors for coho salmon and other fish species; however, most of these restoration actions have been selected based on landowner access and other opportunistic factors, and not from a comprehensive, watershed-wide effort that prioritizes and targets restoration activities for subwatersheds and specific stream reaches. To address the limited amount of information on the current status of fish and stream habitat, the Council developed a data collection protocol to update ODFW's 1990s stream inventory information. The inventory includes snorkel surveys to establish fish abundance and distribution, with an emphasis on coho, systematic stream habitat measurements, and collection of water temperature data.

The stream habitat data is collected in a manner that facilitates comparison to the 1990s ODFW habitat inventories and HabRate model results. This approach provides a framework for assessing stream habitat changes over time. The evaluation of information on coho distribution and numbers, stream habitat quality, and water temperature patterns assists with identifying the stream-specific factors limiting coho populations. Specific restoration actions can then be developed and prioritized based on how well specific actions and locations address the limiting factors and ODFW's coho habitat benchmarks.

Elk Creek Watershed Council's Fish and Stream Inventory Methods

The Council's fish and stream habitat inventory methodology involves snorkeling and recording habitat data for every 5th pool (20% subsample of pools) to assess coho numbers and distribution, and to characterize stream habitat. For every snorkeled pool, and the riffle area immediately upstream of the pool, additional data are recorded on the habitat characteristics, including pool width, length, and depth; substrate (e.g., sands, gravels, cobbles); and the quantity of large wood present in the pool and riffle. The stream habitat inventory methods largely conform to the ODFW aquatic habitat protocol.

To assess water temperature patterns, continuous water temperature data loggers are placed at the top and the bottom of the stream system where fish and habitat are inventoried. The continuous water temperature data – collected through the summer period when water temperatures are the highest – provide information on water temperature changes throughout the day and over the course of the summer. Placing temperature loggers in the upper and lower portions of the stream channel network provides insights into how water temperatures change in the downstream direction as streams progress from headwater areas with dense vegetation cover over small channels, to large valley-bottom streams with less vegetation cover over wider channels.

The stream and fish inventory information is summarized and evaluated to assess the factors that are limiting coho juvenile rearing. Examples of liming factors (LFs) that are commonly observed include few deep pools with large wood cover, stream channels that are deeply entrenched and isolated from the floodplain, and high water temperatures.

DRAFT

Restoration Action Plans

A Restoration Action Plan (Action Plan) is developed for each inventoried stream. The purpose of the Action Plan is to document the factors limiting both summer and winter juvenile coho survival, and to outline restoration actions to address those limiting factors. The restoration actions are guided by ODFW habitat benchmarks (e.g., the number of pieces of wood placed). To date, inventories and Action Plans have been completed for the following streams:

- Jack Creek (Middle Elk Creek Subwatershed) - 2015
- Curtis, Cox, Thief, and Lees Creek (Upper Elk Creek Subwatershed) - 2015
- Hardscrabble Creek (Middle Elk Creek Subwatershed) - 2016
- Ellenburg Creek (Lower Pass Creek Subwatershed) - 2016

The Ellenburg Creek stream and fish inventory findings and restoration actions are outlined in Appendix A as an example of the Council's approach to Action Plans.

The Action Plans provide the foundation for the Council to pursue funding for implementing restoration actions. Recently the Council received an Oregon Watershed Enhancement Board (OWEB) grant to support restoration actions for portions of Jack and Hardscrabble Creeks. The Council is currently working to fund and implement restoration actions for Ellenburg Creek (see Appendix A).

Addressing Key Limiting Factors for Coho Salmon

The Council's restoration actions focus on improving stream habitat that supports coho during the two periods when conditions most limit coho salmon survival: the summer period when water temperatures are high, and the winter period when fish seek refuge from high stream flows. The emphasis is on restoration actions in low-gradient, valley bottom stream reaches with complex habitats that support coho during both of these periods. Low-gradient stream reaches ("response reaches") are more likely to respond to restoration actions that improve both winter and summer habitat. For example, restoration actions such as the placement of large wood in the stream channel help capture stream substrate, which over time forms pools, reconnects the stream channel to the floodplain, and creates complex habitats. Complex habitats include side channels and off-channel alcoves, beaver ponds, and connections to wetlands and backwater areas.

A key conclusion of the fish and stream habitat inventories is that elevated water temperatures and limited high-quality pool habitat areas are limiting coho populations during the warm summer periods. Coho were largely absent from areas where maximum water temperatures were at or above 68^0 F.

Because coho will move upstream into cooler water areas, improving connectivity and habitat quality in streams where summer rearing water temperatures are optimal is a restoration priority. The Council is addressing this priority through extensive restoration actions in cooler, upstream channels, primarily placing large wood, boulders, and other materials to capture bedload and to create pools and other habitats for juvenile coho.

Water temperatures are too high in the lower portions of many streams in the watershed for summer juvenile coho rearing. Habitat actions in the higher temperature areas focus on improving stream temperatures by increasing shade and taking steps to decrease exposed bedrock areas through the placement of large wood and other structures designed to capture bedload (sediment, cobbles, and gravel). Bedrock areas contribute to water heating because shallow water flowing over these areas is exposed to direct solar radiation. In contrast, where there is abundant substrate, a portion of the stream flows through the substrate, where it is not exposed to solar radiation and can cool.

DRAFT

Elk Creek Watershed Restoration: Strategy to Actions

The following diagram outlines the relationships between the Strategic Plan, Rapid Stream and Fish Inventories, Stream Restoration Action Plans, and implementing restoration actions. The Strategic Plan sets the overall direction and subwatershed priorities for targeting stream inventories and subsequent restoration actions. The strategic framework is adaptive, and it is expected that priorities and actions will change over time as new data and restoration project monitoring information are generated.

Restoration Priorities

The Council developed criteria for identifying subwatershed priorities for phasing stream restoration planning and implementation as follows:

Criteria A: Percent of streams with poor coho winter habitat based on HabRate model results.

Rationale: Winter habitat (e.g., access to off-channel habitats during high-water events) is the key factor limiting coho populations.

Criteria B: Percent of streams with *both* poor coho winter *and* summer habitat based on HabRate model results.

Rationale: It is efficient to focus restoration on the portion of the stream network where poor winter and summer habitat overlap.

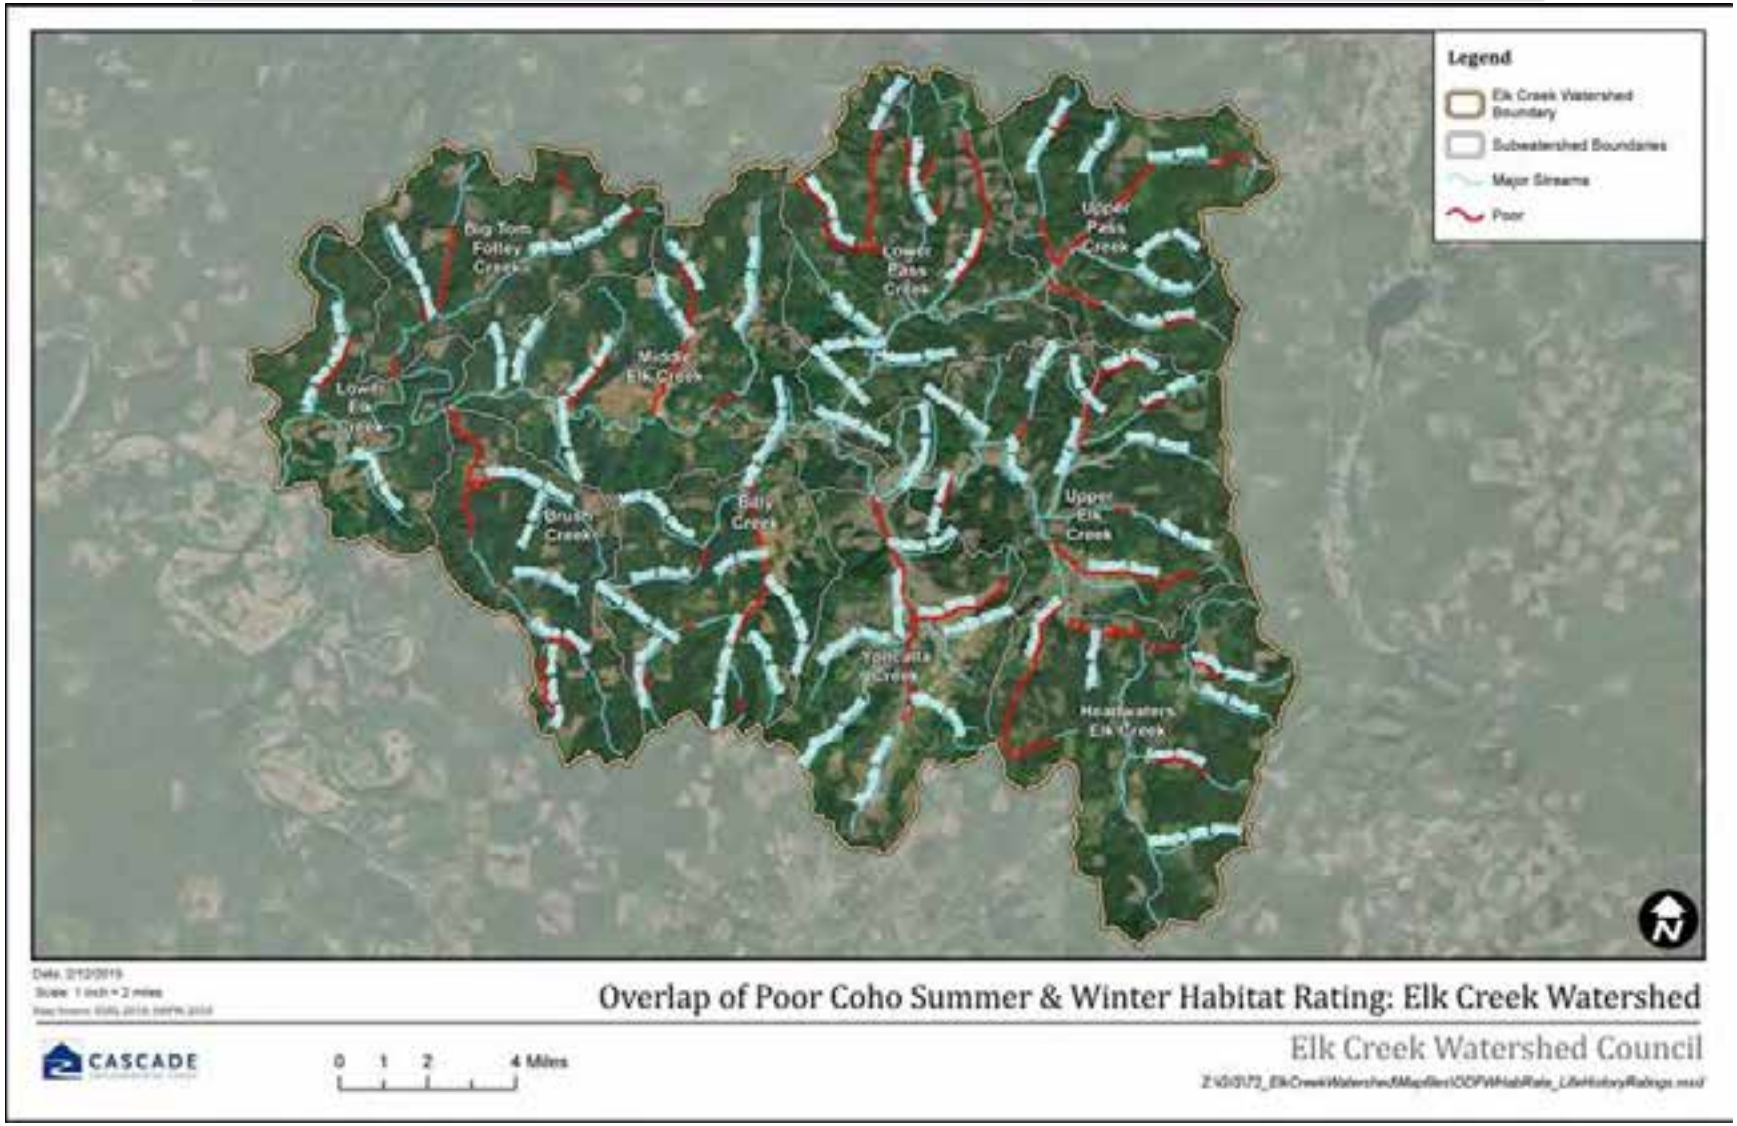
Criteria C: Average stream rating for the quality of coho spawning substrate based on HabRate model results.

Rationale: Adequate substrate (e.g., well-sorted gravels and cobbles) supports successful coho spawning.

Criteria D: Percent of industrial forest land.

Rationale: The Watershed Council has developed good working relationships, and successfully implemented restoration actions, with industrial forest landowners. The industrial forest lands in the Elk Creek Watershed encompass the full range of habitat necessary to support coho recovery – including spawning and summer and winter rearing habitats.

Criteria E: Landowner opportunity to engage in restoration actions based on the Council's assessment.



Rationale: The Council's outreach is focused on engaging landowners in voluntary restoration actions on private land**.** Some landowners, mainly industrial forest and other large owners, are receptive to pursuing restoration actions on their lands.

The table on the next page shows the subwatershed restoration priority ranking. The priorities are intended to guide restoration planning and implementation phasing. For example, the Council is now planning to collect stream and fish inventory information in the Big Tom Folley Creek system. The stream and fish inventory information collected will provide the foundation for developing a stream restoration action plan and implementing restoration actions over time.

Subwatershed priorities will evolve and change as new information is available and phased restoration actions are implemented over time.

DRAFT

Elk Creek streams with HabRate model rating categories for juvenile coho habitat where there is overlapping poor winter and summer habitat quality

Elk Creek Subwatershed priorities for planning and implementing restoration actions.

Priorities were determined through HabRate ratings for summer and winter rearing habitat and spawning substrate. Additional criteria include percent of industrial forest land and the Council's assessment of landowner opportunities to engage in restoration actions on private lands.

Subwatershed	Total Stream Channel Miles Surveyed	Poor Summer Habitat %	Poor Winter Habitat %	Poor Winter / Summer Overlap %	% Private Industrial Forest	% HabRate: Poor Winter 1 = 30% - 39% 2 = 40% - 59% 3 = ≥60%	% HabRate: Poor Summer/Winter Overlap 1 = 30% - 39% 2 = 40% - 49% 3 = ≥50%	% HabRate: Spawning Substrate (ave. for all reaches) 1 = Poor 2 = Fair 3 = Good	% Industrial Forest Land 1 = <26% 2 = 27% - 39% 3 = ≥40%	Landowner Opportunity 1 = Limited 2 = Fair 3 = Good	TOTAL POINTS	PRIORITY RANKING	Landowner Opportunity Comments / Other Comments
Middle Elk Creek	11.30	59%	72%	59%	30%	3	3	2	2	3	13	HIGHEST	Cooperation with major landowner. Restoration to be implemented on Jack and Hardscrabble Creek. Landowner is receptive to stream assessments and restoration projects
Lower Pass Creek	29.78	65%	80%	46%	45%	3	2	1	3	3	12	HIGHEST	Cooperation with Giustina Land & Timber; landowner is receptive to stream assessments
Big Tom Folley Creek	15.23	39%	61%	31%	47%	3	1	2	3	3	12	HIGHEST	BLM priority watershed. Cooperation with Seneca Jones Timber Company and BLM for stream assessments and restoration projects
Brush Creek	13.50	44%	96%	44%	45%	3	2	2	3	1	11	NEXT HIGHEST	Limited working relationship with primary industrial forest landowner; substantial restoration already accomplished in the subwatershed
Headwaters Elk Creek	16.28	53%	84%	37%	26%	3	1	1	2	3	10	NEXT HIGHEST	BLM priority watershed. The Council is working on landowner outreach
Billy Creek	17.31	69%	55%	40%	26%	2	2	2	2	2	10	NEXT HIGHEST	Limited working relationship with primary industrial forest landowner
Lower Elk Creek	4.35	49%	52%	33%	29%	2	1	2	2	3	10	NEXT HIGHEST	Cooperation with Seneca Jones Timber Company and BLM for stream assessments and restoration
Yoncalla Creek	10.57	100%	88%	88%	20%	3	3	1	1	1	9	LOWEST	Fragmented private ownership. Little industrial forest land. Flood control levees limit restoration opportunities
Upper Elk Creek	17.80	53%	71%	49%	25%	3	2	1	1	2	9	LOWEST	Fragmented private ownership. Limited working relationships with landowners
Upper Pass Creek	12.37	65%	37%	25%	38%	1	1	1	2	2	7	LOWEST	Fragmented private ownership. Limited working relationships with landowners. Erodible soils
TOTALS	148.49												

DRAFT

Restoration Outcomes

The Strategic Plan describes the Council's planned activities through 2025. Over this period the Council will complete restoration activities designed to address the key limiting factors for coho salmon: lack of winter and summer habitat complexity, high water temperatures, and lack of access to quality off-channel habitat.

Ecological outcomes are the long-term environmental effects resulting from the Council's comprehensive restoration actions over time. The Council's restoration approach focuses on restoring stream, floodplain, and riparian habitat and watershed processes. The emphasis is on restoring habitat characteristics that support and sustain ecological processes for the long-term. In some instances, restoration restores habitat structure in the short term while also taking actions that support the short- and long-term recovery of watershed processes and habitats. For example, restoration actions may include enhancing habitat complexity through structural actions, such as placing large wood in streams and floodplains. These structural actions, in conjunction with planting native trees and other vegetation to restore floodplain and riparian habitats, over time will promote the delivery and retention of large wood in the system as trees and other woody debris fall into the stream and are caught on the placed wood.

By 2025 the Council's restoration activities will achieve the following outcomes for improved habitat quality, capacity, and diversity in support of Oregon coastal coho populations:

1. Restored Watershed Processes, Stream Habitat Complexity, and Off-Channel Floodplain Access.

   Objective: 8 miles of stream channel and associated floodplain habitat restored.

2. Improved Water Temperatures.

   Objective: 8 miles of riparian habitat and associated stream shade restored through native plantings and invasive control.

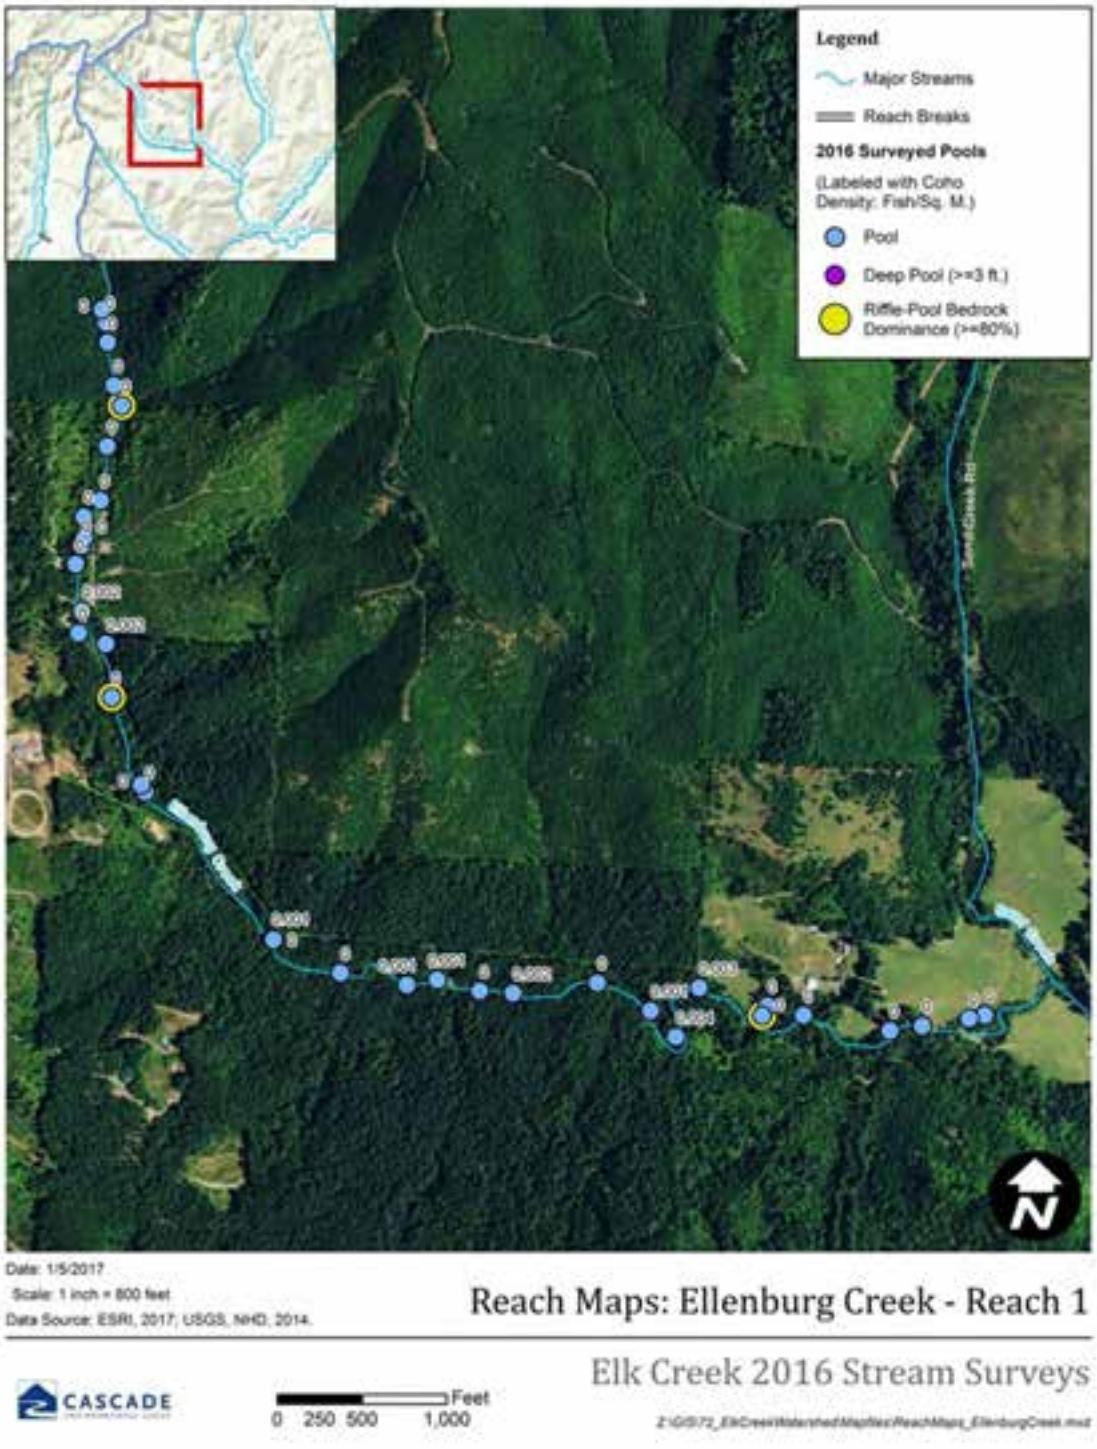
3. Improved Stream Restoration Effectiveness through Monitoring and Analysis.

   Objective: All implemented restoration projects will have monitoring data collected and analysis completed to determine if the project is meeting restoration goals and outcomes over time. This analysis will be used to modify and improve the effectiveness of future stream restoration actions.

DRAFT

Appendix A:

Summary of the Ellenburg Creek Restoration Action Plan



Ellenburg Creek

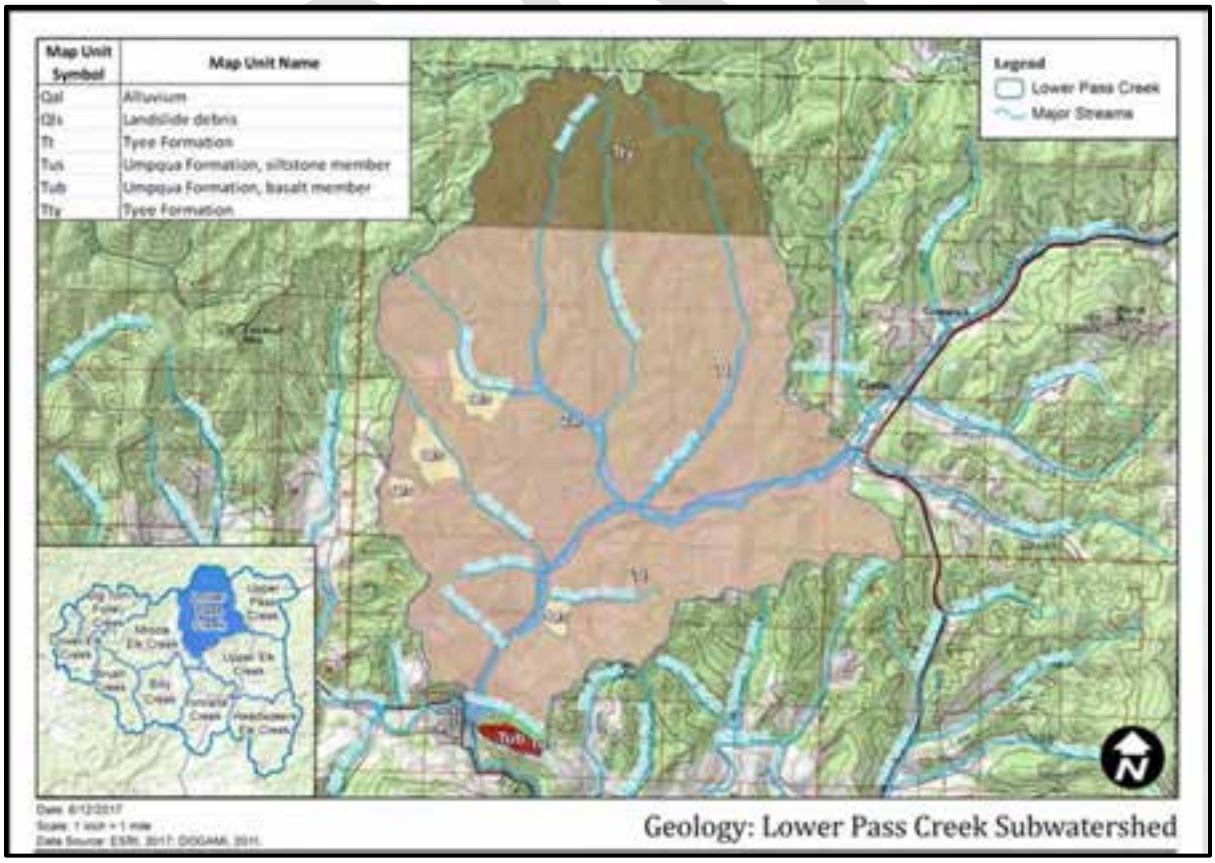
Elk Creek Watershed Council

June 2017

Ellenburg Creek Stream Habitat Inventory

Ellenburg Creek is a tributary to Sand Creek in the Lower Pass Creek Subwatershed. The 1990s ODFW habitat inventory did not include Ellenburg Creek. In order to assess the factors limiting coho, data on coho numbers and distribution, stream habitat, and water temperatures were was collected in the summer of 2016 for approximately 1.92 miles of Ellenburg Creek.

Ellenburg Creek Stream Habitat

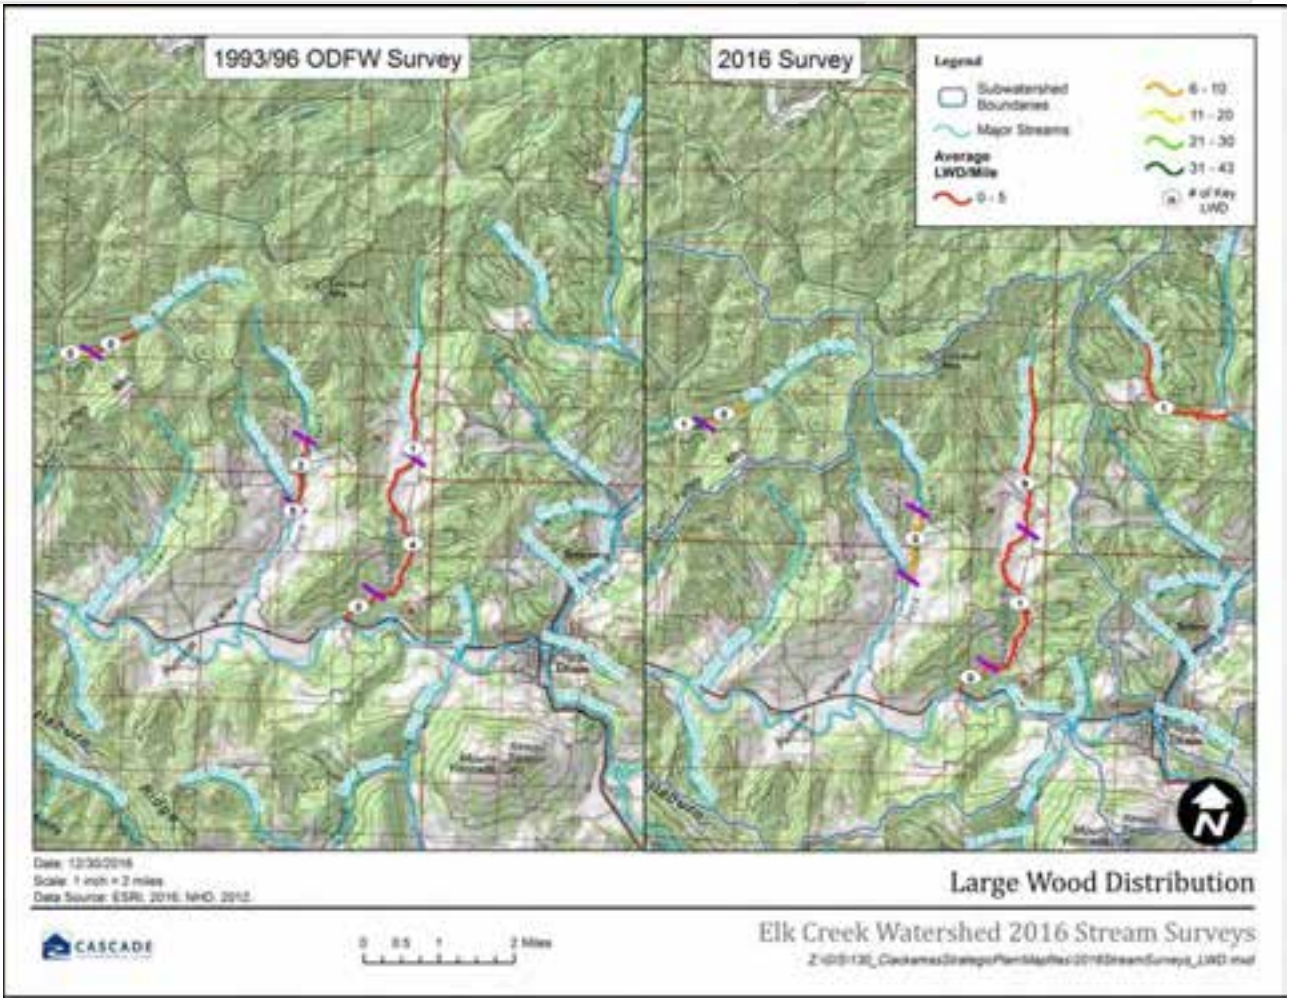


Overview:

The inventoried section of Ellenburg Creek is characterized by a low- to moderate gradient channel, with an average gradient of approximately 2%. Gradients as high as 5% were observed in several channel sections where there were bedrock chutes or small drops. These steeper channel areas were very short and did not present any fish passage issues. Coho salmon prefer gradients of 4% or less for adult spawning and juvenile rearing, and the inventoried reach is within this preferred gradient.

The inventoried reach is characterized as a narrow valley with low terraces that somewhat constrains channel movement in the lower portion, and a narrow valley more constrained by hillslopes in the upper portion. Three primary bedrock-dominated areas were observed, and about 9% of the reach length is dominated by bedrock. The 2016 survey noted a possible fish passage barrier in upper Ellenburg Creek. A log had lodged itself at the top of a four-foot bedrock shelf; no juvenile coho were observed above the barrier during the snorkel survey.

Substrate:



The map below illustrates the Lower Pass Creek Subwatershed's geologic formations. The subwatershed, particularly in the headwater areas, is underlain by sand- and siltstones (e.g., Tyee Formation). These fine-grained sand- and siltstone formations contribute sand and silt to the stream channel substrate. Other parts of the sub-watershed are underlain by harder rocks including basalts (e.g., Umpqua Formation, basalt member) covered by historic landslide debris that contributes coarser material, such as cobbles and gravels, to the stream channel. The combination of fine- and coarse-grained rocks in the stream system yields abundant substrate for creating habitat, including depositional areas where logs can capture substrate, creating pools, and well-sorted gravels and cobbles, which are ideal for coho spawning and rearing.

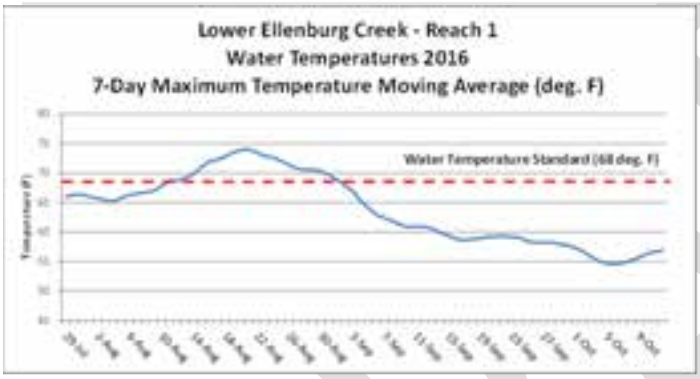
Large Wood:

The number of large wood pieces counted in the 2016 Ellenburg Creek inventory averaged 1.99 pieces/mile; the number of key pieces averaged 0.07 key pieces/mile. Overall the number of pieces of wood in the channel is very low and not adequate to support the formation of quality pool habitat. In particular, key pieces of large wood (those of sufficient size to remain stable during flood events) are nearly absent. Stable key pieces trap other pieces of large wood and create complex habitats with cover and deep pools. These large key pieces also trap substrate at levels sufficient to cover bedrock, and to aggrade incised channels and improve floodplain connectivity.

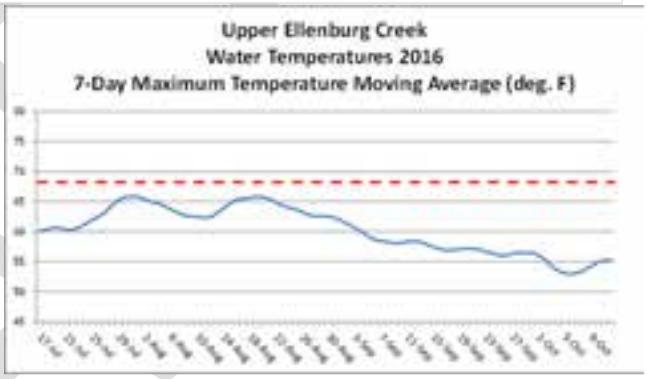
Ellenburg Creek large wood counts in comparison to other recently inventoried streams. Ellenburg Creek is on the right side of the map

Pools:

The density of pools was 81.09 pools per mile. No deep pools (> 3 feet deep) were noted in the 2016 Ellenburg Creek inventory.



The low pool numbers, and lack of deep pools, are indicators of poor habitat quality. A high density of pools, and particularly of deep pools with cooler water, is important for juvenile coho survival. Stream flows were low during the inventory period and these extremely low flows created isolated pools. High densities of rearing coho were trapped in some of these pools with no connectivity to upstream areas and cooler water. As the summer progressed some pools probably dried up, killing the fish.



Water temperatures:

The graphs on this page show the 7-day-maximum-water-temperature moving average over the monitoring period for lower and upper Ellenburg Creek. The graphs also show the DEQ's 68^0 F temperature standard for trout and salmon. Lower Ellenburg Creek exceeded 68^0 F for an extended period between August 11 and September 3, 2016. In contrast, water temperatures in upper Ellenburg Creek were cold throughout the monitoring period, never exceeding 66^0 F, two degrees below the DEQ temperature standard.

Based on the continuous water temperature monitoring observations during the habitat inventory, summer water temperatures are too high for summer coho rearing in lower Ellenburg Creek during the periods of the summer with higher air temperatures and lower flows, which primarily occur from August to early September. Upper Ellenburg Creek has optimal temperatures for coho summer rearing. No juvenile coho were observed in the very lowest portions of Ellenburg Creek. It appears that juvenile coho are moving upstream to cooler areas during the hottest period of the summer. This finding is supported by research which has documented coho moving upstream to escape high water temperatures.

Lower and upper Ellenburg Creek summer 2016 water temperatures

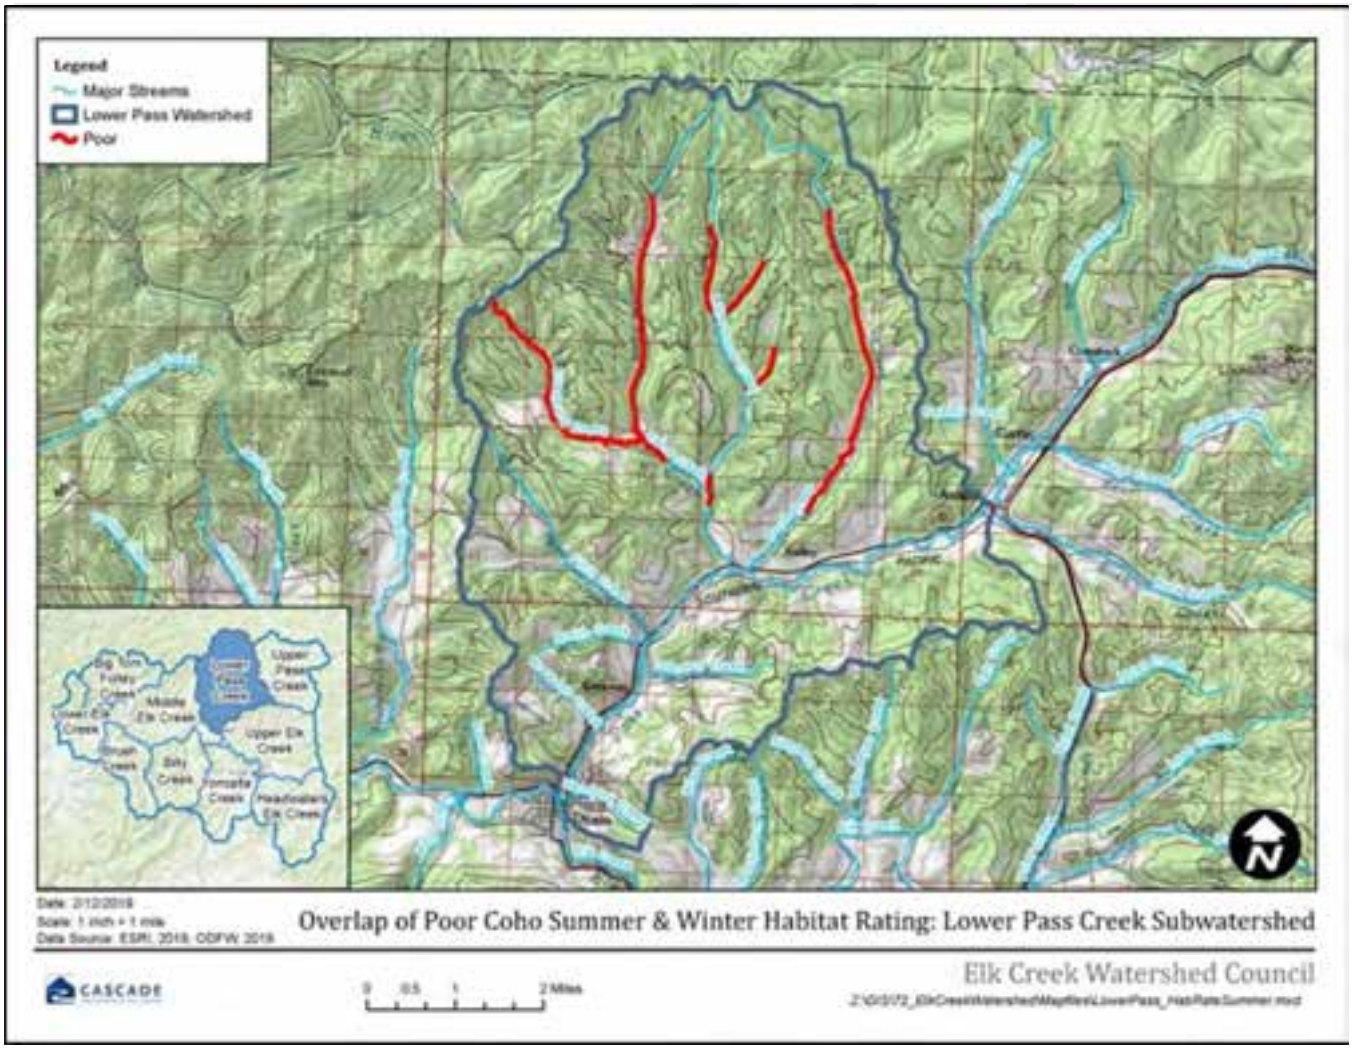
Coho Densities:

Very low coho densities were noted in Ellenburg Creek in 2016 (average = 0.0005 coho/m2). The highest densities of coho were in the middle and upper portions of the inventory reach, but the numbers were very low, and in most pools no coho were observed; no, or very few, coho were observed in the lower portions of the reach.

It appears that juvenile coho distribution and densities are controlled by both by summer water temperatures and the quality of available pool habitat. The lower reaches of Ellenburg Creek had no coho. The highest densities of coho, though still very low, were found in the upper portions where the reach flows through forested areas and where water temperatures are very low.

Ellenburg Creek Restoration Strategy

The HabRate model evaluated Ellenburg Creek's current habitat quality against ODFW benchmarks for substrate, cover, and pool complexity (see table on next page). Overall, lower Ellenburg Creek has poor winter and summer coho rearing habitat. Substrate quality is the only benchmark rated as fair.



For comparison, the map on the next page shows stream segments with winter and summer HabRate model evaluations for Ellenburg Creek and the other Lower Pass Creek tributaries that were assessed by ODFW in the 1990s. In addition to Ellenburg Creek, most of the streams in the subwatershed are rated as poor summer and winter coho rearing habitat, though this finding should be confirmed with the Council's more recent habitat inventories.

The restoration strategy for Ellenburg Creek focuses on improving summer and winter habitat conditions. Restoration actions will be guided by ODFW benchmarks for the enhancement of pools, increasing the quantity of large wood, improving side-channel and floodplain connectivity, and enhancing riparian trees and other native vegetation where appropriate.

Ellenburg Creek HabRate limiting factors evaluation for summer and winter coho habitat characteristics: 1 = Poor, 2 = Fair, 3 = Good. The overall rating is poor for winter and summer habitat

Stream	Subwatershed	Reach #	Reach Length (Mi)	Substrate	Cover	% Pools	Pool Complexity	Summer Rearing 0+ Rating	% Pools	% Sheltered Pools	Pool Complexity	Over-Winter 0+ Rating
ELLENBURG CREEK	UPPER PASS CREEK	1	1.92	2	1	1	1	1	1	1	1	1

Ellenburg Creek and other Lower Pass Creek Subwatershed streams with HabRate model rating categories for juvenile coho where there is overlapping poor winter and summer habitat quality

OREGON WATERSHED ENHANCEMENT BOARD

Budget Summary:
OWEB Amount Requested: $127,145
Total Project Amount: $131,465

Administrative Information

Abstract

Provide an abstract statement for the project. Include the following information: 1) Identify the project location; 2) Briefly state the project need; 3) Describe the proposed work; 4) Identify project partners.

The Greater Yamhill Watershed Council (GYWC) encompasses the Yamhill and Chehalem Watersheds, an area of more than 529,000 acres, ranging from the crest of the Coast Range to the Willamette River. This service area includes eight sub-basins and more than 1,000 stream miles. Roughly 70% of the drainage lies within Yamhill County, with most of the remaining area in northern Polk County. Small portions of the watershed are within Washington, Lincoln, and Tillamook Counties. The GYWC includes 10 incorporated cities and a total population of more than 110,000.

Council Capacity Support funding is requested to help fund an Executive Director and basic operations needed to implement the strategic goals of the GYWC's stakeholder-driven Watershed Restoration Action Plan. Priority projects include building council capacity and strengthening organizational health, initiatives for riparian habitat restoration, oak and prairie habitat restoration, fish passage and LWD enhancement, priority invasive weed control and inventories, fish population assessments, as well as supporting a thriving volunteer base that integrates community members into all aspects of the GYWC's watershed programming and planning.

Funding will be used to conduct landowner recruitment, project development, volunteer engagement, stakeholder coordination, strategic planning, governance, organizational development, and fiscal management.

Primary partners include Yamhill SWCD, Polk SWCD, NRCS, OWEB, ODFW, ODF, US BLM, USFWS, Confederated Tribes of Grand Ronde, Cities of McMinnville and Newberg, as well as other small cities within the watershed boundary, Yamhill County Public Works, local school districts, Yamhill Watershed Stewardship Fund, local interest groups, and a diverse variety of private landownership.

Location Information

Current Location:

What is the ownership of the project site(s)?

✓ *Public land (any lands owned by the Federal government, the State of Oregon, a city, county, district or municipal or public corporation in Oregon)*

What agency(ies) are involved?

Cities of McMinnville, Newberg, Yamhill, Willamina, Amity, Dayton, Dundee, Lafayette, and Carlton
School Districts of McMinnville, Newberg, Yamhill, Willamina, and Carlton
Yamhill & Polk SWCDs
Yamhill & Polk Counties
NRCS
US BLM
USFWS
USFS

❑ *Tribal lands (any lands owned/managed by a Tribal government)*
❑ *Private (land owned by non-governmental entities)*
❑ *Not applicable to this project*

✓ *This grant will take place in more than one county.*

List the counties affected:

Yamhill and Polk Counties.

Permits

Other than the land-use form, do you need a permit, license or other regulatory approval of any of the proposed project activities?

❍ Yes

● No

Racial and Ethnic Impact Statement

Racial and Ethnic Impact Statement

❍ The proposed grant project policies or programs could have a disproportionate or unique POSITIVE impact on the following minority persons. (indicate all that apply)

❍ The proposed grant project policies or programs could have a disproportionate or unique NEGATIVE impact on the following minority persons. (indicate all that apply)

● The proposed grant project policies or programs WILL HAVE NO disproportionate or unique impact on minority persons.

Insurance Information

If applicable, select all the activities that are part of your project - These require a risk assessment tool unless otherwise noted (check all that apply).

❑ *Working with hazardous materials (not including materials used in the normal operation of equipment such as hydraulic fluid)*

❑ *Earth moving work around the footprint of a drinking water well*

❑ *Removal or alteration of structures that hold back water on land or instream including dams, levees, dikes, tidegates and other water control devices (this does not include temporary diversion dams used solely to divert water for irrigation)*

✓ *Applicant's staff or volunteers are working with kids related to this project (DAS Risk assessment tool not required, additional insurance is required)*

❑ *Applicant's staff are applying herbicides or pesticides (DAS Risk assessment tool not required, additional insurance is required)*

❑ *Insurance not applicable to this project*

Additional Information

❑ *This project affects Sage-Grouse.*

Problem Statement

Does the watershed council have a fiscal sponsor?

❍ Yes
● No

Is the council a membership organization?

❍ Yes
● No

The council is a group of councils operating collectively.

❍ Yes
● No

Is the applicant a group of councils operating independently?

❍ Yes
● No

For Details Upload the council's most recent bylaws.

Councils are required to review their council's bylaws once every three years, provide the date of the last time the council's governing body reviewed the council's bylaws?

06/14/2022

Councils are required to review their policies and procedures once every three years, provide the date of the last time the council's governing body reviewed the council's policies and procedures?

06/14/2022

For Details Upload the council's most recent policies and procedures.

For Details Upload the council's local government designation

For Details Upload the council's policies and procedures.

Date of the council's 2021-2023 self assessment?

01/10/2023

Date of last council officer elections.

01/10/2023

For Details Upload the minutes from the board meeting documenting the results of the officer election.

Does the council have written position descriptions for council board officers?

● Yes
❍ No

Does the council have written roles and responsibilities for council governing body members?

● Yes
❍ No

How many times did/will the council governing body meet between July 1, 2021-June 30, 2023?
17

How many times will the council governing body meet between July 1,-June 30, of the upcoming biennium for which you are seeking funding?
20

Describe how the council advertises its general council meetings.
The GYWC's Monthly Public Board Meetings are advertised through a variety of outlets, including the Yamhill County News-Register newspaper, at the McMinnville Public Library Bulletin and website, on the Yamhill County Public Works website, the Yamhill SWCD Newsletters and Websites, the GYWC website, and GYWC Facebook. The GYWC also maintains an email distribution list of interested parties, which receives the meeting announcements.

Do council governing body meetings have agendas, sign-in sheets, and minutes?
● Yes
❍ No

Describe how your board membership includes a diverse range of geographic areas and community interests in the watershed.
The GYWC Board of Directors currently includes 6 voting members, as well as a diverse group of technical / stakeholder advisory (non-voting) liaisons. GYWC voting and non-voting membership alike represent a wide diversity of priority interests, landownership types, and geographies within the Greater Yamhill Watershed.

--VOTING MEMBERSHIP--
Our voting membership represents a range of stakeholder types, local commodities, and priority habitats. 1 of our voting members is an agency representative (City of McMinnville) and the remaining 3 are volunteers.

Members interests are with water quality, agriculture, fish habitat monitoring & restoration, as well as terrestrial habitat restoration.

--TECHNICAL/STAKEHOLDER ADVISORY (non-voting) ---
Representation includes members of local the Yamhill NRCS and SWCD office, members of local City governments, many state and federal agencies and the Confederated Tribes of Grand Ronde.

Our technical / stakeholder advisory members provide essential connections to their representative agencies and organizations. They work with the GYWC staff and Board voting members on prioritizing, developing, implementing, and managing on-the-ground watershed programs and strategic actions plans for habitat monitoring and restoration, and landowner engagement. They are imperative in helping to secure funding and in-kind services to support on-the-ground projects. Our watershed programs would not be possible without the contributions of these advisory members.

Describe any board membership and recruitment challenges and actions being taken to address those challenges.
--VOTING MEMBERSHIP--
Our priority goal is to more deeply engage the voting body in management and action, while providing for continuity of daily operations of administration. GYWC has hired a part-time administrative assistant and a CPA to perform administrative and reporting tasks. This addresses a key capacity barrier to provide additional support for daily operations/admin while engaging the Board/Officers more deeply in management.

Our 2nd goal is to maintain and expand our current voting membership to at least 7 total members. We hope to engage new members from Newberg and the South / North Valleys where we have lesser geographic representation on the voting body at this time.

Currently the GYWC has 6 voting members, with bylaws allowing for a range of up to 11. GYWC has struggled in the past to recruit new voting membership. In 2023 GYWC has recruited two new members who have already taken an active role in the success of the Council.

Since COVID-19, more community members have participated in our monthly public Board meetings as we have been able to conduct business using Web-video and Call-In options. As COVID-19 concerns are alleviated, the GYWC plans to transition to a hybrid model of in-person meetings with options for participation remotely. This hybrid participation model will be invaluable for retaining and expanding voting membership as typical barriers include travel time/transportation access to in-person meetings, or members have a need to travel away for work and school, or have other obligations which make remote participation a vital option for engagement.

--- TECHNICAL/STAKEHOLDER ADVISORY (non-voting) ---
One of the challenges we've had with our Technical / Stakeholder Advisory membership is recruiting engagement enough members of the following: agency reps for smaller cities, and additional stakeholders of agricultural commodities and forestry (industrial and family woodland). While these types of stakeholders have participated effectively with the GYWC for specific watershed projects that involve their individual properties, and we partner together as a more intimate collaboration to get work done, GYWC seeks to engage these stakeholders as part of larger collaborative and planning processes. Outreach to groups and individuals in Winter/Spring 2023 has been meet with interest. Greater collaboration and involvement is anticipated moving forward.

Are projects of the council, including those identified in the work plan, identified in a council action plan or strategic plan?

● Yes
❍ No

Provide the name and date of the most recent action plan or strategic plan.

Workload Descriptions and Assignments for OWEB Capacity v22.06.10

Is the work of the council specifically designed to benefit salmon or steelhead?

● Yes
❍ No

✓Upper Willamette River - Steelhead
✓Upper Willamette River - Chinook Salmon

Describe how the resulting council capacity grant will benefit salmon or steelhead or their habitat?

The Greater Yamhill Watershed contains 360 miles of stream habitat for Upper Willamette Winter steelhead trout and 109 miles of stream habitat for Upper Willamette Spring Chinook Salmon. Limiting factors include impaired water quality (303d listings, i.e. temperature, DO, pesticides, turbidity/sediment); water quantity and over-allocation of surface water rights during summer; impaired access to habitat due to numerous fish passage barriers; and altered physical habitat related to invasive plant species, stream incision and channelization, removal and lack of LWD, removal and degradation of riparian/floodplain habitat, and lack of floodplain and side-channel connectivity.

The council's 2013 Watershed Restoration Action Plan and pending June 2019 Action Plan Update, 2014 Yamhill Fish Passage Restoration Action Plan, and 1999 - 2002 5th-field HUC sub-basin assessments focus largely on fish

recovery actions. In the past 2 years the council has assisted with the development of 15 restoration projects that address salmon and/or steelhead and their habitats. The Executive Director will utilize watershed assessments, action plans and relevant Recovery Plans to develop a prioritized list of future restoration and monitoring projects.

GYWC has partnered with the BLM and the Spirit Mountain Community Fund to conduct eDNA sampling to determine the presence of fish in various waterbodies in the watershed. The Council plans to continue to partner on research using existing collected samples, and conduct new eDNA sampling projects.

Regional Assessments or Recovery Plans
Upper Willamette River Conservation and Recovery Plan for Chinook Salmon and Steelhead

The Oregon Plan for Salmon and Watersheds

Council Capacity Metrics:
https://www.oregon.gov/oweb/Forms/OC-Application-Watershed-Council-Metrics-23-25.xlsx

Input the total acres encompassed by this watershed.
529000

Input the Federal Recovery plan applicable to your watershed council.
Upper Willamette River Conservation and Recovery Plan for Chinook Salmon and Steelhead, Oregon Department of Fish and Wildlife and National Marine Fisheries Service Northwest Region, 2011.

Input the description of the plan implemented that outlines the need for this activity
This project supports local watershed councils by providing capacity to engage in salmonid recovery planning and coordination. The Recovery Plan(s) indicate state and local collaboration and partnerships, especially in the form of watershed councils, are needed to successfully implement Recovery Plan actions and refer to the Oregon Plan. The Oregon Plan for Salmon and Watersheds (1997) provides the governance structure for implementing restoration in Oregon and specifically charges these watersh

Proposed Solution

Community Engagement

Briefly describe the council's stakeholder engagement accomplishments from the 2021-2023 biennium.

* Seventeen public meetings of the Board of Directors so far in 2021-2023, with more planned in March, April, May and June 2023.

* Held Annual Elections in January 2023.

* Recruited two new board members for a total of six board members.

* Completed Operational Assessment.

* Hired Executive Director, February 2023.

* Develop and maintain social media and online presence, including:
Email Distribution List - 881 subscribers
Facebook Page - 552 followers
Instagram - 54 followers
Website

Stakeholder Engagement has resulted in a variety of partnerships and landowner participation in projects. These include:

* Private landowner cash contributions to restore floodplain in Hess Creek.

* Outreach to owners of working lands and urban stakeholders in Cozine Creek, including referrals, annual mailers, presentations and tours.

* Recruitment of landowners and cash contributions to restore upland oak woodland outside of McMinnville.

* Contacts with landowners, including the Confederated Tribes of Grand Ronde, various industrial timber companies, small woodland owners to secure survey permissions for Rapid Bio Assessment of Fish Distributions & Abundance.

* Partnership with Yamhill SWCD and Yamhill County Public Works on the Yamhill County Roadside Vegetation Management Committee - attending quarterly meetings, tours of priority weed areas and implementation of demonstration projects.

* Coordinate volunteer-led manual treatment of Garlic Mustard.

Briefly describe the council's stakeholder engagement challenges from the 2021-2023 biennium

Recruiting technical advisors and stakeholders from smaller cities, as well as agricultural and forestry representatives has been a challenge. These stakeholders participate in project specific efforts on their individual lands, however we sould like more collaboration in the overall planning process of the council.

Meetings during the COVID-19 pandemic were challenging due to restrictions on in-person attendance. As restrictions are relaxed, hybrid meetings are anticipated to allow stakeholders a variety of ways to participate.

The Council was without a staff member for a significant portion of the biennium. Hiring an Executive Director in February 2023 has created additional capacity for stakeholder engagement.

Briefly describe the council's stakeholder engagement plans for the 2023-2025 biennium.

* Quarterly E-Newsletters
* Weekly Website Updates
* At least 10 annual meetings of the Council, with additional Executive Committee meetings
* Publicize meetings and events through website, social media and mailchimp email list
* Annual community presentations, workshops, project tours, or similar outreach events
* 1-2 outreach booths at existing local events each year, such as farmers markets, town and harvest festivals, and Earth Day Celebrations.
* Quarterly participation in Yamhill County Roadside Vegetation Management Committee - including recruitment of demonstration projects.
* Offer and coordinate student internship opportunities with local colleges, universities and community colleges.
* Landowner outreach events as part of Salt Creek Collaborative focus on water quality, fisheries, and long-term planning in sub-basin.
* Landowner outreach in Cozine Creek and Baker Creek areas, including urban lands and working lands.
* Focus on stakeholder engagement to owners of working lands throughout the watershed boundary.
*Focus on partnerships with retirement communities, homeowners associations, and service/community organizations with common goals.

Describe the council's efforts to engage with local tribes present in the council's geography.

Local tribes present within the geographical boundary of the Greater Yamhill Watershed Council include the Confederated Tribes of Grand Ronde and Confederated Tribes of Warm Springs. The Council actively seeks to partner and collaborate with the tribes on restoration projects and outreach events.

One example of collaboration in 2022 was the first annual Camas Festival at Linfield University. The GYWC and Confederated Tribes of the Grand Ronde partnered with the University to host a celebration of the use of camas lilies as a traditional foodway. The event included a tour of camas growth in the Cozine Creek area. Approximately 120 people attended the event. A second annual festival is planned for May 2023.

Another example is that the GYWC received funding from the Spirit Mountain Community Fund and also secured landowner permission from the Confederated Tribes of the Grand Ronde to complete eDNA sampling within the watershed.

Describe the council's efforts to engage with non-traditional partners.

The council held virtual meetings during the COVID-19 pandemic, and now plans hybrid meetings. These options allow stakeholders to attend meetings that would otherwise find travel to be a burden.

The council actively partners with local higher education institutions on community engagement and restoration activities. This reaches a diverse cross-section of individuals and provides links to partners that might otherwise be overlooked in the community.

The council also plans to expand outreach to owners of working lands in the watershed. This expands the traditional focus of the GYWC on urban lands.

A future opportunity includes outreach to the Hispanic and Latino community. The 2021 US Census estimates that 12.6% of Yamhill County's population speaks a language other than English at home. The Census identifies 16% of the County's population as Hispanic or Latino. Offering outreach materials in alternative languages is an opportunity for greater stakeholder participation.

Restoration

Provide a brief summary of the council's 2021-2023 restoration accomplishments.

Cozine Creek
* Maintenance of previously completed restoration sites
* Outreach to owners of working lands and urban stakeholders to secure access, tours, contributions.
* Riparian enhancement for 1 acre of habitat along unnamed tributary within Ash Meadows Park, in McMinnville.

Chehalem Valley
* Maintenance of previously completed restoration sites

Salt Creek
* Maintenance of previously completed restoration sites
* Outreach to agricultural landowners for additional restoration sites

Hess Creek
* Large wood material placement
* Riparian vegetation planting and maintenance.

Yamhill River
* Culvert replacement on unnamed tributary of Glenbrook Creek, approximately 1.5 miles from confluence of Gooseneck Creek, tributary to Mill Creek and Yamhill River

Oak and Prairie Habitat Restoration
* Miller Woods site planting and maintenance
* Cooke Property planting and maintenance

Briefly describe the council's restoration challenges from the 2021-2023 biennium

GYWC was without staff for a significant portion of the 2021-2023 biennium, which limited capacity to accomplish restoration activities. This capacity has been enhanced with the hiring of a new Executive Director in February 2023. Full-time staff for the council will allow development of partnerships and allow for outreach to landowners and other stakeholders.

In addition, board member recruitment has been successful. Four existing board members were joined by two new board members in January 2023. The hiring of a part-time administrator and CPA in 2022 has allowed the Board to become more engaged in action rather than day-to-day administration.

Provide a brief summary of the council's restoration plans for 2023-2025.

Riparian Habitat Restoration
Working in collaboration with a diversity of partners, the GYWC seeks to continue its thriving riparian habitat restoration program to address poor surface water quality, elevated stream temperatures, channel erosion and a lack of LWD recruitment across urban and working lands.

The GYWC will align its primary riparian habitat restoration efforts within four existing strategic water quality monitoring and community engagement focus areas: Cozine Creek, Chehalem Valley, Salt Creek and Palmer Creek.

The urban interface of these focus areas, in particular, is defined in the GYWC Needs Assessment and Action Plan Update as a valued niche role for the GYWC. Urban areas are under-served locally, with no other conservation group leading collaborations to improve urban stream water quality or stormwater quality.

GYWC will strengthen partnership with the BLM to streamline financial and in-kind match to support LWD project implementation and grant proposal development. Have a stakeholder meeting to review data and determine how to use data to identify new LWD.

The Partnership will also work together to update the 2014 Fish Passage Barrier Database and Action Plan based on the results of the RBA Fish Snorkel Inventories. This will also include updating the Database / Plan to include the Upper South Yamhill sub-basin, which was excluded from the 2014 report due to lack of fish passage data collected in that sub-basin, which will be partially remedied by the RBA inventory results.

GYWC is a partner with the Yamhill Soil and Water Conservation District to conduct landowner outreach for two weed control projects in 2023. These include outreach for garlic mustard on Baker Creek, as well as garden yellow loosestrife on the Willamette River at the Grand Island Greenway.

Planning

Describe how the council uses planning documents to identify and implement on-the-ground watershed restoration and stakeholder engagement projects.

Potential projects and stakeholder engagement opportunities are reviewed to determine whether they acheve the goals outlined in the GYWC Watershed Restoration Action Plan.

Are projects of the council identified in a council action plan or strategic plan?

● Yes
❍ No

Provide the name and date of the most recent action plan or strategic plan.

Greater Yamhill Watershed Council Watershed Restoration Action Plan, November 14, 2014

Wrap-Up

List the watershed council staff (or contractors), their roles, affiliation (staff or contractor), length of time in position (use the Qualifications space), and contact information.

Role	Name	Affiliation	Qualifications	Email	Phone
Administrator	Tom Wilson	Contractor	Professional Contractor with Business Liability Insurance	tom@rhythmadmin.net	(971) 218-9718

Provide context and justification for how your budget was developed. Explain how project costs and/or rates were determined.

The OWEB Council Support 2023-2025 grant budget was developed by the GYWC Board of Directors. The primary change from the 2021-2023 budget is hiring a full-time Executive Director, to provide the volunteer council with capacity to accomplish the goals of the action plan.

Two other important changes from the 2021 - 2023 are focused on providing administrative and fiscal support.

This includes a line item for a part-time Administrative Assistant who will provide support for the GYWC Board and Executive Director.

The Administrative Assistant's time will be used for bookkeeping/fiscal reporting and engagement for the Board of Directors and Committees, including prep for and participation in (minutes taking) at monthly meetings. This position will work with the Executive Director and Board Officers to achieve these goals. The position is identified as a top priority for the GYWC's organizational health and capacity needs for ongoing management and administration.

The second new line item includes a contracted Fiscal Year Financial Review by our CPA. This Review will help highlight strengths and opportunities in the GYWC's fiscal policies and practices. We hope in the future to be able to continue these Reviews every year and potentially conduct an audit as funding allows. This Review is also identified as a top priority for GYWC's organizational health and ongoing management and administration.

Does the budget identify a contingency amount for specific line item(s) within the Contracted Services and/or Material and Supplies budget category?

❍Yes

GREATER YAMHILL WATERSHED COUNCIL

Bylaws

Approved:

James Riedman, Chair

11/18/2015

Signed: _____

(Authorized Signer)

GREATER YAMHILL WATERSHED COUNCIL BYLAWS

NAME OF CORPORATION: GREATER YAMHILL WATERSHED COUNCIL

ARTICLE I: PURPOSE

The corporation is organized and operated exclusively for charitable, scientific, and educational purposes. Subject to the limitations stated in the Articles of Incorporation, the purposes of this corporation shall be to engage in any lawful activities, none of which are for profit, for which corporations may be organized under Chapter 65 of the Oregon Revised Statutes (or its corresponding future provisions) and Section 501(c)(3) of the Internal Revenue Code (or its corresponding future provisions).

The corporation's primary purpose shall be to work collaboratively with communities and landowners to develop and carry out voluntary watershed protection, restoration, enhancement, monitoring, and community engagement activities.

ARTICLE II: NONMEMBERSHIP

This corporation shall have no 'members' as that term is defined by Oregon Revised Statutes Chapter 65, but shall have members for other purposes. These members shall have none of the rights or duties described in ORS Chapter 65 (or its corresponding future provisions).

ARTICLE III: MISSION STATEMENT

The Greater Yamhill Watershed Council works to protect, restore, and monitor the quality of local natural resources through collaborative, community-based, and voluntary solutions.

ARTICLE IV: SERVICE AREA

The Greater Yamhill Watershed Council's primary service area encompasses the lands drained by the Yamhill River and Chehalem Creek Watersheds, the Lambert Slough, and Grand Island that drain directly into the Willamette River. These lands may be collectively referred to as the Greater Yamhill Watershed.

ARTICLE V: MEMBERSHIP

The Greater Yamhill Watershed Council shall endeavor to recruit and maintain membership representative of a broad range of interests in reasonable proportion and in accordance with the stated purposes and in accordance with ORS 541.910 and ORS 541.890(15).

Membership Eligibility

Membership in the GYWC is open to any individual, community, business or government group that either lives or performs work within the Greater Yamhill Watershed.

Members shall complete a registration form that indicates a desire to take an active part and/or to be kept informed of Council activities.

Only registered members are eligible for nomination to the Board of Directors and making recommendations to the Board of Directors.

Removal

Membership may be terminated with or without cause by a two-thirds vote of the Board of Directors in office.

Membership Fees

The Board of Directors may establish a membership fee schedule for use in carrying out its business.

ARTICLE VI: BOARD OF DIRECTORS

Duties

The affairs of the corporation shall be managed by the Board of Directors.

Number

The Board of Directors may vary between a minimum of three and a maximum of eleven members, each referred to as a Director.

Qualifications

A Director on the Board must be an active, registered member of the Council. In accordance with ORS 541.910(2) the Board of Directors shall represent a balance of interested and affected persons in the watershed, including, but not limited to, the following:

- Watershed Residents (from each of the sub-basins of the watershed)
- Yamhill and Polk Counties
- Cities of McMinnville and Newberg
- Small Cities
- Yamhill and Polk Soil and Water Conservation Districts
- Confederated Tribes of Grand Ronde
- McMinnville Water and Light

- Other Utilities
- Business or Community Development Associations
- Agriculture
- Viticulture
- Industrial Forestry
- Small Woodlands Association
- Environmental Groups
- Student Representatives (high school and college)

Election
Directors of the Board shall be elected by a majority vote of the Board of Directors present at the annual meeting.

Terms of Office
The term of office for a Director shall be two years. Directors may serve up to two consecutive two-year terms in a seat. The Board of Directors may elect to waive a term limit for a Director if an appeal is submitted justifying the need for an additional, consecutive term. The Board shall make provisions to stagger the terms of Directors so that each cycle less than one-half of the terms shall expire.

Removal
A Director may resign by giving notice to the Board. A Director may be removed for failure to attend three consecutive meetings or with or without cause by a vote of two-thirds of Directors in office.

Vacancies
Vacancies on the Board of Directors shall be filled by majority vote of Directors in office.

Quorum and Action
A quorum at a Board meeting shall be a majority of the number of Directors prescribed by the Board, or if no number is prescribed, the majority of the number in office immediately before the meeting begins.

If a quorum is present, action is taken by a majority vote of the Directors present, except as otherwise provided by these bylaws. Where the law requires a majority vote of the Directors in office to establish committees to exercise Board functions, to amend the Articles of Incorporation, to sell assets not in the regular course of business, to merge, or to dissolve, or for other matters, such action is taken by that majority as required by law.

Regular Meetings
Regular meetings of the Board of Directors shall be held at the time and place to be determined by the Board of Directors, but no less frequently than once per quarter. No other notice of the date, time, place or purpose of these meetings is required.

Annual Meetings
The annual meeting shall be held each year on a date in January as determined by the Board of Directors. If the annual meeting date is other than a regular meeting, notice shall be given to each Director as provided under Special Meetings. At the annual meeting, Directors and Officers shall be elected.

Special Meetings
Special Meetings of the Board of Directors shall be held at the time and place to be determined by the Board of Directors. Notice of such meetings, describing the date, time, place, and purpose of the meeting, shall be delivered to each Director personally, or by telephone, or by mail, or by email not less than five days in advance of such meeting.

Action by Consent
Any action required or permitted by law to be taken at a meeting of the Board of Directors may be taken without a meeting if a consent in writing, setting forth the action to be taken or so taken, shall be signed by all Directors in office. A written communication includes a communication that is transmitted or received by electronic means. Signing includes an electronic signature that is executed or adopted by a Director with the intent to sign. A written consent is included in records of the corporation as action by the Board of Directors.

Compensation
Directors shall not receive compensation for Board service, but may be reimbursed for actual and reasonable expenses incurred in performing their duties upon the approval of the Board of Directors.

ARTICLE VII: BOARD OFFICERS

Titles and Qualifications
The corporation shall have a Chair and Secretary as required by law and may have a Vice-Chair and Treasurer, as elected by the Board of Directors. All officers of this corporation must be members of the Board of Directors. The same person may hold more than one office, other than Chair and Secretary or Chair and Treasurer, if the Board so elects.

Term and Election
The term of office for officers shall be one year. Officers may serve up to two consecutive one-year terms. Officers shall be elected by a majority vote of the Board of Directors present at the annual meeting.

Vacancy
An officer may resign at any time by delivering notice to the Board. An officer may be removed with or without cause by a two-thirds vote of the Directors in office.

Any vacancy in an officer position shall be filled by an election of the Board. Such person shall hold such office until the next annual meeting at which time regular elections of officers shall occur.

Chair
The Chair is the chief officer of the corporation and shall act as the Chair of the Board. The Chair shall ensure that all orders and resolutions of the Board are carried into effect, call and manage meetings of the Board, and sign as necessary as the specific representative of the Council. The Chair shall have any other powers and duties as may be prescribed by the Board of Directors.

Vice-Chair
The Vice-Chair shall exercise all functions of the office of Chair in the event the Chair is absent or unable to act, and perform other duties as prescribed by the Board of Directors.

Secretary
The Secretary shall have overall responsibility for all record keeping. The Secretary shall perform, or cause to be performed, the following duties: a) official recording of the minutes of all proceedings of Board of Directors meetings and actions; b) provision for notice of all meetings of the Board of Directors; c) authentication of the records of the corporation; and d) any other duties as may be prescribed by the Board.

Treasurer
The Treasurer shall have the overall responsibility for all corporate funds. The Treasurer shall perform, or cause to be performed, the following duties: a) maintenance of full and accurate accounts of all financial records of the corporation; b) deposit of all monies and other valuable effects in the name and to the credit of the corporation in such depositories as may be designated by the Board of Directors; c) disbursement of all funds when proper to do so; d) presentation of financial reports as to the financial condition of the corporation to the Board of Directors; and e) any other duties as prescribed by the Board of Directors.

ARTICLE VIII: COMMITTEES

Board Committees

The Board of Directors may establish Board committees as it deems necessary and desirable. A Board committee is any committee that exercises any function of the Board of Directors and shall be composed of two or more directors elected by a majority vote of all Directors in office. A quorum at a Board Committee meeting shall be a majority of all Committee members in office. If a quorum is present, action is taken by a majority vote of Directors present.

Advisory Committees

The Board of Directors may establish Advisory Committees as it deems necessary and desirable. An Advisory Committee is any committee that does not exercise Board functions. Committee chairs shall be appointed by the Board. These committees shall have at least one Director of staff member, but otherwise have no membership requirements.

Limitations on the Authority of Committees

No committee may authorize payment of a dividend or any part of the income or profit of the corporation to its Directors or officers; may approve dissolution, merger, or the sale, pledge, or transfer of all or substantially all of the corporation's assets; may elect, appoint, or remove Directors or fill vacancies on the Board or on any of its committees exercising Board functions; nor may adopt, amend, or repeal the Articles of Incorporation, Bylaws, or any resolution by the Board of Directors.

ARTICLE IX: CORPORATE RECORDS

The Council shall keep at its principal office, or such other location as designated by the Board, the following corporate records:

- Articles of Incorporation and Bylaws as amended to date;
- Minutes of all meetings of the Board and committees exercising Board functions;
- Books and records of all financial accounts;
- A list of the names and business or home addresses of its current Board;
- Copies of the annual financial statements and annual audits for the seven most recent years;
- Copies of the federal, state, and local income tax annual returns and annual reports for the seven most recent years;
- Copies of the most recent annual report delivered to the Secretary of State of Oregon;

- Copies of federal and state tax exemption materials; and
- Any other document or information necessary to the maintenance and operation of the corporation.

ARTICLE X: INDEMNITY OF DIRECTORS AND OFFICERS

The Corporation will indemnify an individual, who is made party to a proceeding because s/he is or was a director or officer, against liability incurred in the proceeding to the fullest extent permitted by law.

ARTICLE XI: AMENDMENTS TO ARTICLES AND BYLAWS

The Articles of Incorporation may be amended and/or restated by a two-thirds vote of all Directors in office at any meeting where such action has been announced and a summary has been presented in the meeting's notice.

These bylaws may be amended or altered by a majority vote of all Directors in office at any meeting where such action has been announced and a summary has been presented in the meeting's notice.

These bylaws may be repealed and new bylaws adopted by a majority vote of Directors in office at any meeting where such action has been presented in the meeting's notice.

2013 GYWC Watershed Restoration Action Plan

Addendum 11/14/2014

This addendum is to document the GYWC's understanding that recently completed habitat studies and conservation strategies for Fender's blue butterfly and associated species (summarized below) necessitate a thorough review of and updates to the council's 2013 Watershed Restoration Action Plan to incorporate priorities for upland restoration.

Habitat Studies

HCP for Fender's Blue Butterfly on Private Lands in Yamhill County

The Yamhill SWCD and Institute for Applied Ecology (IAE) recently completed a multi-year habitat/population study for ESA-listed Fender's blue butterfly and Kincaid's lupine for private lands in Yamhill County. This study provided the data necessary for the YSWCD to draft a Habitat Conservation Plan (HCP) (Draft, March 2014).

IAE was contracted to develop an Action Plan based on the collected data, which was published alongside the draft HCP (Conservation Strategy for Fender's Blue Butterfly and Associated Habitats in Yamhill County; March, 2014). This strategic plan was developed to complement the YSWCD's HCP, as well as to serve as a stand-alone oak/prairie restoration planning document for local conservation organizations.

HCP for Fender's Blue Butterfly on Yamhill County Right-of-Ways

Yamhill County Public Works also recently completed a multi-year habitat/population study for ESA-listed Fender's blue butterfly and Kincaid's lupine for County transportation right-of-ways. The study provided the data necessary to finalize a Habitat Conservation Plan (HCP) and secure a federal ESA take-permit specific to County right-of-ways (Approved, March 2014).

GYWC Watershed Restoration Planning

The current 2013 Watershed Restoration Action Plan is aquatic/floodplain oriented. The GYWC has an important opportunity to integrate comprehensive oak/prairie restoration information and recommendations into its Watershed Restoration Action Plan now that these Fender's blue butterfly databases and associated strategic plans have been developed. The GYWC intends to broaden its Action Plan focus to a watershed approach, which encompasses the high priority habitats (upland and aquatic/floodplain) and associated species that our service area supports. In doing so, we intend to identify the particular niche that the GYWC can fill for oak/prairie restoration projects in our service area.

We are cognizant of the organizations working in this restoration arena locally and feel that the GYWC will able to participate in a meaningful and collaborative manner with our partners. The GYWC has already taken steps to pursue these collaborations by participating in a 2014 NRCS RCPP grant funding request to support Yamhill/Polk County oak and prairie restoration. This proposal is a partnership with nearly all of the key local players in oak/prairie restoration. If awarded, the GYWC will provide much needed support for landowner recruitment and outreach. The proposal partners have strongly encouraged this role for the GYWC.

Again, our intent is to use the most current and comprehensive watershed data available to set restoration priorities and identify the actions that the GYWC will take in the coming years. Expanding our focus to include upland areas is an essential component to our watershed restoration goals. We look forward to working with our restoration partners in 2014/2015 to review our current Watershed Restoration Action Plan and to define a strategic, watershed approach that gives equal consideration to priority upland and aquatic/floodplain habitats.

Acknowledgements

The completion of the Greater Yamhill Watershed Restoration Action Plan was accomplished through the combined efforts of citizens, local universities, private and non-profit organizations, and public agencies.

Technical advice for the Action Plan was provided by a Technical Advisory Committee (TAC), composed of the following individuals:

Steve Wegner – Bureau of Land Management

Erik Grimstad – City of McMinnville

Chad Tillberg – Linfield College

Tom Murtagh – Oregon Department of Fish and Wildlife

Dave Stewart – Oregon Department of Fish and Wildlife

Marc Bell – Polk Soil and Water Conservation District

Tom Thomson – Polk Soil and Water Conservation District

Terry Anthony – Portland State University & Conservation Strategies

Kelsey Copes-Gerbitz – The Nature Conservancy

Marie Vicksta – Yamhill Soil and Water Conservation District

Dan Kent and **Kevin Scribner** of Salmon-Safe contributed content and valuable comments.

Funding for the development of the Action Plan was provided by the **Oregon Watershed Enhancement Board** and by the **Bureau of Land Management**.

Notes:

The Greater Yamhill Watershed Council Action Plan Summary

The Greater Yamhill Watershed Council, a non-profit organization with a volunteer board and council members, fosters community engagement in the basin to protect and enhance the health of our watershed. With the volunteerism of our community and a local sense of stewardship, we can achieve long-term watershed health.

The Greater Yamhill Watershed Restoration Action Plan advances the Council's mission to improve the health of the Yamhill River, Chehalem Creek, and tributary streams. The Action Plan is the framework and roadmap for guiding the Council's activities by pursuing the following goals:

Goal 1: Organize the Council for action

Goal 2: Concentrate the Council's activities by emphasizing actions in riparian and aquatic areas within Willamette Valley lowlands

Goal 3: Work collaboratively with organizations and residents on watershed restoration, education and outreach, and monitoring

Goal 4: Track watershed conditions and restoration success through monitoring and assessment lectures about watershed issues and fish populations;

Council meetings are held on the second Thursday night of the month and the public is encouraged to attend. In addition, the Council sponsors a variety of fun and educational activities

What can you do in your community?

- Participate in streamside tree planting and water quality monitoring;
- Mark storm drains in urban areas;
- SOLVE stream cleanups – help remove trash and unnatural debris from your creek;
- Get dressed-up and be goofy with the Council in McMinnville's annual UFO festival Alien Parade.
- Join other residents to survey spawning salmon
- Attend lectures about watershed issues and fish populations;
- And a host of other fun activities that connect you to nature

For more information on the Council, upcoming events, and volunteer activities, visit the Council's web site and facebook account:

http://www.yamhillwatershedcouncil.org/

https://www.facebook.com/greateryamhillwatershedcouncil

Volunteers are the heart of the Greater Yamhill Watershed Council.

Notes:

Introduction

The Greater Yamhill Watershed Council is a diverse group of community residents, landowners, environmental groups, businesses, and government agencies who work to enhance the natural resources of the Greater Yamhill Watershed. Working in collaboration with partner organizations and landowners, the Council seeks to increase understanding of the watershed and to accelerate the pace and effectiveness of watershed enhancement through voluntary restoration actions.

The Greater Yamhill Watershed Restoration Action Plan advances the Council's mission to improve the health of the Yamhill River, Chehalem Creek, and tributary streams. The Action Plan is the strategic framework and detailed roadmap intended to guide Council activities over the next five years. These activities include organizational development, voluntary restoration project implementation, building partnerships with other organizations, community and landowner education and involvement, and collecting information on watershed conditions.

Leonard A. Rydell, Yamhill County Small Woodlands Association

Bruce Sigloh, Watershed Resident

Steve Wegner, Mary's Peak Resource Area – Salem Bureau of Land Management

Council Staff

Luke Westphal, Executive Director

Notes:

Watershed Council Accomplishments

Since its formation in 1995, the Greater Yamhill Watershed Council has engaged the community and landowners in a number of educational and watershed enhancement activities, including landowner workshops, riparian restoration projects, fish habitat improvements and volunteer water temperature and water quality monitoring. Some of the stream restoration projects completed by the Council include enhancing fish habitat in Gooseneck Creek, a tributary to Mill Creek; improving upland and wet prairie habitats within Yamhill County's Deer Creek Park; and extensive riparian tree planting and invasive plant control along Muddy Creek. The Council is involved with the Palmer and Cozine Creek Pesticide Steward Partnerships (PSPs). Through water quality monitoring, the PSP identifies potential concerns and improves water quality affected by pesticide use. This partnership combines local expertise and water quality sampling results to encourage voluntary changes in pesticide use and management practices.

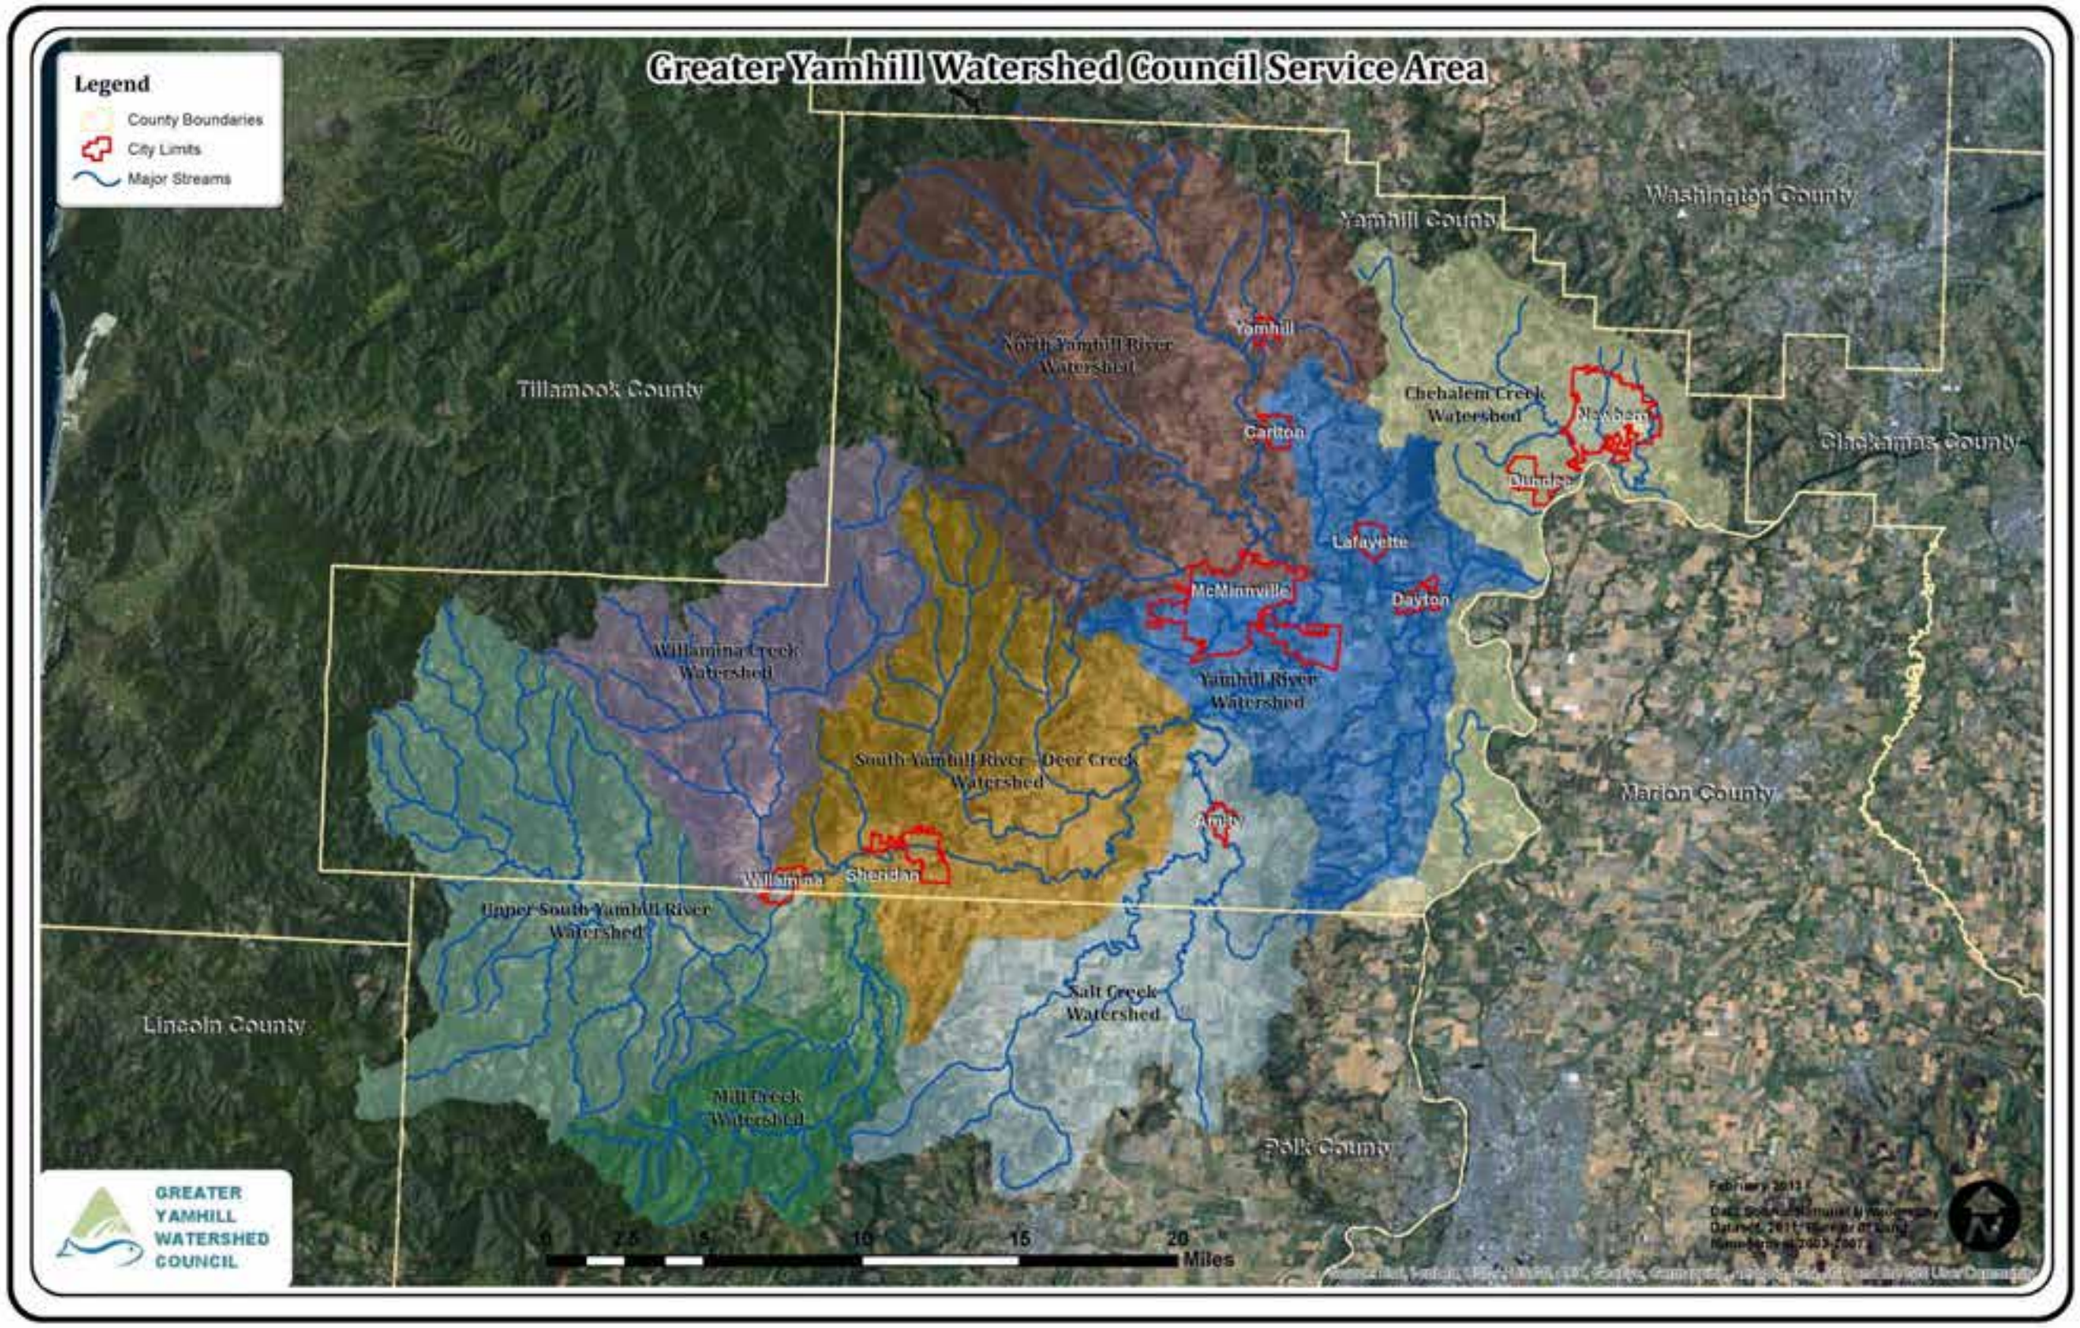
Development of the Action Plan

This document builds on the Greater Yamhill Watershed Council's 2005 action plan. The range of activities covered in the Action Plan include those necessary to increase the pace and effectiveness of the Council's watershed enhancement and educational actions. The Action Plan focuses on organizational development, on-the-ground restoration, building partnerships, outreach and education, and watershed assessment and monitoring. Because these activities cannot be achieved by the Council working in isolation, the Action Plan also provides a framework for developing partnerships with local and regional organizations that are in alignment with the Council's watershed improvement mission.

The Action Plan was developed through the guidance of the Council's Board and a Technical Advisory Committee (TAC). The TAC was comprised of representatives from partnership organizations, including Yamhill and Polk Soil and Water Conservation Districts (SWCDs), Oregon Department of Fish and Wildlife (ODFW), the Bureau of Land Management (BLM), City of McMinnville, Linfield College, The Nature Conservancy, and Portland State University. The Council Board's Chair and Executive Director also participated in the TAC meetings.

Greater Yamhill Watershed Overview

Encompassing an area of 529,510 acres, ranging from the crest of the Coast Range to the Willamette River, the Greater Yamhill Watershed Council's service area encompasses the Yamhill and Chehalem basins. Overall, the Greater Yamhill Watershed Council's service area includes eight watersheds:



North Yamhill River	Salt Creek
Willamina Creek	South Yamhill River/Deer Creek
Upper South Yamhill River	Yamhill River
Mill Creek	Chehalem Creek*

*Chehalem Creek Watershed includes Lambert Slough, a tributary to the Willamette River.

The majority (approximately 87%) of land in the Greater Yamhill Watershed Council's service area (hereafter, Greater Yamhill Watershed) is in private ownership with predominant land uses of agriculture and industrial forestry. The Bureau of Land Management, Confederated Tribes of the Grand Ronde, and the U.S. Forest Service manage properties in the Coast Range upland areas of the basin.

Roughly 70% of the Greater Yamhill Watershed lies within Yamhill County, with most of the remaining in Polk County. Small portions of the watershed are within Washington, Lincoln, and Tillamook Counties. There are ten incorporated cities and towns in the watershed: McMinnville, Newberg, Willamina, Sheridan, Amity, Carlton, Yamhill, Lafayette, Dayton, and Dundee.

The watershed's human population is growing. In 2012, Yamhill County's population estimate is 100, 550, a considerable increase over the U.S. Census' 1990 population estimate of 65,551 (PSU Population Research Center 2012 http://www.pdx.edu/prc/home). Much of the population growth has been concentrated in the Greater Yamhill Watershed's towns and cities.

Aquatic habitats and fish populations

The Yamhill River and Chehalem Creek begin in the Coast Range and foothills. These streams meander through the valley and past communities such as Sheridan, McMinnville, and Newberg before reaching the Willamette River. The watershed's streams are bordered by forests, wetland areas and other water-associated, or "riparian vegetation", that provides shade and other important habitat for wildlife and fish. Historically, the Yamhill River was characterized by a wide band of riparian and floodplain forests with an active channel meandering across the floodplain. Over the last 100 years, various land use practices have dramatically reduced the amount of streamside vegetation and the ability of the channels to migrate across their floodplains.

Cutthroat trout spawn and live their lives within the Greater Yamhill Watershed's streams, including Chehalem Creek. Coho salmon, winter steelhead, and lamprey are present in the watershed. These species are anadromous—fish that spend their adult life at sea and breed in freshwater. Another anadromous fish, Chinook salmon, do not spawn in the watershed, but young salmon from Cascade Range spawning streams will move from the Willamette River into the lower Yamhill River during the higher winter and early spring flows as they make their slow journey to the ocean. Coho salmon, which are weaker swimmers than Chinook salmon and could not ascend Willamette Falls, were not historically present in the watershed. With the addition of a fish ladder at the falls, coho are now accessing spawning areas in the Yamhill River and other Willamette River tributaries and their populations are growing.

As a result of habitat modifications, historical overfishing, and other factors, Willamette River Basin Chinook salmon and steelhead trout populations have declined to alarming levels, and the larger reproductive units they belong to—the Upper Willamette River Chinook evolutionarily significant unit (ESU) and the Upper Willamette River steelhead distinct population segment (DPS)—are listed as threatened under the ESA.

While the majority of Willamette River Basin winter steelhead spawn in tributaries on the east side of the basin flowing out of the Cascade Range (e.g., Molalla and Santiam Rivers), steelhead do spawn in the west-side Coast Range tributaries. The Oregon Department of Fish and Wildlife (ODFW) recognizes the Yamhill, Tualatin, and Luckiamute Rivers as containing west-side steelhead populations. While these steelhead populations are not as large as the east-side populations, steelhead production from west-side tributaries, including the Yamhill River, help buffer or compensate for the other populations and contribute to the population's recovery.

The majority of Upper Willamette winter steelhead, including the fish returning to the Greater Yamhill Watershed's streams, return to freshwater in January through April, pass Willamette Falls from mid-February to mid-May, and spawn in March through June, with peak spawning in late April and early May. Steelhead can migrate far upstream to spawn in smaller, higher gradient tributaries. Juvenile steelhead rear in streams for one to four years (most often two years), then migrate in April through May downstream through the Willamette River and Columbia River estuary into the ocean.

Historically, the Willamette Basin lamprey population was the largest in the Columbia River Basin. Pacific lamprey has seen dramatic population decline throughout the Pacific Northwest and the number of lamprey passing Willamette Falls has also fallen precipitously. The reasons for the population decline are not well understood, but lamprey passage problems at Willamette Falls, dams, and road crossings have contributed to the population's decline.

Lamprey begin to migrate from the ocean in the early spring, moving into the Willamette River and then up the tributary rivers and small streams. The adults reside in freshwater for approximately a year before spawning. Little is known about Willamette Basin lamprey behavior or distribution during the adult migration and holding period.

Recent studies sponsored by the Confederated Tribes of the Grand Ronde and other organizations have provided preliminary information on Willamette Basin lamprey migration patterns. These studies indicate that a significant proportion of the Willamette Basin's lamprey population migrates into the Yamhill River where they spawn in small tributary streams, such as Agency Creek, a tributary to Willamina Creek. After emergence from the stream gravels, larval lamprey burrow in silt and fine sediment substrates where they rear and feed on detritus and other organic material for 4 to 8 years, after which they undergo metamorphosis and migration to the ocean.

Upland habitats and wildlife

The Greater Yamhill Watershed includes extensive forested areas within the Coast Range and foothills. As the watershed transitions from the forested areas into the flat, broad Willamette Valley the landscape becomes very diverse: farms, wineries, woodlots, homes, and small urban centers are interspersed with natural environments, including rare Willamette Valley habitats such as oak woodlands and prairie grasslands.

Fender's blue butterfly on Kincaid's lupine

The increasingly rare native upland habitats are home to important plant and wildlife species. One example is Kincaid's lupine. This lupine, which grows in native prairies that have been virtually eliminated from the Willamette Valley as a result of conversion to agriculture, urbanization, and other development, is threatened in the wild. Fender's blue butterfly, which is protected under the federal Endangered Species Act (ESA), needs Kincaid's lupine to survive. The butterfly's larvae eat the plant's leaves during the fall then crawl down the stem and hide among the roots during the mild winters. In spring, the larvae re-emerge and eat more leaves and then form cocoons.

Notes:

Watershed Restoration Partner Organizations

Organizations are achieving a lot in the watershed – below are some examples of what is happening in restoration with a focus on partnerships and how upland restoration is being achieved.

Yamhill and Polk Counties

In 1995, recognizing the importance of conserving the natural resources of the watershed, Polk and Yamhill Counties formed the Greater Yamhill Watershed Council (then named the Yamhill Basin Council) to identify problems and needs in the watershed and to develop an action plan. Polk and Yamhill Counties own and manage significant acreage across the Greater Yamhill Watershed. Yamhill County is a key partner for the proposed Yamhales Westsider Trail, which would provide a multi-use trail connecting from McMinnville to Gaston following an unused rail line. Yamhill County Parks manages a variety of parks and natural areas, most of which are located near water bodies. Yamhill County Parks implements land management practices to protect water quality, including the protection and enhancement of riparian and wetland areas, greatly limiting the use of fertilizers and pesticides, landscaping with native plants, and controlling invasive plant species. Yamhill County Parks is also a key partner for the proposed Yamhill River Watertrail, which is being led by a committee of local residents and organizations. Polk and Yamhill County Public Works Departments are engaged in discussions with the Greater Yamhill Watershed Council to address high priority fish passage barriers. Polk County is currently partnering with the Greater Yamhill Watershed Council to acquire funding to address a high priority fish passage barrier in the Mill Creek watershed. Yamhill County Public Works is also finalizing a Habitat Conservation Plan (HCP) to protect upland prairie species on County lands, including two federal and state listed species: Kincaid's lupine and Fender's blue butterfly.

Cities

A number of local municipalities are active in the restoration and preservation of natural resources in the Greater Yamhill Watershed. The City of Newberg is leading efforts to improve urban water quality through their Willamette Total Maximum Daily Load (TMDL) Implementation Plan. The City of McMinnville has partnered with a variety of local conservation groups to conduct water quality monitoring programs, riparian plantings, and storm drain markings in partnership with the GYWC. The City of Dundee established the 20-acre Harvey Creek Trail and partnered with the Greater Yamhill Watershed Council to replace a fish passage barrier culvert. The City of Sheridan worked with the Council to restore riparian vegetation along the South Yamhill River. The City of Carlton partnered with the Council to plant trees along the North Yamhill River at Wennerberg Park. In addition, the Cities of Carlton, Dayton, Dundee, Lafayette, McMinnville, Newberg, Sheridan, and Willamina provide sponsorships for the Greater Yamhill Watershed Council's programs.

Yamhill SWCD

The YSWCD works to conserve, restore, and protect Yamhill County's natural resources by providing technical, financial, and educational assistance to citizens, landowners and businesses. The YSWCD owns and maintains a number of important conservation properties, including Miller Woods and Chegwyn Farms. The District has also made significant progress in the protection and restoration of upland habitats. The YSWCD is currently finalizing a Habitat Conservation Plan (HCP) to protect upland prairie species on private lands, including two federal and state listed species: Kincaid's lupine and Fender's blue butterfly.

Polk SWCD

The PSWCD is organized to promote conservation and wise use of natural resources in Polk County. In addition to implementing on-the-ground restoration and monitoring activities, the District has developed extensive outreach and education programs for youth and adults, including landowner resource management workshops, outdoor school events, college internships, and has published a variety landowner resource handbooks.

Bureau of Land Management

The BLM has significant upland and forested holdings across the Greater Yamhill Watershed, in particular the North Yamhill, Willamina, Upper South Yamhill, and Mill Watersheds. The BLM actively manages these lands to produce a consistent volume of timber while protecting and restoring water quality and native salmonid fisheries, among other natural resource concerns. Conservation activities implemented by the BLM include road sediment and erosion control, aquatic and riparian habitat enhancement, fish passage restoration, and sustainable forest thinning.

Confederated Tribes of the Grand Ronde

The Confederated Tribes of Grand Ronde is a diverse organization that provides a variety of programs and services to tribal members and surrounding communities. The Tribe's Natural Resources Department is organized to manage the natural resources of the Grand Ronde Tribes, such as upland forests and prairies, streams, fish and wildlife. Pacific lamprey is a culturally significant species to the Tribe and is found in Agency Creek. The Tribe is currently working collaboratively with Oregon State University and Cramer Fish Sciences to conduct research on Pacific lamprey behavior, migration, and distributions.

Yamhill Partners for Land and Water

The YPLW is an informal group of public and private organizations working together to protect and enhance the natural resources of the Yamhill valley area and its people by conserving significant lands & waters for wildlife habitat, for working lands, and for parks & natural spaces. The YPLW is actively working to establish a land trust presence in Yamhill County. In addition, the YPLW is particularly focused on the protection and enhancement of oak savanna and woodlands, upland and wet prairies, and populations of the federal and state listed Kincaid's lupine and Fender's blue butterfly.

Yamhill Watershed Stewardship Fund

The YWSF is a Yamhill County-based non-profit corporation dedicated to promoting knowledge and appreciation of healthy lands, waters, and wildlife in the Yamhill River valley. The YWSF provides local community grants for environmental outreach and education and sponsors annual environmental-themed film festivals.

Institute for Applied Ecology

IAE is a 501(c)(3) nonprofit organization with a mission to conserve native species and habitats through restoration, research, and education. The IAE has developed and implemented habitat restoration and conservation research programs throughout Oregon, including the introduction of federally listed Nelson's checkermallow within Deer Creek County Park in Yamhill County.

The Nature Conservancy

The TNC is actively engaged in upland conservation efforts in the Yamhill Valley. The TNC owns and manages the 630-acre Yamhill Oaks Preserve, which includes significant holdings of rare oak woodlands, upland prairies, and populations of federal and state listed Kincaid's lupine and Fender's blue butterfly. The TNC is an active member of the YPLW and has led the YPLW's strategic planning efforts.

Greater Yamhill Watershed Issues

There are a number of environmental issues affecting the Greater Yamhill Watershed's rivers and streams. Historical practices and current land use management are contributing to poor water quality and fish habitat. Most of the watershed's streams and associated riparian vegetation and floodplains are suffering from multiple symptoms that indicate poor watershed health. The Greater Yamhill Watershed Council is dedicated to improving the watershed by addressing the range of environmental problems. The sections below outline the key issues affecting the watershed.

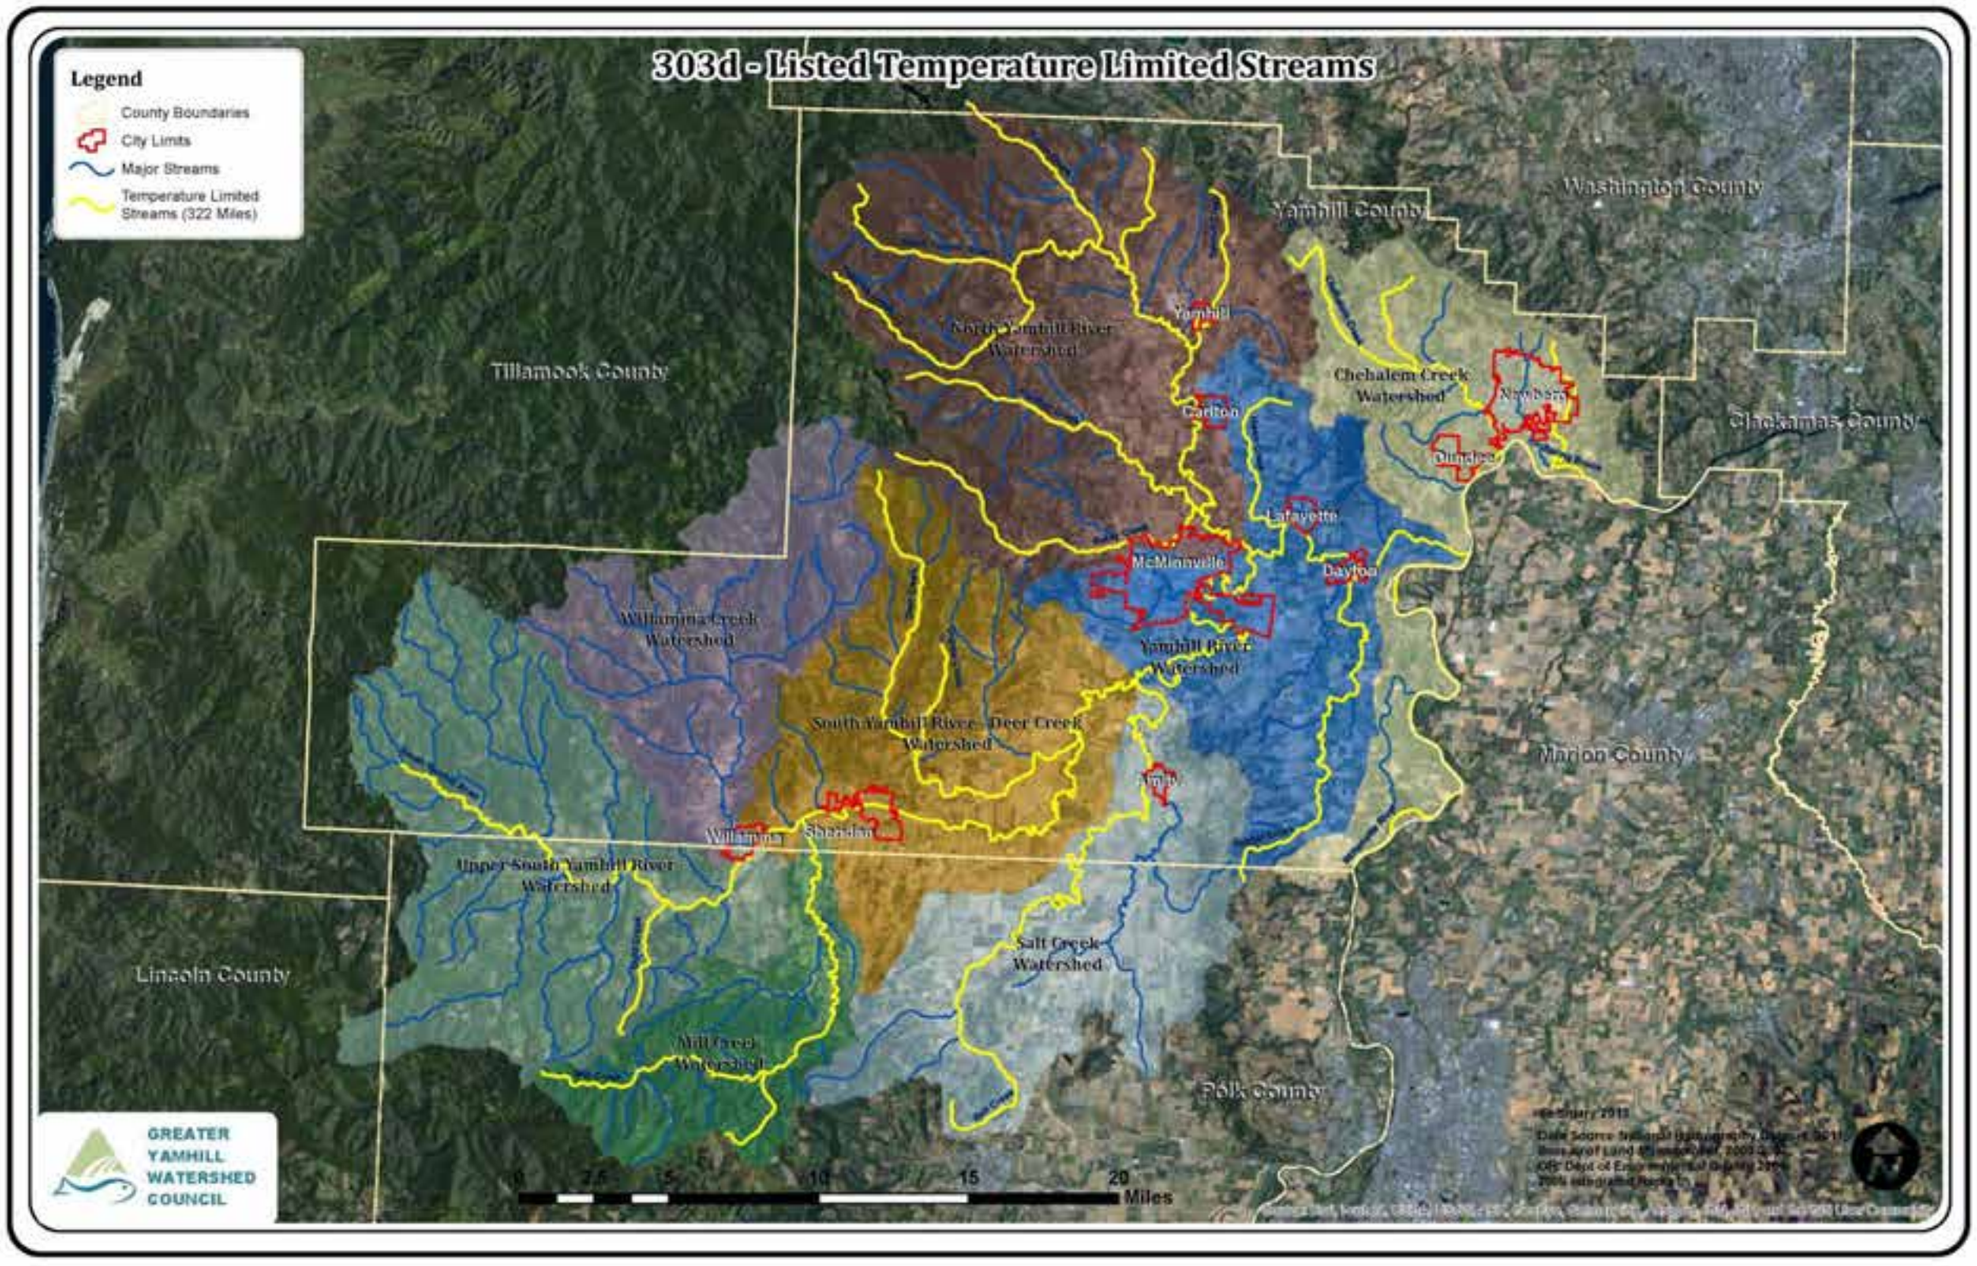
Watershed Issues Addressed by the Action Plan

Hot: Water temperatures exceed what is healthy for fish and other organisms.

Dry: Reduced water flows restrict stream habitat and increase water temperatures.

Disconnected: Road stream crossings can be barriers to fish movement; channels are disconnected from floodplains, which reduces fish habitat.

Dirty: Contaminated water from poor urban stormwater management and runoff from inadequately maintained rural roads and other land use practices is contributing to poor water quality.



Simplified: Streams have lost complexity that contributes to high quality fish habitat, including deep pools and cover, due to reduced amounts of large wood in streams and land uses affecting the width and quality of streamside vegetation and the active floodplain.

Weedy: Invasive plants are non-native species that invade habitats. In riparian areas and floodplains, invasive plants replace native plants and degrade habitats.

Hot

Stream water temperatures that are too high for healthy fish populations are a problem in the Greater Yamhill Watershed. Late summer water temperatures in large portions of the watershed's streams often exceed 65 degrees Fahrenheit, which is stressful for cold-water fish such as trout and steelhead. A key factor that contributes to these high water temperatures is loss of shade over stream channels. Removal of riparian areas or narrowing of the corridor of vegetation next to streams reduces the amount of cover over the stream, increasing sun exposure and heating the water. The Oregon Department of Environmental Quality (DEQ) has identified Greater Yamhill Watershed streams that exceed healthy temperature for fish. More than 322 miles of streams are "water quality limited" for temperature.

Dry

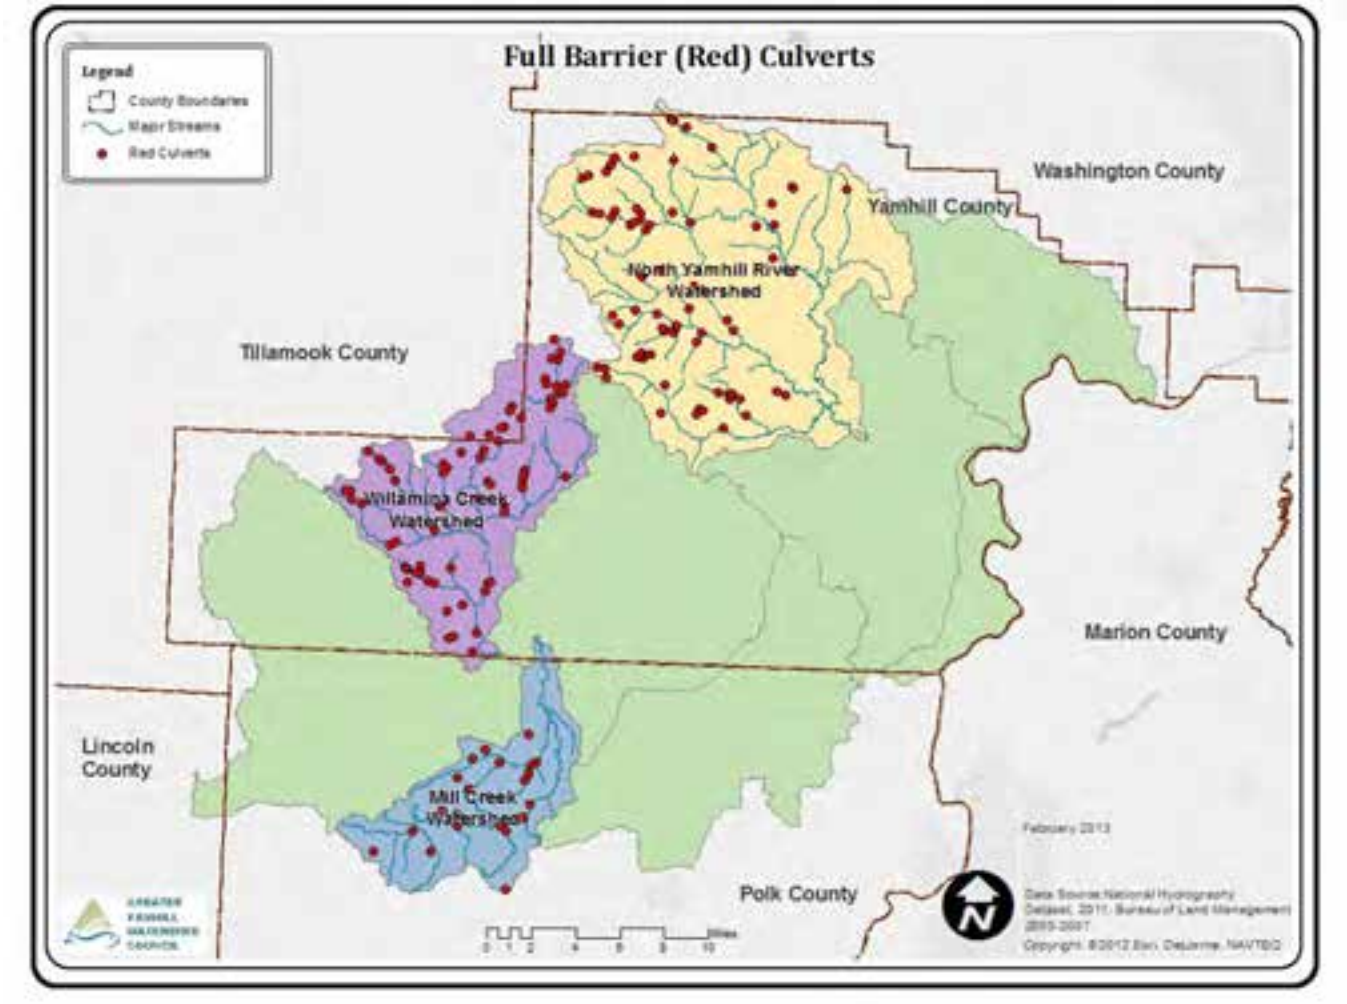
By its nature the Yamhill River, its tributaries, and Chehalem Creek have very low flows during the summer and early fall. Unlike many of the other Willamette Basin rivers that are fed by the high Cascade Mountains, low flows in the Greater Yamhill Watershed are not supplemented by a large snowpack, abundant groundwater, or water stored in reservoirs behind dams. The low water levels of the Greater Yamhill Watershed's streams are further reduced when water is withdrawn for agricultural and municipal uses. Low flows reduce the habitat available for aquatic species, including ESA-listed steelhead, and exacerbate high water temperatures because the low water volume heats up more quickly.

Climate change could magnify the Greater Yamhill Watershed's warm streams and low flows. There is a growing consensus that climate change is occurring at global, national, regional, and local scales. Predicted climate change is expected to affect watersheds and the abundance and persistence of many native fish, wildlife and plant species, with significant impacts on native salmon and trout.

A recent State of Oregon report, *Climate Change and Freshwater Resources in Oregon* (Chang and Jones 2010), outlines the potential impact of climate changes on watersheds. The following is a summary of how the report's predicted climate change could affect rain-dominated watersheds within the Willamette Basin:

- More extreme events such as floods and droughts.
- Higher summer air temperatures, accompanied by reduced precipitation, will decrease stream flow in the summer.
- Water temperatures will rise as air temperature increases, particularly in urban streams where natural riparian vegetation is typically lacking. The decline in stream flows will exacerbate water temperature increases because the lower volume of water will be heated up more quickly.
- Short-term droughts (3–6 months) will increase. These droughts, combined with increased frequency of heat waves, could drive the increased frequency of sustained periods of high water temperatures and lower summer flows.
- Increased evaporation due to warmer air temperatures may also result in reductions in total annual groundwater recharge.

Disconnected



Historically rivers and streams within the Greater Yamhill Watershed could actively meander across the floodplain. Over the last 100 years, the placement of revetments and other practices have diminished the tendency for rivers and streams to meander. These actions have disconnected channels from the floodplain, reduced fish habitat by limiting access to floodplain areas during high flows, and blocked side channels.

Fish passage barriers on tributary streams to the Yamhill River can pose significant problems for fish populations. Road crossing culverts are the primary fish passage barrier present in the Greater Yamhill Watershed. Culverts, which can be too high or too steep for fish to swim through, prevent fish from accessing important areas for spawning or from moving into cool tributary streams when the river warms during the summer months. With more than 1,500 road crossings within the watershed, there are a large number of potential fish passage barriers that can affect fish populations.

The Council has been evaluating fish passage at road crossing culverts in the Mill Creek, Willamina, and North Yamhill Watersheds. This information will aid in identifying culverts that are barriers to fish passage and prioritizing culvert replacement. Improving fish passage will have immediate benefits by opening more stream habitat to steelhead, cutthroat trout, and lamprey populations.

Dirty

Urban and rural areas within the Greater Yamhill Watershed contribute to poor water quality in streams. Roads, parking lots, rooftops, and other areas are "impervious" to water infiltrating into the ground. Rainfall hitting these impervious surfaces quickly runoff the storm drain system, contributing large amounts of water carrying sediments, oils, and other contaminates into streams. In rural areas, ditches along roads that are not properly maintained, or farm fields that do not control erosion can also transport water with sediments, pesticides and other chemicals into streams. In addition, poor land management practices can introduce other chemicals into waterways, including pesticides, and leaky septic systems and other sources can contaminate water with bacteria.

Simplified

Large wood from trees falling into stream channels provides important habitat for fish and wildlife. Large accumulations of wood in the river (i.e., log jams) help scour deep pools which tend to be cooler, and provide cover for fish and wildlife. Throughout the Greater Yamhill Watershed, there has been a dramatic reduction in the amount of wood in stream channels. Historical practices, such as log drives down the Yamhill River during the early logging of the watershed, promoted the removal of wood. Removal of riparian trees, the narrowing of the band of vegetation along channels from land use, and the conversion of conifer trees to deciduous trees such as alder, have also limited the contribution of wood into the streams.

In addition, the placement of revetments and other practices to "control" the river have diminished the Yamhill River's tendency to meander. Together, these factors have narrowed the active floodplain and corridor of floodplain vegetation; the combined effect has been a reduction in the number of trees in the channel that contributes to quality habitat.

Weedy

Invasive plants are non-native species that invade habitats. In the Greater Yamhill Watershed's riparian areas and floodplains, invasive plants replace native plants and degrade habitats. Blackberry, Japanese knotweed, purple loosestrife, spurge laurel, and other invasive plants are aggressively taking over habitat along the Yamhill River and other streams and reducing habitat diversity and quality. Reducing vegetation quality along streams can degrade water quality and fish habitat over time by diminishing the numbers of native trees and reducing shade over channels.

Armenian (Himalayan) Blackberry displaces native riparian habitats

Reed canarygrass creates a monotypic infestation where no other plants will grow

Notes:

Action Plan Structure

The Greater Yamhill Watershed Restoration Action Plan is the foundation for the Council's activities and coordinated actions with partner organizations. The Action Plan is organized around a framework that describes the overarching purpose of the plan, goals that define success, and the strategies and actions designed to achieve the goals.

Action Plan Purpose

Working in partnership with other organizations, individuals, and landowners, the Greater Yamhill Watershed Council will increase resident's understanding of the watershed and accelerate the pace and effectiveness of aquatic and riparian restoration.

Notes:

Greater Yamhill Watershed Council

Action Plan Structure

Purpose →Goals → Strategies →Actions

Purpose: Broad and visionary. The reason for the Action Plan and coordinated actions

Goals: Specific outcomes that will define success

Strategies: Overall approach used to achieve the goals in alignment with the purpose

Actions: Specific activities, including where, when, and partnerships

Notes:

Action Plan Goals

The purpose of the Greater Yamhill Watershed Restoration Action Plan will be accomplished by pursuing the following goals:

Goal 1: Organize the Council for action

Goal 2: Concentrate the Council's activities by emphasizing actions in riparian and aquatic areas within Willamette Valley lowlands

Goal 3: Work collaboratively with organizations and residents on watershed restoration, education and outreach, and monitoring

Goal 4: Track watershed conditions and restoration success through monitoring and assessment

Action Plan Strategies and Actions

Greater Yamhill Watershed Restoration Action Plan's strategies outline the direction and overall approach to achieve the Action Plan's goals. The strategies provide the framework for the Council's specific actions, including where and the partnerships that will be implemented to achieve the goals. The Action Plan strategies are as follows:

- Organizational health
- Partnerships with landowners and organizations
- Education and outreach
- On-the-ground-restoration
- Monitoring
- Assessment and reporting
- Fundraising

Goal 1: Organize the Council for action

The Greater Yamhill Watershed Council's organizational structure and representation contributes to the Action Plan's success. The Board's diverse representation, experience, skills, and perspectives will guide the implementation of the Action Plan and help provide outreach and communication to the broader community and partner organizations. The Board will form Technical Advisory Committees (TACs) that will provide scientific and technical guidance and review for the Action Plan's restoration projects and other activities. Council staff will implement projects under the guidance and review of the Board and TACs.

Activities pursued under this goal will include reviewing Board membership, TAC representation, and staff skills to assure alignment with the Action Plan's goals and activities. Gaps identified through this review will facilitate recruitment of new Board and TAC members and provide a framework for staff development.

Strategy: Organizational Health

Action 1-1 – Review Board membership and augment Board representation to facilitate implementation of the Action Plan

Action 1-2 – Recruit a full working Board and implement Annual Work Plans for Board Directors

Action 1-3 – Identify and pursue opportunities for Board and Staff development and training

Strategy: Partnerships with Landowners and Organizations

Action 1-4 – Form an Action Plan implementation technical advisory committee (TAC)

Action 1-5 – Identify landowners and recruit individuals from organizations who will help facilitate Action Plan implementation for Board and TAC membership

Action 1-6 – Develop and implement a communication plan to inform the general public, key partners, and stakeholders on the status of the watershed, Action Plan progress, and opportunities for engagement

Strategy: Education and outreach

Action 1-7 – Revise the Council's website and regularly update the website and the Facebook page to facilitate community outreach

Strategy: Fundraising

Action 1-8 – Identify and recruit a range of funding sources to implement projects and to support watershed council capacity needs

Goal 2: Concentrate the Council's activities by emphasizing actions in riparian and aquatic areas within Willamette Valley lowlands

The Greater Yamhill Watershed Council will focus its activities within watershed areas where lowlands, agriculture, and urban areas are dominant. Relative to the forested Coast Range areas, the lowlands of the Willamette Valley, where intensive land uses are concentrated, have the poorest aquatic habitat and water quality. Within these areas, the Council will emphasize actions in streams, riparian corridors, and floodplains. It is important for the Council to stress working in the aquatic and riparian environment because other partner organizations, such as the Yamhill Partners for Land and Water, The Nature Conservancy, and the Soil and Water Conservation Districts, are focusing work in upland habitat areas such as prairies and oak woodlands. The Council will continue to work with these and other organizations, but with a concentration on stream, riparian and floodplain habitats.

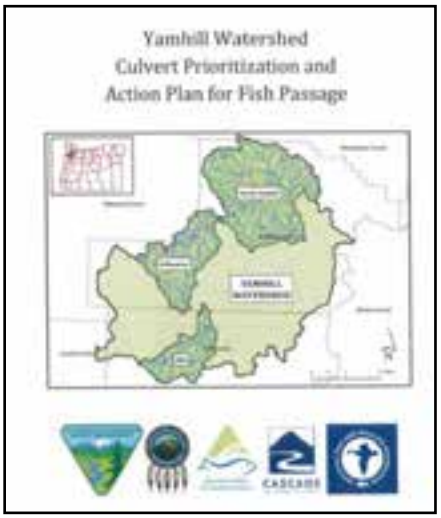
The Greater Yamhill Watershed Restoration Action Plan will focus activities in the five watersheds where lowlands, and associated agricultural and urban land uses, are a key landscape component:

- Chehalem Creek
- North Yamhill River
- South Yamhill River
- Salt Creek
- Yamhill River

The emphasis on areas within these watersheds does not mean the Council will not pursue projects and outreach in the other watersheds where uplands and forestry are the dominant land uses. The Council will pursue as a priority addressing fish passage barriers and opportunistic projects and partnerships focused on in-stream habitat and other projects in these other watersheds, the Forested Upland Focus Area, comprised of the Upper South Yamhill River, Mill Creek and Willamina Creek Watersheds.

Strategy: Education and outreach

Action 2-1 – Promote best management practices, including tools and programs used by OSU Extension Service, Natural Resources Conservation Service (NRCS), SWCD's, and Salmon-Safe



Action 2-2 – Implement volunteer program for storm-drain markings

Action 2-3 – Identify and complete at least one demonstration project in each watershed

Action 2-4 – Facilitate watershed residents' participation in salmon spawning surveys in collaboration with ODFW

Action 2-5 – Pursue outreach opportunities, including participation in local events and partnerships with the through Evergreen Museum's Wings & Waves Waterpark

Action 2-6 – Develop and implement targeted landowner/sector workshops to promote best management practices, including Salmon-Safe certifications

Strategy: On-the-ground restoration

Action 2-7 – Implement aquatic and riparian projects and best management practices

Action 2-8 – Implement fish passage improvements based on the 2013 *Yamhill Watershed Culvert Prioritization and Action Plan for Fish Passage*

Action 2-9 – Implement stormwater and Low Impact Development (LID) projects and best management practices

Action 2-10 – Implement road and agricultural sediment control projects and best management practices

Strategy: Monitoring

Action 2-11 – Implement water quality monitoring projects

Action 2-12 – Continue to participate and expand Yamhill Pesticide Stewardship Partnership (PSP)

Strategy: Assessment and reporting

Action 2-13 – Complete rapid bioassessments of fish distribution and abundance in the streams throughout the North Yamhill, Willamina, and Mill Creek watersheds

Goal 3: Work collaboratively with organizations and residents on watershed restoration, education and outreach, and monitoring

A number of organizations in the watershed are pursuing restoration and have unique expertise. Partnerships will enhance the Council's capabilities and increase the pace and effectiveness of restoration. In addition to the organizations described on page 11 of

Partnerships

We can't do it alone!

Restoration at the scale of the Greater Yamhill Watershed is a big undertaking. Partnerships with other organizations enhance the Council's capabilities to improve the watershed.

this plan, the Council will strive to identify other local, state and national organizations that have missions in alignment with the Council's watershed restoration activities.

Through the development of the Greater Yamhill Watershed Restoration Action Plan, Salmon-Safe was identified as an organization that has a unique role in the watershed and that complements the Council's mission.

Salmon-Safe, a Portland-based non-profit, has a track record of applying environmental certification in Yamhill County and beyond as a strategy to inspire water quality protection and habitat conservation. More than a decade after certifying its first farms and vineyards in Yamhill County, Salmon-Safe has become one of the nation's leading regional eco labels with more than 80,000 acres of farm and urban lands certified in Oregon, Washington, California, and British Columbia.

Salmon-Safe focuses on improving practices in these areas:

- **Riparian areas**
- **Water use**
- **Erosion and sediment control**
- **Fish passage**
- **Integrated pest management**
- **Animal management**
- **Enhancing habitat and**

Salmon-Safe has become a leading U.S. certifier of ecologically sustainable viticulture with more than 250 Oregon and Washington vineyards achieving certification, including nearly half of the wine grape acreage in Oregon's Willamette Valley. Certification for winegrowers focuses on reducing runoff from hillside vineyards and enhancement of native biodiversity on vineyard sites. The Yamhill Watershed contains the largest concentration of Salmon-Safe certified vineyards in the Pacific Northwest.

Salmon-Safe offers a series of peer-reviewed certification programs linking land management practices with the protection of agricultural and urban watersheds. Whether the site is farm, orchard, residential development, corporate or university campus, certification requires adopting management practices that protects water quality and restore habitat. With Salmon-Safe certification, landowners gain added-value in the marketplace, improve watershed habitat and water quality, and contribute to salmon recovery.

Salmon-Safe's certification program complements the Council's watershed restoration mission. Building on Salmon-Safe's success with Yamhill Watershed winegrowers, the Council will engage local partners, landowners, and institutions to facilitate participation in Salmon-Safe certification. The Council will collaborate with Salmon-Safe to pursue a long-term, whole-watershed approach, targeting a range of agricultural and other sectors and land uses, including urban areas, to improve management practices at a landscape scale.

Strategy: Organizational and landowner partnerships

Action 3-1 – Define roles, responsibilities, and actions to pursue with key partners

Action 3-2 – Work in collaboration with Salmon-Safe to define, roles, responsibilities, and actions, including grant proposals and other fund-raising strategies, to pursue with Salmon-Safe

Action 3-3 – Pursue partnerships with growers, SWCD's, and Salmon-Safe to promote agriculture-focused best management practices, including Salmon-Safe certification

Action 3-4 – Pursue partnerships and projects with landowners of forested uplands, including Confederated Tribes of the Grand Ronde, BLM, and private forest landowners

Action 3-5 – Pursue partnerships with cities, corporations, residential developers, and universities to promote urban-focused best management practices, including Salmon-Safe certification

Action 3-6 – Pursue partnerships with natural area and park land management groups to promote natural area-focused best management practices, including Salmon-Safe certification

Action 3-7 – Explore collaborations with partners, including the YSWCD and Salmon-Safe, to communicate pesticide monitoring results to agricultural landowners, improve involvement in the PSP, and to promote landowner involvement in conservation practices utilized by Salmon-Safe, the YSWCD, Natural Resources Conservation Service (NRCS), and other partners

Action 3-8 – Pursue partnerships with other watershed councils to maximize staff and council resources effectively and efficiently

Goal 4: The Council tracks watershed conditions and restoration success through monitoring and assessment

The Greater Yamhill Watershed Council is committed to understanding watershed conditions in order to target restoration actions, measure progress in watershed conditions over time, and evaluate the success of on-the-ground restoration and other actions. Targeted information collection and reporting will help inform the Council, partner organizations, and stakeholders on the status of the watershed's resources and help to target restoration activities to the locations where they are most effective.

The Council has collected information to assess watershed conditions, including water quality and fish passage barrier in formation. With the exception of the fish barrier information, which has been analyzed and reported, the Council's water quality data have not be organized or summarized in a manner that provides a comprehensive assessment of the watershed conditions.

The Council, in coordination with partnership organizations, will summarize past data collection efforts and implement a systematic data collection process that is designed to assess the status of the watershed, help target restoration areas and activities, and to evaluate improvements in watershed conditions over time. The monitoring and assessment activities will include water quality collection and reporting, fish presence and spawning inventories, fish passage barrier assessments, and post-restoration project monitoring. The Council will synthesize and summarize the collected data and other information into a periodic "state of the watershed" report that will communicate findings to partner organizations, watershed residents, and other stakeholders.

Strategy: Organizational and landowner partnerships

Action 4-1 – Pursue monitoring and assessment partnerships with Confederated Tribes of the Grand Ronde, BLM, SWCDs, Cities, Counties, PSPs, and Salmon-Safe

Strategy: Assessment and reporting

Action 4-2 – Provide periodic "state of the watershed" report (synthesize water quality, rapid bioassessment, and other information)

Action Plan Phasing

Greater Yamhill Watershed Restoration Action Plan outlines actions that will be pursued over a five year period. The Greater Yamhill Watershed Council's Board and Action Plan TAC will review Council activities within the framework of the Action Plan on an annual basis. Based on this review and an assessment of staffing and funding, the Council and TAC will develop and approve a work plan that will outline the actions to be pursued through the course of the year.

Year 1 activities will focus on organizing the Council and TAC to support the implementation of the Action Plan. Year 1 activities will focus on the following:

- Review Board membership, augment Board representation, recruit working Board members, and implement Annual Work Plans for Board Directors;
- Organize an Action Plan implementation technical advisory committee (TAC);
- Develop and implement a communication plan to inform partner organizations, the watershed community, and other stakeholders about the Council's activities and opportunities for engagement;
- Pursuing partnerships with other organizations, including implementing Salmon-Safe certification in priority watershed areas;
- Pursue specific outreach activities, including the Evergreen Museum's Wings and Waves Waterpark and existing community events
- Implementing specific on-the-ground restoration projects, with an emphasis on addressing fish passage barriers;
- Identifying landowners for demonstration projects; and
- Implementing targeted monitoring and watershed assessment actions, including continued involvement in the PSPs, and collecting information on fish presence and distribution.

Notes:

Appendix A: Compiled Action Plan Strategies and Actions

Action Plan Goals

Goal 1: Organize the Council for action

Goal 2: Concentrate the Council's activities by emphasizing actions in riparian and aquatic areas within Willamette Valley lowlands

Goal 3: Work collaboratively with organizations and residents on watershed restoration, education and outreach, and monitoring

Goal 4: Track watershed conditions and restoration success through monitoring and assessment

Strategy	Greater Yamhill Watershed Action Plan – Actions
Organizational health	**Action 1-1** – Review Board membership and augment Board representation to facilitate implementation of the Action Plan **Action 1-2** – Recruit a full working Board and implement Annual Work Plans for Board Directors **Action 1-3** – Identify and pursue opportunities for Board and Staff development and training

Strategy	Greater Yamhill Watershed Action Plan – Actions
Partnerships with landowners and organizations	**Action 1-4 –** Form an Action Plan implementation technical advisory committee (TAC) **Action 1-5** – Identify landowners and recruit individuals from organizations who will help facilitate Action Plan implementation for Board and TAC membership **Action 1-6** – Develop and implement a communication plan to inform the general public, key partners, and stakeholders on the status of the watershed, Action Plan progress, and opportunities for engagement **Action 3-1** – Define roles, responsibilities, and actions to pursue with key partners **Action 3-2** – Work in collaboration with Salmon-Safe to define, roles, responsibilities, and actions, including grant proposals and other fund-raising strategies, to pursue with Salmon-Safe **Action 3-3** – Pursue partnerships with growers, SWCD's, and Salmon-Safe to promote agriculture-focused best management practices, including Salmon-Safe certification **Action 3-4** – Pursue partnerships and projects with landowners of forested uplands, including Confederated Tribes of the Grand Ronde, BLM, and private forest landowners **Action 3-5** – Pursue partnerships with cities, corporations, residential developers, and universities to promote urban-focused best management practices, including Salmon-Safe certification **Action 3-6** – Pursue partnerships with natural area and park land management groups to promote natural area-focused best management practices, including Salmon-Safe certification **Action 3-7** – Explore collaborations with partners, including the YSWCD and Salmon-Safe, to communicate pesticide monitoring results to agricultural landowners, improve involvement in the PSP, and to promote landowner involvement in conservation practices utilized by Salmon-Safe, the YSWCD, Natural Resources Conservation Service (NRCS), and other partners **Action 3-8** – Pursue partnerships with other watershed councils to maximize staff and council resources effectively and efficiently **Action 4-1** – Pursue monitoring and assessment partnerships with Confederated Tribes of the Grand Ronde, BLM, SWCDs, Cities, Counties, PSPs, and Salmon-Safe

Strategy	Greater Yamhill Watershed Action Plan – Actions
Education and outreach	**Action 1-7** – Revise the Council's website and regularly update the website and the Facebook page to facilitate community outreach **Action 2-1** – Promote best management practices, including tools and programs used by OSU Extension Service, Natural Resources Conservation Service (NRCS), SWCD's, and Salmon-Safe **Action 2-2** – Implement volunteer program for storm-drain markings **Action 2-3** – Identify and complete at least one demonstration project in each watershed **Action 2-4** – Facilitate watershed residents' participation in salmon spawning surveys in collaboration with ODFW **Action 2-5** – Pursue outreach opportunities, including participation in local events and partnerships with the through Evergreen Museum's Wings & Waves Waterpark **Action 2-6** – Develop and implement targeted landowner/sector workshops to promote best management practices, including Salmon-Safe certifications
On-the-ground-restoration	**Action 2-7** – Implement aquatic and riparian projects and best management practices **Action 2-8** – Implement fish passage improvements based on the 2013 *Yamhill Watershed Culvert Prioritization and Action Plan for Fish Passage* **Action 2-9** – Implement stormwater and Low Impact Development (LID) projects and best management practices **Action 2-10** – Implement road and agricultural sediment control projects and best management practices
Monitoring	**Action 2-11** – Implement water quality monitoring projects **Action 2-12** – Continue to participate and expand Yamhill Pesticide Stewardship Partnership (PSP)
Assessment and reporting	**Action 2-13** – Complete rapid bioassessments of fish distribution and abundance in the streams throughout the North Yamhill, Willamina, and Mill Creek watersheds **Action 4-2** – Provide periodic "state of the watershed" report (synthesize water quality, rapid bioassessment, and other information)
Fundraising	**Action 1-8** – Identify and recruit a range of funding sources to implement projects and to support watershed council capacity needs

MEMORANDUM

To: Yamhill and Polk County Board of Commissioners

From: Kenneth Friday, Senior Planner KF

Re: **Yamhill Basin Council**

February 16, 1995 the Yamhill Basin Council Steering Committee met to recommend appointments to the Yamhill Basin Council. The goal of the basin council is to identify problems and needs in the watershed and develop a basin action plan. To do this the council must represent a broad range of interests in the Yamhill Basin. The steering committee has identified members it believes will accomplish this goal. These appointments need to be approved by both the Polk and Yamhill County Board of Commissioners. The steering committee has recommended the following appointments:

NAME	AFFILIATION	REPRESENTING
Mike Propes	Polk County	County Government
Dennis Goecks	Yamhill County	County Government
Greg Scholes	Newberg Planning	City Government
Sue Hollis	Dayton Administratur	Small Cities
Mike Sauerwein	Sheridan City Manager	City Government
John Kennedy	McMinnville Public Works	City Government
John Harshman	McMinnville Water and Light	Utilities
Ray Hobson	Perrydale Water Association	Water Assoc.
Sam Sweeney	Farm Owner	Agriculture

2-22-95 Board Order
95-100

Roger Buchholz	Bailey Nurseries	Agriculture
Stan Christensen	Yamhill SWCD	Agriculture
Dan Upton	Willamette Ind.	Forestry
Leonard Rydell	Small Woodlands Assoc.	Forestry
Richard Zimbrick	Timber Owner	Forestry
Janice Thompson	Park and Rec. Board	Unaffiliated
* To Be Appointed	Bureau of Land Mgmnt.	Federal Agency
* To Be Appointed	Carlton Lake Rest.	Carlton Lake Restoration
* To Be Appointed	Confederated Tribes of G.R.	Confederated Tribes of Grand Ronde

* Note: Because several names have been submitted by these organizations, they will each be requested to choose their own representative.

In addition, one other council member is being sought to represent environmental concerns. When that person is selected their name will be forwarded to both county boards for approval.

Subject: RE: Request for Resolution Research - Greater Yamhill Watershed Council
Attachments: BOC Memo, 2-9-94.pdf; Board Order 95-100, 2-22-95.pdf; Charter & Rules.pdf

Good Morning, Bernadette.

Your information helped point me in the right direction and I found three documents in the file that may be helpful.

1. The oldest document is dated February 9, 1994, and it is a memo between commissioners. It contains good background information.

2. The document dated February 17, 1995, has Board Order 95-100 dated February 22, 1995 on it, indicating official acceptance by the Board of Commissioners. We consider this the creation document of the Watershed Council, however, it is a memorandum rather than a resolution.

3. The third document, identified as *Charter & Rules – 1999 Revision*, was received in our office on February 8, 1999, and placed in the file. I'm not sure who created the document and we have no Board Order to make it an official document. On the last page you will see 'Terms of Office' mentioned although we have no Board Order indicating acceptance of terms by the commissioners.

No resolution can be found in the hard-file or any e-files.

You are a kind and good person yourself, Bernadette, and your words touched my heart. A sincere thank you!

Subject: Request for Resolution Research - Greater Yamhill Watershed Council

Good Afternoon Barbara,

First, I've got to tell you that it is always a pleasure working with you. You are courteous, helpful and always professional – what a great skill set! Yamhill County & the Commissioners are lucky to have you as their "first point of contact"!!

Next, per our telephone conversation earlier today, you were going to have Ann (?) do a little research on finding the Resolution that approved the formation of the Yamhill Basin Council. As far as I can find, the Resolution went before the Board of Commissioners in either late January, February or early March of 1995. I hope this will be enough to go on – if not, please just let me know and we'll try another tact. Thanks again!

Open and Inclusive Organization

The Greater Yamhill Watershed Council (Council) is committed to operating as an open, inclusive, and diversely-represented organization. In addition, the Council desires to be as transparent as possible while maintaining obligations to protect the privacy of donors, employees, volunteers, client, and other persons or entities.

Public Notification of Meetings Policy:

A key component to having an open and inclusive council is inviting the public to regular meetings. Regularly scheduled board meetings occur at least once a quarter. In order to promote these meetings and encourage community involvement the council will post the date, time, and location of the meeting in the following at least one week before the meeting:

- Newspaper Community Bulletins (online and print)
- Council Website, Social Media, and Newsletters
- Partner Organization Websites, Social Media, and Newsletters

Public Requests for Documentation:

The Council shall make the following available to the public for inspection upon request:

- Articles of Incorporation
- Bylaws
- Organizational/Governance Policies and Procedures
- Form 1023 Request for Tax-Exemption and Tax-Exempt Determination Letter
- Form 990 Federal Return of Organization Exempt From Income Tax (three most recent years)
- Audited Financials
- Annual Organizational Reports
- Agendas and Board-Approved Minutes for Meetings of the Board of Directors and Board Committees.

The Council may comply with the requirement that it provide copies to the public by posting these documents on the Council's website in an electronic format. Documents may also be posted to trusted, secure third-party websites, such as www.guidestar.org.

Balanced Interests on Governing Body

The mission of the Greater Yamhill Watershed Council (Council) is to work collaboratively with communities and landowners to develop and carry out voluntary watershed protection, restoration, enhancement, monitoring, and community engagement activities. In order to achieve our mission, the council strives to bring people and organizations with different goals, views, and resources onto its Board of Directors. In doing so, the Council seeks to engage a balance of interests and affected persons within the watershed.

Efforts will be made to bring together individuals, community, business, or government groups that either live or work within the Greater Yamhill Watershed. The Board of Directors will actively recruit Board members to maintain a broad range of interests on the governing body, including, but not limited to, the following key interests:

- Watershed Residents (from each 5th-field sub-basin)
- Agriculture (Farm Bureau and Growers)
- Viticulture (AVAs, Growers, LIVE)
- Nurseries
- Forestry (Industrial and Small Woodlands)
- Tribal Governments (Confederated Tribes of Grand Ronde, Confederated Tribes of Warm Springs)
- Incorporated Municipalities (Amity, Carlton, Dayton, Dundee, Lafayette, McMinnville, Newberg, Sheridan, and Willamina)
- County Governments (Polk and Yamhill)
- State Agencies (ODA, ODF, and ODFW)
- Federal Agencies (BLM, NRCS, USDA, USFWS)
- Soil and Water Conservation Districts (Polk and Yamhill)
- Water and Irrigation Districts (Buell/Red Prairie Water District, McMinnville Water and Light, Palmer Creek Irrigation District)
- Public and Private Conservation Organizations and Businesses
- Educational Institutions (Colleges, School Districts, Universities)
- Student and Youth Representatives

Council Membership Form

Thank you for your interest in becoming a member of the Greater Yamhill Watershed Council (Council). Membership is an opportunity to show your support for local, grassroots, natural resource conservation in your community. As a member, you join a diverse network of individuals, organizations, and stakeholders working together to empower our local communities to be good stewards of the lands and waters in the Yamhill and Chehalem valleys.

Membership Benefits: Council members are eligible for deeper involvement in our watershed programming and governance, as well as discounts on training and gear, including:

- Nomination to Council Committees, Board of Directors, Associate Directors
- Nomination to the Network of Oregon Watershed Councils (NOWC) Board of Directors and Committees (NOWC supports the interests & needs of Councils statewide)
- Discounts and Scholarships on Trainings, Workshops, and Conferences (as available)
- Discounts on Gear purchased through participating companies (as available)

Council Board of Directors Application Form

Thank you for your interest in serving as a member of the Greater Yamhill Watershed Council's (Council) Board of Directors (Board). Service on the Council Board is a volunteer position dedicated to providing effective governance and leadership for the Council, working in coordination with a diversity of partners, including the Board of Directors, Associate Board members, Committee members, the Executive Director and other Staff, Partner Organizations, as well as Donors and Funders.

To qualify for nomination to the Board, you must be a registered member of the Council and agree to the Board Member Roles and Responsibilities policy included in this packet.

Prior to applying for nomination to the Board, it is encouraged that prospective candidates serve at least one year as a Committee member or an Associate Board Member.

Term of Appointment:
The term of office for a Board Member is two years, expiring at the Council Annual Meeting.

Directors may serve up to two consecutive two-year terms. Additional consecutive terms may be served upon written intent to continue service and with approval from the Board.

Application Process:
Please complete the Board Member application packet and return to the Council by mail, email attachment, or our main office.

Applications may be submitted at any time and will be considered at the next available meeting of the Board. Applicant will be notified of the meeting date and encouraged to attend to present their application.

Application for Board of Directors: Must be a registered Council Member. If you need to update your contact information, please complete a new Council Membership Form.

Name: _____ Date: _____

Applicant Questionnaire: (Attach additional sheets as needed)

1. **Interest in Service:** Why are you interested in serving on the Council Board of Directors?

6. **Roles and Responsibilities:** Members of the Board of Directors are required to serve in accordance to the terms of the Board Member Roles and Responsibilities Policy.

   ☐ I have read, understand, and agree to the terms of the Board Member Roles and Responsibilities Policy.

Board Member Roles and Responsibilities

The Greater Yamhill Watershed Council (Council) is a 501c-3 non-profit organization that works collaboratively with communities and landowners to develop and carry out voluntary watershed protection, restoration, enhancement, monitoring, and community engagement activities.

The Council endeavors to recruit and maintain a diverse and engaged membership. Any individual, community, business, or government group that either lives or performs work within the Greater Yamhill Watershed is eligible to register for membership. Registered members may make recommendations to the Board of Directors (Board) and are eligible for nomination to the Board.

The affairs of the Council are managed by the Board as stipulated in the Bylaws. As individuals and a collective group, the Board shall endeavor, to the best of their abilities and resources, to serve in the following capacities:

- Demonstrate a commitment to and understanding of the Council's mission, goals, programs, policies and procedures, and fundraising
- Represent a key interest of the watershed
- Share experience and knowledge
- Work cooperatively to improve Council performance, efficacy, and sustainability
- Expand knowledge or responsibilities through training
- Represent the Council in the community and encourage public involvement
- Serve on at least one committee

Areas of Governance

The Board is responsible for governing the Council's affairs. Governance is primarily driven by developing, maintaining, and administrating policies and procedures that define how the Council is managed and operated, including:

Community Representation:
How do we ensure community interests and needs are fully represented and addressed? How do we encourage an open and inclusive culture throughout our organization and our activities?

- Maintain and administer Balanced Interests and Open and Inclusive Organization policies
- Identify, prioritize, and actively pursue a diversity of representation and interests in Membership, Board of Directors, Employees, and Volunteers
- Provide for and promote opportunities for the public to engage in the Council's governance, programs, and projects

Capacity Building:
How do we plan for adequate resources to achieve the Council's mission and goals, and to implement strategic plans and programs?

- Maintain and administer Capacity Building policies and plans
- Develop diverse financial support from grantors and donors
- Build mutually-beneficial partnerships and cooperatives
- Seek opportunities that enhance community support, engagement, understanding, and involvement in the Council's mission and goals

Annual Reviews & Strategic Planning:
How do we identify what is working and what is not, why, and what actions will be taken in the short/long-term based on that knowledge?

- Review mission and goals
- Create and evaluate organizational and programmatic action plans
- Develop and review work plans
- Evaluate overall organizational health and Strategic Planning and Evaluation policies annually

Finance:
How do we soundly manage and maximize the benefits of financial investments from our funders, donors, and supporters?

- Maintain and administer Financial Policies & Procedures
- Ensure financial accountability, transparency, and reporting to funders, donors, members, Board of Directors, OR DOJ, IRS, and the public
- Set and review accounting operations, procedures and controls to safeguard assets and minimize risks of mismanagement
- Oversee an ongoing process of budget development, approval, and review
- Manage and maintain property the organization possesses

Human Resources:
How do we recruit, retain, manage, support, and develop personnel (i.e. the Board of Directors, Membership, Employees, and Volunteers)?

- Manage and Support personnel
    - Maintain and administer personnel policies
    - Recruit and Retain personnel
    - Train, evaluate, and recognize personnel
    - Support the growth and development of personnel

Board Officers Roles & Responsibilities

The Board of Directors (Board) shall elect Council Officers, including a **Chair** and **Secretary** as required by law, and a **Vice-Chair** and **Treasurer** as desired. Council Officers must be members of the Board.

Chair (required by ORS 65.371)

- Performs all duties of a Board Member (see Board Member Roles & Responsibilities)
- Chairs the Executive Committee
- Serves as the Principal Officer of the organization
- Actively ensures that the Board fulfills governance duties, including developing, maintaining, and administering policies and procedures; and operating in accordance with the Articles of Incorporation and Bylaws.
- Ensures that resolutions of the Board are carried out.
- Ensures roles are set for Board meetings, including facilitator, secretary, & timekeeper
- Performs other duties as prescribed by the Board

Vice-Chair

- Performs all duties of a Board Member (see Board Member Roles & Responsibilities)
- Serves on Executive Committee
- Performs duties of the Chair in the event the Chair is absent or unable to act
- Perform other duties as prescribed by the Board

Secretary (required by ORS 65.371)

- Performs all duties of a Board Member (see Board Member Roles & Responsibilities)
- Serves on Executive Committee
- Performs or causes to be performed, the following record keeping tasks
    - Official recording of the Board meeting minutes and actions;
    - Provision for notice of all meetings of the Board
    - Authentication of the records of the corporation
- Performs other duties as prescribed by the Board

Treasurer

- Performs all duties of a Board Member (see Board Member Roles & Responsibilities)
- Serves on Executive Committee
- Performs or causes to be performed, the following financial duties:
    - Maintenance of full and accurate accounts of all financial records
    - Deposit of all monies and other valuable effects in the name and to the credit of the corporation in such depositories as may be designated by the Board
    - Disbursement of all funds when proper to do so
    - Presentation of financial reports as to the financial condition of the corporation to the Board;
- Actively ensures that the Board fulfills governance duties related to corporate funds, including developing, maintaining, and administering financial policies and procedures; and operating in accordance with the Articles of Incorporation and Bylaws
- Performs other duties as prescribed by the Board

Executive Director Roles & Responsibilities

The Executive Director (ED) provides leadership for the Council, manages daily operations, and implements the Board of Director's (Board) resolutions. The ED reports and is accountable to the Board.

Working in coordination with the Board, Officers, and Committees, the ED performs, or causes to be performed, the following tasks, as well other duties prescribed by the Board:

Partnership Development & Facilitation

- Build partnerships and facilitate stakeholder processes that implement priority watershed programs, including restoration, monitoring, and education & outreach
- Network with groups to identify and develop partnership opportunities, including participating in other organizations' activities and meetings
- Provide opportunities for the public to participate in Council activities
- Develop and maintain community outreach tools and materials

Watershed Project Development & Management

- Develop projects that align with documented watershed priorities and Council action plans, including restoration, monitoring, and education and outreach projects
- Manage project implementation, including permitting, contractors, budgets, and reporting
- Develop and facilitate updates to Council action plans and work plans.

Personnel & Volunteer Management

- Advise the Board of human resource and volunteer needs
- Manage staff, interns, and volunteers, including recruitment, training, coordination, and supervision

General & Administrative Services

- Coordinate meetings, including announcements and documentation.
- Maintain organizational, project, and programmatic records and databases.
- Provide fiscal services, including purchasing, accounts payable, accounts receivable, payroll, grant administration, budgeting, forecasting, and tax accountant coordination

Fundraising

- Secure diverse funding for priority watershed programs and Council operations
- Implement fundraising events and activities to support Council capacity needs.

Board and Advisory Committees

As defined in the Bylaws, the Board of Directors (Board) may establish Committees as deemed necessary and desirable. For example, to meet a need such as developing education and outreach, to recruit members to the governing body, or to develop a restoration project.

Board Committees
The Board may establish Board Committees, which may exercise limited Board functions and are composed of two or more Directors. Voting membership of Board Committees is limited to Board Members.

The Council shall have, at a minimum, the following Board Committee(s):

- **Executive Committee (EC):** Chaired by the Board, and composed of the current Board Officers, and others as designated by the Board. The EC is responsible for ensuring the maintenance and administration of policies and procedures that govern the Council, including Board development and governance, program operations and management, financial oversight and accountability, as well as fundraising and capacity building.

  The EC reports and is accountable to the Board. The Board may delegate Board duties to the EC, including tasks that are defined in policy as Board duties.

Advisory Committees
The Board of Directors may also establish Advisory Committees that do not exercise Board functions. These committees shall have at least one Director, staff member or others as designated by the Board, but otherwise have no membership requirements. Advisory Committees report and are accountable to the Board.

The Council shall establish and convene the following Advisory Committees as desired to facilitate the development and implementation of watershed programming and capacity building:

- **Habitat Restoration**
- **Education & Outreach**
- **Monitoring & Assessments**
- **Capacity Building**
- **Self-Assessment**

Self-Assessment of Governing Body

The Board of Directors (Board) is committed to assessing the performance of the Council and the Board itself in order to identify our strengths and areas in which we have room for improvement.

The Board shall conduct a self-assessment at a minimum of every two years, including:

- An advisory committee shall be appointed in March to determine the instrument or process to be used in Board self-assessment. The process for evaluation shall be recommended to and approved by the Board.
- If an instrument is used, all Board Members will be asked to complete the evaluation instrument and submit them to the Board Secretary.
- A summary of the evaluations will be presented to and discussed by the Board
- The overall goal of the self-assessment is to improve Council operations and policies for the benefit of our local watersheds and communities. Such assessments help to clarify roles, to enhance harmony and understanding among Board Members, and to improve efficiency and effectiveness of the Board.
- The results of the self-assessment and Board discussion will be used to improve and focus Council work plans and action plans

Succession Planning for Board Leadership & Executive Director

BOARD MEMBERS & OFFICERS

Holistic planning for changes in Board Membership and Officer Leadership is an essential duty of the Board of Directors, and, while challenging, provides an opportunity to identify skills, representation, and perspectives that may complement continued growth and advancement of organizational health. A succession policy for Board Members and Officers is an important tool for effective management and long-term strategic planning. The Board shall be prepared in the event of permanent change in Board Membership and Officers – either planned or unplanned – to ensure stability and accountability of the Council. The Board shall be responsible for implementing this policy and its related procedures, and for annually reviewing and updating the policy as needed.

The purpose of this policy is to provide guidance of roles and procedures to support positive leadership transitions that build organizational capacity when a planned or unplanned change occurs in Board Membership and Officer Leadership.

Emergency Succession

- **Temporary Unplanned Absence**: In the event of an unplanned, short-term absence (3 months or less) or long-term absence (more than 3 months) in which a Board Member is unable to fulfill their duties because of unexpected circumstances, the Board may appoint an existing, registered Council member to fill the vacancy through a majority vote of the Board members present at a meeting with a quorum. If the vacant Board Member is also an Officer, the Board may appoint an existing Board Member to fill the Officer position through a majority vote of the Board members present at a meeting with a quorum. The appointed Board Member and/or Officer will complete the existing term duration of the vacancy filled.

- **Permanent Unplanned Absence**: In the event of an unplanned, permanent absence in which a Board Member or Officer is unable to return to their position, the Board may appoint an existing, registered Council member to fill the vacancy through a majority vote of the Board members present at a meeting with a quorum. If the vacant Board Member is also an Officer, the Board may appoint an existing Board Member to fill the Officer position through a majority vote of the Board members present at a meeting with a quorum. The appointed Board Member and/or Officer will complete the existing term duration of the vacancy filled. The Board may elect to begin a search process for a permanent replacement for the vacated Board Member / Officer Position.

Planned Board & Officer Transitions

In the event that a Board Member or Officer has reached a term-limit or provides notice that they will not be seeking re-election, it is the Board's responsibility to ensure that their succession is thoughtfully planned out so as to ensure continued effectiveness of governance and management of the Council's operations. Planning for Board Member or Officer succession should include consideration of an organizational and Board self-assessment, reviews of roles and responsibilities

for Board Members and Officer Positions, and a clear and timely search and selection process for a replacement.

- **Organizational Review and Board Self-Assessment:** The Executive Committee and Board of Directors will work in coordination with the Executive Director to conduct an Organizational Review of the Council's policies, strategic plans, and operations. In addition, the Executive Committee will work with the Board to implement a Board Self-Assessment to review practices, skills, representation, and performance of the Board as a whole and as Board Members individually. The Executive Committee will provide a summary report to the Board.

- **Job Descriptions of Board Members & Officers:** The Board will annually review the Job Descriptions of the Board Members and Officers to ensure alignment with organizational strategic plans, policies, and resources.

- **Board Member and Officer Recruitment and Election:** After completion of the above due diligence, the Board will work in coordination with the Executive Director to plan a search and recruitment process that is transparent and timely. The Board may elect to develop a list of potential candidates to contact whose qualities align with the current leadership needs of the Council's Board. Once recruited, the Board is ultimately responsible for appointing the new Board Member or Officer to fill the vacancy, which is conducted through a majority vote of the Board Members present at a meeting with a quorum. If the vacancy is an Officer Position, the recruited member must be an existing Board Member before they are eligible for election to an Officer Position.

EXECUTIVE DIRECTOR

The Board of Directors (Board) understands that changes in executive leadership are inevitable for any organization and can be a challenging time, involving both risk and opportunity. A succession policy for the Executive Director position is a critical tool for effective management and long-term strategic planning. The Board shall be prepared in the event of a permanent change in the Executive Director position, either planned or unplanned, to ensure the stability and accountability of the Council. The Board shall be responsible for implementing this policy and its related procedures and for annually reviewing and updating the policy as needed.

The purpose of this policy is to establish guiding principles, clarify roles, and to identify procedures that support a positive leadership transition that fosters good endings and beginnings with departing and arriving leaders and builds organizational capacity when a planned or unplanned change occurs.

Guiding Principles

- The Board believes that its due diligence responsibility, as well as the interests of the Council, will be best served by a robust, competitive search process. The Executive Director has the single greatest impact on the Council's development and effectiveness, therefore, his or her

selection should not be rushed. Internal candidates from the staff and/or Board will be seriously considered along with qualified candidates emerging from external search.

- The Executive Director's position is often shaped by the incumbent's talents and areas of specialized interest. That person's departure may necessitate other organizational changes including the creation of new positions and/or realignment of current positions.

- The foremost goal of an interim Executive Director is the maintenance and continuity of the Council's mission-related work. A transition also presents an opportunity for growth and organizational development.

Emergency Succession

- **Temporary Unplanned Absence**: In the event of an unplanned, short-term absence (3 months or less) or long-term absence (more than 3 months) in which the Executive Director is unable to fulfill their duties because of unexpected circumstances, the Board may assign some or all of the Executive Director's duties to other staff or a member of the Board, or contract or hire an outside interim Executive Director.

  The Board must approve any changes in wages for staff acting as the interim Executive Director. The interim Executive Director will report directly to the Executive Committee and the Board of Directors. The Board Chair, in consultation with the Executive Committee and Interim Executive Director will contact all staff members to inform them about the interim leadership plans. The interim Executive Director shall, in consultation with the Board, communicate the temporary leadership structure to key stakeholders, partners, and funders.

- **Permanent Unplanned Absence**: In the event of an unplanned, permanent absence in which the Executive Director is unable to return to the position, the Board may select a staff member, Board member, or an outside person as an interim Executive Director and begin the search process for hiring new leadership.

  The Board must approve any changes in wages for staff acting as the interim Executive Director. The interim Executive Director will report directly to the Executive Committee and the Board of Directors. The Board Chair, in consultation with the Executive Committee and Interim Executive Director will contact all staff members to inform them about the interim leadership plans. The interim Executive Director shall, in consultation with the Board, communicate the temporary leadership structure to key stakeholders, partners, and funders.

Duties of the Interim Executive Director: The primary responsibility of the Interim Executive Director is to assure that the organization continues to operate without disruption and that all organizational commitments previously made are appropriately executed, including but not limited to:

- Managing day-to-day operations of the organization, including grant and contract obligations, reports, and other obligations to funders and other stakeholders
- Supervising staff
- Maintaining finances and revenue generation and overseeing budgets and expenditures

- Reporting to Board and Executive Committee on a regular basis on the status of the organization and support needs
- Conducting organizational analysis and consulting with the Board on potential improvements to operations
- Serving as the spokesperson for the organization including speaking engagements and other external communication

Departure Defined Transition

A Planned Succession or "departure defined transition" can provide an opportunity to position the Council for sustainability and continued success. Preparing for a planned succession includes identifying internal and external communication plans, conducting an organizational assessment and identifying leadership needs, updating Executive Director job description, and defining a clear and transparent search and hiring process.

- **Communication Plan:** The Executive Committee will work with the Executive Director to coordinate communication of the Planned Transition to staff and key stakeholders, including partners and funders.

- **Organizational Assessment:** The Executive Committee will work with the Executive Director to review the Council's existing policies, strategic plans, financial status, risk management, and administrative systems. The Executive Committee will also coordinate with the Technical Advisory Committee for input on organizational performance and leadership needs. A summary report will be provided to the Board.

- **Job Description:** The Board will annually review the Job Description of the Executive Director to ensure alignment with organizational strategic plans, policies, and resources.

- **Executive Director Search and Hiring Process:** After completion of the above due diligence, the Executive Committee will work in coordination with the Board and Executive Director to plan a search and hiring process that is transparent and timely. The Board may elect to create a special Hiring Committee to carry-out the recruitment process, or may elect to have the Executive Committee implement the process. The recruitment process will include opportunity for Board review of the announcement, applications submitted, and results of interviews. The full Board will be responsible for final hiring decisions and approving offers of employment.

Conflicts of Interest

The Board of Directors (Board) shall monitor the transactions between the Council and insiders to ensure that any transaction between the Council and an insider that is a conflict of interest is fair to the corporation and does not grant excessive benefit to the insider.

The purposes of this policy are to ensure that Board Members and Officers act loyally to the Council and that the Board Members, Officers, and those who exercise substantial influence over the corporation do not use their influence to obtain benefits in excess of fair market value in transactions with the corporation. This policy seeks to ensure that the Council maintains high ethical standards and observes state and federal taxation concerning conflicts and excess benefits transactions.

Definition of Conflicts Of Interest
Definition of Conflict: A conflict of interest arises when an insider described below may benefit financially from a decision he or she could make in his or her capacity as an insider, including indirect benefits to family members or businesses with which the insider is closely associated. A conflict of interest arises in any such transaction between the Council and an insider, except for:

- Transactions in the normal course of operations that are available to the general public under similar terms and circumstances, and
- Expense reimbursements to an insider made pursuant to an accountable plan under IRS Reg. 1.62-2(c)(2).

Consequences of Conflicts: Some conflicts of interest are prohibited and the Council cannot engage in them. Others are permitted but are subject to special procedures set out below to ensure that the transaction is fair to the corporation and complies with applicable laws, regulations, and funder agreements.

Conflicts that Fall Outside of Definition: The Board recognizes that this policy may not describe all of the transactions or matters in which an insider or an individual or business closely connected with an insider may engage in a transaction or other matter with the Council that creates divided loyalties or the possibility or perception of a conflict of interest or of unfair advantage to the other party. In such cases, the Board shall determine whether the transaction should be treated as a conflict of interest under this policy or should otherwise be scrutinized.

Definition of Insider
An insider is any of the following persons, family members, or entities:

Insider: An insider is any person who is in a position of authority over the Council or who exerts substantial influence over the corporation, including Board members, Officers, Key staff, funders, and major donors. An insider described in this section remains an insider for five years after his or her influence over the Council ends.

Family Members: Family members of insiders are also insiders. Family members include any person who is related by blood or marriage, or whose relationship is similar to that of persons who are related by blood or marriage.

Entities: An entity in which a Board Member is a general partner, Board Member, Officer, or other key employee is an insider. Corporations and limited liability companies in which an insider owns more than 5% of the voting power, partnerships in which the insider owns more than 5% of the profits and trusts or estates in which the insider owns more than 5% of the beneficial interest are insider entities.

Other Nonprofits and For-Profits: Another nonprofit or for-profit entity is an insider if:

- One of our Board Members is also a Board Member or Officer of the other entity, and
- We and the other entity are engaged in a transaction that is significant enough that the transaction is or should be approved by the Boards of both organizations.

Prohibited Conflicts

Loans to Directors or Officers: The Council cannot make a loan or guarantee an obligation to or for the benefit to any of its Board Members, Officers, or other insiders.

Gifts: Unless the amount is approved by the Board, the Council cannot make gifts of value higher than $50 to Board Members, Officers, or other insiders. An insider may not receive more than $100 worth of gifts from the Board in a fiscal year.

Procedure for Permissible Conflicts

In order to ensure that permissible transactions with insiders are fair to the corporation and comply with state and federal laws:

1. *Full Disclosure:* All insiders must promptly and fully disclose all material facts of every actual or potential conflict of interest to the Board of Directors at the time such conflict arises.

2. *Determination of Fairness:* When the Council engages in a transaction with an insider that constitutes a conflict of interest, the Board shall handle the transaction as follows:

    a. *Impartial Board:* The Board shall exclude any insider that has a conflict of interest with respect to the transaction from all discussion and from voting on the transaction. The Board may ask questions of the insider prior to beginning its discussion.

    b. *Comparable Data:* The Board shall gather appropriate data to ensure that the compensation for each insider is reasonable.

    c. *Documentation:* The Board shall document its decision by keeping written records that state the terms of the transaction and date approved, the Board Members present and who voted on it, the comparability data and how the data was obtained, and any actions taken with respect to Board Members who had a conflict of interest with

respect to the transaction. The records must be prepared before the latter of the next Board meeting or 60 days after the final action is taken. Once prepared, the records must be reviewed and approved by the Board within a reasonable time.

3. *Reporting Benefits:* When the Council provides an economic benefit to an insider for the insider's services as an employee or an independent contractor, the Council shall contemporaneously document the transaction as required by the IRS (generally on an original Form W-2, Form 990, or Form 1099, or with a written employment contract).

Compliance with Policy
In order to ensure compliance with this policy:

1. *Annual Disclosure Statement:* Each year, Board Members, Officers, and key staff shall each disclose interests that could give rise to a conflict of interest under this policy. Such disclosure shall be made on the Disclosure and Acknowledgement form attached to this policy and shall be filed with the Secretary or the Secretary's designee.

2. *List of Potential Insiders:* On an annual basis, the Secretary or the Secretary's designee shall develop and maintain a list of insiders who engage in or are reasonably likely to engage in transactions that constitute conflicts of interest with the Council during the year.

3. *Ongoing Disclosure Obligation:* Board Members, Officers, and key employees shall have an ongoing obligation to notify the Board promptly of interests that subsequently arise that could give rise to a conflict of interest under this policy.

4. *Monitoring:* The Board Secretary or the Secretary's designee shall monitor and enforce compliance with this policy by reviewing the list of insiders and the Disclosure and Acknowledgement forms each year and by bringing potential or actual conflicts to the attention of the Board. The Board shall disclose conflicts as they arise and ensure that the procedures in this policy are followed.

5. *Conveyance to Executive Director:* The Board Secretary or the Secretary's designee shall convey the list of insiders identified above to the Executive Director and shall instruct the Executive Director to notify the Board if the Executive Director or any employee plans to engage in a transaction with an insider that constitutes a conflict of interest, including payment or reimbursement for business or travel expenses of the insider and/or members of the insider's family not made pursuant to an accountable plan under IRS Reg. 1.62-2(c)(2). If so, the Board shall monitor the transaction to ensure that it complies with the procedure in Section IV above.

Delegation to Committee
The Board may delegate its responsibilities under this policy to a committee of the Board. The committee shall comply with this policy and shall report to the Board in a timely manner.

Conflicts Of Interest Policy Disclosure and Acknowledgement Statement

Each Board Member, Officer, and key employee shall sign and submit this form annually.

Disclosure
Please report below any actual or potential conflicts of interest between the corporation and you, a family member, or a business, or corporation with which you are connected within the meaning of the Conflicts of Interest Policy.

You have an ongoing obligation to notify the Board promptly of any such conflicts of interest that subsequently arise.

List of Conflicts or Potential Conflicts
Please list and explain any conflicts here:

Please submit this form to the Board Secretary and retain a copy for your records.

Whistleblower

The Council seeks to conduct all of its activities in a responsible, legal, and ethical manner. All Members of the Board of Directors (Board), Officers, staff, and volunteers must practice integrity and honesty in fulfilling their responsibilities; must comply with all applicable laws and regulations; and must comply with all Council governing documents, policies, and procedures.

The purpose of this Whistleblower Policy is to provide a mechanism to report irresponsible, illegal, or unethical behavior.

Reporting Responsibility
This Whistleblower Policy is intended to encourage and enable Board Members, Officers, staff, volunteers, and other representatives of the Council to raise serious concerns internally so that the Council may address and correct inappropriate conduct and actions. It is the responsibility of all Board Members, Officers, staff, and volunteers to report concerns about suspected violations of laws and regulations and policies and procedures that govern the Council.

No Retaliation
It is contrary to the values of the Council for anyone to retaliate against any officer, director, employee, or volunteer who, in good faith, reports an ethics violation, or a suspected violation of law, or suspected fraud, or suspected violation of any regulation or policy governing the operations of the Council. Board Members, Officers, staff, or volunteers shall not, with intent to retaliate or discriminate, take any action harmful to any person described above, including interference with the lawful employment or livelihood of any person. Moreover, any Board Member, Officer, staff, or volunteer who retaliates against someone who has reported a concern in good faith is subject to discipline up to and including dismissal from their position or termination of employment.

Reporting Procedure
Concerns should be stated in writing when at all possible, and may be submitted anonymously. All reported concerns are considered confidential and handled per this Policy.

Concerns should first be discussed with and reported to the Board Chair. If the reporting individual is not comfortable directing their concern to the Chair, is not satisfied with the Chair's response, or the Chair is implicated in the complaint, then the concern shall be directed to another Board Member, Officer, or the Executive Director.

Concerns received shall be promptly forwarded to the Board. Except in the event of an anonymous submission, the Board will promptly notify the reporting individual an acknowledgment of receipt of the reported concern.

All reports will be promptly investigated by the Board, and appropriate corrective action will be approved, if warranted by the investigation. Action must include a conclusion and/or follow-up with the reporting individual for complete closure of the concern. The Board has the authority to retain outside legal counsel, accountants, or any other resource deemed necessary to conduct a full and complete investigation of the allegations.

Acting in Good Faith
Anyone reporting a concern must act in good faith and have reasonable grounds for believing the information disclosed indicates an irresponsible, illegal, or unethical behavior. Any reports that prove not to be substantiated and which prove to have been made maliciously or knowingly to be false will be viewed as a serious disciplinary offense and may result in discipline up to and including dismissal from the volunteer position or termination from employment.

Confidentiality
The Council encourages anyone reporting a concern to identify himself or herself when making a report in order to facilitate review and investigation. However, reports may be submitted anonymously. Reports of concerns, and investigations pertaining thereto, shall be kept confidential to the extent possible, with the understanding that confidentiality may not be maintained where identification is required by law or in order to enable the Council or law enforcement to conduct an adequate investigation

Use of Litigation

The Greater Yamhill Watershed Council (Council) works to protect, restore, and monitor the quality of local natural resources through collaborative, community-based, and voluntary solutions. We seek to positively engage the public and bring people together to meet the challenges in the watershed.

The Council does not rely on litigation to compel regulatory enforcement as a means to implement our mission. We do not use litigation to pursue protection, enhancement, or restoration of watershed health (i.e. use litigation to enforce environmental regulations).

The Council may pursue grant funding opportunities that result from litigation (i.e. BPA Willamette Wildlife Mitigation Program) and accept funds that result from litigation (i.e. SEP funds). The Council may also accept funds that result from out-of-court settlement agreements.

Litigation necessary to enforce contracts is considered tenable, and is not considered litigation used to compel regulatory enforcement as a means to implement the Council's mission.

Records Retention and Destruction

The Council is committed to ensuring that records are retained as appropriate and as required by law and that unlawful destruction of documents does not occur.

Supervision of Records Retention
The Secretary or Secretary's designee shall serve as the Record Retention Supervisor. The Supervisor will manage records in accord with these guidelines as well as to ensure compliance with all local, state, and federal laws. The Supervisor may establish guidelines for additional records.

The Supervisor shall develop a policy for retention of electronic records, including emails. The electronic retention policy shall determine what files need to be kept and shall include backup procedures, archiving of documents, and regular check-ups of the reliability of the system.

Observance of Retention Policy
All employees and volunteers will follow records retention guidelines set out in this policy and by the Record Retention Supervisor. Records outlined in the Record Retention Schedule should be retained for the length of time provided on the schedule and destroyed at the end of the stated period.

Duration Special Circumstances
The Record Retention Supervisor may adjust the duration of retention as needed by the corporation, provided the term meets the minimum retention requirements of local, state, and federal laws.

Document Destruction
No officer, director, employee, or volunteer of this corporation shall knowingly destroy a document with the intent to obstruct or influence the investigation or proper administration of any matter within the jurisdiction of any department or agency of the United States or any state or its subdivisions.

Suspension of Record Destruction Schedule
In the event the Council becomes involved in any governmental investigation, audit, or litigation, further disposal of documents shall be suspended until such time as the Board of Directors, with advice from an attorney, determines otherwise. All staff and volunteers shall be notified of the suspension of regular disposal procedures.

Discipline
Any employee found to have knowingly violated this policy and destroyed records shall be subject to appropriate disciplinary action up to and including discharge.

Records Retention Schedule
The Records Retention Schedule is not exhaustive and will be updated when additional information is available. The Schedule has not been reviewed by legal counsel and is based upon examples from comparable nonprofit watershed councils in Oregon and from the 5th edition (current) Oregon Nonprofit Corporation Handbook produced by the Nonprofit Association of Oregon (2012)

The following documents shall be retained as described:

Type of Record	Retention Requirement
Corporate	
Governance & Incorporation Records: Articles of Incorporation and Bylaws; Minutes of Board of Directors and Board committee meetings; Annual state incorporation reports	Permanent
Intellectual Property: Trademark registrations, copyrights, and samples of protected works	Permanent
Government Relations: State and federal lobbying and political contribution reports and supporting records	10 years
Accounting, Fiscal, and Payroll	
Corporate Tax Records: IRS Form 1023, tax-exemption determination letter, and related correspondence; Annual state (CT-12) and federal (990) tax returns/reports and supporting records; files relating to tax audits	Permanent
External Audit Records: Audited financial statements/reports and attorney contingent liability letters	Permanent
Internal Audit Records	3 years
Accounts Receivable and Payable: Ledgers and schedules; Invoices	7 years
Bank Records: Bank reconciliations, bank statements, deposit slips and checks (unless for important payments and purchases)	3 years
Checks: For important payments and purchases only	Permanently
Employee Timesheets and Expense Reports	7 years
Payroll Tax Records: W-2 and W-4; Federal quarterly form 941; State quarterly reports; State withholding form WR; 1099 forms	7 years
Insurance	
Insurance Records: Policies (including expired), accident reports, claims, etc.	Permanently
Waivers of Liability: For clients and volunteers	7 years

Contracts	
Funded Grants: Proposals, grant agreements and amendments, reports, and correspondence	7 years after closure
Contracts: Final, execution copies of all contracts, agreements, licenses, leases, etc.	6 years after expiration
Human Resources	
Employment and Personnel Records: Employee names, addresses, social security numbers, dates of birth, USCIS form I-9; job description; dates of hire and termination/separation; evaluations and disciplinary actions	7 years
Employment Applications (including not hired)	3 years
Retirement and Pension Records	Permanently
General and Programs	
Correspondence (General)	2 years
Correspondence (Legal and Important)	Permanently
Photographs (high quality with details)	10 years
Presentations (re-usable)	7 years
Press Releases/Public Filings	Permanent

Financial Policies and Procedures

The Council is committed to protecting and using our assets for our nonprofit mission. Proper financial practices are very important in doing this, since proper practices help to prevent and detect errors and fraud. Strong financial practices also assure our donors that we use their gifts for the purposes for which they were intended.

The Board of Directors is responsible for the active oversight of the financial position of the Council. The Executive Director is responsible for developing and enacting operational procedures to implement the policies described in this document. The Board shall establish a standing Executive Committee to review and assist in the administration of these policies and procedures.

To the greatest extent possible, the Council's financial policies and procedures are in accord with generally accepted accounting principles (GAAP). The Board seeks to continuously improve our capacity to operate consistent with GAAP.

All financial records are to be kept in an electronic accounting system (such as QuickBooks), routinely backed-up on a secure, external system, available for review by the Board of Directors upon request, and shown to the Executive Committee in agreed-upon formats (e.g. monthly, quarterly, and annual reports).

General Practices

Review of Risks: The Board of Directors will review these policies each year to consider whether financial risks have changed and whether additional controls may be implemented based on Council capacities and available resources. Such changes may include a change in laws or regulations that govern the financial operations of the Council, hiring of employees, or a major change in our programs. The Board will identify any new risks and adopt appropriate procedures to minimize those risks. The Board may consult with a professional to ensure that these policies properly address such risks.

Segregation of Roles: There are several fiscal "roles" in the Council, including: custody, authorization, execution, and monitoring. For example, the individual who has authority to sign checks acts in the custodial role. The person who approves payment of a bill is authorizing. The Board of Directors as a whole acts in the authorizing role when it approves the annual budget and makes a decision to purchase a major item like a copier. The person who prepares the checks for signature acts in the execution role, executing an action that has been authorized by the Board through the annual budget or by the individual responsible for approving payment of the bill. The individual who reconciles the bank statement acts in the monitoring role. The Board also acts in a monitoring role when it reviews the monthly financial reports to be sure that its plan (the budget) is being executed properly.

To the greatest extent possible, the Board of Directors seeks to separate the responsibilities for fiscal roles so that at least two fulfill these roles. **It is particularly important that the same person does not authorize, execute, and monitor any transaction.** At each step of handling funds, the Council shall ensure that more than one person verifies that the step is done correctly.

Receipt of Funds

Risks: The Council faces the risk that funds that we receive may be stolen or lost or that someone may be falsely accused of stealing funds. We also face the risk that we may fail to record a restriction that a donor has placed on our use of funds.

Policy: All funds, whether cash or check, which the Council receives will be deposited intact into the bank account, with no monies removed to make payments or for other purposes. All cash receipts should be deposited into the bank as soon as possible. This allows for a complete accounting and independent verification of what happens to our funds. Communications from donors that establish restrictions on the use of their contributions will be recorded. If we believe that a donor has restricted the use of funds in a conversation, we will follow up and secure written confirmation of the donor's intent.

Procedure:

1. Receipt of Checks: The Executive Director or a designee opens all mail addressed to the Council; makes a photocopy of all checks received and provides the photocopies to the Executive Committee. This allows the Committee to verify that all checks received are deposited.

   The Executive Director or a designee will endorse all checks by an endorsement stamp that provides that the check is "For Deposit Only" and will be paid to the order of the corporate bank and lists the organization's name and account number. This lessens the risk that a check may be stolen and cashed.

2. Receipt of Cash: Cash is easily stolen or miscounted and must be handled carefully:
   - *a.* The person accepting the cash must provide a written log when taking the cash.
   - *b.* The log entry should state the person's name, the date, the amount of the cash, and the purpose of the payment.
   - *c.* When a donation receipt is requested (or required by law), use a pre-numbered receipt book with an automatic duplicate copy.
   - *d.* No pages may be removed from the log entry book or receipt book
   - *e.* The log entry book, receipt book, and cash shall be placed in a secure location, such as a locked drawer or safe.
   - *f.* The Executive Committee will compare the log entry book, receipt book, and the bank's list of cash deposits when making the Bank Reconciliation (described below).

3. Depositing and Recording: The Executive Director or designee will deposit and record corporate funds as follows:
   - *a.* Grant Funds
     - *i.* An Estimate shall be created based on the approved grant budget dated for when the grant was officially awarded. This provides for user-friendly and efficient budget tracking of grant-funded projects.
     - *ii.* Invoices shall be created for each grant reimbursement request or payment advancement.
     - *iii.* When funds are received, a Receipt of Payment will be entered and funds recorded in the Undeposited Funds Account.

iv. When funds are ready for deposit, a Record of Deposit will be entered for the appropriate bank account and a deposit slip prepared.
v. When feasible, the funds will be deposited by an individual other than the person who initially received the funds, such as a member of the Executive Committee. Otherwise, the funds will be deposited by the Executive Director.
vi. An electronic and hard-copy record of the following will be filed chronologically:
    1. Invoice, with hand-written cross-reference notations at the top denoting the grant funder, project ID / restricted use, and date of request for funding disbursement.
    2. Detached Deposit Summary from the Deposit Slip
    3. A photocopy of the check and voucher
    4. Deposit Receipt from the corporate bank

b. Donations
i. Donation Receipts shall be created for each donor's contributions and funds recorded in the Undeposited Funds Account. If cash will be included, the Donation Receipt shall provide sufficient information for cross-reference with the hand-written pre-numbered receipt book.
ii. When funds are ready for deposit, a Record of Deposit will be entered for the appropriate bank account and a deposit slip prepared.
iii. When feasible, the funds will be deposited by an individual other than the person who initially received the funds, such as a member of the Executive Committee. Otherwise, the funds will be deposited by the Executive Director.
iv. An electronic and hard-copy record of the following will be filed chronologically:
    1. Donation Receipt, with hand-written cross-reference notations at the top denoting the donor, project ID / restricted use, and date of request for donation.
    2. Detached Deposit Summary from the Deposit Slip
    3. A photocopy of any check and voucher
    4. Deposit Receipt from the corporate bank.

4. <u>Acknowledging Donations</u>: While IRS rules require acknowledgment of donations of more than $75, our policy is to provide written acknowledgement for every gift we receive of more than $40.
    a. The Executive Director or designee shall respond to each donation with a letter (mailed or electronic, depending on contact information available/provided)) thanking the donor for their generosity.
    b. The thank you letter shall include the amount of the gift, state if the gift was cash (which includes a check), and provide the Council's EIN # for tax purposes.
    c. If the gift was donated property of some kind, the thank you letter will not place a value on the donated property.
    d. If the donor received something of value in return, the letter must contain a description of the donation and a good faith estimate of the value of what was provided to the donor in return.
    e. The thank you letter should state one of the following

i. No goods or services were provided in exchange for your contribution, or
ii. In exchange for your contribution, we provided you () whose fair market value is ($).

Disbursement of Funds

Payments by Check

Risks: The Council faces the risk that our funds will be spent on unauthorized items, that someone will steal our funds by taking blank checks or by writing checks to payees who are not our vendors, or that payments we make will be improperly recorded.

Policy: Make all disbursements from the Council's funds by check, with the exceptions of petty cash and Board-approved electronic disbursements.

Procedure:

1. Opening Bank Accounts: Bank accounts may be opened only upon authorization by the Board of Directors.
    a. All bank accounts must be opened with the Council's employer identification number (EIN).
    b. The Board shall approve the authorized signers on the Council's bank accounts.
    c. Where feasible, an individual who reconciles the bank statement should not be an authorized signer.
    d. Where feasible, an individual who acts in a custodial and executing role should not be an authorized signer.

2. Custody of Checks: The Executive Director is the only person authorized to have access to unused check stock. The checks should be stored in a locked location and information about how to access them should be kept confidential from everyone but the Board Chair.

3. Check Authorization: All invoices will be forwarded immediately to the Executive Committee for review and authorization to pay, except for recurring expenses in an approved budget (i.e. rent, utilities, etc).
    a. The Executive Director and Executive Committee will review all invoices for accuracy, agreement with contracts, conformity to budget or Board authorization, and compliance with grant fund requirements.
    b. The Executive Director and Executive Committee will ensure that all conditions and specifications on a contract or order have been satisfactorily fulfilled.
    c. The Executive Director will enter the invoice as a bill in QuickBooks and assign appropriate billing/accounting information.
    d. The Executive Committee will approve invoices, indicating they have reviewed the invoice and authorized a check.

4. Payments by Check: Upon approval of the invoice, the Executive Director is authorized to enter a Bill Payment and prepare checks for signature.

    If a check is voided, the check will have "VOID" written in large letters in ink on the face and have the signature portion of the check torn out. Voided checks will be kept on file.

5. Duties of Check Signers: All checks will be signed by Board Members authorized by the Board. A check signer must not be the person who prepares the checks or who conducts the bookkeeping. Prior to signing the check, a check signer will do the following:
    a. Compare the check to the original invoice
    b. Ensure that the Executive Committee has provided documentation of authorization of the check
    c. Ensure that the amount of the check is not clearly unreasonable

6. Distribution and Recording of Check Payments:
    a. The Executive Director will distribute authorized, signed checks to their intended recipients.
    b. An electronic and hard-copy record of the following will be filed chronologically:
        i. Bill, with hand-written cross-reference notations at the top denoting the vendor, project ID / funding source, and date of invoice.
        ii. Original Invoice (or receipt) received from the vendor
        iii. Detached check voucher

7. Prohibited Practices: In no event will:
    a. Invoices be paid unless approved by the Executive Committee or are recurring expenses in an approved budget (rent, utilities, etc)
    b. Blank checks be signed in advance
    c. A check signer sign a check made out to the signer
    d. Checks be made out to Cash, Bearer, etc, except for Petty Cash re-charge

8. Special Circumstances:
    a. The Executive Director may sign a check if none of the signatory Board members are available and the check is essential to avoid fees or penalties, to meet regular payroll and associated bills (e.g. tax, retirement, health insurance payments), to re-issue a check that has already been approved, or to provide a check to a contractor for work already performed per the requirements of an approved contract and authorized by the Executive Committee.

Petty Cash Funds

Risks: Payments by cash are not as completely documented and are not as easily monitored as payments by check and thus subject the Council to a relatively greater likelihood of errors and fraud.

Policy: The Petty Cash Fund should only be used when payment by check is impracticable. The Petty Cash balance should always be $200 in cash and receipts.

Procedure:

1. Administration of Petty Cash Fund: The Executive Director is responsible for the administration of the Petty Cash Fund.
    a. The Fund shall be funded by checks made out to Petty Cash that are authorized by the Executive Committee and signed by Board-designated signers. The Executive Director

will record checks written to reimburse the Petty Cash Fund in QuickBooks as journal entries.

b. The Executive Director will require receipts for all purchases and may ask those reimbursed to sign for money provided as reimbursement.

c. The Executive Director will record all cash purchases in a journal and save the receipts.

d. The Executive Director will also enter the journal transactions into QuickBooks as Bills following the same process used to record check payments.

e. An electronic and hard-copy record of the following will be filed chronologically:

i. Bill, with hand-written cross-reference notations at the top denoting the vendor, project ID / funding source, and date of invoice.

ii. Original Invoice (or receipt) received from the vendor

Expense Reimbursement

Risks: The Council does not have the same level of control over expenses incurred on behalf of the corporation by those who pay with personal funds and seek reimbursement as it does for expenses paid directly by the Council. The corporation is not in as good a position to determine whether the goods or services purchased might have been obtained at a lower price elsewhere, whether there is personal benefit to the person seeking reimbursement and how the expenditure fits in with the rest of the organization's budget.

Policy: In proper circumstances, Board Members, employees, and volunteers are entitled to be reimbursed for expenses related to the Council that they incurred on behalf of the organization. To receive reimbursement, the following requirements must be met:

- The expense must have been authorized in advance by the Board of Directors or by the Executive Committee or later approved by the Board of Directors.
- The expense must have been incurred for goods or services purchased for the Council.
- Travel expenses must be related to the Council. Reimbursement and allowances will be made at the current standard rates as established by the IRS or as established by a grant agreement.

Procedure: To be reimbursed for expenses:

1. Documentation: Reasonable documentation must be provided showing the date, amount, and the goods or services purchased. Credit card receipts and store receipts that do not describe the purchase are not reasonable documentation. The receipt must describe the purchase.
2. Timely Submission: Documentation and a request for reimbursement must be submitted within 30 days from the date the expense was incurred.
3. Payment and Recording: Depending on the amount of the expenses, reimbursements will be issued and recorded in accordance with the policies/procedures stated above for Payments by Check or Petty Cash Funds.
4. Overpayment: If the Council overpays on a reimbursement, any excess reimbursement must be returned within a reasonable period of time.

Payroll

Risks: The Council faces the risk that our funds will be spent on unauthorized payroll expenses, that someone will steal our funds by taking blank checks or by writing checks to payees who are not our employees, or that payroll expenses we make will be improperly calculated or recorded.

Policy: In addition to the controls established for payments by check, Payroll expenses will be subject to additional internal controls that reduce the risk of error and fraud, including separation of duties, requiring documentation and approval of timesheets, and requiring enhanced payroll subscription services. In addition, the same person must consistently process payroll and have minimal if any interruptions during the process.

Procedure:

1. Check Authorization: Timesheets will be submitted to the Executive Director and forwarded immediately to the Executive Committee for review and authorization to pay.
    a. The Executive Director and Executive Committee will review all timesheets for accuracy, consistency with employee job descriptions and employment agreements, conformity to budget or Board authorization, and compliance with grant requirements.
    b. The Executive Committee will approve timesheets, indicating they have reviewed the timesheets and authorized a payroll check.

2. Payroll Payments by Check: Upon approval of the timesheets, the Executive Director is authorized to enter Payroll Checks, to prepare the final payroll summary, and prepare checks for signature.

3. Duties of Check Signers: All payroll checks will be signed by Board Members authorized by the Board. Where feasible, a check signer should not be the person who prepares the checks or who conducts the bookkeeping. Prior to signing the check, a check signer will do the following:
    a. Compare the payroll check to the timesheet invoice
    b. Review the final payroll summary
    c. Ensure that the Executive Committee has provided documentation of authorization of the payroll check
    d. Check to be sure that the amount of the payroll check is not clearly unreasonable

4. Distribution and Recording of Payroll Check Payments:
    a. The Executive Director will distribute authorized, signed payroll checks to employees in person or through mail (if requested).
    b. An electronic and hard-copy record of the following will be filed chronologically:
        i. QuickBooks Payroll Summary, with hand-written cross-reference notations at the top denoting the employee, project ID / funding source, and date of payroll period.
        ii. Timesheet approved by Executive Committee
        iii. Check voucher

Purchasing

Risks: The Council wants to ensure that all purchases on behalf of the corporation are authorized by the Board of Directors or by Board policies. Unauthorized purchases deplete the Council's resources and interfere with the Board's ability to govern properly.

Policy: All purchases made on behalf of the Council must be made pursuant to the Board-approved budget or Board rules.

Procedure:
1. All purchases not specifically itemized in a Board-approved budget must be pre-approved by the Executive Committee
2. All purchases over $1,000 must be pre-approved by the Executive Committee whether or not the purchases/services are in an approved budget.

Tax Forms And Legal Liabilities

Risks: The Council wants to ensure that all taxes and liabilities are filed in accordance with applicable laws and regulations that govern the corporation. In addition, the Council faces the risk that tax forms and legal liabilities will be improperly calculated or recorded.

Policy: All taxes and legal liabilities will be reviewed by the Executive Committee. The Council may consult a professional CPA to ensure proper reporting and accounting.

Procedure:
1. The Executive Director will work with the Executive Committee and/or Board-approved CPA to facilitate preparation of the organization's 990 and CT-12 tax returns. Copies of these forms shall be provided to the Board of Directors for review prior to filing.
2. State and Federal quarterly payroll reports are prepared and filed by the Executive Director, who may elect to use the CPA or other payroll service provider. Copies of the quarterly payroll reports shall be provided to the Executive Committee for review prior to filing.
3. The Executive Director will immediately notify the Executive Committee of any tax problems or penalties, who will then notify the Board.

Budgeting, Monitoring, Reporting, & Audits

Risks: Budgeting, monitoring, reporting, and conducting audits allow us to track our finances, uncover errors, and manage our resources effectively. Monitoring also assists us in identifying discrepancies between our accounting records and banking records that suggest theft or fraud, checks signed by unauthorized signers, and identify theft.

Policy: The Executive Committee will work with the Executive Director to prepare/review Budgets and to ensure that regular financial statements are provided to the Board of Directors consistent with GAAP reporting standards. The Executive Committee will also monitor the Council's accounts regularly and will perform or cause to be performed written reconciliations of all bank or investment accounts which prove that the balances presented on our financial reports agree with the records of the bank.

Procedure:
1. Fiscal Period: The fiscal period for the organization shall be July 1 to June 30

2. Budgeting: Annual budgets are prepared by the Executive Director and Executive Committee and approved by the Board of Directors before the beginning of the budget fiscal year.

3. Regular Reporting:
    a. The Board of Directors shall receive a regular (no less than quarterly) accounting of the Council's financial status, preferably at each meeting. This is to include a Statement of Financial Position (Balance Sheet), Statement of Activities (Profit/Loss), Statement of Cash Flow or Cash Position.
    b. The Board may propose items for an ad hoc investigation. The Executive Director will work closely with the Board-designated reviewers as necessary to complete an adequate investigation of the item in question in a timely manner and report conclusions to the Board.

4. Bank Reconciliations:
    a. The Executive Director shall provide the Executive Committee with a copy of all records of deposits, disbursements, and other bank transactions for reviewing monthly bank statements.
    b. The Council will ensure that the Executive Director and Executive Committee have online, read-only access to the bank account and bank statements.
    c. The Executive Committee will work with the Executive Director to reconcile the bank statement each month. Reconciliations should be done within 7 days of receiving the statements, as follows:
        i. Review all checks for correct signatures, number of signatures, and protest to the bank any signature errors.
        ii. Review the checks in the bank record to ensure that:
            1. The name of the payee, the amount of the check, and the date of the check agree with the corporation's accounting records
            2. Whoever the check was made out to was the depositor of the check
        iii. Compare the bank deposit records with our accounting records to determine whether each deposit recorded in the accounting records agrees with the bank record.
        iv. Check whether the ending balance in the bank statement agrees with the general ledger cash account.
        v. Review the list of outstanding checks. All checks outstanding over 90 days will be thoroughly reviewed.
        vi. Review the list of deposits in accounting records not yet recorded by the bank.
        vii. Once reconciled the Executive Committee will sign a printed copy acknowledging that the reconciliation was performed.

5. Audits: The Council shall authorize and contract, as required and funded by any Grant Agreement, audits of the financial accounts and records requiring audit. The Executive Committee and Executive Director shall cooperate with and assist the Auditor(s) in conducting the audit. The Executive Committee will review and approve audits upon their completion. A current copy of Council audits will be available for review by the general public upon request.

Exceptions

Exceptions to this policy may be made by the unanimous decision of the Executive Committee and the Executive Director. These exceptions must be reported in writing at the next Board meeting.

Insurance Coverage & Liabilities

The Council is committed to identifying and mitigating the risks and liabilities associated with the diversity of its watershed activities and programs. Insurance coverage is a key component of safeguarding our assets, particularly to help cope with the financial consequences of unpredictable events that are sudden and accidental.

The Board of Directors is responsible for the active oversight of the Council's risks and liabilities, including insurance coverage and limits. The Board shall set, and annually review, the types of coverage and minimum amounts needed to safeguard the Council.

General Coverage

Insurance Type	Minimum Amount	When Required
Worker's Compensation (SAIF Insurance)	$500,000 per accident	Required per State Statute
General Liability	$1,000,000 per occurrence $2,000,000 general aggregate	Always
Automobile Liability	$1,000,000 combined single limit (per accident)	Always
Board & Officer Liability	$1,000,000 aggregate	Always

Activity-Based Coverage

Pesticide Applicator Limited Pollution Liability	$500,000 per occurrence $1,000,000 aggregate	When Council staff are applying pesticides and herbicides
Pollution Liability	$500,000 per occurrence $1,000,000 aggregate	When Council staff are performing earthwork near wetlands, water, or ESA species
Professional Liability	$500,000 per occurrence $1,000,000 aggregate	When Council staff have a professional license and are doing work that falls under that license.
Abuse or Molestation Coverage	$100,000 per occurrence $300,000 aggregate	When Council staff or volunteers are working with children

Specialized Insurance Types and Coverage Amounts
For projects that carry greater risks to the organization, our personnel, or our community, the Council is responsible for identifying these liabilities and assuring that appropriate insurance coverage types and amounts are secured.

Examples of projects that require specialized insurance include:

- Working with hazardous materials (not including materials used in the normal operation of equipment, such as hydraulic fluid)
- Earth moving work around the footprint of a well
- Aerial application of chemicals
- Transporting individuals on the water
- Removal or alteration of structures that hold back water on land or instream including, dams, levees, dikes, tide gates, and other water control devices (this does not include temporary diversion dams used solely to divert water for irrigation)

Working with Contractors
Contractors hired by the Council must meet the minimum limits and coverage types described in the above tables, based on the contracted project and activities. The Council shall require that these limits and coverage types be included in signed contracts, and that the contractor will provide certificates of insurance documenting that adequate and appropriate insurance coverage has been obtained for the contracted project and activities.

Suspected Child Abuse & Neglect

Purpose
The Greater Yamhill Watershed Council (Council) provides environmental educational activities and volunteer opportunities for youth. In accordance with Oregon's Reporting of Child Abuse Law, the Council has adopted policy and procedures for reporting suspected child abuse and neglect.

The Council declares that the relationship between a child and his/her parent, and/or guardian and Council staff and other Council agents is of paramount importance. It is our responsibility to intervene based upon information in any and all instances of suspected non-accidental injury, neglect, sexual abuse and cruelty imposed on a child by their parents, and/or guardians, Council staff or other Council agents, and in the suspected instance where a child is deprived of his/her right to conditions of minimal nurture, health and safety.

All suspected child abuse and neglect will be reported to the Child Welfare Hotline 503.731.3100 Oregon State Law (ORS 419B.005 – 419B.045).

All Council staff and other Council agents (including Board of Directors, volunteers, and students and interns) who become aware of any evidence of such abuse or neglect shall comply with stated policy and procedure.

Definitions
The following definitions may assist in identifying reportable situations. If you have any questions, please contact the Council Executive Director.

A. Abuse

- **Physical Abuse** the non-accidental damage of physical injury or physical maltreatment of a child. Examples may include:
    - Throwing, kicking, burning or cutting a child
    - Striking a child with a closed fist
    - Shaking a child
    - Interfering with a child's breathing
    - Threatening a child with a deadly weapon
    - Doing any act that would cause bodily harm greater than temporary pain or minor temporary marks.
    - Physical discipline that includes excessive or unreasonable force against the child.

- **Sexual Abuse** committing or allowing to be committed any sexual offense against a child.
  This may include:
  - Any contact or interaction between a child and an adult when the child is being used for the sexual stimulation of the perpetrator or another person;
  - Intentional touching, either directly or through the clothing, of the sexual or other intimate parts of a child (not associated with bathing or diaper changing).
  - This may also include permitting, compelling, encouraging, aiding or otherwise causing a child to engage in touching the sexual or other intimate parts of another.
  - Sexual abuse may also be committed by a person under the age of 18; when that person is significantly older than the victim or when the perpetrator is in a position of power or control over another child.
  - Examples of signs of child sexual abuse may be torn, stained or bloody underclothing; genital discharge; infection or swelling, physical trauma or irritation of the genital area; pain with urination and difficulty in walking.
- **Sexual Exploitation** includes but is not limited to such actions as allowing, permitting, compelling, encouraging, aiding, or otherwise causing a child to engage in:
  - Prostitution
  - Sexually explicit, obscene or pornographic activity to be filmed, photographed, or electronically reproduced or transmitted.
  - Sexually explicit, obscene or pornographic activity as part of a live performance.

B. Neglect

- **Neglect** is an act or a failure of a child's parent, legal custodian, guardian or caregiver that shows a serious disregard of the child's health, welfare and safety.
  This may include the following examples:
  - Failure to provide food, shelter, clothing, supervision or health care necessary for a child's health, welfare or safety.
  - Actions, failures to act or omissions that result in injury or create a risk of injury to the physical, emotional and/or cognitive development of a child.
  - The ongoing effects of consistent inaction or behavior by a parent, custodian, guardian or caregiver to perform basic parental functions, obligations or duties when the result is to cause injury or create a risk of injury.

C. Threat of Harm

- **Threat of harm** includes all activities, conditions and persons that place a child at substantial risk of physical or sexual abuse, neglect, or mental injury. Threat of harm includes all actions, statements, written or non-verbal messages conveying threats of physical or mental injury which are serious enough to unsettle the child's mind including:
  - Expressions of intention to inflict pain, injury, evil, or punishment on the child.
  - An avowed determination to injure the child presently or in the future.
  - A caretaker regularly telling a child that if she/he tries to make decisions independent of the caretaker, or is too curious, then terrifying consequences, possibly death, will happen to the child.
  - Circumstances that expose children to acts of domestic violence. Violence in the home threatens a child's emotional state as well as physical well-being.

Reporting Procedures & Forms

- All Council staff, Board of Directors, volunteers, students and interns are required to immediately report any suspected sign of child abuse and neglect.
- It is important that the person suspecting the abuse listen to the child carefully for reporting purposes, but do not interview the child or contact the child's guardians. All interviews, contacts, and investigations will be done by the Department of Human Services (DHS).
- The person suspecting the abuse will immediately make a verbal report to their Day-of Council Supervisor and/or the Executive Director and complete the Suspected Child Abuse Report Form (Reporting Form).
  - The purpose is to confer on concern and to complete the Reporting Form, and is not for approval to report suspected abuse to the Child Welfare Hotline.
  - In the event the Executive Director is the alleged perpetrator, the verbal report is directed to the Day-of Supervisor and/or the Council Board Chair.
- The person suspecting the abuse will also immediately make a verbal report to the Child Welfare Hotline 503.378.6704. The Hotline will ask for the same or similar information as is included in the Council Reporting Form.
- The Executive Director will immediately inform Council Board Chair about the report of suspected abuse
- **Reporting Form:** The person suspecting the abuse will complete the Suspected Child Abuse Report Form (Report Form) and send the completed report to the Council Executive Director, marked "Confidential", within 24-hours.

  The Reporting Form includes the following questions to be completed to the best of the reporter's knowledge:
  - Name of the class or location of the program and date where suspected abuse was learned of
  - Name of the child, address, birthdate and sex.
  - Names of the parents, custodians or guardians responsible for the care of the child.
  - Nature and extent of alleged abuse, including:
    - Any evidence of previous abuse
    - The explanation given for the abuse
    - Any other information that the person making the report believes might be helpful in establishing the cause of the abuse and the identity of the perpetrator

Confidentiality

- Information obtained and/or shared by the Council and DHS personnel in meetings when discussing the details of the suspected abuse shall remain confidential.
- Council staff and other agents shall not discuss any details of the suspected abuse to a party not entitled to the information; disclosure or discussion of any details of suspected abuse to a party not entitled to the information may be cause for immediate termination. Do not contact the child's guardians or inform them that a report has been made (this will be done by DHS)
- Storage of all suspected child abuse or neglect files must be marked "CONFIDENTIAL" and be stored in a locked cabinet at the Council main office. No copies will be made of the forms on any child abuse and/or neglect report. The files are to remain readily available for

inspection or review by DHS for up to seven (7) years. . Thereafter, all files are to be disposed of in a confidential and secure manner.

When Council Staff or Agents are Suspected:

- If the Executive Director is informed by staff, law enforcement and/or DHS personnel of an investigation or incident of suspected child abuse that may have occurred at a Council site, by a Council staff person or other Council agent, a parent volunteer, or another child enrolled in a Council program, the Executive Director shall complete the Suspected Child Abuse Report form and document what type of abuse is being alleged or investigated and submit to the Council Board Chair within 24-hours.
- Any Council staff person or agent who observes another Council staff or agent, parent volunteer and/or other child enrolled in a Council program committing any suspected child abuse as defined in this document, must follow the reporting policy and procedures for suspected child abuse and neglect.
- In the event the Executive Director is the alleged perpetrator, the Council staff person or other agent observing the incident must follow the appropriate reporting procedures for suspected child abuse or neglect and report directly to the Council Board Chair.

Disciplinary Action

- When a Council staff person or other agent is observed and accused of violating the Suspected Child Abuse and Neglect Policy and Procedures, that person will be immediately removed from his/her position. Said removal shall be verified by written correspondence.
- Staff may be eligible for suspension with pay while removed from their position.
- A Council staff person or other agent accused of child abuse shall be reinstated upon a determination by DHS or the investigative law enforcement entity that the alleged abuse has no supportable factual basis.
- In the event where the situation clearly demonstrates a clear and evident case of child abuse or neglect, as defined, such staff or other agent shall be immediately terminated.

Orientation & Ongoing Training

- Orientation and annual training on the Suspected Child Abuse and Neglect Reporting Policy and Procedures must be provided to all relevant staff, Board of Directors, volunteers, and students and interns prior to assuming work duties that bring them into contact with youth.
- Orientation and annual training will include information on identification and reporting of child abuse and neglect; legal responsibilities of mandatory reporters, Council program policy and procedures, community resources and any other pertinent information. Training materials from other contact agencies will be incorporated into the orientation and training program as appropriate.
- Upon completion of orientation, said staff or other agent is required to sign and date the Acknowledgement of Orientation and Ongoing Training Form, which will be retained in their personnel file

SUSPECTED CHILD ABUSE & NEGLECT POLICY

Mandatory Reporting Form

Instructions:

- All Council staff, Board of Directors, volunteers, students and interns are required to immediately report any suspected sign of child abuse and neglect.

- It is important that the person suspecting the abuse listen to the child carefully for reporting purposes, but do not interview the child or contact the child's guardians. All interviews, contacts, and investigations will be done by the Department of Human Services (DHS).

- The person suspecting the abuse will immediately make a verbal report to their Day-of Council Supervisor and/or the Executive Director and complete the Suspected Child Abuse Report Form (Reporting Form).
    - The purpose is to confer on concern and to complete the Reporting Form, and is not for approval to report suspected abuse to the Child Welfare Hotline.
    - In the event the Executive Director is the alleged perpetrator, the verbal report is directed to the Day-of Supervisor and/or the Council Board Chair.

- The person suspecting the abuse will also immediately make a verbal report to the **Child Welfare Hotline (503)-378-6704**. The Child Welfare Hotline will ask for the same or similar information as is included in the Council Reporting Form.
- The Executive Director will immediately inform Council Board Chair about the report of suspected abuse

Reporting Form Questions:

The person suspecting the abuse will complete the below Suspected Child Abuse Report Form (Report Form) to the best of their knowledge. Send the completed report to the Council Executive Director, marked "Confidential", within 24-hours.

1. Name of the class or location of the program and date where suspected abuse was learned of:

2. Name of the child, address, birthdate and sex.

3. Names of the parents, custodians or guardians responsible for the care of the child.

4. Nature and extent of alleged abuse, including:

    - Any evidence of previous abuse

    - The explanation given for the abuse

5. Any other information that the person making the report believes might be helpful in establishing the cause of the abuse and the identity of the perpetrator

SUSPECTED CHILD ABUSE & NEGLECT POLICY
Acknowledgement of Orientation & Annual Training

The Council values the participation and contributions of staff, Board of Directors, volunteers, and students and interns. All such staff and other agents of the Council are asked to sign this statement as acknowledgement of having received a copy of and orientation regarding the Suspected Child Abuse and Neglect Policy and Procedures.

Personnel Policy

The Greater Yamhill Watershed Council (the Council, the Council) is committed to fair, clearly stated, and supportive relationships between the organization and its staff. This personnel policy has been adopted by the Council to guide the personnel practices of the council and ensure consistent personnel decisions. It is the intention of the council to administer the personnel programs in a manner which complies with the letter and spirit of all applicable federal, state and local regulations.

This policy is not a contract. The statements are not intended to be exhaustive and are subject to change at any time without prior notice at the discretion of the Board of Directors. Employment is voluntary or "at-will," and employees may resign or be terminated from employment at any time, with or without cause.

Employee Relations

Equal Employment Opportunity

The Greater Yamhill Watershed Council is an Equal Opportunity Employer. It is the policy of the Council that employment decisions for all applicants and employees will be made without regard to race, color, religion, sex, national origin, age, disability, marital or veteran status, disability or other characteristics protected under local, state or federal law. No employee will be retaliated against for raising concerns under this policy.

Harassment

All employees and Council participants are expected and required to treat one another in a courteous and respectful manner at all times.

Harassment of any kind is prohibited. This specifically includes sexual harassment and other harassment based upon characteristics protected under local, state and federal discrimination regulations. By definition, harassment is any unwanted attention or action prohibited by law by someone in the workplace that creates an intimidating, hostile, or offensive work environment, including sexual harassment.

Retaliation against employees for complaints regarding behaviors described above or other conduct addressed by this policy will not be tolerated.

- If a person's behavior makes an employee uncomfortable, the employee should feel free to immediately advise the person that, in the employee's opinion, the behavior is inappropriate and that the employee would like it stopped.
- If the employee is not comfortable discussing the issue with the person, or if the person fails to respect an employee's request, the employee should report the incident to his or her supervisor. If, for whatever reason, the employee does not feel that the supervisor is a suitable person to whom to report the incident the employee should contact the Executive Director, or if appropriate, the Board Chair or a member of the Executive Committee.

Reports of harassment will be investigated promptly. Appropriate corrective actions will be taken upon completion of the investigation. Employees and Council members found to be

harassing other employees will be immediately and appropriately disciplined, up to and including immediate discharge.

Employee Classifications
All employees are classified in one of the following categories:

Regular, Part-Time Employees: Employees who are regularly scheduled to work less than 32 hours per week. Paid time off will be accrued at a rate proportional to the regularly scheduled hours. This individual is not eligible for additional employee benefits.

Regular, Full-Time Employees: Employees who are regularly scheduled to work at least 32 hours per week. This individual is eligible for all employee benefits.

Interns: Interns are not considered employees and may be of paid or unpaid status. If paid, the arrangement will be one lump stipend and considered a skill training educational opportunity. Interns are not eligible for benefits.

Temporary Employees: Employees who are paid hourly under Letter of Agreement for a specified period of time, usually six (6) months or less. Temporary employees are not eligible for benefits or paid time off. Most temporary help meets a specific short term Council need.

Employees are classified as either exempt or non-exempts according to provisions of the Fair Labor Standards Act.

All employees, regardless of status or duration of employment, are expected to meet and maintain Council standards for job performance and behavior.

Recruitment Procedures
All regular employee positions will be advertised.

Written job descriptions will be adopted by the Council for all positions.

The Council intends to recruit, hire, and rank applicants on the basis of the applicant's relative knowledge, skills, abilities, and specific job related factors. The decision to employ an applicant will be based solely on the applicant's qualification for the particular position along with other requisite job skills.

Hiring
On or before the first day of employment, persons employed by the Council will receive a letter of hire. The letter will include the following: title of the position, the beginning date of employment, position classification (exempt or non-exempt), the salary and benefits package, and the name or designation of the employee's supervisor. For non-exempt part-time employees it will also designate the hours per week to be worked. In addition the employee will receive a copy of their job description and a copy of the employee policy. The employee will be required to sign a statement acknowledging that they have read and understood the conditions of employment as described in the employee policy

Pay & Hours of Work

Work Schedule

Work Week

A regular work week is Monday through Sunday

Office hours

In general, office hours are Monday-Friday between 8am to 5 pm. Council meetings and other business meetings are held outside of regular office hours and employees may be required to attend. Due to the nature of Council work, actual working hours are variable and may include evening and weekend assignments

Rest and Meal Periods

Each employee is provided with a paid 15-minute rest break for every 4 hours worked. Employees working shifts of six hours or more will also be provided an unpaid 30 or 60 minute meal break.

Rest and meal periods are mandatory. Whenever possible, the rest and meal periods should be taken midway through the segment of work.

Recording Hours Worked

It is the responsibility of each employee to maintain an accurate record of time worked to ensure they are accurately paid.

Pay Days

Employees are paid monthly for the time period of the calendar month. Timesheets are due to the Executive Director by the last working day of the month. Employees will receive a paycheck by the 5th day of the following month.

The paycheck stub will show an employee's total earnings, the amount of each deduction, and the net earnings. Following the end of the payroll year, each employee will be supplied with a Wage and Tax Statement (W-2) form. This statement summarizes the income and deductions for the year.

The Council does not offer pay advances.

Payroll Deductions

Various payroll deductions are made each pay day to comply with federal and state laws pertaining to taxes and insurance. Deductions will be made for the following:

- Federal and State Income Tax Withholding
- Social Security (FICA)
- Medicare
- Workers' Compensation Insurance
- Other items designated and authorized by the employee in writing
- Other items required by law, such as wage garnishments

Overtime

No paid overtime is authorized. Employees shall not work excesses hours without prior approval from their supervisor. Non-exempt employees will be paid time and one-half for approved overtime for more than 40 hours in one week.

Employees are generally not permitted to work voluntarily without pay. However, employees can qualify as a volunteer if all of these conditions are met: 1) The work is at their own initiative, 2) the work is outside their normal work hours, 3) no payment is expected, and 4) the work is different from their regular job with the Council.

Compensatory Time
Employees are not permitted compensatory time.

Performance Management

Performance Reviews
A performance review should be a positive and interactive process whereby both the Council and the individual being reviewed receive information about his or her success in meeting the goals of the Council.

After ninety (90) days, new employees will receive an initial review.

Regular employee annual review
Every regular employee will receive a written performance evaluation by the Review Committee annually at the employee's anniversary date of hire. Employees will be given the opportunity to comment, in writing, on their performance evaluation. Performance evaluations will be signed by the employee and supervisor and placed in the employee's personnel file.

Salary Review
Each employee may be eligible for a salary review at the time of his or her performance review. The Council cannot guarantee salary increases for merit or inflation.

Employee Benefits

Summary
The Council does not currently provide fringe benefits (e.g. health insurance), other than holiday and leave days as provided specifically in these guidelines.

Paid Time Off
Regular full-time employees earn annual paid time off (PTO) leave at the following rate of accrual:

Years of Service	Days Per Year	Hours Accrued per Pay Period
0-3	10	6.66
4+	15	10

PTO hours accrue monthly, and employees may use PTO hours as they are accrued. PTO hours may not be used in advance of monthly accrual (i.e. no negative PTO value at the end of a month).

PTO should be used within the twelve month period in which the leave was earned, whenever possible. PTO hours in excess of 80 at the end of any payroll year will be paid on the final paycheck of that payroll year.
Accrual of PTO will be pro-rated for regular part-time employees.

PTO may be used for multiple types of leave, including vacation, sick leave, family leave, jury duty, or bereavement leave.

PTO Payout – Resignation or discharge
Upon termination of employment, an employee will receive pay for PTO earned up to the termination date, for each full pay period worked. Portions of a pay period worked will not be considered in the final PTO pay calculation.

Holidays
Regular full-time employees are eligible for holiday pay. Official holidays are as follows:
New Year's Day
Presidents Day
Memorial Day
Independence Day
Labor Day
Veteran's Day
Thanksgiving Day
Day after Thanksgiving
Christmas Day
Floating Holiday

One Floating Holiday is put on an employee's record on January 1st of each year and must be used by December 31 of the same year or it is "lost".
If a holiday falls on a Sunday, it will be observed on the following Monday. If a holiday falls on a Saturday, it will be observed on the preceding Friday.
Regular part-time employees will be compensated in proportion to the usual hours worked.
Temporary employees are not compensated for holidays.

Leaves of Absence
Leave Requests
Requests for Leave should be made in writing as far in advance as practicable, with a minimum two (2) weeks in advance. The Board Chair approves scheduled absences for the Executive Director. The Executive Director approves scheduled absences for all other employees. Leave will be granted with consideration being given to minimum interference with the Council's business.

Unpaid Leave
At the discretion of the Executive Director, or in the case of the Executive Director, the Board Chair, regular employees may be granted unpaid leave for a specified period of time. Employee benefits do not accrue while an employee is on unpaid leave. The employee must utilize any accrued paid time off during the leave. Requests will be granted as business conditions permit. The Board of Directors must be notified of any long-term unpaid leave.

The employee may be required to supply the Council with certification of the condition necessitating leave.

Parental Leave
At the discretion of the Board of Directors an employee may be granted a maximum of six (6) calendar weeks of parental leave in a 12-month period for the purposes of preparing for the birth or adoption of a child or caring for the newborn child. Accrued PTO may be used during this period, but it is otherwise unpaid leave.

Jury Duty
Employees should notify the Executive Director, or in the case of the Executive Director, the Chair, when summoned for Jury Duty. The supervisor and the employee will discuss the potential time commitment of jury duty and the needs of the Council to determine the manner in which to handle the summons.

The Council can offset any amounts received by an employee as jury fees or witness fees for a particular week against the salary due for that particular week. An exempt employee will not be compensated for work weeks in which no work is performed during the entire work week.

Benefits and leave will continue to accrue at regular rates and accrual caps will be waived during jury service.

Bereavement Leave
Regular employees shall be granted one (1) working day with pay due to a death in their immediate family (mother, father, sister, brother, spouse/partner, children, in-laws, grandparent, and grandchildren). With prior approval, PTO leave time may be used to supplement bereavement leave. Employees should notify the Executive Director, or in the case of the Executive Director, the Chair, when bereavement leave is required.

Military Leave
The Council intends to fully comply with Oregon and Federal laws as it relates to service by an employee in the uniformed services or National Guard. Any employee who is absent on their annual two week reserve or National Guard Duty or called up to active duty in the military should consult with the Executive Director, or in the case of the Executive Director should consult with the Chair to discuss the leave policies applicable to such absence.

Unauthorized Absences
Employees absent from work without the authorization of the board of Directors or their immediate supervisor may be subject to disciplinary action.

Except under extraordinary circumstances, an employee who is absent without authorization for three (3) consecutive days will be considered to have resigned voluntarily. The effective date of the resignation will be the last day that the employee was present at work.

Council Information

Work Products and Files

The work products of an employee and all supplies and materials, if purchased by the Council, shall remain the property of the council after voluntary or involuntary termination of that employee. The employee may retain any personal files; however, work files, other papers and copyright to any materials or media shall remain with the Council.

Electronic Communications

Limitations on Use

The electronic communications systems, including, but not limited to Internet access, software, e-mail, weblogs, text messages, and voice-mail, are owned by the Council. These systems are provided for employee use to promote efficient work performance. Use of the systems is limited to employees and others expressly authorized by the Council.

Occasional personal use of the systems is permitted. However, all use of these systems must be in keeping with our standards for professionalism in communications and must not adversely affect employee productivity. Broadcast, internally or externally, of unsolicited personal views on social, political, religious or other non-business related matters is not permitted.

Employee Privacy

All computer records, files, software and e-mail and voice-mail messages created, sent, received or stored on the Council system are considered Council records. The Council retains unrestricted access to these records. Therefore, the contents of records created, sent, received or stored on the Council's systems are not private.

Conflicts Of Interest

Council relies on the integrity and loyalty of every employee. Conflicts of interest are to be avoided at all times. Any employee of the Council in a position to award and/or administer contracts, hire subcontractors, or engage in procurement activities must disclose to the Executive Director, or if it is the Executive Director, to the Chair, if there is a personal or familial relationship, the disclosure or non-disclosure, or which might call into question the impartiality of the employee. If such a relationship exists, the Executive Committee must review and approve, in writing, the transaction or contract before it is executed. Violation of the policy will at a minimum result in a written performance warning and, notwithstanding all other provisions of the Employee Policy, could constitute grounds for termination.

No employee may accept a gift related to Council business valued at more than $50 unless specifically authorized by the Board of Directors.

Safety & Health

Safety and health is a primary concern of the Council. The Council strives to provide a safe and healthful work environment for its employees. Every employee must accept the responsibility to prevent injuries to themselves and fellow employees by prudently following safe work practices. All employees must report any injury incurred through work to their supervisor as soon as possible.

Drug & Alcohol Policy

The Council is strongly committed to providing a safe and productive working environment for our employees. Each employee is expected and required to report for work on time and in appropriate mental and physical condition to work safely and effectively.

Illegal and Controlled Substances

The following rules apply to Council employees:

- The use of alcohol or illegal drugs is prohibited during normal business activities. An exception for moderate consumption of alcohol (up to 2 beverages) may be made for networking events where alcohol is being served.
- Reporting for work, working or engaging in any activity on the Council's behalf under the influence of or with an illegal substance, alcohol, or unauthorized controlled substance in your system is prohibited.

Violation of these rules will subject an employee to disciplinary action up to and including discharge.

Treatment

Employees needing help with a substance abuse problem are encouraged to contact their supervisor or a treatment facility. No person will be penalized for seeking or accepting counseling or treatment for a substance abuse problem so long as job performance and/or safety are not compromised.

Grievance Procedure

It is the fundamental policy of the Council to have a workable system for employees to get questions answered and work-related problems resolved. Many conflicts can be resolved using the following approach:

1. First the employee is encouraged to try to work out the problem directly with the person involved.

2. If an employee cannot resolve the problem or is uncomfortable dealing directly with the other person, an employee should inform the Coordinator, or for the Coordinator, inform the Chair.

3. If the employee and the Coordinator (or Chair) are unable to resolve the problem after a serious attempt, or the issue directly involves the Coordinator, or for the Coordinator, involves the Chair, the employee should make an appointment with the Executive

committee, who after hearing all sides, conducting any necessary investigations, will make a recommendation for the employee's consideration.

4. If the problem remains unresolved, an employee or the Steering Committee may present the issue to the full Board for consideration. The board will have final decision-making authority for employment-related conflicts and is the only entity with the authority to terminate an employee.

5. Employees are not required or expected to tolerate any form of unlawful conduct such as sexual harassment.

In all instances, a thorough and fair investigation will take place, giving careful consideration to the rights and dignity of the people involved. The results of the investigation are confidential, except when requested in writing by the grieving employee or deemed relevant to a legal action.

Other Important Information

Personnel Records

The Council office shall maintain a personnel record for each employee, and will contain documentation regarding all aspects of an employee's tenure with the Council, such as employment application, change of status records, commendations, and performance letters or reviews. Personnel records may not be removed from the Council office. All personnel records are the property of the Council.

The personnel record is available for the employee's review. A copy of the personnel record will be provided to the employee if requested in writing. Employees may include letters of recognition, prior training, or additional records from outside sources in their personnel record.

The employee is responsible for notifying the Executive Director of changes in address, telephone number, and/or family status (births, marriage, divorce etc.) as payroll transactions may be affected by these changes.

Travel and Expenses

General Expense

Occasionally, employees may incur expenses on behalf of the Council. Employees will be reimbursed for actual work-related expenses incurred, as long as expenses are reasonable and the following procedures are followed:

- Employees must have their supervisor's approval before incurring each expense.
- Keep a receipt or other proof of payment for every expense.
- If the expense is less than $200, it may be reimbursed through Petty Cash funds.
- Expense reimbursement must be requested within 30 days of incurring an expense.

The supervisor is responsible for processing expense reimbursement requests. If the request is approved, reimbursement will be received no later than 60 days after the request.

Travel-Related Expense

Employees of the Council are eligible for job-related travel, lodging and per diem reimbursement. Council will pay reasonable travel expenses for official Council business, which may include:

- The cost of travel to and from the airport or bus station, including parking expenses and tolls
- The cost of airline or bus tickets
- The cost of an economy class rental car and gas, if necessary
- A mileage reimbursement
- The cost of lodging
- The cost of meals and other incidental expenses

The Council refers to the State of Oregon (OWEB) mileage/ per diem/ lodging reimbursement rates when processing mileage/travel expenses. See the OWEB Travel Reimbursement/allowance Guidelines for more information.

Employees must have their supervisor's approval prior to incurring travel expenses. Conference attendance must be approved by the Board of Directors prior to registration to ensure funding is available. Receipts must be provided for all expenses to the greatest extent possible.

The Council does not reimburse employees for their commute to and from the workplace.

Layoffs

It is Council's goal to provide stable employment to our employees. There may be occasions, however, when it may be necessary to initiate layoffs. In such cases, the Council will make every effort to give as much notice of an impending layoff as possible.

If an employee is selected for layoff, the final paycheck will be provided no later than the end of the next business day.

Employees recalled will retain their original date of hiring for purposes of benefit accrual, but will not actually accrue benefits while on layoff.

Termination Of Employment

Voluntary Resignation

All employees are "at will" and may resign at any time for any reason. Employees who voluntarily terminate employment with the Council are asked, when possible, to give the council at least 2 weeks' notice prior to the date of the employee's departure. Proper notice allows the Council sufficient time to prepare the final paycheck and secure a replacement.

Other Discharges

All employees are "at will employees" which means they may be terminated at any time with or without cause without subjecting the Council to a claim for breach of an employment contract. Decisions regarding termination of staff will be made by the Board of Directors. Discipline and/or discharge may result for many reasons including, but not limited to, inappropriate behavior and/or unsatisfactory performance, as defined below.

Inappropriate behavior is defined as including, but not limited to, misbehavior on the job, refusal to do work, wrongful use of or taking of organizational property, conviction of a felony or misdemeanor, and violation of any policies or practices of the Council.

Unsatisfactory performance means failure of an employee to meet performance standards, to complete tasks in a timely, competent way, or to maintain an adequate attendance record. Uncooperative behavior or negative attitudes that affect the work or morale of others may result in termination. At the discretion of the Executive Director, any staff member facing termination for unsatisfactory performance may be given the option to resign as described in the above section under "Voluntary Resignation."

Final Paychecks
Final Paychecks will be processed according to State of Oregon regulations.

Exit Interview
An exit interview may be requested by the Supervisor. The purpose of the exit interview is to ensure that all the required forms are completed and to collect any Council property in the employee's possession (e.g. keys, promotional materials).

Employment References
When the Council receives a request for information from another person or entity about an employee, either during employment or after the employee's employment has ended, it is the Council's policy to provide only the following:

a) dates of employment
b) last job title

In general, Council's policy is not to furnish any other information about work performance or employment, unless the employee specifically directs it to do so and signs a release prepared by the Council which authorizes it to do so. If an employee does not authorize the Council to furnish any additional information, it will advise the requesting person or entity that, absent a release, Council's policy is to provide only the information set out in a-b.

Conclusion
The continued success of the Council depends upon the commitment of all employees to support our standards and mission. The information in this Policy outlines best business practices to ensure success for the employee and for the Council.

This policy is intended to provide answers to many of the questions that may arise in an employment relationship. If an employee has any questions about the information that is outlined in the preceding pages, they are encouraged to discuss it with their supervisor.

Personnel Policy Acknowledgement Statement

I acknowledge that I have received and read the Council Employee Policy. I agree to conform to the rules, policies and procedures of the Council. I understand that these policies provide only a general reference and are not a full statement of Council's procedure nor are they a contract.

Overview

The Council is committed to protecting and using our assets for our nonprofit mission. Proper financial practices are very important in doing this, since proper practices help to prevent and detect errors and fraud. Strong financial practices also assure our donors that we use their gifts for the purposes for which they were intended.

The Board of Directors is responsible for the active oversight of the financial position of the Council. The Executive Director is responsible for developing and enacting operational procedures to implement the policies described in this document. The Board shall establish a standing Executive Committee to review and assist in the administration of these policies and procedures.

To the greatest extent possible, the Council's financial policies and procedures are in accord with generally accepted accounting principles (GAAP). The Board seeks to continuously improve our capacity to operate consistent with GAAP.

All financial records are to be kept in an electronic accounting system (such as QuickBooks), routinely backed-up on a secure, external system, available for review by the Board of Directors upon request, and shown to the Executive Committee in agreed-upon formats (e.g. monthly, quarterly, and annual reports).

General Practices

DRAFT

Review of Risks: The Board of Directors will review these policies each year to consider whether financial risks have changed and whether additional controls may be implemented based on Council capacities and available resources. Such changes may include a change in laws or regulations that govern the financial operations of the Council, hiring of employees, or a major change in our programs. The Board will identify any new risks and adopt appropriate procedures to minimize those risks. The Board may consult with a professional to ensure that these policies properly address such risks.

Segregation of Roles: There are several fiscal "roles" in the Council, including: custody, authorization, execution, and monitoring. For example, the individual who has authority to sign checks acts in the custodial role. The person who approves payment of a bill is authorizing. The Board of Directors as a whole acts in the authorizing role when it approves the annual budget and makes a decision to purchase a major item like a copier. The person who prepares the checks for signature acts in the execution role, executing an action that has been authorized by the Board through the annual budget or by the individual responsible for approving payment of the bill. The individual who reconciles the bank statement acts in the monitoring role. The Board also acts in a monitoring role when it reviews the monthly financial reports to be sure that its plan (the budget) is being executed properly.

To the greatest extent possible, the Board of Directors seeks to separate the responsibilities for fiscal roles so that at least two fulfill these roles. **It is particularly important that the same person does not authorize, execute, and monitor any transaction.** At each step of handling funds, the Council shall ensure that more than one person verifies that the step is done correctly.

Request for Funds

The Watershed Council will bill for the OWEB Capacity Grants no less than quarterly.

Receipt of Funds

Risks: The Council faces the risk that funds that we receive may be stolen or lost or that someone may be falsely accused of stealing funds. We also face the risk that we may fail to record a restriction that a donor has placed on our use of funds.

Policy:

All funds, whether cash or check, which the Council receives will be deposited intact into the bank account, with no monies removed to make payments or for other purposes. All cash receipts should be deposited into the bank as soon as possible. This allows for a complete accounting and independent verification of what happens to our funds. Communications from donors that establish restrictions on the use of their contributions will be recorded. If we believe that a donor has restricted the use of funds in a conversation, we will follow up and secure written confirmation of the donor's intent.

Procedure:

1. Receipt of Checks:
   The Executive Director or a designee opens all mail addressed to the Council; makes a photocopy of all checks received without a voucher (as needed) and provides the photocopies to the Executive Committee. This allows the Committee to verify that all checks received are deposited.

   The Executive Director or a designee will endorse all checks by an endorsement stamp that provides that the check is "For Deposit Only" and will be paid to the order of the corporate bank and lists the organization's name and account number. This lessens the risk that a check may be stolen and cashed.

2. Receipt of Cash: Cash is easily stolen or miscounted and must be handled carefully:
   a. The person accepting the cash must provide a written log (i.e., entered into QB) when taking the cash.
   b. The log entry should state the person's name, the date, the amount of the cash, and the purpose of the payment.
   c. When a donation receipt is requested (or required by law), use a pre-numbered receipt book with an automatic duplicate copy.
   d. No pages may be removed from the log entry book or receipt book
   e. The log entry book, receipt book, and cash shall be placed in a secure location, such as a locked drawer or safe.
   f. The Executive Committee will compare the log entry book, receipt book, and the bank's list of cash deposits when making the Bank Reconciliation as described below or JUMP.

3. Receipt of Electronic Payments
   a. Invoices and receipts will be entered into QuickBooks.
   b. For PayPal, copies of the donations and e-transfers (as lump sum) are saved and entered into QuickBooks per individual donor. The entries for total sum is to match PayPal and bank statement.
   c. The Executive Committee will compare the log entry book, receipt book, and the bank's list of cash deposits when making the Bank Reconciliation as described below or JUMP

4. Depositing and Recording: The Executive Director or designee will deposit and record corporate funds as follows:
   a. Grant Funds / Contract
      i. An Estimate shall be created based on the approved grant budget dated for when the grant was officially awarded. This provides for user-friendly and efficient budget tracking of grant-funded projects.
      ii. Invoices shall be created for each grant reimbursement request or payment advancement.

DRAFT

iii. When funds are received, a Receipt of Payment will be entered and funds recorded in the Undeposited Funds Account.
iv. When funds are ready for deposit, a Record of Deposit will be entered for the appropriate bank account and a deposit slip prepared.
v. When feasible, the funds will be deposited by an individual other than the person who initially received the funds, such as a member of the Executive Committee. Otherwise, the funds will be deposited by the Executive Director.
vi. An electronic and hard-copy record of the following will be filed chronologically:
    1. Invoice, with hand-written cross-reference notations at the top denoting the grant funder, project ID / restricted use, and date of request for funding disbursement.
    2. Detached Deposit Summary from the Deposit Slip
    3. A photocopy of the check and voucher
    4. Deposit Receipt from the corporate bank

b. Donations
i. Donation Receipts shall be created for each donor's contributions and funds recorded in the Undeposited Funds Account. If cash will be included, the Donation Receipt shall provide sufficient information for cross-reference with the hand-written pre-numbered receipt book.
ii. When funds are ready for deposit, a Record of Deposit will be entered for the appropriate bank account and a deposit slip prepared.
iii. When feasible, the funds will be deposited by an individual other than the person who initially received the funds, such as a member of the Executive Committee. Otherwise, the funds will be deposited by the Executive Director.
iv. An electronic and hard-copy record of the following will be filed chronologically:
    1. Donation Receipt, with hand-written cross-reference notations at the top denoting the donor, project ID / restricted use, and date of request for donation.
    2. Detached Deposit Summary from the Deposit Slip
    3. A photocopy of any check and voucher
    4. Deposit Receipt from the corporate bank.

5. Acknowledging Donations: While IRS rules require acknowledgment of donations of more than $75, our policy is to provide written acknowledgement for every gift we receive of more than $40.
    a. The Executive Director or designee shall respond to each donation with a letter (mailed or electronic, depending on contact information available/provided)) thanking the donor for their generosity.
    b. The thank you letter shall include the amount of the gift, state if the gift was cash (which includes a check) and provide the Council's EIN # for tax purposes.

DRAFT

c. If the gift was donated property of some kind, the thank you letter will not place a value on the donated property.
d. If the donor received something of value in return, the letter must contain a description of the donation and a good faith estimate of the value of what was provided to the donor in return.
e. The thank you letter should state one of the following
    i. No goods or services were provided in exchange for your contribution, or
    ii. In exchange for your contribution, we provided you () whose fair market value is ($).

Disbursement of Funds

Payments by Check

Risks: The Council faces the risk that our funds will be spent on unauthorized items, that someone will steal our funds by taking blank checks or by writing checks to payees who are not our vendors, or that payments we make will be improperly recorded.

Policy:

Make all disbursements from the Council's funds by check, with the exceptions of petty cash and Board-approved electronic disbursements.

Procedure:

1. Opening Bank Accounts: Bank accounts may be opened only upon authorization by the Board of Directors.
    a. All bank accounts must be opened with the Council's employer identification number (EIN).
    b. The Board shall approve the authorized signers on the Council's bank accounts.
    c. An individual who reconciles the bank statement should not be an authorized signer, unless the Board approves an authorized signer.
    d. An individual who acts in a custodial and executing role should not be an authorized signer.
2. Custody of Checks: The Executive Director is the only person authorized to have access to unused check stock. The checks should be stored in a locked location.
3. Check Authorization: All invoices will be forwarded immediately to the Executive Committee for review and authorization to pay, except for recurring expenses in an approved budget (i.e., rent, utilities, etc.).
    a. The Executive Director and Executive Committee will review all invoices for accuracy, agreement with contracts, conformity to budget or Board authorization, and compliance with grant fund requirements.

DRAFT

b. The Executive Director and Executive Committee will ensure that all conditions and specifications on a contract or order have been satisfactorily fulfilled.
c. The Executive Director will enter the invoice as a Bill in QuickBooks and assign appropriate billing/accounting information.
d. The Executive Committee will approve invoices, indicating they have reviewed the invoice and authorized a check.

4. Payments by Check: Upon approval of the invoice, the Executive Director is authorized to enter a Bill Payment and prepare checks for signature.

   If a check is voided, the check will have "VOID" written in large letters in black ink on the face and have the signature portion of the check torn out. Voided checks will be kept on file.

5. Duties of Check Signers: All checks will be signed by Board Members authorized by the Board. A check signer **must not** be the person who prepares the checks or who conducts the bookkeeping. Prior to signing the check, a check signer will do the following:
   a. Compare the check to the original invoice
   b. Ensure that the Executive Committee has provided documentation of authorization of the check
   c. Ensure that the amount of the check is not clearly unreasonable

6. Distribution and Recording of Check Payments:
   a. The Executive Director will distribute authorized, signed checks to their intended recipients.
   b. An electronic and hard-copy record of the following will be filed chronologically:
      i. Bill, with hand-written cross-reference notations at the top denoting the vendor, project ID / funding source, and date of invoice.
      ii. Original Invoice (or receipt) received from the vendor
      iii. Detached check voucher

7. Prohibited Practices: In no event will:
   a. Invoices be paid unless approved by the Executive Committee or are recurring expenses in an approved budget (rent, utilities, etc.)
   b. Blank checks be signed in advance
   c. A check signer sign a check made out to the signer
   d. Checks be made out to Cash, Bearer, etc., except for Petty Cash re-charge

8. Special Circumstances:
   a. The Executive Director may sign a check if none of the signatory Board members are available, and is authorized by the Executive Committee, and the check is essential to avoid fees or penalties, to meet regular payroll and associated bills (i.e., tax, retirement, health insurance payments), to re-issue

DRAFT

a check that has already been approved, or to provide a check to a contractor for work already performed per the requirements of an approved contract and authorized by the Executive Committee.

Petty Cash Funds

Risks: Payments by cash are not as completely documented and are not as easily monitored as payments by check and thus subject the Council to a relatively greater likelihood of errors and fraud.

Policy:

The Petty Cash Fund should only be used when payment by check is impracticable. The Petty Cash balance should always be $200 in cash and receipts.

Procedure:

1. Administration of Petty Cash Fund: The Executive Director is responsible for the administration of the Petty Cash Fund.
    a. The Fund shall be funded by checks made out to Petty Cash that are authorized by the Executive Committee and signed by Board-designated signers. The Executive Director will record checks written to reimburse the Petty Cash Fund in QuickBooks as journal entries.
    b. The Executive Director will require receipts for all purchases and may ask those reimbursed to sign for money provided as reimbursement.
    c. The Executive Director will record all cash purchases in a journal and save the receipts.
    d. The Executive Director will also enter the journal transactions into QuickBooks as Bills following the same process used to record check payments.
    e. An electronic and hard-copy record of the following will be filed chronologically:
        i. Bill, with hand-written cross-reference notations at the top denoting the vendor, project ID / funding source, and date of invoice.
        ii. Original Invoice (or receipt) received from the vendor

Expense Reimbursement

Risks: The Council does not have the same level of control over expenses incurred on behalf of the corporation by those who pay with personal funds and seek reimbursement as it does for expenses paid directly by the Council. The corporation is not in as good a position to determine whether the goods or services purchased might have been obtained at a lower price elsewhere, whether there is personal benefit to the

DRAFT

person seeking reimbursement and how the expenditure fits in with the rest of the organization's budget.

Policy:

In proper circumstances, Board Members, employees, and volunteers are entitled to be reimbursed for expenses related to the Council that they incurred on behalf of the organization. To receive reimbursement, the following requirements must be met:

- The expense must have been authorized in advance by the Board of Directors or by the Executive Committee or later approved by the Board of Directors.
- The expense must have been incurred for goods or services purchased for the Council.
- Travel expenses must be related to the Council. Reimbursement and allowances will be made at the current standard rates as established by the IRS or as established by a grant agreement.

Procedure:

To be reimbursed for expenses:

1. Documentation: Reasonable documentation must be provided showing the date, amount, and the goods or services purchased. Credit card receipts and store receipts that do not describe the purchase are not reasonable documentation. The receipt must describe the purchase.
2. Timely Submission: Documentation and a request for reimbursement must be submitted within 30 days from the date the expense was incurred.
3. Payment and Recording: Depending on the amount of the expenses, reimbursements will be issued and recorded in accordance with the policies/procedures stated above for Payments by Check or Petty Cash Funds.
4. Overpayment: If the Council overpays on a reimbursement, any excess reimbursement must be returned within 90 days from the date the expense was incurred.

Payroll

Risks: The Council faces the risk that our funds will be spent on unauthorized payroll expenses, that someone will steal our funds by taking blank checks or by writing checks to payees who are not our employees, or that payroll expenses we make will be improperly calculated or recorded.

Policy:

In addition to the controls established for payments by check, Payroll expenses will be subject to additional internal controls that reduce the risk of error and fraud, including separation of duties, requiring documentation and approval of timesheets, and requiring

DRAFT

QuickBooks enhanced payroll subscription services. In addition, the same person must consistently process payroll and have minimal if any interruptions during the process.

Procedure:

1. Check Authorization: Timesheets will be submitted to the Executive Committee for review and authorization to pay.
    a. The Executive Director and Executive Committee will review all timesheets for accuracy, consistency with employee job descriptions and employment agreements, conformity to budget or Board authorization, and compliance with grant requirements.
    b. The Executive Committee will approve timesheets, indicating they have reviewed the timesheets and authorized a payroll check.
    c. When funds allow, use a payroll service.

2. Payroll Payments by Check: Upon approval of the timesheets, the Executive Director or Board Designee (Treasurer) is authorized to enter Payroll Checks, to prepare the final payroll summary, and prepare checks for signature.

3. Duties of Check Signers: All payroll checks will be signed by Board Members authorized by the Board. A check signer should not be the person who prepares the checks or who conducts the bookkeeping. Prior to signing the check, a check signer will do the following:
    a. Compare the payroll check to the timesheet invoice
    b. Review the final payroll summary
    c. Ensure that the Executive Committee has provided documentation of authorization of the payroll check
    d. Check to be sure that the amount of the payroll check is not clearly unreasonable

4. Distribution and Recording of Payroll Check Payments:
    a. The Executive Committee will distribute authorized, signed payroll checks to employees in person or through mail (if requested).
    b. An electronic and hard-copy record of the following will be filed chronologically:
        i. QuickBooks Payroll Summary, with hand-written cross-reference notations at the top denoting the employee, project ID / funding source, and date of payroll period.
        ii. Timesheet approved by Executive Committee
        iii. Check voucher

Purchasing

DRAFT

Risks: The Council wants to ensure that all purchases on behalf of the corporation are authorized by the Board of Directors or by Board policies. Unauthorized purchases deplete the Council's resources and interfere with the Board's ability to govern properly.

Policy:

All purchases made on behalf of the Council must be made pursuant to the Board-approved budget or Board rules.

Procedure:

1. All purchases not specifically itemized in a Board-approved budget must be pre-approved by the Executive Committee
2. All purchases over $1,000 must be pre-approved by the Executive Committee whether or not the purchases/services are in an approved budget.

Tax Forms and Legal Liabilities

Risks: The Council wants to ensure that all taxes and liabilities are filed in accordance with applicable laws and regulations that govern the corporation. In addition, the Council faces the risk that tax forms and legal liabilities will be improperly calculated or recorded.

Policy:

All taxes and legal liabilities will be reviewed by the Executive Committee. The Council may consult a professional CPA to ensure proper reporting and accounting.

Procedure:

1. The Executive Director will work with the Executive Committee and/or Board-approved CPA to facilitate preparation of the organization's IRS 990 and OR CT-12 tax returns. Copies of these forms shall be provided to the Board of Directors for review prior to filing.
2. State and Federal quarterly payroll reports are prepared and filed by the Executive Director, who may elect to use the CPA or other payroll service provider. Copies of the quarterly payroll reports shall be provided to the Executive Committee for review prior to filing.
3. The Executive Director will immediately notify the Executive Committee of any tax problems or penalties, who will then notify the Board.

Budgeting, Monitoring, Reporting, & Audits

DRAFT

Risks: Budgeting, monitoring, reporting, and conducting audits allow us to track our finances, uncover errors, and manage our resources effectively. Monitoring also assists us in identifying discrepancies between our accounting records and banking records that suggest theft or fraud, checks signed by unauthorized signers, and identify theft.

Policy:

The Executive Committee will work with the Executive Director to prepare/review Budgets and to ensure that regular financial statements are provided to the Board of Directors consistent with GAAP reporting standards. The Executive Committee will also monitor the Council's accounts regularly and will perform or cause to be performed written reconciliations of all bank or investment accounts which prove that the balances presented on our financial reports agree with the records of the bank.

Procedure:

1. Fiscal Period: The fiscal period for the organization shall be July 1 to June 30

2. Budgeting: Annual budgets are prepared by the Executive Committee or Board Designee and approved by the Board of Directors before the beginning of the budget fiscal year.

   Regular Reporting:
   - *a.* The Board of Directors shall receive a regular (no less than quarterly) accounting of the Council's financial status, preferably at each meeting. This is to include a Statement of Financial Position (Balance Sheet), Statement of Activities (Profit/Loss), Statement of Cash Flow or Cash Position, Budget vs Actual for Open Funds, and Statement of Cash Forecasting.
   - *b.* The board has created an online calendar that is populated with grant reporting requirements. The board has contracted an administrator who will monitor the calendar and provide a monthly report to the board on upcoming deadlines.
   - *c.* The Board will provide oversight for the Executive Director or Board Designee to prepare documents for board review and submittal to OWEB.
   - *d.* The Board may propose items for an ad hoc investigation. The Executive Director will work closely with the Board-designated reviewers as necessary to complete an adequate investigation of the item in question in a timely manner and report conclusions to the Board.

3. Bank Reconciliations:
   - *a.* The Executive Director or Board Designee shall provide the Executive Committee with a copy of all records of deposits, disbursements, and other financial transactions for reviewing monthly bank statements.
   - *b.* The Council will ensure that the Executive Director and Executive Committee have online access to the bank account and bank statements.

DRAFT

c. The Executive Committee will work with the Executive Director or Board Designee to reconcile the bank statement each month. Reconciliations should be done within 7 days of receiving the statements, as follows:
    i. Review all checks for correct signatures, number of signatures, and protest to the bank any signature errors.
    ii. Review the checks in the bank record to ensure that:
        1. The name of the payee, the amount of the check, and the date of the check agree with the corporation's accounting records
        2. Whoever the check was made out to was the depositor of the check
    iii. Compare the bank deposit records with our accounting records to determine whether each deposit recorded in the accounting records agrees with the bank record.
    iv. Check whether the ending balance in the bank statement agrees with the general ledger cash account.
    v. Review the list of outstanding checks. All checks outstanding over 90 days will be thoroughly reviewed.
    vi. Review the list of deposits in accounting records not yet recorded by the bank.
    vii. Once reconciled the Executive Committee will sign a printed copy acknowledging that the reconciliation was performed.

4. Audits: The Council shall authorize and contract, as required and funded by any Grant Agreement, audits of the financial accounts and records requiring audit. The Executive Committee and Executive Director shall cooperate with and assist the Auditor(s) in conducting the audit. The Executive Committee will review and approve audits upon their completion. A current copy of Council audits will be available for review by the general public upon request.

DRAFT

Project #1 - All 1
Project #2 Interim ED 2
Project #3 – Jordan, Interim ED, New ED 2
Project #4 – interim ED 2
Project #7 – Interim ED 3
Project #5 – Jordan, Interim ED, New ED 3
Project #9 - Jacob (Dependent on Jacob's time) / Interim ED, New ED 4
Project #10 – Jordan, Interim ED, New ED 4

Project #1 - All

OWEB Grant Number 218-039
Strengthening Organizational Health & Council Capacity
Project Category Stakeholder Engagement
Priority High

Governance – Tom, Board, Interim ED, New ED

- Host at least 6 publicized Monthly Public to maximize time for administrative housekeeping and balance public engagement
- Host at least 10 Executive Committee Meetings each per year to oversee. management and development of the GYWCs programming.
- In person meetings have been far more successful for outreach purposes and the GYCW is transitioning to Hybrid meeting for better access.
- Publicize meetings on Web site and thru Mail Chimp to encourage public engagement.
- Hold Annual Elections of Board Directors, Officers, and Committee members.
- Successfully retain existing Board members, and recruit at least 3 new Members to address gaps the Council needs.
- Conduct annual self-assessments of
    - policies and procedures
    - organizational and programmatic budgets
    - stakeholder representation
    - governing body diversity and skill sets
    - insurance and risk management
    - any additional safeguards identified by the board to ensure performance and meet workload obligations.

Outreach – Tom, Outreach Contractor, Interim ED

- E-Newsletters Quarterly
- Monthly Website Updates
- Annual community presentations, workshops, project tours, or similar outreach events

- 1-2 outreach booths at existing local events each year, such as farmers markets, town and harvest festivals, and Earth Day Celebrations.

Project #2 Interim ED

Riparian Habitat Restoration
OWEB Grants 11-18-009, 11-18-01
Project Category Restoration/Acquisition
Priority High

Cozine Creek: Post-planting Maintenance Phase

- Connect with Linfield regarding maintaining the Cozine Project amid changes in staffing.
- Outreach to our Cozine Creek working lands and urban stakeholders, including referrals, annual mailers, presentations, and tours.

Chehalem Valley: Maintenance Phase - Not Grant Funded

Salt Creek: Continue Maintenance phase and outreach to Salt Creek landowners and transition to Baker Creek for ag riparian.

Project #3 – Jordan, Interim ED, New ED

11-18-009; 1118-015
Oak & Prairie Habitat Restoration
Project Category l Restoration/Acquisition
Priority High

- Miller Woods project area has an active open small grant, will be planted in fall and then transitioned to maintenance.
- Cooke Property project area has an active open small grant, will be planted in fall and then transitioned to maintenance.

Project #4 – interim ED

Instream Habitat Restoration
Project Category Restoration/Acquisition
Priority High

- Goal of securing an assistance agreement with the BLM to streamline financial and in-kind match to support LWD project implementation and grant proposal development. Have a stakeholder meeting to review data and determine how to use data to identify new LWD.
- The Partnership will also work together to update the 2014 Fish Passage Barrier Database and Action Plan based on the results of the RBA Fish Snorkel Inventories.
- This will also include updating the Database / Plan to include the Upper South Yamhill sub-basin, which was excluded from the 2014 report due to lack of fish

passage data collected in that sub-basin, which will be partially remedied by the RBA inventory results.

Project #7 – Interim ED / Contractor John Runyon (Cascade Env. Group) for stakeholder meetings.

Project Title Rapid Bio Assessment of Fish Distributions & Abundances (RBA)
Project Category Monitoring
Priority High

- The results of the RBA Inventories will be used by our local partnership to inform planning and development of habitat restoration projects, as described in the "Instream Habitat Restoration" **project #4.**
- In addition, the data will be used to update the GYWCs 2014 Fish Passage Action Plan database and priorities, including the addition of the Upper South Yamhill sub-basin to the Action Plan, which was not included prior because of a lack of fish passage data.

Project #5 – Jordan, Interim ED, New ED

Priority Invasive Weed Control & Inventory
Project Category Restoration/Acquisition
Priority Medium

- Coordinate with the Yamhill SWCD to aid with Garlic Mustard and Knotweed (is this summer and need to do outreach, let SWCD know).
- Treatments where overlap exists with the GYWC's Cozine, Chehalem, and Palmer Creek focus areas. This includes continued landowner recruitment, surveying of weeds, coordination of volunteers for manual treatment and creating access paths, as well as coordinated contracted services for weed control as needed.
- The GYWC will continue to participate in quarterly meetings of the Yamhill County Roadside Vegetation Management Committee, which is spearheading this project. This also includes assisting with planning, recruitment, and implementation of roadside vegetation management demonstration projects.

Project #9 - Jacob / Interim ED, New ED

Project Title Volunteer-Led Fish Spawning Surveys
Project Category Monitoring
Priority Low

- 10+ stream miles monitored for spawning activity for Coho salmon (Oct- Dec) and ESA-listed winter steelhead trout (Feb - May), across four priority sub-basins.
- Continue to offer and coordinate student internship opportunities with local colleges, universities, and community colleges.

Project #10 – Jordan, Interim ED, New ED

Project Title Salt Creek Collaborative
Project Category Stakeholder Engagement
Priority Low

- The GYWC will continue to serve on the Collaborative's Steering Committee providing technical assistance about fisheries, water quality, and long-term planning in the Salt Creek sub-basin.
- We anticipate additional landowner outreach events and presentations will be coordinated to explore potential options for local management of water resources and natural concerns.
- The GYWC will also continue to implement the recruited Riparian Habitat Restoration project in the Salt Creek basin described in the "Riparian Habitat" project and conduct additional landowner outreach in the area to recruit another agricultural riparian project.

Match Funding Form

OWEB

Document the match funding shown on the budget page of your grant application.

OWEB accepts all non-OWEB funds as match. An applicant may NOT use another OWEB grant to match an OWEB grant; this includes ODA Weed Board projects because they are funded through OWEB grants. However, an applicant who benefits from a pass-through OWEB agreement with another state agency, by receiving either staff expertise or a grant from that state agency, may use those benefits as match for an OWEB grant. (Example: A grantee **MAY** use as match the effort provided by ODFW restoration biologists because OWEB funding for those positions is the result of a pass-through agreement).

At the time of application, match funding for OWEB funds requested does not have to be secured, but you must show that **at least 25% of match funding has been sought**. On this form, you do not necessarily need to show authorized signatures ("secured match"), but the more match that is secured, the stronger the application. Identify the type of match (cash or in-kind), the status of the match (secured or pending), and either a dollar amount or a dollar value (based on local market rates) of the in-kind contribution.

If you have questions about whether your proposed match is eligible or not, see Allowable Match document in OGMS https://apps.wrd.state.or.us/apps/oweb/fiscal/nologin.aspx under Technical Assistance application or contact your local OWEB regional program representative (contact information available in the instructions to this application).

Project Name: GYWC Council Support 2022-23

Applicant: Greater Yamhill Watershed Council

Match Funding Source	Type	Status*	Dollar Value	Match Funding Source Signature/Date*
GYWC Board of Directors	in-kind	secured	$4,320	6/12/22

Guests: Kenneth Law Davis, Lou Savage, Grace Stone, Eric Tomczak, Anna Rankin (Pudding River), Kurt Berning (Pudding River), Eric Ellingson, Susan Aldrich-Markham, Virginia Wood - Friendsview Retirement,

Reports

Accountant

Please find attached the Financials Workbook for December.

This month there is a new tab of everyone GYWC paid above the 1099's threshold and who may be reportable. Other than Gordon (who I believe is probably known to at least one of the board), I contacted everyone on the list today and cleared some, got one EIN, and left messages for all the rest. I will e-file all the 1099's and the W-2 for Luke before the end of the month.

Jordan, I'd love to start work the first week in February on billing out Q4 amounts to grants. Let me know what your ability is.

Admin

Zoom Phone Set up with new number. Messages recorded. Must use extensions.

Action

Board Voted Passed 4-0

Elect Executive Committee (Chair/Vice/Treasurer)
Explanation of Roles and Responsibilities

Jordan and Jacob passed 4-0.

Jordan Chair
Jacob Vice Chair
Matt Secretary

Passed 5-0

Multiple payments from OWEB came through and multiple checks went out.

Check on tax reporting in relation to Statewide Transit Tax. We got mail saying that we did not file for the period ending on Sept. 30 2022.

OWEB Small Grant Final Reports are due for Miller Woods & Fromherz project 1/18. I can ask Kathy Leopold about extensions or we might be able to pull this off?

OWEB Glenbrook Culvert grant also needs a final report due by mid-february.

OWEB Capacity Grant - I want to make sure that when we hire a new ED we will be able to bill at a rate that covers their salary $60-70k per year. In the application we stated we would bill at $35/hr, which wouldn't cover hourly rate + taxes + insurance stipend... Should we reach out to Liz to see if we need an official budget adjustment or other form to fill out to make that change?

Payroll set-up for new ED. Should we consider switching to quickbooks online? Or possibly use a service like Gusto Payroll.

I think we need to vote on a new board chair as I was appointed to fulfill the remainder of Zach's term (from the bylaws):

> ***Term and Election***
>
> *The term of office for officers shall be one year. Officers may serve up to two consecutive one-year terms. Officers shall be elected by a majority vote of the Board of Directors present at the annual meeting.*
>
> ***Vacancy***

An officer may resign at any time by delivering notice to the Board. An officer may be removed with or without cause by a two-thirds vote of the Directors in office.

Any vacancy in an officer position shall be filled by an election of the Board. Such person shall hold such office until the next annual meeting at which time regular elections of officers shall occur.

Schedule interviews for new ED between Jan. 16 and 22.

Directors
Partner
ED Hiring
New Director Outreach
OWEB / Projects
Fish Survey

Kurt Berning described his experience as the new ED and was looking forward to work collaboratively.

GYWC native plant sale is on and running. Over 40,000 plants.
There is a local working group meeting with NRCW on February 15th.

Jacob would like to do EDNA on Salt Creek.and Lou said it would be great to have a visit.

Budget Summary:
OWEB Amount Requested: $131,465
Total Project Amount: $185,460

Administrative Information

Abstract

Provide an abstract statement for the project. Include the following information: 1) Identify the project location; 2) Briefly state the project need; 3) Describe the proposed work; 4) Identify project partners.

The UBWC operates within the Umatilla Basin located entirely in Umatilla County with main offices located in Pendleton where the majority of the watersheds rivers join. The Umatilla Watershed has historically had 6 anadromous species: Steelhead (oncorhynschus my kiss gairdneri), Spring and Fall Chinook salmon (Oncorhynchus tshawytscha), Coho salmon (Oncorhysnchus kisutch), and Pacific Lamprey (Lampetra trident ate).. It has has Bull trout (Salvelinus confluent) and Mountain whitefish (Prosopium williamsoni) in it's upper headwaters. Both Bull trout and summer Steelhead are currently listed as threatened undertake Endangered Species act. Three populations of salmon were extirpated from the Umatilla Watershed in the early 20th century, but recently have been reintroduced. The Umatilla Basin has a substantial amount of agricultural practices on, and around, the lands that surround the Umatilla River The Umatilla Basin supports a large agricultural community. Historically the Umatilla River has been used as a main source of irrigation and continues to be today. Diversion Dams were installed in the river to back up river water for irrigation purposes. Due to the fact that some diversion dams were placed in the river over fifty years ago and have not been updated since, these dams are now out dated. These dams were also installed in the river prior to any regulations on fish passage, therefore creating fish passage issues This grant project will fund the Umatilla Basin Watershed Councils activities towards improving fish passage and habitat through large scale restoration projects along the Umatilla and its tributaries. The council uses existing data while development new information to prioritize strategic restoration actions that will provide that most beneficial uplift to the entire system. As a local non-profit we like to see ourselves as a group of local individuals who come together to help educate, restore, and monitor Oregons natural resources.

Location Information

Current Location:

What is the ownership of the project site(s)?

❑*Public land (any lands owned by the Federal government, the State of Oregon, a city, county, district or municipal or public corporation in Oregon)*

❑*Tribal lands (any lands owned/managed by a Tribal government)*

❑*Private (land owned by non-governmental entities)*

✓*Not applicable to this project*

❑*This grant will take place in more than one county.*

Permits

Other than the land-use form, do you need a permit, license or other regulatory approval of any of the proposed project activities?

❍ Yes
● No

Racial and Ethnic Impact Statement

Racial and Ethnic Impact Statement

❍ The proposed grant project policies or programs could have a disproportionate or unique POSITIVE impact on the following minority persons. (indicate all that apply)

❍ The proposed grant project policies or programs could have a disproportionate or unique NEGATIVE impact on the following minority persons. (indicate all that apply)

● The proposed grant project policies or programs WILL HAVE NO disproportionate or unique impact on minority persons.

Insurance Information

If applicable, select all the activities that are part of your project - These require a risk assessment tool unless otherwise noted (check all that apply).

❑*Working with hazardous materials (not including materials used in the normal operation of equipment such as hydraulic fluid)*

❑*Earth moving work around the footprint of a drinking water well*

❑*Removal or alteration of structures that hold back water on land or instream including dams, levees, dikes, tidegates and other water control devices (this does not include temporary diversion dams used solely to divert water for irrigation)*

❑*Applicant's staff or volunteers are working with kids related to this project (DAS Risk assessment tool not required, additional insurance is required)*

❑*Applicant's staff are applying herbicides or pesticides (DAS Risk assessment tool not required, additional insurance is required)*

✓*Insurance not applicable to this project*

Additional Information

❑ *This project affects Sage-Grouse.*

Problem Statement

Does the watershed council have a fiscal sponsor?

❍ Yes
● No

Is the council a membership organization?

❍ Yes
● No

The council is a group of councils operating collectively.

❍ Yes
● No

Is the applicant a group of councils operating independently?

❍ Yes
● No

For Details Upload the council's most recent bylaws.

Councils are required to review their council's bylaws once every three years, provide the date of the last time the council's governing body reviewed the council's bylaws?

01/01/2022

Councils are required to review their policies and procedures once every three years, provide the date of the last time the council's governing body reviewed the council's policies and procedures?

01/01/2022

For Details Upload the council's most recent policies and procedures.

For Details Upload the council's local government designation

For Details Upload the council's policies and procedures.

Date of the council's 2021-2023 self assessment?

02/10/2023

Date of last council officer elections.

09/19/2022

For Details Upload the minutes from the board meeting documenting the results of the officer election.

Does the council have written position descriptions for council board officers?

● Yes
❍ No

Does the council have written roles and responsibilities for council governing body members?

● Yes
❍ No

How many times did/will the council governing body meet between July 1, 2021-June 30, 2023?
12

How many times will the council governing body meet between July 1,-June 30, of the upcoming biennium for which you are seeking funding?
5

Describe how the council advertises its general council meetings.
The UBWC advertises meetings through a number of different methods, such as; social media, email chains, the EO, word of mouth, direct phone calls, and the tribal radio station. Staff and board members also announce meeting opportunities and invitations at other meeting functions and/or partnering NGO meetings.

Do council governing body meetings have agendas, sign-in sheets, and minutes?
● Yes
❍ No

Describe how your board membership includes a diverse range of geographic areas and community interests in the watershed.
In 2023-2025 the UBWC is working towards gathering new board member support following a loss of some members during the covid-19 era. To guide this search, the UBWC is focused on gaining a wide-range of diverse backgrounds which include; basin wide geographic representation, diverse ethnic and cultural backgrounds, encouragement towards younger members, a wide range of educational and work experienced backgrounds but primarily individuals who have a strong passion for their communities and watershed restoration.

Describe any board membership and recruitment challenges and actions being taken to address those challenges.
In the past, the UBWC had strong pipeline for board representation from individuals who recently retired from the local Pendleton DEQ office. In recent years, the UBWC has worked towards expanding board representation to include individuals from a wider age and work background(s). The UBWC identified and understands the importance and value of having board representation from all ten communities that we represent and we will continue to look for support based on those geographic locations. The Covid-19 era brought on many challenges for gathering new board members due to the temporary loss of in-public UBWC events but also do to the many other NGO's that our board members are involved in and use as recruitment grounds. The UBWC hopes to gain new tribal representation, water users, educational institute (student and/or staff), and private sector board members during the 2023-2025 biennium.

Are projects of the council, including those identified in the work plan, identified in a council action plan or strategic plan?
● Yes
❍ No

Provide the name and date of the most recent action plan or strategic plan.
-Birch Creek Assessment & Action Plan 2017
-UBWC Bi-Annual Statement of Work (2023-2025)

Is the work of the council specifically designed to benefit salmon or steelhead?
● Yes
❍ No

✓Middle Columbia River - Steelhead
✓Middle Columbia River spring-run - Chinook Salmon

Describe how the resulting council capacity grant will benefit salmon or steelhead or their habitat?

The Umatilla Basin Watershed Council depends on the capacity support from OWEB to staff the organizations full time director. This position is tasked with building partner support, identifying project opportunities, gathering landowner support, and then leveraging these partnerships towards funding opportunities that result in on the ground restoration focused on supporting habitat restoration for Oregon's salmonid populations. The UBWC's main project focus has been on large scale river restoration actions such as; floodplain reconnection, barrier removals, facilitation partners with landowner supported water and land acquisitions, as well as supporting on the ground river cleanups, native re-veg opportunities, and invasive species removal opportunities. The UBWC staff also serves on other local and state boards as well as serving on the OWEB Region-6 Small Grant Review Team, the Umatilla Restoration Tech Team, the Stewards of the Umatilla River Environment. The UBWC also serves as the supply station for other NGO's who want to adopt a river through the SOLVE Program. All of these programs missions support and benefit salmon and steelhead habitat restoration.

Input the total acres encompassed by this watershed.
1632625

Input the Federal Recovery plan applicable to your watershed council.
-Conservation & Recovery Plan for Oregon Steelhead Populations in the Middle Columbia River Steelhead Distinct Population Segment (2010)
-Mid-Columbia River Conservation & Recovery Plan

Input the description of the plan implemented that outlines the need for this activity
Middle Columbia River Steelhead Distinct Population Segment ESA Recovery Plan:
"Limiting Factors and Threats for the DPS at a general level, based on information from the ICTRT and the four management unit plans, the major factors limiting the viability of Middle Columbia steelhead populations are degraded tributary habitat, impaired fish passage in the mainstem Columbia River and tributaries, hatchery-related effects, and predation/competition/disease." (Middle Columbia River Steelhead Distinct Population Segment ESA Recovery Plan, 2008)

https://www.salmonrecovery.gov/Files/RecoveryPlans/mid-c-plan.pdf

The Umatilla Subbasin plan states, "passage obstructions are likely to cause immediate mortality, they are considered imminent threats and should be addressed wherever they occur. The obstructions listed in Table 45, Section 3.5.1.2 need to be addressed as high priority."

According to the Northwest Power and Conservation Council Umatilla/Willow sub basin plan; “Steelhead"

Proposed Solution

Community Engagement

Briefly describe the council's stakeholder engagement accomplishments from the 2021-2023 biennium.

During the 2021-2023 biennium the UBWC focused stakeholder engagement through our social media presence due to the impacts that Covid lockdowns had on day-to-day business. We were able to utilize social media algorithms to fund focused targeted ads based on individuals geographic locations, age, and ethnic backgrounds, which helped the Council reach a broader audience than we traditional had with meetings and/or public events. The UBWC continued to carry out our annual x2 river cleanup events, but we drew back on providing food and other components that put the community at a greater risk due to covid. We were able to bring in new components by partnering with the Umatilla National Forest who helped the UBWC incorporate a native tree give-away which helped our river cleanup event continue to grow even during the face of covid lockdowns. By late 2022 and into 2023 as covid regulations ended, the UBWC continued to re-establish our public events as well as our presence at the local farmers markets.

Briefly describe the council's stakeholder engagement challenges from the 2021-2023 biennium

The main challenges the UBWC faced with stakeholder/community engagement efforts during the 2021-2023 biennium was funding focused on community engagement efforts without a specific "engagement grant" as well as the regulation/changes that Covid brought on to our communities. The UBWC has always heavily relied on community volunteers for engagement efforts and the majority of those volunteers were of the retirement age - this was the population group that pulled back the most during the covid era. With funding challenges, the UBWC like many other Council's rely on the Council Capacity funding to cover many areas; office overhead, admin work, director salary, project management time, initial time invested into scoping and getting new projects off the ground. All of these areas are essential and help bring in new funding, so it is often difficult to shift a large amount of resources towards engagement because these efforts payoff on a longer timeline but often do not directly increase

Briefly describe the council's stakeholder engagement plans for the 2023-2025 biennium.

For the 2023-2025 biennium the UBWC plans to continue growing new partners with the x2 annual river cleanup event. Over the past few years we've grown the event to include; Umatilla National Forest, Umatilla County Public Works, Parks & Rec, Solve, S.U.R.E., and Amazon Corporate office. We are going to continue with the native tree give-away as well as booths at locals farmers market(s). We have plans to continue developing our new website in-progress as well as continued and increased efforts with our social media outreach campaigns. During the 2023 grant cycle, the UBWC has plans to apply for an OWEB Stakeholder Engagement grant which will focus on targeted engagement with landowners who are positioned on high-ranking prioritized passage barriers. The UBWC and partners have also launched the Umatilla Restoration Tech Team with the UBWC as the facilitator tasked at bringing partners together quarterly to discuss and share support for restoration projects in the basin.

Describe the council's efforts to engage with local tribes present in the council's geography.

The UBWC continues to closely collaborate with the Confederated Tribes of the Umatilla Indian Reservation on any and all projects that the Council carries out. Currently, the UBWC is working on designing and/or implementing five priority fish passage projects with CTUIR as well as a large scale basin wide assessment and action plan which focuses on the mainstem of the Umatilla from the headwaters of the Columbia River all the way up into the reservation at the headwaters of the North and South Fork(s) of the Umatilla River. CTUIR administers BPA funding in our basin so they are a major funding support in fisheries restoration efforts, with a DNR staff of over 140 individuals. This staff supports the UBWC with project funding, cultural 106 project clearance, and many other crucial aspects of restoration actions. The UBWC uses CTUIR documents to guide our work, mainly the River Vision and First Foods plans developed by CTUIR leadership.

Describe the council's efforts to engage with non-traditional partners.

The UBWC continues to develop new partners that have not traditionally played a major role in restoration efforts

in the basin. Such as Public Works and most notably our newest partnership with Amazon Corporate and Walmart Corporate who have become one of our main sponsors and staffing volunteers at our annual river cleanups. We also continue to work towards developing closer relationships with water users, the county, other NGO's, local educational institutes, other watersheds. The UBWC takes the position that everyone in the basin benefits from watershed restoration and that we all have a stake in protecting and enhancing our natural resources for future generations.

Restoration

Provide a brief summary of the council's 2021-2023 restoration accomplishments.

During the 2021-2023 biennium that UBWC completed the 100% design drawings for two high-priority ODFW statewide barrier(s) located on in the West Birch Creek sub-watershed. These barriers were identified in the Birch Creek Assessment & Action Plan as well as the Oregon ODFW Statewide Barrier Priority List. These barriers known as the Stanley Creek Culvert & the Hascall Diversion Dam are slated for project implementation during the 2023 in-stream work-window. The UBWC secured restoration funding for these projects through the OWEB Restoration grant funding, combined with ODFW, BPA/CTUIR funds as well as support from Umatilla County. After removing these barriers in 2023, the UBWC will have tackled five statewide fish passage barrier removals since 2017 and we are on track to secure funding for three more priority barriers, which are located in the Patawa Creek system - marking the UBWC's first restoration project located entirely on tribal lands. During this cycle, partners in the basin also began the process of securing funds and scoping work for the Umatilla Mainstem Assessment, which will wrap up by the end of the 2025 cycle. The UBWC also worked with local agencies, NGO's, and tribal governments to secure funding from the National Park Service to begin a trail connector throughout the Umatilla Basin, which will run along the Umatilla River - the UBWC is tasked with invasive species removal and re-veg of native species along the new trail corridor.

Briefly describe the council's restoration challenges from the 2021-2023 biennium

Like other work during the 2021-2023 cycle, the UBWC faced challenges brought on by the covid pandemic. These challenges were financial as well as an impact on the ability to work face-to-face with partners, landowners, and other agencies in order to gather support for on the ground restoration. Another major challenge during this period was the recruitment of new board members as well as leadership struggles between past board members. The board was split on focusing on projects or going back towards rebuilding a monitoring program. Another challenge during the period was the attention brought on to the high-nitrate levels in the lower Umatilla River area. This challenge is still in the process of being addressed through outreach, well testing, and what future action items will be required to address these issues. A number of partners in the basin are working towards this issue. Flooding in recent years has also brought on a lot of challenges will landowners.

Provide a brief summary of the council's restoration plans for 2023-2025.

During the 2023-2025 cycle, the UBWC will address the high-priority barriers on Stanley Creek and West Birch Creek while also securing design funding for three priority barriers located on the Patawa Creek system. Partners will also be collaborating on the Umatilla Mainstem Assessment & Action Plan, while also continuing to implement projects/high restoration actions items identified in the Birch Creek Assessment & Action Plan. The UBWC has began work on our first OWEB Stakeholder Engagement grant which will focus on an expansion to Morrow County as well as making contact with a set list of over 20 landowners who are situated on and/or near passage barriers listed in the ODFW Statewide Priority Barrier list.

Planning

Describe how the council uses planning documents to identify and implement on-the-ground watershed restoration and stakeholder engagement projects.

The UBWC uses a number of state, tribal, and federal documents to support the prioritization of our statement of work. Past and on-going assessments & action plans completed by the UBWC and partners are also utilized in project priorities. The four main documents that the UBWC works from are; the Oregon Department of Fish & Wildlife's culvert & barrier priority list, the Birch Creek Assessment & Action Plan, the Umatilla Main-stem Assessment (in-progress), as well as CTUIR's First Foods & Umatilla River Vision. The UBWC re-works the organizations statement of work every two years and then uses these priorities to make contact with landowners at which point the priorities are refocused based on landowner, partner, and funding support opportunities. Although the UBWC uses these documents to heavily guide our work, we also use input from local stakeholders and the overall board member guidance to help build our statement of work.

Are projects of the council identified in a council action plan or strategic plan?

● Yes
❍ No

Provide the name and date of the most recent action plan or strategic plan.

The Birch Creek Assessment & Action Plan

Provide context and justification for how your budget was developed. Explain how project costs and/or rates were determined.

This projects budget was developed using comparative rates with other Natural Resource NGO's and watershed council data provide by the Network of Oregon Watershed Councils partnered research with Oregon State University. Cost of living in Eastern Oregon as well as recent increases in cost of living/doing day-to-day business were also factored into the development of this budget.

Does the budget identify a contingency amount for specific line item(s) within the Contracted Services and/or Material and Supplies budget category?

❍Yes

●No

Funding and Match

Fund Sources and Amounts

Organization Type	Name	Source Note	Contribution Type	Amount	Description	Status
Tribe	Confederated Tribes of the Umatilla Indian Reservation	Capacity support for Project Scoping & Management/Fiscal Flow-through Project Funding	Cash	$5,000	Project Capacity Support & Fiscal Admin (Project Specific)	Pending
County	Umatilla County	County Commissioners Support	Cash	$20,000	Umatilla County Commissioner Support	Secured
Private organization	Amazon	Annual River Cleanup Donation	Cash	$500	Annual S.U.R.E River Cleanup Donation	Secured
Private organization	Walmart	Annual River Cleanup	Cash	$500	Annual S.U.R.E River Cleanup	Secured
Non-Governmental Organization	Umatilla Basin Watershed Foundation	Executive Committee & Board Volunteer Time	In-Kind - Labor	$2,560	Exec. Committee & Board Volunteer Time	Secured
Non-Governmental Organization	Umatilla Basin Watershed Foundation	Executive Committee & Board Volunteer Time	Cash	$435	Meeting Supply Donation(s)	Secured
Non-Governmental Organization	Stewards of the Umatilla River Environment	Annual River Cleanup	In-Kind - Volunteers	$25,000	Average Volunteer hours per-year (S.U.R.E)	Secured
Fund Source Cash Total	**$26,435**	**Fund Source In-Kind Total**	**$27,560**			

Match

Contribution Source-Type: Description	Amount
Confederated Tribes of the Umatilla Indian Reservation -Cash: Project Capacity Support & Fiscal Admin (Project Specific)	$0
Umatilla County-Cash: Umatilla County Commissioner Support	$20,000
Amazon-Cash: Annual S.U.R.E River Cleanup Donation	$0
Walmart-Cash: Annual S.U.R.E River Cleanup	$0
Umatilla Basin Watershed Foundation-In-Kind - Labor: Exec. Committee & Board Volunteer Time	$2,560
Umatilla Basin Watershed Foundation-Cash: Meeting Supply Donation(s)	$435
Stewards of the Umatilla River Environment -In-Kind - Volunteers: Average Volunteer hours per-year (S.U.R.E)	$25,000
Match Total	**$47,995**

Do match funding sources have any restrictions on how funds are used, timelines or other limitations that would impact the portion of the project proposed for OWEB funding?

❍ Yes

● No

Do you need state OWEB dollars (not Federal) to match the requirements of any other federal funding you will be using to complete this project?

❍ Yes
● No

Does the non-OWEB cash funding include Pacific Coast Salmon Recovery Funds?

❍ Yes
● No

BYLAWS
OF
UMATILLA BASIN WATERSHED FOUNDATION

The name of the organization is Umatilla Basin Watershed Foundation. The organization is organized in accordance with the Oregon Nonprofit Corporation Act, as amended. The organization has not been formed for the making of any profit, or personal financial gain. The assets and income of the organization shall not be distributable to, or benefit the trustees, directors, or officers or other individuals. The assets and income shall only be used to promote corporate purposes as described below. Nothing contained herein, however, shall be deemed to prohibit the payment of reasonable compensation to employees and independent contractors for services provided for the benefit of the organization. This organization shall not carry on any other activities not permitted to be carried on by an organization exempt from federal income tax. The organization shall not endorse, contribute to, work for, or otherwise support (or oppose) a candidate for public office. The purpose of the organization is the following:

Watershed Enhancement and Restoration

The organization is organized exclusively for purposes pursuant to section 501(c)(3) of the Internal Revenue Code.

ARTICLE I
MEETINGS

Section 1. Annual Meeting. An annual meeting shall be held once each calendar year for the purpose of electing directors and for the transaction of such other business as may properly come before the meeting. The annual meeting shall be held at the time and place designated by the Board of Directors from time to time.

Section 2. Special Meetings. Special meetings maybe be requested by the President or the Board of Directors. A special meeting of members is not required to be held at a geographic location if the meeting is held by means of the internet of other electronic communications technology in a manner pursuant to which the members have the opportunity to read or hear the proceedings substantially concurrent with the occurrence of the proceedings, note on matters submitted to the members, pose questions, and make comments.

Section 3. Notice. Written notice of all meetings shall be provided under this section or as otherwise required by law. The Notice shall state the place, date, and hour of meeting, and if for a special meeting, the purpose of the meeting. Such notice shall be mailed to all directors of record at the address shown on the corporate books, at least 10 days prior to the meeting. Such notice

shall be deemed effective when deposited in ordinary U.S. mail, properly addressed, with postage prepaid.

Section 4. Place of Meeting. Meetings shall be held at the organization's principal place of business unless otherwise stated in the notice. Unless the articles of incorporation or bylaws provide otherwise, the board of directors may permit any or all directors to participate in a regular or special meeting by, or conduct the meeting through the use of, any means of communication by which all directors participating may simultaneously hear each other during this meeting. A director participating in a meeting by this means shall be deemed to be present in person at the meeting.

Section 5. Quorum. A majority of the directors shall constitute at quorum at a meeting. In the absence of a quorum, a majority of the directors may adjourn the meeting to another time without further notice. If a quorum is represented at an adjourned meeting, any business may be transacted that might have been transacted at the meeting as originally scheduled. The directors present at a meeting represented by a quorum may continue to transact business until adjournment, even if the withdrawal of some directors results in representation of less than a quorum.

Section 6. Informal Action. Any action required to be taken, or which may be taken, at a meeting, may be taken without a meeting and without prior notice if a consent in writing, setting forth the action so taken, is signed by the directors with respect to the subject matter of the vote.

ARTICLE II
DIRECTORS

Section 1. Number of Directors. The organization shall be managed by a Board of Directors consisting of 11 director(s).

Section 2. Election and Term of Office. The directors shall be elected at the annual meeting. Each director shall serve a term of 3 year(s), or until a successor has been elected and qualified.

Section 3. Quorum. A majority of directors shall constitute a quorum.

Section 4. Adverse Interest. In the determination of a quorum of the directors, or in voting, the disclosed adverse interest of a director shall not disqualify the director or invalidate his or her vote.

Section 5. Regular Meeting. The Board of Directors shall meet immediately after the election for the purpose of electing its new officers, appointing new committee chairpersons and for transacting such other business as may be deemed appropriate. The Board of Directors may provide, by resolution, for additional regular meetings without notice other than the notice provided by the resolution.

Section 6. Special Meeting. Special meetings may be requested by the President, Vice-President, Secretary, or any two directors by providing five days' written notice by ordinary United States mail, effective when mailed. Minutes of the meeting shall be sent to the Board of

Directors within two weeks after the meeting. A special meeting of members is not required to be held at a geographic location if the meeting is held by means of the internet of other electronic communications technology in a manner pursuant to which the members have the opportunity to read or hear the proceedings substantially concurrent with the occurrence of the proceedings, note on matters submitted to the members, pose questions, and make comments.

Section 7. Procedures. The vote of a majority of the directors present at a properly called meeting at which a quorum is present shall be the act of the Board of Directors, unless the vote of a greater number is required by law or by these by-laws for a particular resolution. A director of the organization who is present at a meeting of the Board of Directors at which action on any corporate matter is taken shall be presumed to have assented to the action taken unless their dissent shall be entered in the minutes of the meeting. The Board shall keep written minutes of its proceedings in its permanent records.

Section 8. Informal Action. Any action required to be taken at a meeting of directors, or any action which may be taken at a meeting of directors or of a committee of directors, may be taken without a meeting if a consent in writing setting forth the action so taken, is signed by all of the directors or all of the members of the committee of directors, as the case may be.

Section 9. Removal / Vacancies. A director shall be subject to removal, with or without cause, at a meeting called for that purpose. Any vacancy that occurs on the Board of Directors, whether by death, resignation, removal or any other cause, may be filled by the remaining directors. A director elected to fill a vacancy shall serve the remaining term of his or her predecessor, or until a successor has been elected and qualified.

Section 10. Committees. To the extent permitted by law, the Board of Directors may appoint from its members a committee or committees, temporary or permanent, and designate the duties, powers and authorities of such committees.

ARTICLE III
OFFICERS

Section 1. Number of Officers. The officers of the organization shall be a President, one or more Vice-Presidents (as determined by the Board of Directors), a Treasurer, and a Secretary. Two or more offices may be held by one person. The President may not serve concurrently as a Vice President.

President/Chairman. The President shall be the chief executive officer and shall preside at all meetings of the Board of Directors and its Executive Committee, if such a committee is created by the Board.

Vice President. The Vice President shall perform the duties of the President in the absence of the President and shall assist that office in the discharge of its leadership duties.

Secretary. The Secretary shall give notice of all meetings of the Board of Directors and Executive Committee, shall keep an accurate list of the directors, and shall have the authority to certify any records, or copies of records, as the official records of the organization. The Secretary shall maintain the minutes of the Board of Directors' meetings and all committee meetings.

Treasurer/CFO. The Treasurer shall be responsible for conducting the financial affairs of the organization as directed and authorized by the Board of Directors and Executive Committee, if any, and shall make reports of corporate finances as required, but no less often than at each meeting of the Board of Directors and Executive Committee.

Section 2. Election and Term of Office. The officers shall be elected annually by the Board of Directors at the first meeting of the Board of Directors, immediately following the annual meeting. Each officer shall serve a one year term or until a successor has been elected and qualified.

Section 3. Removal or Vacancy. The Board of Directors shall have the power to remove an officer or agent of the organization. Any vacancy that occurs for any reason may be filled by the Board of Directors.

ARTICLE IV
CORPORATE SEAL, EXECUTION OF INSTRUMENTS

The organization shall not have a corporate seal. All instruments that are executed on behalf of the organization which are acknowledged and which affect an interest in real estate shall be executed by the President or any Vice-President and the Secretary or Treasurer. All other instruments executed by the organization, including a release of mortgage or lien, may be executed by the President or any Vice-President. Notwithstanding the preceding provisions of this section, any written instrument may be executed by any officer(s) or agent(s) that are specifically designated by resolution of the Board of Directors.

ARTICLE V
AMENDMENT TO BYLAWS

The bylaws may be amended, altered, or repealed by the Board of Directors by a two-thirds majority of a quorum vote at any regular or special meeting. The text of the proposed change shall be distributed to all board members at least ten (10) days before the meeting.

ARTICLE VI
INDEMNIFICATION

Any director or officer who is involved in litigation by reason of his or her position as a director or officer of this organization shall be indemnified and held harmless by the organization to the fullest extent authorized by law as it now exists or may subsequently be amended (but, in the case of any such amendment, only to the extent that such amendment permits the organization to provide broader indemnification rights).

ARTICLE VII
DISSOLUTION

The organization may be dissolved only with authorization of its Board of Directors given at a special meeting called for that purpose, and with the subsequent approval by no less than two-thirds (2/3) vote of the members. In the event of the dissolution of the organization, the assets shall be applied and distributed as follows:

All liabilities and obligations shall be paid, satisfied and discharged, or adequate provision shall be made therefore. Assets not held upon a condition requiring return, transfer, or conveyance to any other organization or individual shall be distributed, transferred, or conveyed, in trust or otherwise, to charitable and educational organization, organized under Section 501(c)(3) of the Internal Revenue Code of 1986, as amended, of a similar or like nature to this organization, as determined by the Board of Directors.

Certification

Douglas Bennett, President of Umatilla Basin Watershed Foundation, and Ken Thompson, Secretary of Umatilla Basin Watershed Foundation certify that the foregoing is a true and correct copy of the bylaws of the above-named organization, duly adopted by the initial Board of Directors on March 01, 2021.

I certify that the foregoing is a true and correct copy of the bylaws of the above-named organization, duly adopted by the initial Board of Directors on March 01, 2021.

Purpose of this manual

This manual, as a supplement to the Bylaws of the Umatilla Basin Watershed Council, provides a reference to the policies and procedures adopted by the Council to guide operational affairs. This manual is intended to adapt through revision to reflect changes or clarifications in the policy

and/ or procedure. Subsequent adoptions, which occur as needed, shall replace old versions of this manual in entirety.

The Umatilla Basin Watershed Foundation, a 501 (c)(3) status non-profit organization, is the non-profit extension of the Umatilla Basin Watershed Council with the sole purpose of supporting Council work through fiscal sponsorship. Further clarification of the relationship between the Umatilla Basin Watershed Council and Umatilla Basin Watershed Foundation is defined in the Fiscal Sponsor Relationship and Fiscal Policy of the Umatilla Basin Watershed Council statement supplementing revised UBWC Bylaws.

Fiscal Management Policies and Procedures

General Fiscal Management Policies

Generally Approved Accounting Principles (GAAP): The Umatilla Basin Watershed Council and Foundation follow GAAP for non-profit organizations with the exceptiong of cash basis accountin principles (see Fiscal Management Policies and Procedures C.)

Federal Funding Standards: Pertaining to federal funding soures, UBWC incorporates Office of Management and Budget (OMB) Circular A-122.

Cash Basis of Accounting: Cash received by the Umatilla Basin Watershed Council or Foundation is recorded as income, while cash paid out for goods and services (including wages) is recorded as expenses. This practice suits the operation of UBWC, while not conforming with GAAP, such practice is currently utilized by similar organizations.

Deferred Revenue: In the event of advanced payment of restricted funds, UBWC may record this revenue as being deferred or temporarily restricted revenue prior to accumulated expenses including services.

Equipment and Property: Equipment and property of a value equal or greater than $1,000 is recorded and inventoried as an asset. The inventory shall track an item description (including serial number), date of acquisition, value or cost at acquisition, appraised or depreciated value on annual schedule, and location. Equipment with a useful life of one year or less, or a cost of $1,000 or less, shall be recorded as a supply or consumable expense.

"**The mission of Umatilla County is to serve the citizens of Umatilla County efficiently and effectively.**"

Oregon Watershed Enhancement Board (OWEB)
Organizational Capacity Assessment Tool

Introduction

The Oregon Watershed Enhancement Board is a state agency that provides grants to help Oregonians take care of local streams, rivers, wetlands and natural areas. Community members and landowners use scientific criteria to decide jointly what needs to be done to conserve and improve rivers and natural habitat in the places where they live. The agency is led by a 17-member citizen board drawn from the public at large, tribes, and federal and state natural resource agency boards and commissions.

Council Capacity grants help support the operating capacity of effective watershed councils. OWEB's merit review process encourages continuous improvement of watershed councils' organizational management, operating structure, and the planning and implementation of on-the-ground watershed, restoration and community engagement activities. The merit review process also ensures watershed councils are working toward strengthening their role in watersheds through activities focusing on organizational resilience, leadership, collaboration, and that the watershed council represents a balance of interested and affected persons within the watershed.

Purpose

All watershed councils that receive a Council Capacity grant are required to complete a biennial self-assessment in order to assess the organization and identify areas for improvement. This self-assessment tool was developed to help watershed councils identify strengths and challenges of their organizations, and establish capacity building goals. The assessment should be used as a learning tool for the organization. Self-assessment is critical to improvement and overall mission success. Beginning in 2017-2019 watershed councils will be required to submit the Summary Chart created at the end of the assessment. The individual answers will remain with the council. OWEB does not intend to use this tool as a formal evaluation of where individual councils land within each category. Instead, the agency encourages each council to take the evaluation process seriously, using this tool to set organizational capacity goals, and creating plans to achieve those goals over time. OWEB will use the summary information from all councils to help the agency identify common strengths and challenges across the state.

Instructions for Completing the Assessment: Please note that you will want to save a copy of this tool to your computer's desktop in order to be able to have that information available for future reference.

This workbook contains several worksheets -- one worksheet for each organizational capacity dimension and additional worksheets containing instructions. There is also a section to record general information about your organization and individuals completing the Assessment, a summary table, and a summary chart. The various worksheet tabs are located at the bottom of the screen; click on the tabs to view each worksheet.

You will be rating your organization on a variety of capacity elements:

1. Leadership: the capacity of organizational leaders to inspire, prioritize, make decisions, provide direction, and innovate.
2. Adaptive: the capacity of a nonprofit organization to monitor, assess, and respond to internal and external changes.
3. Management: the capacity of a nonprofit organization to ensure the effective and efficient use of organizational resources.
4. Operational:[3] the capacity of a nonprofit organization to implement key organizational and programmatic functions.

Who Should Complete the Assessment?

The assessment is intended for self-guided use by each watershed council. We recommend that your organization's executive director/coordinator and board chair be first to complete the assessment *individually*. Many organizations will find it useful to have other staff, board members, and/or constituents complete the assessment as well. Upon completing the assessment on an individual basis, participants should gather to discuss their ratings and reach consensus on one set of ratings that best represents the organization. Completing the assessment using a team approach improves validity and reduces individual biases. This process also serves as a catalyst for key stakeholders to engage in a rich dialogue about the organization.

Step 1: Rate Your Organization

For each capacity element (located on worksheets 1-4), identify the description that best describes your organization's status or level of performance. *You are likely to discover that, for some elements, your organization's capacity will not fully match any of the descriptions. In these instances, simply identify the description that is most suitable for your organization.* It is better to underestimate rather than overestimate your organization's capacity in a particular area. With an accurate portrait of the capacity of your organization, you will be better equipped to identify the most critical areas for improvement.

To input your selections, click on the yellow cell to the right of each capacity element. Then select the down arrow and choose from the list that appears. If a capacity element does not apply to your organization (e.g. some organizations do not have revenue generation activities or the intention to create them), select "N/A". BE SURE to provide a capacity rating (or select "N/A") for each capacity element. FAILING TO DO SO will adversely impact your summary scores. A section for comments about your ratings is included at the bottom of each capacity dimension worksheet. Use this section to include any clarifying information about the selections you made.

Step 2: Select Priority Capacity Elements

On the Summary Table worksheet, select the *four* capacity elements that your organization is most interested in strengthening over the next one to two years. Mark an "X" in the "priority" column next to the four capacity elements you chose as top priorities for your organization.

For Additional Information

If you have questions about any part of this assessment, please contact :

1. Leadership Capacity

Capacity Elements		Level 1	Level 2	Level 3	Level 4	Input capacity rating in this column
1.01	Mission	No written mission or limited expression of the organization's reason for existence (lacks clarity or specificity); either held by very few in organization or rarely referenced.	Some expression of organization's reason for existence that reflects its values and purpose, but may lack clarity; held by some within organization and occasionally referenced.	Clear expression of organization's reason for existence which reflects its values and purpose; held by many within organization and often referenced.	Clear expression of organization's reason for existence which describes an enduring reality that reflects its values and purpose; universally held within organization and frequently referenced.	Level Four
1.02	Strategic Plan	Strategic Plan is either non-existent, unclear, or incoherent (largely a set of scattered initiatives); Strategic Plan has no influence over day-to-day behavior.	Strategic Plan exists but is either not clearly linked to mission, vision, and overarching goals, or lacks coherence, or is not easily actionable; Strategic Plan is not broadly known and has limited influence over day-to-day behavior.	Strategic Plan has been developed and is linked to mission and vision but is not fully ready to be acted upon; strategy is mostly known, and day-to-day behavior is partly driven by it.	Clear, coherent Strategic Plan that is both actionable and linked to overall mission, vision, and overarching goals; strategy is universally known and consistently helps drive day-to-day behavior at all levels of the organization.	Level Four
1.03	Board Composition & Commitment	Membership with limited diversity in fields of practice and expertise; drawn from a narrow spectrum of constituencies relevant to the organization; little or no relevant experience; commitment to organization's success, vision, and mission is unclear; meetings are sporadic and/or attendance is sometimes poor	Some diversity in fields of practice and expertise; membership represents a few different constituencies relevant to organization; some evidence of commitment to organization's success, vision, and mission; regular meetings are well-planned and attendance is adequate; occasional subcommittee meetings	Good diversity in fields of practice and expertise; membership represents most constituencies relevant to the organization; solid evidence of commitment to organization's success, vision, and mission; regular, purposeful meetings are well-planned and attendance is consistently good; regular subcommittee meetings	Membership with broad variety in fields of practice and expertise, and drawn from the full spectrum of constituencies relevant to the organization; includes functional and issue area expertise; proven track record of learning about the organization and addressing its issues; consistently demonstrated commitment to the organization's success, mission, and vision; regular, purposeful meetings are well-planned and attendance is consistently strong; regular meetings of focused subcommittees	Level Three

1.04	Board Governance	Roles of board are unclear; board rarely scrutinizes budgets, holds ED/Coordinator and other board members accountable, or operates according to formal procedures.	Roles of board are clear; board functions according to by-laws, reviews budgets, and occasionally sets organizational direction and targets, but does not have a system to review ED/Coordinator or board performance, monitor potential conflicts of interest, scrutinize audits, or review IRS and state filings.	Roles of board are clear and function well; board reviews budgets, audits, IRS and state filings; size of board set for maximum effectiveness with formal recruiting process; board co-defines performance targets and actively encourages ED/ Coordinator and full board to meet targets; annual review of ED/ Coordinator's performance, but board not prepared to hire or fire ED/Coordinator.	Roles of board are clear and the board works well together; board fully understands and fulfills fiduciary duties; size of board set for maximum effectiveness with rigorous recruiting process; board actively defines performance targets and holds ED/Coordinator and full board fully accountable; board empowered and prepared to hire or fire ED/ Coordinator if necessary; board periodically evaluated.	Level Four
1.05	Board Involvement & Support	Provide little direction, support, and accountability to ED/ Coordinator; not fully informed about material and other major organizational matters; largely “feel-good” support.	Provide occasional direction, support, and accountability to ED/ Coordinator; generally informed about all material matters in a timely manner; input and responses often solicited.	Provide direction, support, and accountability to ED/ Coordinator; fully informed about all material matters; input and responses actively sought and valued; full participant in major decisions.	Provide strong direction, support, and accountability to ED/ Coordinator and engaged as a strategic resource; communication between board and ED/Coordinator reflects mutual respect, appreciation for roles and responsibilities, shared commitment, and valuing of collective wisdom.	Level Three
1.06	ED/ Coordinator Organizational Leadership / Effectiveness	Some difficulty building trust and rapport with others; shares little of own experiences as developmental/coaching tool; inconsistent attention to organizational vision.	Responsive to opportunities from others to work together; generally confident in others’ ability to be successful; shares own experience and expertise; visible commitment to organization and its vision.	Actively and easily builds rapport and trust with others; effectively encourages others to succeed; shares relevant experience and expertise, yet gives others freedom to work their own way, try out new ideas, and grow; shows constant commitment to organization and its vision; inspires others around vision.	Constantly establishing successful, win-win relationships with others, both within and outside the organization; delivers consistent, positive, and reinforcing messages to motivate people; finds or creates special opportunities to promote people’s development; lives the organization’s vision; compellingly articulates path to achieving vision that enables others to see where they are going.	Level Four
1.07	ED/ Coordinator Financial Judgment	Difficulty considering financial implications of decisions; limited understanding of basic financial concepts, unclear policies.	Draws appropriate conclusions after studying the facts; understands basic financial concepts; gives some consideration to financial impact of major decisions and able to explain financial information to the board.	Uses sound financial judgment; solid understanding of financial concepts; regularly considers financial impact of all decisions.	Exceptional financial judgment; deep understanding of complex financial concepts; has keen, almost innate sense for financial impact of all decisions.	Level Four

Comments:	Type comments here.

Please proceed to Worksheet 2.

2. Adaptive Capacity

	Capacity Elements	Level 1	Level 2	Level 3	Level 4	Input capacity rating in this column
2.01	Strategic Planning	Limited ability and tendency to develop strategic plan, either internally or via external assistance; if strategic plan exists, it is rarely or never referenced.	Some ability and tendency to develop high-level strategic plan either internally or via external assistance; strategic plan sometimes directs management decisions.	Ability and tendency to develop and refine concrete, realistic strategic plan; some internal expertise in strategic planning or access to relevant external assistance; strategic planning carried out on a near-regular basis; strategic plan used to guide management decisions.	Ability to develop and refine concrete, realistic, and detailed strategic plan; critical mass of internal expertise in strategic planning, or efficient use of external, sustainable, highly qualified resources; strategic planning exercise carried out regularly; strategic plan used extensively to guide management decisions.	Level Four
2.02	Organizational Evaluation / Performance Measurement	Very limited measurement and tracking of organizational performance and progress; all or most evaluation based on anecdotal evidence; no external performance comparisons made; organization collects some data on program activities and outputs (e.g., number of community events held, grants received), but has no measurement of outcomes (e.g., the number of trees that survive to free to grow).	Performance partially measured and progress partially tracked; some external performance comparisons made; organization regularly collects solid data on program activities and outputs, and has begun to measure outcomes.	Performance measured and progress tracked in multiple ways on a regular basis; effective internal and external benchmarking occurs but may be confined to select areas; multiple indicators used in evaluation, with primary focus on outcomes; some attention paid to cultural appropriateness of evaluation process/ methods; social impact measured, but longitudinal (long-term) or independent nature of evaluation is missing.	Comprehensive, integrated system (e.g., balanced scorecard) used for measuring organization's performance and progress on continual basis; internal and external benchmarking part of the organizational culture and used by staff in target-setting and daily operations; clear and meaningful outcomes-based performance indicators exist in all areas; careful attention paid to cultural appropriateness of evaluation process/ methods; measurement of social impact based on longitudinal studies with	Level Four
2.03	Program Relevance & Integration	Core programs and services vaguely defined and lack clear alignment with mission and overarching goals; programs seem scattered and largely unrelated to each other.	Most core programs and services well-defined and solidly linked with mission and overarching goals; program offerings may be somewhat scattered and not fully integrated into clear strategy.	Core programs and services well-defined and aligned with mission and overarching goals; program offerings fit together well as part of clear strategy.	All programs and services well-defined and fully aligned with mission, overarching goals, and constituency; program offerings are clearly linked to one another and to overall strategy; synergies across programs are captured.	Level Four

2.04	Assessment of External Environment & Community Needs	Planning not supported by systematically collected information about community needs or external opportunities and threats; organization has very few connections to community members and opinion leaders that can provide information about evolving community needs.	Information about community needs or external opportunities and threats used to inform planning, although collection is haphazard; organization has a few connections to community members and opinion leaders that can provide information about evolving community needs.	Information about community needs and external opportunities and threats used to inform planning; organization has many connections to community members and opinion leaders with whom they communicate about evolving community needs.	Clear, established systems regularly used to assess community needs and external opportunities and threats; information systematically collected and used to support and improve planning efforts; organization has numerous connections to community members and opinion leaders with whom they regularly communicate about evolving community needs.	Level Four
2.05	Partnerships & Alliances	No partnerships or alliances with other for-profit, nonprofit, public sector entities or state or federal agencies.	Early stages of building relationships and collaborating with other for-profit, nonprofit, public sector entities or state or federal agencies; if relations do exist, some may be precarious or not fully “win-win”.	Some key relationships with a few types of relevant entities have been built and leveraged; action around common goals is generally short term.	Strong, high-impact, relationships with variety of relevant entities have been built, leveraged, and maintained; relationships anchored in stable, long-term, mutually beneficial collaboration.	Level Three
2.06	Community Presence & Standing	Community presence either not recognized or organization is generally not regarded as a player in the community; few members of the community (e.g., other nonprofit leaders, government representatives, and academics) engage with organization; community leaders rarely call on organization for its input on issues important to organization.	Community presence somewhat recognized, and organization is generally regarded as a player in the community; some members of the community actively engage with organization; community leaders occasionally call on organization for its input on issues important to organization.	Known within the community beyond just constituents/members; perceived as open and responsive to community needs; members of larger community (including some highly respected members) actively engage with organization; community leaders often call on organization for its input on issues important to organization.	Widely known within the community, and perceived as actively engaged with and extremely responsive to it; many members of the larger community (including many highly respected members) actively engage with organization; community leaders always call on organization for its input on issues important to organization.	Level Three

2.07	Community Involvement	Community involvement is limited.	Community offered a range of roles in the organization; volunteer positions of leadership open to constituents, but rarely filled by them; constituent work mostly task-oriented; constituents trained or supported in their work on an ad hoc basis.	One or two systems in place to actively recruit and involve community; constituents take on a variety of roles in organization, including volunteer positions of leadership; training provided to constituents in some of the skill areas needed to affect change.	Variety of systems in place to actively recruit and involve community's; community members take on a wide variety of roles in organization, including volunteer positions of leadership; training is provided to community in all of the skill areas needed to affect change.	Level Three

Please proceed to Worksheet 3.

3. Management Capacity

	Capacity Elements	Level 1	Level 2	Level 3	Level 4	Input capacity rating in this column
3.01	Staff	Interest and abilities limited to present job; little ability to solve problems as they arise.	Good capabilities, including some ability to solve problems as they arise; many are interested in work beyond their current jobs and in the success of organization's mission.	Bring a broad range of skills; most are highly capable and committed to mission and strategy; eager to learn and develop, and assume increased responsibility.	Bring broad range of skills; most are highly capable in multiple roles and committed to both mission, strategy, and continuous learning; eager and able to take on special projects and collaborate; frequent source of ideas and momentum for improvement and innovation.	Level Four
3.02	Dependence of organizations' leaders & Staff on ED/ Coordinator	Very strong dependence on ED/Coordinator; organization would cease to exist without his/her presence.	High dependence on ED/ Coordinator; organization would continue to exist without his/her presence, but likely in a very different form.	Limited dependence on ED/Coordinator; organization would continue in similar way without his/her presence but areas such as fundraising or operations would likely suffer during transition period.	Reliance but not dependence on ED/ Coordinator; smooth transition to new leader could be expected; fundraising and operations likely to continue without major interruption.	Level Four
3.03	Funding Model	Strong dependence on a few funders, largely of same type (e.g., government, foundations, corporations, or individuals).	Multiple types of funding sources with only a few funders in each type, or many funders within only one or two types of funders.	Solid base of funders from many types of funding sources; some ability to guard against market instabilities (e.g., operating reserves, small endowment) and/or has developed some sustainable revenue-generating activity.	Highly diversified funding streams; organization insulated from potential market instabilities (e.g., fully developed endowment) and/or has developed sustainable revenue-generating activities; other nonprofits try to imitate organization's fundraising activities and strategies.	Level Three

3.04	Financial Planning / Budgeting	No or very limited financial planning; general budget developed; performance-to-budget loosely or not monitored.	Limited financial plans, updated on an ad hoc basis; budget utilized as operational tool; used to guide/assess financial activities; some attempt to isolate divisional (program or geographical) budgets within central budget; performance-to-budget monitored periodically.	Solid financial plans, updated regularly; budget integrated into most operations; reflects organizational needs; solid effort made to isolate divisional (program or geographical) budgets within central budget; performance-to-budget monitored regularly.	Very solid financial plans, continuously updated; budget integrated into all operations; used as strategic tool; budget developed from process that incorporates and reflects organizational needs and objectives; well-understood divisional (program or geographical) budgets within overall central budget; performance-to-budget closely and regularly monitored.	Level Four
3.05	Financial Operations Management	Gifts and grants deposited; bills paid, though sometimes late; supporting documents sometimes misplaced.	Financial activities consistently documented and reported; appropriate checks and balances exist; activities tracked to budget.	Established internal controls govern all financial operations; activities fully tracked, supported, and reported; some attention paid to cash flow management.	Robust systems and controls govern all financial operations and their integration with budgeting, decision making, and organizational goals; cash flow actively managed.	Level Three
3.06	Standard Operating Procedures (SOPs)	No formal SOPs to capture and document internal knowledge.	SOPs exist in a few areas but are either not user-friendly or not comprehensive enough to have an impact; SOPS known by only a few people, or only occasionally used and rarely updated.	Well-designed, user-friendly SOPs in some areas; not fully comprehensive; SOPs are known by many people within organization and often used and occasionally updated.	Well-designed, user-friendly, comprehensive SOPs to capture, document, and disseminate knowledge internally in all relevant areas; all staff are aware of SOPs and trained in their use; SOPs used and updated frequently.	Level Four
3.07	Volunteer Management	No active recruitment of volunteers (only passive recruitment such as people who walk in the door); no defined roles for volunteers to fill; few systems in place to train and support volunteers.	Some active recruitment of volunteers; volunteer roles involve a range of time commitments and skill levels; volunteer work is mostly task-oriented; basic training to volunteers provided, generally on an ad hoc basis.	Active recruitment of volunteers on a regular basis; wide range of volunteer roles available; written job descriptions for most common volunteer positions; some systems exist to track and manage volunteers; volunteer orientations and trainings take place periodically, with attention paid to both skills and cultural competency; staff trained on how to manage volunteers.	Volunteer recruitment systems successfully fill organizational needs with appropriate volunteers; wide range of volunteer roles available, including positions of leadership; written job descriptions for all volunteer positions; robust volunteer management systems in place; volunteer orientations and trainings take place on a regular basis, with attention paid to both skills and cultural competency; staff experienced and/or extensively trained in volunteer management.	Level Four
Comments:	Type comments here.					

Please proceed to Worksheet 4.

4. Operational Capacity

Capacity Elements		Level 1	Level 2	Level 3	Level 4	Input capacity rating in this column
4.01	Staffing Levels	Some positions within organization (staff and board) are unfilled, inadequately filled, or experience high turnover and/or poor attendance.	Critical positions within the organization are filled, though some inappropriately; attendance problems are limited; high turnover is sometimes a challenge.	Critical positions within the organization are adequately and appropriately filled; attendance problems are rare; turnover is limited.	All positions within and the organization are adequately and appropriately filled; attendance problems are extremely rare; turnover is limited; vacancies filled immediately.	3
4.02	Skills, Abilities, & Commitment of Volunteers	Volunteers not working up to their potential or ill-equipped for work with organization; may be unreliable or have low commitment.	Many volunteers working up to their potential; mostly reliable, loyal, and committed to organization's success.	Capable set of individuals that bring required skills to organization; reliable, loyal, and generally committed to organization's success and to "making things happen"; work easily with most staff, but do not generally play core roles without staff supervision.	Extremely capable set of individuals that bring complementary skills to organization; reliable, loyal, highly committed to organization's success and to "making things happen"; often go beyond call of duty; able to work easily with wide range of staff and play core roles without special supervision.	Level Four
4.03	Board Involvement & Participation in Fundraising	Generally weak fundraising; most board members do not recognize fundraising as one of the board's roles and responsibilities; no goals or plans for board-driven fundraising activities exist; members do not generally make financial contributions to organization.	Main fundraising needs covered; board members accept that the board has some fundraising responsibilities, but some concerns exist regarding ability of board to be successful in this area; board fundraising activities are limited; some members make a personally significant annual financial contribution to organization based on their individual means.	Fundraising needs meet; many board members embrace fundraising as one of the board's core roles and responsibilities, and participate with fundraising endeavors; realistic and appropriate board fundraising goals and plans exist; fundraising activities are underway; most members make a personally significant annual financial contribution to organization based on their individual means.	Well developed staff and board fundraising plan, all needs met; all board members embrace fundraising as one of the board's core roles and responsibilities; realistic and appropriate board fundraising goals and plans in place; board actively fundraises and has achieved measurable progress towards goals; all members make a personally significant annual financial contribution to organization based on their individual means, and some contribute more	Level Three

4.04	Communications & Outreach	No marketing materials, or outdated materials; strictly internally-focused and little to no outreach to stakeholders; any materials that exist are unprofessional in presentation.	Loose collection of materials used for marketing; generic documents and not always updated to reflect current programs, activities, and outcomes; materials have a minimal degree of professionalism or consistent look and feel; a few key materials are provided in multiple languages as needed.	Packet of marketing materials used on a consistent basis; information contained in the materials is up to date and reflects current programs, activities, and outcomes; materials reasonably professional in presentation and aligned with established standards for font, color, logo placement, etc.; most materials are provided in multiple languages as needed.	Packet of marketing materials used consistently and easily updated on a regular basis; materials extremely professional in appearance and appeal to a variety of stakeholders; all materials consistently adhere to established standards for font, color, logo placement, etc.; all materials are provided in multiple languages as needed.	Level Three
4.05	Website	No individual website.	Basic website containing general information, but little information on current developments; site maintenance is a burden and performed only occasionally.	Comprehensive website containing basic information on organization as well as up-to-date latest developments; most information is organization-specific; easy to maintain and regularly maintained.	Sophisticated, comprehensive, and interactive website, regularly maintained and kept up to date on latest area and organization developments; praised for its user-friendliness and depth of information; includes links to related organizations and useful resources on topic addressed by organization.	Level Two
4.06	Databases / Management Reporting Systems	No systems for tracking clients, staff volunteers, program outcomes and financial information.	Electronic databases and management reporting systems exist in only few areas; systems perform only basic features, are awkward to use, or are used only occasionally by staff.	Electronic database and management reporting systems exist in most areas for tracking clients, staff, volunteers, program outcomes, and financial information; commonly used and help increase information sharing and efficiency.	Sophisticated, comprehensive electronic database and management reporting systems exist for tracking clients, staff, volunteers, program outcomes, and financial information; widely used and essential in increasing information sharing and efficiency.	Level Three
4.07	Buildings & Office Space	Inadequate physical infrastructure, resulting in loss of effectiveness and efficiency (e.g., unfavorable locations for clients and employees, no possibility of confidential discussions, insufficient workspace for individuals, no space for teamwork).	Physical infrastructure can be made to work well enough to suit organization's most important and immediate needs; a number of improvements could increase effectiveness and efficiency.	Fully adequate physical infrastructure for the current needs of the organization; infrastructure does not impede effectiveness and efficiency.	Physical infrastructure well-tailored to organization's current and anticipated future needs; well-designed to enhance organization's effectiveness and efficiency; favorable locations for clients and employees; plentiful space encourages teamwork; layout increases critical interactions among staff.	Level Four

4.08	Management of Legal & Liability Matters	Legal issues not anticipated; issues addressed individually when they arise; insurance coverage not regularly reviewed.	Legal support resources identified, readily available, and employed on "as needed" basis; major liability exposures managed and insured.	Legal support regularly available and consulted in planning; occasional review of insurance.	Well-developed, effective, and efficient internal legal infrastructure for day-to-day legal work; additional access to general and specialized external expertise to cover peaks and extraordinary cases; regular evaluation of insurance.	Level Four
Comments:	Need to continue improvement of website

Match Funding Form

Document the match funding shown on the budget page of your grant applica7on.

OWEB accepts all non-OWEB funds as match. An applicant may NOT use another OWEB grant to match an OWEB grant; this includes ODA Weed Board projects because they are funded through OWEB grants. However, an applicant who benefits from a pass-through OWEB agreement with another state agency, by receiving either staff exper7se or a grant from that state agency, may use those benefits as match for an OWEB grant. (Example: A grantee **MAY** use as match the effort provided by ODFW restora7on biologists because OWEB funding for those posi7ons is the result of a pass-through agreement).

At the 7me of applica7on, match funding for OWEB funds requested does not have to be secured, but you must show that **at least 25% of match funding has been sought**. On this form, you do not necessarily need to show authorized signatures ("secured match"), but the more match that is secured, the stronger the applica7on. Iden7fy the type of match (cash or in-kind), the status of the match (secured or pending), and either a dollar amount or a dollar value (based on local market rates) of the in-kind contribu7on.

If you have ques7ons about whether your proposed match is eligible or not, see Allowable Match document in OGMS hVps://apps.wrd.state.or.us/apps/oweb/fiscal/nologin.aspx under Technical Assistance applica7on or contact your local OWEB regional program representa7ve (contact informa7on available in the instruc7ons to this applica7on).

Project Name: 2023-2025 Council Capacity

Applicant: Uma7lla Basin Watershed Founda7on

Match Funding Source	Type	Status*	Dollar Value	Match Funding Source Signature/Date*
Uma7lla Basin Watershed Founda7on	Cash	Secured	$435.00	Doug Bennett - President
Uma7lla County	Cash	Secured	$20,000.00	
Uma7lla Basin Watershed Founda7on	In-Kind	Secured	$2,560.00	Doug Bennett - President
Confederated Tribes of the Uma7lla Indian Reserva7on	Cash	Pending	$5,000.00	
Stewards of the Uma7lla River	In-Kind	Pending	$25,000.00	

*** IMPORTANT:** If you selected "secured" in the Status column for any match funding source, you must provide either the signature of an authorized representa7ve of the match source in the Match Funding Source Signature/Date column, or aVach a leVer of support from the match funding source that specifically men7ons the dollar amount you show in the Dollar Value column.

UMATILLA BASIN WATERSHED COUNCIL ("UBWC")
BOARD MEETING MINUTES
2nd and 3rd Quarter 2022

CALL TO ORDER
Doug Bennett called the meeting of the UBWC Board meeting to order at 6:00 p.m. on 2nd & 3rd Quarter 2022.

Held by Zoom video conference & in-person at 27 SE 3rd Street, Pendleton, Oregon

Present:
Doug Bennett, President
Lowell Saylor, Vice President
Sarah Anderson, Secretary-Treasurer

Regrets:
Carlisle Harrison
Ken Thompson

Staff:
Michael Ward, Executive Director

Guests:
None

Quorum present: Yes

2.0 PROJECT UPDATES

West Birch Creek
It was reported that the West Birch Creek project has been going smoothly and that the necessary funding has been secured. Michael Ward recommended that the Board review the Comment Tracking form as it is a good resource for information on fishery science and how projects are conducted.

Regarding the updating of landowner agreements, Michael advised that the original landowner agreement was developed for the design of the West Birch Creek project and that with agreement from the landowners, he has been working on new landowner agreements for the restoration of the West Birch Creek project. Going forward, he noted that future landowner agreements will include everything for the design and the restoration work and with all parties, such as the county, Niva Hascal, and her cousin Carrie.

Michael reminded the Board that Permit Package/joint permit application was distributed to the Board and encouraged the Board to read through the package to learn more about the project.

Michael responded to questions from the Board regarding timing and providing progress photos.

2.0 OLD BUSINESS

Motion 1: Doug Bennett made a motion to elect Lowell Saylor as Vice President of the Umatilla Basin Watershed Foundation and to serve as co-chairman of the Board of the Umatilla Basin Watershed Council. Sarah Anderson seconded the motion. Motion carried unanimously, pending a vote from Carlisle Harrison.

The Board confirmed that:

- Doug Bennett is the current President of the Umatilla Basin Watershed Foundation and co-chairman of the Board of the Umatilla Basin Watershed Council; and
- Sarah Anderson is the Secretary-Treasurer of the Umatilla Basin Watershed Foundation and the Board of the Umatilla Basin Watershed Council.

It was further confirmed that the President, Vice President and Secretary-Treasurer are the three signing authorities for the organization's banking.

3.0 CURRENT BUSINESS/GRANTS

3rd Quarter OWEB Funding Request – Council Capacity 21-23

Michael provided an update on the submission of the quarterly OWEB funding requests, noting that the paperwork will be circulated to the Board for review and approval prior to submitting at the end of this month.

NOAA & ODFW Summer Grant Cycles

Michael reported that there were no submissions to the NOAA and ODFW Summer Grants as there were two NOAA grants specific to fish passage: a tribal specific and a non-tribal specific. He highlighted that upon review, the tribes would have a higher chance of success with the tribal specific grant, and as a result, UBWC's project load, letters of support and budget request were included in their grant submission.

Fall Grant Cycle Submission

Michael provided an overview of S. Patawa 1 and 2 designs, noting that two design are being bundled into one submission and that there are funds set aside by the tribes for this, but there could be additional funds if the tribes receive the NOAA grant.

Michael reported that he will be making a submission to the Stakeholder Engagement Grant as the criteria changed over the last three years and applications tend to be low. If successful, the grant would fund discussions with SWCD and Morrow County about UBWC involvement. Further information to be provided by email for the Board's review.

Regarding new grants and programs, Michael mentioned that water land acquisition programs will be brought forward for discussion at a future meeting.

4.0 NEW BUSINESS

UBWC, Parks & Rec, & East Oregonian hosting SOLVE (Tuesday the Aug 30th) in Pendleton

It was reported that the new partnership with Amazon on the cleanup has been a success and that they are interested in funding other projects, such as planting and weeding for the West Birch project and others. Michael reported that corporate sponsorships for the cleanup projects has been working well and that he will be looking for other corporate sponsorship opportunities in the future.

5.0 ANNOUNCEMENT

OCEANS Connect 2022 – Seaside Oregon on Sep 6-8
Michael provided an update on his attendance at the OCEANS Connect 2022 conference, noting that he connected with individuals from Morrow County and University of Oregon and that he was asked to serve on the state board again to focus on onboarding watershed council staff and board members across the state.

Rattlesnake or Bull Snake?
Michael reported that a snake was found in the office. It was confirmed to be a bull snake.

Wage/Salary Increase
The President advised that the Board discussed Michael's wage request. Michael provided an overview of his rationale for requesting a wage increase after close to six years at UBWC. He explained that his proposal considered the budget, cost-of-living changes since joining, current market comparable wages across the state, lack of backpay or retirement contributions, and the importance of creating a position that is competitive and attractive. As one Board member, Carlisle Harrison, was absent at the meeting, the Board agreed to make a decision by email so that Carlisle may have an opportunity to ask questions and vote on the matter.

Michael also provided an overview of his long-term vision on what staffing and Board composition could look like in order to best position the UBWC for success.

In terms of Board recruitment, he advised that a schedule of UBWC's quarterly meetings and cleanups should be set for the coming year so that it can be advertised on social media. The Board discussed its plans in the next year, including increasing the size of the Board to at least six or eight members by utilizing social media to attract Board members, having a presence at farmer's markets, writing editorials for the newspapers, etc.

1.0 TREASURER'S REPORT
Sarah Anderson provided a brief overview of the Treasurer's Report, which was circulated by email. There were no concerns raised by the Board.

6.0 PUBLIC FORUM
There were no public comments.

7.0 4TH QUARTER WILL BE HELD ON OCTOBER TBD
Michael advised that a meeting calendar from December 2022 to December 2023 will be circulated by email to the Board for their review and agreement.

ADJOURNMENT
The UBWC Board meeting was adjourned at **7:18 p.m. on 2nd & 3rd Quarter 2022.**

_____
Board Chair

(Date of approval)

Prepared by: Michael Ward

Action Items:

- Michael Ward to obtain vote from Carlisle Harrison on the motion to elect Lowell Saylor as Vice President of the Umatilla Basin Watershed Foundation and to serve as co-chairman of the Board of the Umatilla Basin Watershed Council.
- Michael to circulate the 3rd Quarter & Final OWEB Funding Request to the Board for review and approval by the end of September 2022.
- Michael to send information about the Stakeholder Engagement Grant submission to the Board for review.
- Michael to add an agenda item for water land acquisition programs at a future meeting.
- Sarah Anderson to draft an email to the Board to electronically vote on Michael Ward's wage increase.

October 2019 Board Meeting Minutes

Athena City Hall, Athena, OR
October 28, 2019

UBWC Board Members Present: Carlisle Harrison, Lowell Saylor, Doug Bennett (chair), Sarah Anderson, and Dick Nichols

UBWC Board Members Absent: JD Tovey, Terry Warhol, Ken Thompson, Kaisa Phillips-Hill

UBWC Staff Present: Michael Ward (Executive Director)

Others Present: Tonya Dombrowski

6:07 PM – Meeting Called to Order – Doug Bennett (chair)

Michael Ward (Executive Director) cleared the agenda immediately after the meeting was called to order. Michael tabled all agenda items until the next Board meeting.

Michael Ward opened discussion by asking the Board Members why the Board Members were in the room. He asked what was the reason for the Watershed Council. Michael quoted the OWEB webpage section on Council Capacity Grants:

"These grants help support the operations of councils that engage people and communities in their watershed to participate in collaborative, voluntary restoration and protection of native fish or wildlife habitat and natural watershed functions to improve water quality or stream flows."

Michael informed the Board that OWEB provides no base funding for outreach activities outside of what is submitted in our statement of work. He stated that outreach funding is very difficult to find. Michael indicated that the role of watershed councils has changed over the past few years and is now project-based. The outreach work that UBWC participated in historically (like Watershed Field Days) is now being done by the SWCD and the outreach coordinator at Walla Walla Basin Watershed Council under a contractual agreement that includes the Salmon in Schools program for Umatilla Basin schools.

Dick Nichols asked about the OWEB Council Capacity Grant funding for UBWC. Michael Ward reported that UBWC received $122,200 from OWEB which covers two years.

Michael Ward indicated that the article in the paper about the Athena Bridge project was excellent outreach and that the Council has transitioned to using electronic media like Facebook for outreach.

Michael provided a brief overview of all of the documents that provide direction and contain requirements for Council operation and actions. Michael discussed the Oregon Plan for Salmon and Watersheds, the Umatilla River TMDL, the Mid-Columbia Steelhead Recovery Plan and others. He stated that each of these plans contain specific actions that are required of the Council and that his actions as Executive Director have been specific to these requirements.

Michael identified the difference in requirements stated in these plans for the SWCD and the Watershed Council. He presented a listing of the different funders which support the work of the Council including OWEB, ODFW, DEQ (SEP program), Economic Development grants, Wildhorse Foundation, BPA funding (goes through CTUIR because UBWC has elected not to take BPA funding) and other funders. Michael described a Walmart grant for $1000 that was awarded to UBWC for the 97 hours of service rendered at the Umatilla River Clean-up.

Michael stated that all of these programs require dedication and accountability on the part of the Watershed Council and that he has been working to provide that accountability. He told the Board Members that it is a very large responsibility to maintain the Council image and improve Council visibility.

Michael further stated that each biennium 2 or 3 watershed councils in Oregon are dropped from OWEB funding and another 2 or 3 have their funding reduced because they are not getting funded grants. Michael stated that because of the pressure to get funded projects, and the wide scope and nature of the job of Executive Director, he puts in a lot of extra hours and overtime in order for the Council to be successful. He indicated that he has been unable to spend the time he needed for the birth of his newest child because he has been working on Council business, writing grant applications and that he was missing an important family event in order to attend the Board meeting tonight. He identified the requirements for six weeks of paid leave called for under HB 2005 and stated that a similar time of family leave should be extended to him as Executive Director of the UBWC. He stated that he was upset over the discussion of unpaid family leave as identified in the Employee Policy Manual for UBWC.

Sarah Anderson stated that the Board was sympathetic to Michael's need for family leave with the birth of his child but that the Board had not had the opportunity to formally discuss family leave (paid or unpaid) and how to address the question of paid or unpaid leave relative to the fact that Michael has worked so much overtime. She stated that there is a formal process for this type of discussion and decision making.

Michael stated that he has not taken a sick day or any leave days this year (2019). He further stated that he has not had a raise in 30 months and has been using his own vehicle for Council business which has put 17,000 miles on his personal vehicles since he was hired.

Michael Ward asked the Board directly for a 15% raise, six weeks of paid paternity leave and a vehicle stipend as identified in the OWEB Council Capacity Grant (currently $4,000 every 2 years).

Doug Bennet asked if Michael has been charging mileage to the UBWC and Michael responded that he has not unless there is a grant that specifically has mileage or gasoline as a project line item. Sarah Anderson suggested that he should use the federally approved mileage rate for mileage accrued when he used his personal vehicle on Council business. Michael declined this suggestion and stated that he "has never used a dollar of the money in the Council budget" because he wanted to keep that money for the Council.

Doug Bennet stated that it was a problem that he was unaware of the hours Michael was working and his vehicle expenses. He said that he and the Board needed to know what Michael was doing but the information was not reaching them. If they had known, the situation would not have gotten this far out of hand. Other Board Members agreed that they had not known that Michael was working such long

hours under difficult conditions and missing family time. Doug stated that Michael needed to provide more direct information to the Board on what he is doing.

Michael Ward stated that it would be helpful for Board Members to attend some of the other meetings that he has to attend. The Council serves 10 towns in the Basin and they are not all being served equally. He stated that the Council has commitments in the TMDL and the Salmon and Watersheds plans that we are not fulfilling. The only commitment of this kind that the Council has fulfilled has been the annual water quality report. Board Members could help the Council in fulfilling these commitments.

Dick Nichols asked Michael for some information on how the six-week paternity leave would work so that the Board would know how basic UBWC functions (like mail pickup and bill pay would be handled. Michael Ward responded that he would need 2 weeks to get ready to take the leave because he had to arrange site visits for all of the OWEB grant applications he had just submitted and take care of some other operational details. He would then plan to be on leave for the remainder of 2019 but would continue to check emails and to answer the phone for Council business. Michael reminded the Board that the hours posted for UBWC on social media are 7 days a week, 8AM to 6PM. Sarah Anderson asked if anyone needed to check on the office while Michael was out on leave. Michael responded that there were no other tenants in the building and that the building manager could watch the office. Dick asked about access to project files if a question came up while Michael was on leave. Michael responded that there is a hard copy of everything in the office and he has an electronic copy available through his phone if anything came up. The Board discussed different options for paternity leave. Board Members were supportive of approving paternity leave but there were questions on whether the leave should be specifically recorded (for example: approve paternity leave from 11-15-2019 to 12-31-2019, where the start and end date of the leave were clearly defined) or if the leave should be more informal (for example: approve six weeks of paternity leave to be completed no later than 01-15-2021, where Michael could keep track of his leave as it was taken and have a more flexible schedule). Sarah stated that the Employee Policy Manual for UBWC is older and needs to be reviewed. Changes need to be voted on by the Board.

Dick Nichols asked Michael for some additional detail on the vehicle stipend he had requested. Michael stated that the OWEB Council Capacity Grant allowed (currently) for $4,000 ($2,000/year) for a vehicle stipend.

Dick Nichols asked Michael what was the basis of the 15% raise he had requested. Michael responded that it was based on 5% per year backtracked for the 30 months where Michael had not received a raise, on competitive wages from other similar positions and on the fact that he receives no benefits. Dick asked what amount a 15% raise would equate to. Michael responded that it would be equal to a final salary of $60,000 per year. Sarah Anderson asked when the raise would be effective.

Sarah Anderson moved that the Board approve six weeks of paid paternity leave from mid-November to the end of 2019, and a 15% raise effective November 1, 2019 and a vehicle stipend to be paid every two years, amount contingent on the OWEB Council Capacity Grant (currently $4,000/biennium). Carlisle Harrison seconded the motion. The motion passed with no dissenting votes.

The Board discussed that the Council bylaws will need to be reviewed and may need to be updated.

Treasurer's Report (Sarah Anderson)

Financial reports and associated information were emailed to all Board Members prior to the meeting. Sarah stated that since the reports were mailed out, an additional $78,000 has been deposited to the Council's account (from OWEB project reimbursements and the SEP funds) so the total balance is now $111,000. Sarah reported that she has been working on the SAMS registration (System for Award Management) which is required for award funding. She indicated that the registration process is very cumbersome but that it is almost complete. She also informed the Board that the accounting firm contracted by UBWC has finished with the taxes and they are ready for signing (there was an extension for 2019). Insurance payments have been added to the debit account so the total amount in that account has been increased by about $1,500 to cover these additional charges.

Dick Nichols asked for some additional detail on the budgets that had been emailed. He asked about the "other expenses" for $1591 and the "miscellaneous expenses" for $2300. He was not sure what charges these categories represent. Sarah said she would send some additional detail by email. Dick also asked about the $5891 rent payment, what time period this represented. Sarah said she would send some information on the rent payment as well.

Sarah Anderson suggested that the Board should have a discussion about project contracts and liabilities at the next meeting.

Doug Bennett asked about the timing of the next meeting, when it was scheduled and Michael Ward suggested that the next meeting should be held the fourth week of January 2020.

Sarah Anderson suggested that it may be appropriate to have a Board meeting to discuss policy and potential changes. She indicated that this meeting would not require Michael to attend as he may be on paternity leave. Michael Ward stated that new policy discussions could wait until next year.

Partner Report

There were no partners attending.

6:01 PM – Meeting Called to Order – Doug Bennett (chair)

Approval of October 2019 Meeting Minutes
Meeting minutes will be approved by email, since they require edits and review by the group.

Treasurer's Report (Sarah Anderson)

Current funds are: $80,378,32 ($2,377.38 available in account for credit card for cloud payments; $78,000.94 in separate, main account). Sarah transferred $3,000 to debit account on 1/6 to replenish funds (do this once or twice a year). Our SAM's registration was active as of Nov. 6.

Michael requested that Sarah rerun and reshare the financial reports for November, December, & January, since he will be updating financials from when Lorie stopped working for the Watershed Council in late summer.

Sarah asked what level of use the Watershed Council should make of LegalZoom. This was originally leveraged by Michael for its templates, but the group discussed that the possibility of using higher levels of these services (including DUNS, SAMS annual updates, annual state and federal non-profit and charitable donations reporting) could be a beneficial, efficient use of funds and volunteer time and could improve long-term communication within the council. RBH group costs currently include our QuickBooks software. We spend ~$2500 on administrative work. There may also be other perks with LegalZoom to make sure we have all our paperwork in order as a non-profit. The Board approved trying the services for one year at that level, to then be reassessed.

Regarding Sarah's question on a central location for important documents, Michael noted that he will be making sure the updated website has important reference documents there. The Board discussed the potential for using the Council's website to host key Council documents behind an internal Board member log-in, in addition to the planned scanned documents to be hosted on the site.

Old Business

The Athena bridge railings have been installed. The group is glad to see this project completed.

Doug asked if there was any feedback on the Athena project. Michael replied that he had heard from Graham Banks, the Walla Walla full time outreach personnel that we partnered with for Salmon in the Classroom. He had gone out there, and the kids were asking about it. Graham may be trying to coordinate a field trip to the site, where Michael could talk about the project.

Generally, Michael noted the positive experiences of working with Rod Anderson and TetraTech on the Athena project.

Current Business/Open Grants

UBWC Meeting Schedule

Michael brought up the UBWC meeting schedule, wondering if there are ways to improve it, to better match the schedule of Council activities. He wondered what the schedule prioritized when it was originally created and brought up the challenges we have with Mondays (often holidays), as well as how we start up meetings again in September when things are busy with the October grant submission schedule. Then we often do not have much to discuss in November. He also asked about how the OWEB submission deadlines match up with our schedule. He asked if the 2nd or 3rd week might be better, or a different day.

The group generally voiced support for reviewing the schedule and agreed that while Mondays still seem to work the best for them, a different week in the month could work better. Normally we have 7 meetings. Michael raised the idea of moving November to August, to accommodate grants, taking one other meeting and make it the Annual River Clean Up, and doing another meeting that's more of an annual round-up/recap. He would like to also update the venue to a more welcoming, relaxed atmosphere, like the Prodigal Son in Pendleton and somewhere similar in Hermiston. The group voiced general support for these ideas.

Michael will send out the updated schedule by email for a vote. Once an updated schedule for the year is approved, he will take it the rest of the way to update it in all the official and public documents/announcements.

UBWC Office Location

Currently, UBWC pays approximately $660/month rent, ~$900/month with utilities. Michael would like to review location options (similar to the meeting schedule – to see if the current approach still is the best fit for UBWC's needs). Downtown has become more affordable, so Michael raised the question of whether it be a better location. While the current workspace is nice (room, parking, etc.), a different location may be able to support more community involvement/drop-in activity. Folks don't generally come by the UBWC office looking to do projects. In addition, there are some safety concerns with the current location along the railroad. However, moving to a new location wouldn't necessarily guarantee it doesn't have similar issues. Perhaps a downtown location might increase foot traffic but also increase distractions. In general, Michael would like to ask what our office space wants to achieve.

Terry asked about possibility of sharing a site. Michael replied that some shared spaces are going for $500 for just a room, while our current office has 4 rooms for not much more than that. He suggested we think outside the box in terms of office space. Would there even be the potential for a business that helps fund the organization? Doug commented appreciation for Michael is thinking outside the box.

The group agreed to keep thinking of ideas and to discuss more in the future. UBWC would still require some storage areas, as well as work areas in an office solution. Michael just trying to figure out how to better serve the community.

Stanley Creek & Hascall Dam Project

The grant application was ranked 2 out of 5 and is now out of Region 6 review hands. They recommended to fund the full $40K (Michael already secured the other $60K). The OWEB final decision is in April (at the OWEB Board State meeting). In total, all applications came to ~$1.7 million, with only a million in the pool. Being number 2 is a good spot to be in. Our application is for addressing two barriers in one project, both of which are statewide priorities. Looking ahead, Michael hopes to be able to achieve a 60% design by summer then do an RFP. There's the potential for the project to take place in 2021. If that happens, we'll have been involved with removing 5 dams in 4 years. Our next step is to wait for the April final decision. Michael noted that any design will also need to include the appropriate permits. If a 60% design is achieved by August, then we would be in a good place to apply for restoration funds in October.

New Business

UBWC Programs (Past & Present)

Michael brought up the importance of revisiting what the council is aiming for, in terms of future projects. We're currently focusing on restoration projects, cleanup and some small grants, whereas in the past there was more on monitoring and the Watershed Field Days. Outreach funding has become limited. Monitoring has been heavily scrutinized, since there's the question of what is then done with all the data collected. Funding programs available currently are different than they were.

Doug noted the outdoor camp through Hermiston. The group brought up some school programs as well, wondering if some of UBWC's former activities are covered by other entities/programs and whether we should focus on areas where we are uniquely poised to address issues. This will also be a topic of continued discussion for the Council.

Announcement

April 18th, 2020 will be the Umatilla River Cleanup. It was rescheduled to be closer to Earth Day. We could have this be one of our meetings, either meeting before or after. We could float through, check in on people, be out and about, cleaning with different groups at different times.

Other Discussion

Several Board members attended the EC3 Climate Change Forum. It's a non-profit formed about three years ago that is getting more active. The Blue Mountain climate change report came out 3 years ago. This group formed itself to coincide with that.

Public Forum

No public comment was presented.

Next Meeting: TBD – Meeting dates and locations for the next year will be approved by email.

Meeting Adjourned at 8:01 PM by Doug Bennett

January Board Meeting - UBWC
Agenda updates:

Small Grants:
Current Window January 21-Feb 1st

List all pending large grants:

U.S Fish & Wildlife:
Umatilla Assessment
OWEB:
Umatilla Assessment (TA Grant) "Do not Fund"
Note* We should have applied for a stakeholder engagement grant and left the assessment cost to other funding sources and the tribes.
Wildhorse Creek Fish Passage (Restoration Grant) "Fund"
Reith Dam Removal Design (TA Grant) "Fund"
ODFW R&E Grant:
Umatilla Assessment
Reith Dam Removal
Northwest Ecological Research Institute (NERI)
Umatilla Main-stem Assessment

Upcoming Grant Possibilites:

OWEB:
2019-2021 Council Capacity (March 2019 due date)
May Grants Possibilities:
OXBOW (TA Grant) for Long Term Conservation Plan; upland, aquatic, and invasive species assessment.
Whitney Easement (Land Conservation Partnership)
Long Term Monitoring Plan (TA)
Reith/Browns Dairy Dam Removal (Restoration Grant)

CTUIR:
Haskell Dam Removal & Stanley Creek Culvert (Design)

ODFW Restoration & Enhancement Program
Reith/Browns Dairy Dam Removal (Restoration)

ODOT/ODFW Fish Passage Compensation Program (Dec 2019 Deadline)
Haskell Dam Removal & Stanley Creek Culvert (Restoration)

April 2020 UBWC Board Meeting Minutes

@ Conference Call-In

UBWC Board Members Present: Sarah Anderson, Doug Bennett, Ken Thompson, Carlisle Harrison, Lowell Saylor

UBWC Board Members Absent: J.D. Tovey, Terry Warhol

UBWC Staff Present: Michael Ward

Others Present:

6:00 PM – Meeting Called to Order – Doug Bennett (Chair)

Approval of March 2020 Meeting Minutes (Doug Bennett)

Ken Thompson moved to approve the March meeting minutes. Doug Bennett seconded and the motion passed unanimously to approve the March meeting minutes approved.

Treasurer's Report (Sarah Anderson)

Financial reports and associated information were sent out to all board members prior to the meeting. Sarah Anderson stated that $2000 was transferred to the debit account (Business Checking) to cover online/automatic payments coming up throughout the summer.

Old Business (Doug Bennett)

The board re-assessed the March agenda that was highly impacted by the Covid-19. The board decided to table rescheduling the canceling spring Umatilla River Cleanup and wait for more information regarding safety and liability in bring large groups of people together.

Current Business (Doug Bennett)

Doug Bennett and Sarah Anderson inquired about operating remotely and if we are set up to do so? Michael Ward responded that most everything is in place and that he only needed to buy a basic black & white printer for home use; Michael informed the board the he had already made this purchase and was able to match the office printer so that ink could be shared. Michael also stated that he had been having issues with the work cell phone and that he will most likely need to replace it soon. The board expressed their support for looking into any needed supplies for temporarily remote work. Ken Thompson asked if any items in the office could be temporarily removed and used at home. Michael responded that he would like to take a desk and computer home.

New Business (Michael Ward)

Until further notice the board instructed Michael to not attend any in-person meetings and/or facilitate any in-person meetings. The board approved the online subscription for Zoom and Gotomeetings.com to be paid monthly out of the Business Checking account.

6:00 PM – Meeting Called to Order – Doug Bennett (Chair)

Approval of April 2020 Meeting Minutes (Doug Bennett)

Sarah Anderson moved to approve the April meeting minutes. Doug Bennett seconded and the motion passed unanimously to approve the April UBWC Board Meetings

Treasurer's Report (Sarah Anderson)

Financial reports and associated information were sent out to all board members prior to the meeting. Sarah Anderson stated that the main account had $56,108.62 in the 'BShort' Checking Account and $5,602.33 in the 'Business Checking' account. Sarah stated that Michael updated her that he was working on wrapping up late reports and funding request for the Wildhorse Creek project and the Council Capacity 2019-2021 FR#1.

Old Business (Doug Bennett)

Continue discussion(s) of moving forward with the current/new updates with Covid-19.

Current Business (Doug Bennett)

The board tabled the May meeting to have an open (non-voting) meeting discussion regarding Covid-19 and how office space, events, and day-to-day operations will/could be forced to change in pandemic situation that might last longer than expected.

May Board Meeting Minutes

Hamley's Steak House, President's Room, Pendleton, OR
May 20, 2019

UBWC Board Members Present: JD Tovey, Terry Warhol, Lowell Saylor, Ken Thompson, Doug Bennett (chair), Sarah Anderson, and Dick Nichols

UBWC Board Members Absent: Carlisle Harrison, Kaisa Phillips-Hill

UBWC Staff Present: None

Others Present: Tonya Dombrowski

6:20 PM – Meeting Called to Order – Doug Bennett (chair)

Approval of April 2019 Meeting Minutes (Doug Bennett)
Dick Nichols moved that the April 2019 minutes be approved as written. Terry Warhol seconded. Motion passed unanimously.

Treasurer's Report (Sarah Anderson)
Financial reports and associated information were disseminated to all Board Members. Sarah Anderson provided the Board with an update on current finances. The Council currently has $27,886 in the bank. The only major paid expenses to report for April are payroll and office rent. Dick Nichols asked if the existing funds were sufficient to cover the rest of the current biennium. Sarah responded that the existing balance should be sufficient. Sarah further reported that there are two pending payments to the Council: $11,000 from the Birch Creek grant and $56,000 from the existing Council Capacity grant. The Council also has three pending funding requests: Supplemental Environmental Project (SEP), USFW Mainstem Umatilla project and ODFW Reith Dam Removal project. The Birch Creek payment is for outreach work. The grant is closed. This will be the final payment. The Board Members reviewed the information that was presented.

Old Business (Doug Bennett)

<u>Elder Ditch</u>

The Board discussed the Elder Ditch. UBWC originally signed the license for the ditch to cross US Bureau of Reclamation (USBR) property specific to legal access for maintenance. The license expired in 2013. USBR would like someone to be accountable for potential problems in the future. The Board discussed the concern that the ditch is not UBWC's ditch or responsibility. There was consensus that UBWC should not sign a new license. The license should be signed by the landowners whose water rights are served by the ditch. The Board discussed the concerns associated with the very rainy spring, over three inches of rain falling in the span of two-three days and the remaining six to seven feet of snow in the headwaters. The Board again recognized USBR's position but encouraged USBR to follow-up with the

contact provided previously by Terry Warhol. The Board felt strongly that UBWC should not sign a new license.

Current Business (Doug Bennett)

Board Elections

Doug Bennett reviewed the positions up for election: President, Vice-President and Secretary/Treasurer for the Umatilla Basin Watershed Foundation. (These same elected officials will also represent the Umatilla Basin Watershed Council.)

President

Doug Bennett called for nominations for President of the Umatilla Basin Watershed Foundation. Ken Thompson nominated Doug Bennett (currently serving as interim Chairman of the Board). Dick Nichols seconded. Hearing no further nominations, the nominations were closed. The vote was called and passed unanimously. Kaisa Phillips-Hill was removed from status as President of the Umatilla Basin Watershed Foundation. Doug Bennett was elected as President of the Umatilla Basin Watershed Foundation, effective immediately. Doug will also serve as Chairman of the Board for the Umatilla Basin Watershed Council, pursuant to the charters for both organizations.

Vice-President

Dick Nichols requested to know specifically what the duties and responsibilities of the Vice-President are. Ken Thompson stated that the Vice-President was to act in the stead of the President if or when the President was unable to serve. He further explained that the Vice-President would be called upon to lead meetings in the President's absence. Several Board members indicated that they would be willing to serve as Vice-President including Terry Warhol and JD Tovey. The Board agreed that both would be excellent candidates.

Doug Bennett called for nominations for Vice-President of the Umatilla Basin Watershed Foundation. Dick Nichols nominated Terry Warhol. Ken Thompson seconded. Hearing no further nominations, the nominations were closed. The vote was called and passed unanimously. Ken Thompson was removed from status as Vice-President of the Umatilla Basin Watershed Foundation. Terry Warhol was elected as Vice-President of the Umatilla Basin Watershed Foundation, effective July 1, 2019. Terry will also serve as Co-Chairman of the Board for the Umatilla Basin Watershed Council, pursuant to the charters for both organizations.

Secretary/Treasurer

Doug Bennett called for nominations for Secretary/Treasurer of the Umatilla Basin Watershed Foundation. Dick Nichols nominated Sarah Anderson (currently serving as Secretary/Treasurer of the Foundation and the Council). Lowell Saylor seconded. Hearing no further nominations, the nominations were closed. The vote was called and passed unanimously. Sarah Anderson was elected for a second term as Secretary/Treasurer of the Umatilla Basin Watershed Foundation, effective July 1, 2019. Sarah will also serve as Secretary/Treasurer of the Board for the Umatilla Basin Watershed Council for a second term.

Ken Thompson acknowledged Sarah's outstanding work on behalf of the Foundation and Council as Secretary/Treasurer. He reminded the Board that the Foundation/Council's books have been much

better organized and that the fiscal reports have been tremendously improved since Sarah took over the job. The Board extended a heartfelt thank you to Sarah for her efforts.

New Business (Doug Bennett)

Dick Nichols requested an update on the efforts to organize a get-together to recognize Jeff Blackwood's years of service on the Foundation and Council Board. Lowell Saylor stated that he had been working to contact Jeff and set up a time to meet together. Lowell reminded the Board that Jeff had served tirelessly and very effectively led the Council through some very challenging times. Dick Nichols offered to make a wooden box with the Council logo and a recognition of Jeff's service engraved on the lid. The box would be fashioned out of the kinds of wood from trees that grow in the Umatilla Basin. Sarah Anderson asked about the time frame for making a box and Dick said that it could be ready in four weeks (the engraving will take two weeks to complete). The Board was supportive of Dick's idea of the box and recommended that he go ahead with it. Dick will send out a mock-up of the engraving for Board approval via email within the next two days.

The Board discussed the opportunity to meet for Jeff's get-together sometime in late June. After some consideration of possible venues, it was decided that the get-together should be at the Prodigal Son Brewery. Lowell offered to bring this up with Jeff and coordinate with the Board members relative to Jeff's schedule. Dick offered to reserve the private room at Prodigal Son when Lowell finds a date that will work for Jeff. Additional information will be disseminated via email to Board members as it comes available.

Announcements

Following this meeting, the Council will adjourn for the summer break. Next meeting will be in September. There were no other announcements.

Partner Report

There were no partners attending.

Public Forum

No public comment was presented.

Next Meeting: 6 PM, September 23, 2019 at the Athena City Hall Meeting Room, 302 East Currant Street, Athena Oregon.

UBWC Mission

"To foster cooperation among watershed users & provide education to people interested in watershed health; and to develop, support, implement, and monitor activities that improve and maintain water quality and water quantity for all uses within the Umatilla Basin"

Chapter 1: Introduction

1a Purpose

The 2014 Umatilla Basin Watershed Council (UBWC) Action Plan identifies organizational goals & program objectives as they pertain to overall watershed health, water quality & quantity, ecological restoration, and community outreach priorities throughout the Umatilla River Basin.

The Umatilla Basin Watershed Council operates through a combination of grants and annual Umatilla County support funding. An important component of this funding comes from the Oregon Watershed Enhancement Board through the Council Capacity and Support Grant, allowing UBWC to secure quality staff and leverage funds to conduct restoration projects, feasibility studies, and educational programs.

1b Description of the Watershed

The Umatilla River Basin (HUC 17070103) covers approximately 2,550 square miles (1.6 million acres) in northeastern Oregon, flowing through the namesake Umatilla River in a generally northwesterly direction. The Umatilla River flows through a course of 90 miles out of the Blue Mountains before joining the Columbia River (river mile 289) near Umatilla, Oregon. Within this vast area there is approximately 5,600 feet of elevation difference from the summit of Black Mountain to the port of Umatilla. Approximately 84% of the basin is comprised of agricultural production (irrigated, dryland, and rangeland), nearly all of the basin's public land lies within the Umatilla National Forest, and urbanized or suburban development comprises the remainder of the landscape.

Sub-basins contributing to the Umatilla River include Meacham Creek, Wildhorse Creek, McKay Creek, Birch Creek Mission Creek, Upper and Lower Butter Creeks, Sand Hollow, Cold Springs Canyon, Stage Gulch, Hunt Ditch, Alkali Canyon, and the North and South Fork headwaters areas.

Temperature and precipitation are highly influenced by elevation within the Umatilla River Basin, lower elevations average as little as eight inches of precipitation, while the higher elevations of the Blue Mountains may receive in excess of fifty inches annually.

Typically the majority of the Basin's precipitation occurs between October and April, although high intensity localized events may occur in late spring or early summer. Peak runoff events occur during periods of winter rain events over frozen ground in the upper and mid basin areas (Umatilla TMDL, 2001).

Water resource concerns occupy a broad spectrum throughout the Umatilla River Basin and include anthropocentric and biological origins. Significant human use concerns stem from water quality and quantity perspectives including agricultural production, seasonal flooding, municipal and industrial consumption, nitrate and bacterial concentration, recreational use, and cultural importance. Biological concerns include water quantity and timing, temperature and sediment thresholds, anadromous fish passage, and substantial habitat fragmentation and degradation; with the 2004 Umatilla/Willow Sub-basin Assessment prioritizing temperature and sediment reductions being the most beneficial to fish populations. The three key concepts are the timing & quantity of water presence, sediment & nutrient transportation, and the coexistence of natural and human systems.

1c Demographics

The Umatilla Basin is predominantly characterized by a rural agricultural nature. Pendleton has historically been a cultural hub for eastern Oregon, however in recent decades Hermiston has shown tremendous growth (+70% since 1990), even surpassing the population of Pendleton. In 2010 the Pendleton-Hermiston Micropolitan Statistical Area had 87,062 inhabitants. During the same census, Umatilla County, which is predominantly within the Umatilla River Basin, had 75,899 inhabitants. While approximately half of the Basin population lives within Pendleton or Hermiston, there are numerous small towns within the area.

1d Background and Historic Information

The Umatilla Basin Watershed Council was created in 1997 by the Umatilla County Board of Commissioners, as a result of the development of the Umatilla Basin Total Maximum Daily Load (TMDL) project. Initial emphasis was directed toward education and outreach, in addition to water quality monitoring that supported the Umatilla TMDL project. As time moved forward the UBWC branched into restoration activities, as well as continuing support of water quality monitoring and community outreach and education directives.

Chapter 2: Planning & Strategy

2a Watershed Action Plan Development

The Umatilla River Basin has a legacy of collaboration cultivated through stakeholder involvement and participation in the TMDL project. Through this collaboration, inroads toward effective working relationships exist within the basin. By the nature of its mission, the UBWC stands as a neutral entity providing sound, scientifically driven information supporting activities which enhance overall watershed health, functionality and community education. As a neutral entity and partner in this shared vision, the UBWC has a responsibility to facilitate and contribute to projects and supporting goals identified in the Umatilla Basin TMDL, the Umatilla/Willow Subbasin Plan (2004), and from the council itself.

Development of an Action Plan benefits the Umatilla Basin Watershed Council through organizing the over-arching, big-picture goals into desired outcomes with objective measures to reach. Further refinement of the objectives develop the strategies available to take action. A vision is meaningless without action, and action is meaningless without a vision; the Action Plan serves as guidance to organize the actions, objectives, and large scale organizational goals for the UBWC.

2b Watershed Inventory

A comprehensive watershed assessment within the Umatilla Basin is supported by two substantive existing documents, the Umatilla River Basin TMDL (2001), and the Umatilla/Willow Subbasin Plan (2004). Climatological, land use, ecological, hydrological, and conservation priorities were developed through extensive collaboration, and a wealth of information is available and is relatively current. Supplemental assessment and monitoring data collected by partnering agencies including the Oregon DEQ, the Confederated Tribes of the Umatilla Indian Reservation, and the US Forest Service are available to reinforce or update the comprehensive assessment.

Through collaboration with established partners, the Umatilla Basin Watershed Council has extensive access to beneficial data and analyses that aid in supporting Council actions. Analysis and modeling of available data sets will enable the UBWC to prioritize the actions that support the strategies, objectives, and watershed goals established in the 2014 Umatilla Basin Watershed Council Action Plan.

2c Watershed Goals, Objectives and Strategies

The Board of Directors for the Umatilla Basin Watershed Council identified guiding principles in support of the organizational mission:

- The UBWC will strive to work towards supporting, collaborating, and cooperating with partners for the overall benefit to the Basin and its communities.
- The UBWC will be a neutral, scientifically sound source for information related to watershed health, taking a professional approach to information requests and interactions on issues related to the UBWC mission.
- The UBWC will strive to have a diverse Board of Directors representing tribal, private, public, and other interests within the Basin.
- Board meetings will be a forum for information exchange between partners.
- The UBWC will continue to support and partner with the Water Quality Technical Committee and Umatilla Basin Restoration Team to further collaborative/cooperative work in meeting mutual interests.
- The Board and Executive Director will work to develop and maintain a work environment that fosters achievement, creativity, and inspiration.

The underlying purpose of the Umatilla Basin Watershed Council is to promote overall watershed health within the Umatilla River Basin through stakeholder cooperation and collaboration. Three key goals support this purpose; watershed planning, monitoring and assessment; community engagement and collaboration; and implementation of watershed restoration projects.

Goal 1: Watershed Planning, monitoring and assessment

Watershed planning, monitoring and assessment includes water quality monitoring, remote sensing and project prioritization, project effectiveness monitoring and assessment. This goal assists in the genesis of projects within the human and ecologic scopes, and directly relates to the adaptive management approach to project management. What can be learned through the process of a project is important in many ways, and generally contributes to the successful planning, implementation, and review of subsequent projects. The UBWC intends to be a dynamic organization capable of responding to changes, while remaining rooted to the core purpose and supporting goals.

Goal 2: Community Engagement and Collaboration

Community engagement and collaboration involves not only the stakeholders or partners on projects, but active engagement with the people who make the Umatilla Basin their home. Through collaboration and stakeholder involvement, UBWC can incorporate the values and

priorities of the residents and cooperating agencies of the Umatilla Basin and work toward a shared vision of what a healthy, functional watershed represents.

Goal 3: Implementation of Watershed Restoration Projects

Watershed restoration projects are the on-the-ground physical manifestation of some of our actions. Restoration projects may have community visibility, buy-in and support functions in addition to the ecological functions provided.

Chapter 3: Application

3a Implementation

Refining the outlined goals is the first step toward implementation, and is followed closely by developing objectives based on available information and organizational priorities. The Umatilla Basin is fortunate in having a high quality and relatively recent TMDL and Watershed Assessment from which to draw. From the known issues and directives of Basin-wide activities a suite of objectives were developed. Strategies for attaining the specific objectives listed below were then identified, as were supporting parties, stakeholders, and a relative priority timeline.

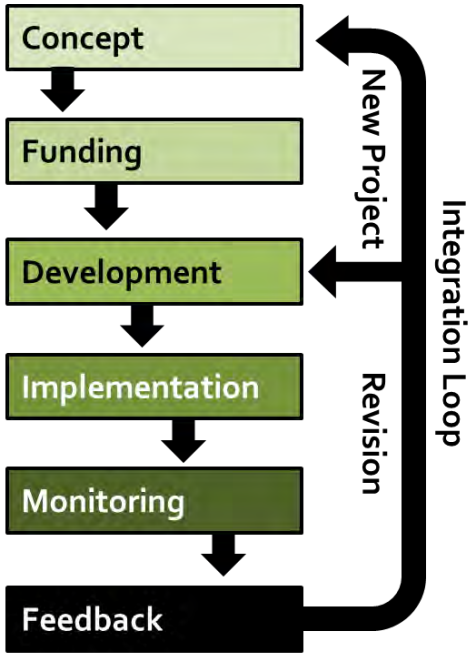
Goal 1: Watershed Planning, Monitoring and Assessment

Objective	Action Item	Stakeholders	Partners	Priority Ranking	Indicators of Success
Reduce sediment load from agricultural runoff	Identify partnership opportunities with NRCS, & SWCDs	Ag landowners throughout the Umatilla Basin	NRCS, SWCDs, UBWC	**High** - continuing basis	Develop common goals between NRCS, SWCDs, UBWC Identify landowners interested in BMP or site restoration projects.
	Quantify extent of headwater erosion area	Ag landowners throughout the Umatilla Basin	NRCS, SWCDs	**High -** near term focus	Develop a baseline map of HES & sources of headwater sub-basin erosion concern areas.
	Assist landowners with buffer and restoration projects	Ag landowners throughout the Umatilla Basin, CTUIR, UBWC, ODFW	NRCS, SWCDs, UBWC, OSU Extension, DEQ	**Moderate** - partner led	Installation of erosion BMP projects, additional interest in participation. Landowner participation survey.
Reduce summer temperatures in identified critical salmonid spawning reaches	Analyze existing data sources, and gaps in existing data	UBWC, CTUIR, ODFW, NOAA	UBWC, CTUIR, USFS	**High** - near term focus	Map of temperature logged reaches of the Umatilla River and its tributaries.
	Continue temperature monitoring	UBWC, CTUIR, ODFW, NOAA, USFS	UBWC, CTUIR	**High** - continuing basis	Temperature profiles for project effectiveness monitoring pre & post restoration implementation.
	Voluntary projects in temperature sensitive reaches	UBWC, CTUIR, ODFW, NOAA, Umatilla Basin Residents	UBWC, SWCDs, CTUIR, NRCS	**High** - coordinate with partners	Implementation of voluntary projects to reduce summer temperatures on thermally impaired reaches.
	Landowner engagement and education	Landowners throughout the Umatilla Basin	UBWC, SWCDs, TU	**Moderate** - coordinate with partners	Develop landowner workshops, provide technical assistance, and distribute information.

Goal 1: Watershed Planning, Monitoring and Assessment, *continued*

Objective	Action Item	Stakeholders	Partners	Priority Ranking	Indicators of Success
Prioritize Umatilla Basin Watershed Council restoration focus areas	Develop GIS overlay model to target high priority focus areas	Ag landowners throughout the Umatilla Basin	NRCS, SWCDs, UBWC	**High** - near term focus	Develop a prioritized map using McHargian overlays to identify key areas to direct on the ground and education efforts within the Umatilla Basin.
Continued support of Umatilla Basin TMDL planning, monitoring, and implementation	Sediment and temperature monitoring & analysis	DEQ, UBWC, CTUIR, USFS Residents throughout the Umatilla Basin	DEQ, UBWC, CTUIR, USFS, SWCDs	**High** - continuing basis	Statistically sound database within SOP requirements supporting consistent data analysis evaluation of composite project effectiveness in supporting all beneficial uses.
Fish passage survey	Analyze existing data sources, and gaps in existing data	UBWC, CTUIR, ODFW, NOAA, ODOT	UBWC, CTUIR, NRCS, ODOT	**Moderate** - coordinate with partners	Map of known fish passage barriers within the Umatilla Basin including natural barriers, dams, and culverts.
	Improve fish passage plan development	UBWC, CTUIR, ODFW, NOAA, USFS, ODOT	UBWC, CTUIR, NOAA, NRCS	**Long Term** - progress dependent	Strategic, coordinated plan for implementing passage improvement across agencies.
Floodplain planning and hydrologic background survey	Floodplain mapping, community engagement, project planning	Residents of the Umatilla Basin, UBWC, ODFW, NRCS	UBWC, NRCS, ODFW, NRCS	**High** - build from current project progress	Identification of future projects with potential to improve groundwater recharge, reduce fragmentation, and reduce flood damages.
	Discharge histogram	Residents of the Umatilla Basin, DWR, DEQ	UBWC, DWR	**Moderate** - supplemental information	Gain background knowledge of ungagged sources of interest to restoration and conservation practices.

Goal 2: Community Engagement and Collaboration



Objective	Action Item	Stakeholders	Partners	Priority Ranking	Indicators of Success
Build visibility and rapport within communities of the Umatilla Basin	Accessible, forum – based meetings on a spatial rotation	UBWC, Residents of the Umatilla Basin Watershed	Community	**High** - continuing basis	Continue to hold monthly meetings which rotate to the distributed communities within the Umatilla Basin.
	Implement high visibility projects and events with volunteer opportunities	UBWC, Residents of the Umatilla Basin Watershed	Community	**High** - continuing basis	Select high impact—high visibility projects that involve schools, local service organizations, municipalities, retirees, and other interested residents to encourage participation.
	Sponsor youth and resident education projects and events	UBWC, SWCDs, Residents of the Umatilla Basin Watershed.	UBWC, SWCDs, OSU Extension	**Moderate** - build quality materials through community and partner relationships	Workshops, demonstration site projects, digital and print informational media development and distribution.
	Sponsor a watershed festival event	Residents of the Umatilla Basin Watershed	UBWC, CTUIR, SWCD, OSU Extension	**Long Term** - Build partner and community support to ensure success	Recurring festivals drawing more participants.

Goal 3: Implementation of Watershed Restoration Projects

Objective	Action Item	Stakeholders	Partners	Schedule	Indicators of Success
Sediment Reduction Projects	Sedimentation Basins	NRCS, SWCD, UBWC, Rural landowners	UBWC, SWCD, ODFW, OSU, NRCS	Year 2 - 3+	Installations of engineered agricultural sedimentation basins in designated high priority areas.
	Cattle exclusion fencing installations	NRCS, SWCD, UBWC, Rural landowners	UBWC, SWCD, OSU, NRCS	Year 1 - 3+	Installations of riparian cattle exclusion fencing & alternative stockwater options.
	Urban runoff pre-treatment elements	Basin municipalities, SWCD, UBWC, DEQ	UBWC, DEQ, SWCD	Year 2 - 3+	Planning, development, and implementation of greenways & stormwater management features and ordinances.
Habitat Restoration Projects	Revegetation and stabilization of banks and floodplains	UBWC, CTUIR, BOR, Public and private landowners	UBWC, CTUIR, BOR	Year 1- 3+	Installation of riparian revegetation projects and demonstration sites.
Fish Passage Projects	Dam removals	UBWC, ODFW, CTUIR	UBWC, ODFW, CTUIR	Year 1 - 3+	Broun Dam, Peterson Dam, Dillon Dam removed and enhanced.
Groundwater recharge projects	Culvert survey & replacement	ODFW, CTUIR, UBWC	UBWC, ODFW, CTUIR	Year 2 - 3+	Prioritized culvert replacement project installations.

3b Plan Updates and Revisions

Adaptive Management Framework

Through adopting an Action Plan, the UBWC is building a holistic model tying the key organizational goals into a cohesive plan for a healthy, functional Umatilla River Basin. The 2014 Umatilla Basin Action Plan is not meant to be a prescriptive document. This plan serves as guidance for Umatilla Basin Watershed Council actions, while remaining adaptive to future concerns and integrating feedback to continually improve project success. Adaptive Management is a systemic process or model that has seen increasing use through natural resource disciplines since inception in the 1970's. The main premise of the Adaptive Management is that management practices and policies can continually improve, refine and evolve through the application of lessons learned through past and present experiences. By implementing an Adaptive Management approach to decision-making and planning, an organization is better prepared to handle internal and external changes including technology, personnel, and partnering agencies.

Action Plan updates are anticipated as the strategies are implemented and objectives are met, allowing further refinement to accommodate revised Council priorities and staffing capabilities. A set schedule for revision is not set, relying on successive annual work plans to track fine grain adjustments and progress toward organizational objectives. The work plan will be developed annually and approved by the Umatilla Basin Watershed Council Board of Directors. This annual work plan will allow Board members to track progress on individual projects contributing to the strategies, objectives, and goals of the UBWC.

Chapter 4: Summary

4a What makes UBWC successful?

Success of the Umatilla Basin Watershed Council depends on many factors, but being a result driven organization and an active community resource stand out among the most important. Being an operation almost entirely funded on grant based projects means that the UBWC must be driven to produce results in every project. Granting bodies want to see an organization make effective use of funding, and producing quality deliverables is critical to the success of future funding.

Communities are the component that brings the Umatilla Basin to life. Creating lasting relationships and building rapport with residents is an important factor in the success of the UBWC to support outreach functions. Effective community engagement encompasses volunteerism, collaboration in board meetings, landowner recruitment, and educational outreach projects spanning generations while fostering a mentality that we are all part of a shared watershed. Through outreach UBWC gains local buy-in and support of projects affecting the watershed as a whole.

4b The future of UBWC

To be successful as an organization, it is important for the Umatilla Basin Watershed Council to adopt and update strategic planning efforts, such as the 2014 Action Plan. An important component of this plan is collaboration with partnering agencies to coordinate efforts and maximize returns on conservation and outreach actions. The future of the Umatilla Basin Watershed Council lies in forging resilient working relationships with collaborators, and in gaining strong community support through participation and projects reflecting the interests of basin residents.

Equal Employment Opportunity and Anti-Discrimination Policy

I. OVERVIEW & SCOPE

Umatilla Basin Watershed Council of 27 SE 3rs St, Pendleton, Oregon 97801, has established an Anti-Discrimination and Equal Employment Opportunity Policy ("EEO"). This EEO policy applies to all aspects of the relationship between Umatilla Basin Watershed Council and its employees, including, but not limited to, employment, recruitment, advertisements for employment, hiring and firing, compensation, assignment, classification of employees, termination, upgrading, promotions, transfer, training, working conditions, wages and salary administration, and employee benefits and application of policies. These policies apply to independent contractors, temporary employees, all personnel working on the premises, and any other persons or firms doing business for or with Umatilla Basin Watershed Council. Disciplinary action will be taken against any employee or agent in breach of this policy.

II. POLICIES

1. DISCRIMINATION. Umatilla Basin Watershed Council shall not tolerate, under any circumstances, without exception, any form of discrimination based on race, creed, religion, color, age, disability, pregnancy, marital status, parental status, veteran status, military status, domestic violence victim status, national origin, political affiliation, sex, predisposing genetic characteristics, sexual orientation, gender identity and gender expression, and any other status protected by the law. This list is not exhaustive. Job promotions will be offered to employees based on merit, experience, and other job-related criteria. For qualified people with disabilities, Umatilla Basin Watershed Council will make every effort to provide reasonable workplace accommodations that comply with applicable laws. All employees, managers, stakeholders, and agents at Umatilla Basin Watershed Council will comply with these anti-discrimination policies. In some cases, local laws and regulations may provide greater protections than those described in this policy.

2. HARASSMENT. Umatilla Basin Watershed Council is committed to providing a work environment that is free from harassment. Any behavior that is unwanted and offensive to the recipient, which creates an intimidating, hostile, or humiliating work environment for that person violates Umatilla Basin Watershed Council's policy. Harassment can occur between members of the opposite sex or the same sex. Harassment, verbal or non-verbal, explicit or implicit, based on an individual's sex, race, ethnicity, national origin, age, religion or any other legally protected characteristics will not be tolerated. All employees, including supervisors, other management personnel, and independent contractors, are required to abide by this policy. No person will be adversely affected in employment with Umatilla Basin Watershed Council as a result of bringing complaints of harassment.

3. SEXUAL HARASSMENT. Unwelcome sexual advances, requests for sexual favors, and

other verbal or physical conduct of a sexual nature constitute harassment when (1) submission to such conduct is made either explicitly or implicitly a term or condition of employment; (2) submission to or rejection of such conduct by an individual is used as a basis for employment decisions, promotion, transfer, selection for training, performance evaluations, benefits, or other terms and conditions of employment; or (3) such conduct has the purpose or effect of creating an intimidating, hostile, or offensive work environment or substantially interferes with an employee's work performance . Umatilla Basin Watershed Council prohibits inappropriate conduct that is sexual in nature at work, on Company business, or at Company-sponsored events including the following: comments, jokes, degrading language, sexually suggestive objects, books, or any form of media electronic or in print form. Sexual harassment is prohibited whether it is between members of the opposite sex or members of the same sex.

4. STATEMENT ON AFFIRMATIVE ACTION. An affirmative action program has been developed where Umatilla Basin Watershed Council seeks to increase the representation and participation of minorities.

5. REPORTING DISCRIMINATION & HARASSMENT. If an employee feels that he or she has been harassed as described in this policy, they should immediately report the matter to management or Douglas Bennett through any verbal or written means. If that contact is not available, or if the employee is not comfortable informing this contact, the employee should immediately inform any other manager or supervisor. Once the matter has been reported it will be promptly investigated and any corrective action will be taken when deemed appropriate. All complaints or unlawful harassment under this policy or otherwise will be handled in as confidential a manner as possible. Timely reporting is encouraged to prevent the re-occurrence of, or otherwise address, the behavior that violates this policy or law. Delays in reporting a complaint can limit the type of effectiveness of a response by Umatilla Basin Watershed Council. The procedure for reporting incidents of discriminatory or harassing behavior is not intended to prevent the right of any employee to seek a remedy under available state or federal law by immediately reporting the matter to the appropriate state or federal agency.

6. RETALIATION. Retaliation against any person associated with Umatilla Basin Watershed Council who reports instances of harassment - whether he or she is directly or indirectly involved - is in violation of Umatilla Basin Watershed Council's policies. All reported incidents are assumed to be made in good faith. Any allegations that are proven false will be treated as a serious matter.

7. DISCIPLINARY MEASURES FOR HARASSMENT. Any employee engaging in behavior that violates this policy will be subject to disciplinary action, including the possible termination of employment, whether or not an actual law has been violated.

8. TRAINING. All employees, supervisors, and management personnel will be required to attend mandatory anti-discrimination, anti-harassment, and/or anti-sexual harassment training of a kind as designated by Umatilla Basin Watershed Council.

9. REMEDIES. Remedies for any instances of verified employment discrimination, whether caused intentionally or by actions that have a discriminatory effect, may include back pay, hiring,

.

promotion, reinstatement, front pay, reasonable accommodation, or other actions deemed appropriate by Umatilla Basin Watershed Council. Remedies can also include payment of attorney's fees, expert witness fees, court costs and other applicable legal fees.

10. POLICY IMPLEMENTATION. Implementation of this Policy will be effective as of March 01, 2021.

ENHANCEMENT BOARD

Agenda Item H

Council Capacity Evaluations

Board Meeting July 25-26, 2023

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-001

Project Name: NCWA 2023-2025 Council Capacity Grant

Applicant: North Coast WS Assn

Application Description

The Council Capacity Grant funds watershed restoration planning and operational activities for the North Coast Watershed Association. Limiting factors, include: altered quality of physical habitat, historic diking and roads, disconnection from the floodplain, impaired water quality, lack of habitat complexity and large wood, lack of riparian coverage, fish passage barriers, lack of quality monitoring data, and increased erosion from land use practices.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board engages with and provides support, management, and supervision to the council coordinator. The council has demonstrated consistent governance and management during recent council coordinator transitions.

OWEB staff found the council demonstrates ***effective progress in planning*** through engagement in several local planning efforts, including the completion of the Return of the Redds Strategic Action for the Lower Columbia River Chum Salmon (2022) and active engagement with local timber companies.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and is working at a pace and scale appropriate for the current capacity of the council.

OWEB staff found the council demonstrates ***effective progress in stakeholder engagement for watershed restoration purposes***. The council has reengaged in stakeholder engagement activities with the community, including collaborating with other local natural resource organizations for outreach events at local breweries. The council has developed relationships with Chinook Tribal members.

Concerns

The council last reviewed its policies and procedures and bylaws in 2020, it must complete another review before the next council capacity application deadline in 2025 to ensure they meet the eligibility criteria of a review once every 3 years.

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board
Full base funding: meets all merit criteria

Staff Recommended Award
$166,142

Staff Conditions
None

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-002

Project Name: LCRWC Council Capacity and Support

Applicant: Columbia SWCD

Application Description

This project seeks to fund a Watershed Council Coordinator for the Lower Columbia River Watershed Council. Council-identified watershed limiting factors include habitat access – impaired access to habitat, hydrograph/water quantity – altered hydrology, knowledge gaps – lack of information, physical habitat quality – altered quality of physical habitat, water quality - altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council to ***demonstrate some progress in planning*** through the recent submittal of a monitoring application for a Rapid Bioassessment in the watershed. Besides the pending application, the council uses no other documents to plan or prioritize the work of the council. If the monitoring application is funded the council would convene a technical advisory team; however, members of the team have not yet been identified or contacted to see if they would be willing to participate.

Concerns

OWEB staff found the council ***does not demonstrate effective governance and management***. The council is currently operating with the fewest number of board members in the history of the organization. The vice chair recently resigned over the decision to submit a monitoring application and there are no candidates for chair or vice chair in the upcoming October council officer election. The council board has not demonstrated effective management of staff and it is not clear how the board participates in management and oversight of the coordinator, in collaboration with the SWCD, who is the employer.

OWEB staff found the council ***does not demonstrate effective progress in on-the-ground watershed restoration***. The council has implemented no restoration projects in the last two years and the two projects it was working on in the last biennium were transferred to the SWCD for implementation. The council has no clear vision for its restoration niche in the watershed.

OWEB staff found the council ***does not demonstrate effective progress in stakeholder engagement for watershed restoration purposes***. The council did not complete any stakeholder engagement activities during the 2021-2023 biennium and has no activities planned for the 2023-2025 biennium. The current board members have created an isolated environment that does not appear to be welcoming to the general public and is not effective at recruiting new engagement or interest in the council's activities.

Concluding Analysis

The watershed council does not demonstrate it is engaging with its local community to plan and develop restoration projects to support local, state, and federal restoration goals. The council membership does not include a diverse range of community interests and does not appear to be open and welcoming to the broader community. The review team did recognize the council

is showing some limited progress toward future planning with the recent submittal of a monitoring application for a rapid bioassessment, but the council did not meet any of the other merit criteria required by OWEB to receive funding.

Recommendations

Staff Recommendation to the Board: Do Not Fund

Staff Recommended Award: $0

Staff Conditions: N/A

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-003

Project Name: MidCoast WC Council Capacity 2023-2025

Applicant: MidCoast WC

Application Description

The MidCoast Watersheds Council, located in Newport, OR, works in an area of nearly one million acres, including all streams draining from the crest of the coast range to the Pacific Ocean, and from the Salmon River at Cascade head to Cape Creek at Heceta Head. The council relies on Council Capacity funding to maintain baseline funding for two staff positions to complete work related to watershed restoration, planning processes, community outreach, and other activities.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council regularly holds meetings and the council board reviews and updates policies and procedures as necessary to ensure the council is following good business practices. The council's board is both geographically diverse and representative of social sectors of the central coast. The council recently filled their tribal representative on the board.

OWEB staff found the council demonstrates ***effective progress in planning*** through leadership in several local planning efforts. The council continues to play an integral role in the Siletz Coho Strategic Action Plan, Central Coast Estuaries FIP and the MidCoast Water Planning Partnership.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration*** though the implementation of several large-scale restoration projects during the last biennium and projects are linked to council priorities.

OWEB staff found the council demonstrates **effective progress in stakeholder engagement for watershed restoration purposes** through a variety of in-person and online engagement opportunities including holding a Salmon River estuary clean-up event, volunteer planting and nursery events, and community meetings featuring engaging guest speakers.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: None

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-004

Project Name: Upper Nehalem Watershed Council Capacity

Applicant: Upper Nehalem WC

Application Description

The Upper Nehalem Watershed Council service area encompasses 555 square miles of temperate rain-forest. We seek capacity support to continue to advance watershed health and native salmon population recovery actions across the landscape in collaboration with partners. From this foundation we are able to maintain a viable network of supporters with whom we secure and leverage essential resources in order to implement a wide scope of actions.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council has an active and engaged board of directors and has recently recruited new members. The council also made some staffing and budgeting adjustments in response to challenges during the previous biennium. The council recently updated its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is an active participant in several local planning efforts including the recently completed Oregon Coast Coho Strategic Action Plan and the Nehalem Basin Partnership. These planning efforts help increase the capacity of the council to engage with the local community.

OWEB staff found the demonstrated ***effective progress in on-the-ground watershed restoration*** through completion of projects and planning for future project implementation.

OWEB staff found the council demonstrates ***effective progress in stakeholder engagement*** for watershed restoration purposes. The council is hosting events and speakers that cover a variety of viewpoints and is leveraging its partnerships to increase its ability to engage the local community. The council is also working to improve outreach to area tribes.

Concerns

The council struggled with capacity and its relationship with partners, including ODF, during the last biennium. The council has worked hard to address both of these challenges and is moving in the right direction.

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: None

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-005

Project Name: Nestucca, Neskowin & Sand Lake Watersheds Council Support

Applicant: Nestucca-Neskowin Watersheds Council

Application Description

The Nestucca, Neskowin & Sand Lake Watersheds Council operates in South Tillamook County. Limiting factors include high stream temperatures due to a lack of riparian vegetation, over-appropriation of stream flow in the summer, numerous fish passage barriers, erosion and sedimentation, invasive plant species, wetland degradation, lack of habitat complexity and lack of floodplain connectivity.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council regularly holds meetings and the council board has been very engaged in the community. The council has identified gaps in representation on the board and is actively working to fill those gaps. The council recently updated its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is leading several local planning efforts, including within the Sand Lake watershed and the Tillamook-Nestucca Salmon SuperHwy partnership. The council recently adopted a new strategic plan and is using it to plan and prioritize the work of the council.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on restoration projects that align with the strategic plan and the capacity of the council. It has a clear niche in the watershed.

OWEB staff found the council demonstrates ***effective progress in stakeholder engagement*** for watershed restoration purposes. The council is actively engaging with the local community using a variety of tools, including a newly awarded outreach grant.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: None

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-006

Project Name: Siuslaw Watershed Council Capacity 23-25

Applicant: Siuslaw WC

Application Description

The Siuslaw Watershed Council, located in Mapleton, OR, has been working with local partners to restore the Siuslaw and Coastal Lakes watersheds on the central Oregon coast since 1997. Council-identified watershed limiting factors include habitat access - impaired access to habitat, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council regularly holds meetings and works on organizational improvement. The council has a very representative board and recently reviewed its bylaws with a diversity, equity and inclusion lens and added additional positions to the board.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is leading and engaged in many planning efforts in the Siuslaw Basin, including the Siuslaw Coho Partnership. The council is using both its own and partnership planning documents to plan and prioritize the work of the council.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council has implemented numerous priority projects over the last biennium and is working on the development of future restoration projects. The council works with local tribal partners to plan and implement restoration projects.

OWEB staff found the council demonstrates ***effective progress in stakeholder engagement*** for watershed restoration purposes. The council uses a variety of stakeholder engagement activities to engage with the local community and continues a strong youth education program with non-OWEB funding.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: None

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-007

Project Name: TBWC Capacity Grant 2023-25

Applicant: Tillamook Bay WC

Application Description

This project seeks to fund a Watershed Council Coordinator for the Tillamook Bay Watershed Council. Council-identified watershed limiting factors include habitat access – impaired access to habitat, physical habitat quality – altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council has addressed most of the concerns that were raised previously during the council capacity review process. The council was re-recognized by the Tillamook County commissioners, has engaged a new board of directors that is representative of the community, regularly holds meetings, and recently updated its bylaws and policies.

OWEB staff found the council demonstrates ***effective progress in planning***. The council has continued to plan and engage with the community despite having no council capacity funding. The council recognizes the need to engage with the local community and update the strategic plan before restarting the council's restoration program.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council continued to make progress on some restoration projects, led by volunteer board members, despite having no council capacity funding. The council is working with local partners to determine future restoration priorities.

OWEB staff found the council demonstrates ***effective progress in stakeholder engagement*** for watershed restoration purposes. Council board members have worked to rebuild relationships throughout the watershed and demonstrated the council has broad support from the watershed community.

Concerns

None

Concluding Analysis

The council was without funding for two biennia and has demonstrated it has addressed OWEB's previous concerns and is making progress in all of OWEB's merit criteria. The council should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-008

Project Name: Council Capacity 2023 – Applegate Partnership

Applicant: Applegate Partnership, Inc.

Application Description

The Applegate watershed contains over 493,000 acres and is split between Jackson and Josephine Counties and Siskiyou County in northern California. The land ownership is primarily federally managed lands with rural residential and private forest making up the rest, and over 700 miles of stream habitat for winter and summer Steelhead, Coho salmon, fall Chinook salmon, and Pacific Lamprey. Through on-the-ground projects, outreach, and participation in local activities, the APWC strives to bring awareness to these communities through our work that mutually benefits the landowners, community and our natural resources.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council regularly holds meetings and has a very engaged board actively working to support the organization and staff. The council recently updated its strategic plan and is using it to guide board recruitment and organizational capacity building.

OWEB staff found the council demonstrates ***effective progress in planning***. The council recently updated its strategic plan and it is using it to guide the work of the council.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and planning for future restoration projects. The council is working with landowners to address difficult water diversion projects and developing solutions that are good for both fish and landowners.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council uses numerous stakeholder engagement methods to engage a broad diversity of community members and is working to improve its relationships with local tribes, which is challenging considering the limited capacity of all partners.

Concerns

The council last reviewed its policies in late 2021 and its bylaws in late 2022, it must complete another review before the next council capacity application deadline in 2025 to ensure they meet the eligibility criteria of a review once every 3 years.

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Application # 224-010

Project Name: Coos Watershed Association 23-25 Capacity

Applicant: Coos Watershed Association

Application Description

The mission of the Coos Watershed Association is to support environmental integrity and economic stability within the Coos watershed by increasing community capacity to develop, test, promote, and implement management practices in the interest of watershed health. This project seeks to fund a Watershed Council Coordinator for the Coos Watershed Association. Council identified watershed limiting factors include habitat access - impaired access to habitat, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council regularly holds meetings, and the council board reviews and updates policies and procedures as necessary to ensure the council is following best business practices. The council has two tribal positions on its board.

OWEB staff found the council demonstrates ***effective progress in planning***. The council and its partners use both the Coos Basin Coho Strategic Action Plan and the Tioga Action Plan to plan and prioritize the work of the council.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is engaged in many restoration efforts, including leading the work of the Coos Coho Basin FIP.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council uses a variety of stakeholder engagement methods to reach a broad diversity of community members and has prioritized working with youth from marginalized communities in its youth outreach efforts.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Project Name: Coquille Watershed Association Council Capacity Application

Applicant: Coquille Watershed Association

Application Description

This council capacity grant will support the work of the Coquille Watershed Association. The mission of the Association is to work collaboratively with landowners to develop and implement voluntary watershed restoration, enhancement, and engagement activities that promote healthy and resilient ecosystems and economies in the Coquille watershed. Council identified watershed limiting factors include hydrograph/water quantity - altered hydrology, knowledge gaps - lack of Information, physical habitat quality - altered quality of physical habitat, water Quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council regularly holds meetings, and the council board is active in the management and oversight of the council and significantly stepped up during recent staffing transitions. The council recently updated its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is leading several local assessment and planning efforts that are engaging local partners and taking the lead in the development of the Coho Business Plan.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing projects and planning for future restoration projects in considering of staffing capacity. The council coordinates closely with tribes on cultural resource work related to their restoration efforts.

OWEB staff found the council demonstrates ***effective progress in community engagement for watershed restoration*** **purposes**. The council is working to engage stakeholders related to tidegate work within the watershed.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-014

Project Name: Lower Rogue Watershed Council Capacity 2023-2025

Applicant: Curry SWCD

Application Description

The Lower Rogue Watershed includes all lands and waters of these lands that drain into the Rogue and Illinois rivers. Our purpose is to protect, enhance, and restore long-term natural resources and economic stability of the Lower Rogue Watershed and the near shore environment. Watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council regularly holds meetings, reviews and updates council documents. The council has worked to make its meetings more inclusive and has identified several areas for board improvement based on its most recent self-evaluation. The council recently updated its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council recently completed a planning process with Curry County. The council has a very thoughtful work plan development process which involves board members and community input.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing projects and planning for future restoration projects. The council recently completed upland restoration work and worked with the tribal fire crew to develop a burning plan to be implemented this biennium.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council has developed relationships with local tribes and is actively engaging them in future restoration planning and implementation. The council has updated its outreach materials and is working to engage beyond its traditional partners with new outreach events in the community.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: None

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-016

Project Name: South Coast Watershed Council Capacity 2023-2025

Applicant: Curry SWCD

Application Description

The South Coast Watershed Council encompasses 10 coastal watersheds on the southern Oregon coast that support coho salmon, Chinook salmon, and/or steelhead. Limiting factors vary across these watersheds, but all are impaired by elevated summer stream temperatures, an overabundant supply of coarse grained sediment, invasive plants, small estuaries, loss of floodplain connectivity and off-channel habitat, and the oversimplification of the low gradient stream network.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council regularly holds meetings, reviews and updates council documents. The council has worked to update how it runs its meetings to improve board engagement. The council recently updated its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is involved in organizational and partnership strategic planning efforts and recently completed a new five-year strategic plan, which will guide the council's future actions.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing projects and planning for future restoration projects that involve both upland and in-stream priorities.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council has worked hard to improve engagement with local tribes and has begun working with a DEI consultant to engage with non-traditional partners, including low-income communities.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: None

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-017

Project Name: Tenmile Lakes Basin Partnership Council Capacity 2023-2025

Applicant: Cascade Pacific RC&D

Application Description

The Tenmile Lakes Watershed is a coastal lake system that contains 113 stream miles and over 3,000 surface acres of Lakes that provide high priority habitat for native Coho Salmon, Winter Steelhead, Coastal Cutthroat Trout and Pacific Lamprey. Limiting factors identified include nonnative fish predation, multiple fish passage barriers, increases sedimentation resulting in toxic algae blooms and nuisance aquatic plant growth, and reduced riparian zone functions. Funding will coordinate and support the TLBP and Partners in implementing multiple projects prioritized within the assessment and action plans.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board consists of many long-serving members who take an active role in leadership and management of the organization. The council is working to recruit new members to fill identified gaps.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is undertaking a significant planning effort in coordination with local tribal partners.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and has many projects currently in development including projects with new partners and projects that address specific priorities identified in local planning documents.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council is very active in the community and prioritizes stakeholder engagement activities to support its wetland restoration priorities.

Concerns

The council last reviewed its policies and bylaws in 2021, it must complete another review before the next council capacity application deadline in 2025 to ensure they meet the eligibility criteria of a review once every 3 years.

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Applicant: Partnership for the Umpqua Rivers

Application Description

This project is located in the Umpqua Basin and is focused on working with willing landowners to improve stream habitat and water quality throughout the project location area. This project seeks to fund a Watershed Council Coordinator for the Partnership for the Umpqua Rivers Watershed. Council-identified watershed limiting factors include habitat access - impaired access to habitat, physical habitat quality - altered quality of physical habitat, water quality - altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board is very engaged and the recent transition to a new Executive Director has gone well. The council continues to look for ways to engage its board and recruit new board members.

OWEB staff found the council demonstrates ***effective progress in planning***. The council has been engaged in several local planning efforts focused on Umpqua Basin oak and tidegates. The council uses several documents, including its strategic plan, Umpqua Basin Action Plan and Project Work plan to plan and prioritize the work of the council.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing projects and planning for future restoration projects and is engaged in the fire recovery from the Archie Creek fire, estuary restoration work and oak restoration. The council works closely with local tribal partners to plan and implement restoration projects.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council is partnering with the University of Oregon Center for Science Communication Research to improve its outreach efforts.

Concerns

The council last reviewed its bylaws in 2020, it must complete another review before the next council capacity application deadline in 2025 to ensure they meet the eligibility criteria of a review once every 3 years.

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: None

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-019

Project Name: Rogue River Watershed Council Capacity 2023-2025

Applicant: Rogue River WC

Application Description

This project seeks to fund a Watershed Council Coordinator for the Rogue River Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality –altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board is very engaged and recently added two new members to increase the diversity of the board. The council recently reviewed its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is leading several local planning efforts and using the draft Upper Rogue Coho Strategic Plan to plan and prioritize work. The council is engaging with drinking water providers to ensure they are considering source water quality in future restoration actions.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing projects while planning for both upland and instream restoration projects and is working with tribal partners to incorporate first foods plants into future restoration work.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council, with its partners, is using planning documents to guide outreach. The council continues to engage with community members to encourage restoration as a tool to build community resilience in response to growing wildfire threats.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $415,355
At the April 2019 Board meeting the Board discussed providing on-going merger support to watershed councils that have successfully merged. Additional merger funding is calculated by multiplying 1.5 times the council's base award. ($166,142 + (($166,142x1.5=$249,213)) =$415,355)

Staff Conditions: None

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-021

Project Name: Elk Creek Watershed Council Support 2023

Applicant: Elk Creek WC

Application Description

Project will provide funding for the Coordinator/Executive Director, and operations of the Elk Creek Watershed Council in the northern part of Douglas County. The Council will work with local landowners and state and federal agencies to plan, develop, and implement on-the-ground projects to benefit fish and wildlife, and water quality in the Elk Creek Watershed, and in the Umpqua basin. Key partners are local landowners, Douglas and Umpqua SWCD, ODFW, Roseburg District BLM, and others.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board is engaged and supportive of the council and has recently recruited a new board member. The council recently reviewed its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council recently completed bioassessment surveys, which were used to inform the newly adopted restoration action plan, which will guide future restoration actions.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council focuses its restoration efforts on private lands and is making progress on existing restoration projects.

OWEB staff found the council demonstrates some ***progress in community engagement*** for watershed restoration purposes. The council has struggled to restart its usual stakeholder engagement approaches post-COVID and is reaching out to landowners to discuss restoration opportunities as its primary outreach tool.

Concerns

The council continues to struggle to recruit a board member from the industrial timber industry, which should be an organizational priority during the next biennium.

The council is using limited approaches to outreach and engage the broader watershed community. Broader stakeholder engagement may lead to increased council participation and help with future board recruitment.

Concluding Analysis

The council has demonstrated progress in all merit criteria and is recommended for full funding. However, the council needs to focus on improving both organization governance and management and stakeholder engagement in the 2023-2025 biennium to ensure it continues to demonstrate process in those two merit criteria areas. The council should consider reviewing its approach to board meetings, including location and time, to make the meetings more accessible to all community members and working to engage with a broader aspect of the watershed.

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: 1) The council must submit a progress report by July 1, 2024 reporting on the following:

- Progress toward engaging an industrial timber industry member on the board, including a description of what outreach efforts were taken and the result of those efforts.

- Progress in current stakeholder engagement activities and the development of new approaches and efforts to make the council meetings more available to the community at large.

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-022

Project Name: 23-25 CWC Capacity

Applicant: Calapooia WC

Application Description

This project seeks to fund a Watershed Council Coordinator for the Calapooia Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council has successfully recruited three new board members and the board continues to be engaged in governance and management. The council recently updated its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is actively using its monitoring activities and local, state and federal plans to inform and plan future restoration actions.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is implementing existing restoration projects based on watershed priorities and has some projects currently in development. It will be important for the council to use its planning efforts and partnerships to make progress on future on-the-ground restoration actions.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council has partnered with the Mid-Willamette Partnership to increase its capacity for outreach and partnership collaboration. The council is developing new tribal partnerships through its engagement in the Mid-Willamette Beaver Partnership.

Concerns

The council is relying on its participation in partnerships to advance its community engagement priorities. The council should continue to evaluate its approach to engagement and find ways to prioritize stakeholder engagement as well as restoration actions.

The council has been focused on restoration projects developed by partners or previous staff; the council does not have a lot of new priority projects on the horizon.

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: None

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-023

Project Name: Clackamas River Basin Council Capacity

Applicant: Clackamas River Basin Council

Application Description

This project seeks to fund a Watershed Council Coordinator for the Clackamas River Basin Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality –altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council is actively engaged in council management and continues to work on improving board governance with a focus on being a welcoming and inclusive organization.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is actively engaging in multiple planning processes, including the Clackamas Basin Partnership, and is using local, state and federal plans to plan and prioritize its work.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and has many projects currently in development through the Clackamas Basin Partnership FIP.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council, with its partners, is using multiple stakeholder engagement methods to engage the local community, including events spread throughout the watershed and focused on a diversity of community groups.

Concerns

The council last reviewed its policies and bylaws in 2019. The council must complete another review before the next council capacity application deadline in 2025 to ensure they meet the eligibility criteria of a review once every 3 years.

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-024

Project Name: Coast Fork Willamette Watershed Council Capacity 23-25

Applicant: Coast Fork Willamette WC

Application Description

This project seeks to fund a Watershed Council Coordinator for the Coast Fork Willamette Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality - altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board is actively engaged in council management and governance and regularly reviews and updates its policies and procedures. The council has a diverse board that is representative of the watershed community. The council recently updated its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is actively engaging in multiple planning processes, including engagement with the Upper Willamette Stewardship Network. The council regularly updates and seeks input on its planning documents to ensure they are living documents.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and is strategic in its restoration efforts. The council leverages its partnerships to help increase its capacity to achieve restoration outcomes in the watershed.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council uses multiple stakeholder engagement methods to engage the local community. The council leverages its partnerships to help increase its capacity to engage broadly within the watershed. The council is engaged with the Upper Willamette Stewardship Network to explore and learn how to be more inclusive and increase its engagement with non-traditional partners.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-025

Project Name: CSWC GCS 2023-25

Applicant: Columbia Slough WC

Application Description

This project seeks to fund a Watershed Council Coordinator for the Columbia Slough Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board has focused on justice, equity, diversity and inclusion training and creating a more inclusive board and organization. The board has been very engaged during several recent staff transitions. The council recently updated it policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council has a Stewardship Action plan that it uses to plan and prioritize its work. The council is successfully engaging under-represented communities in planning efforts.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council has worked to define its restoration niche in the watershed and is making progress on restoration projects appropriate to the urban landscape.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council uses multiple stakeholder engagement methods to engage the diverse watershed community, including bilingual events.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council meets on a regular basis and regularly reviews and updates council documents. The council board has focused on board recruitment and recently added a new member from the upper watershed. The council recently updated its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is actively engaging in multiple planning processes, including the implementation of the Clackamas Partnership SAP. The council will be working to develop a new Action Plan during the 23-25 biennium.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and has many projects currently in development both within and outside the new Clackamas Basin Partnership FIP.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council, with its partners, is using multiple stakeholder engagement methods to engage the local community, including citizen science events spread throughout the watershed. The council is planning broad outreach in coordination with the development of its new Action Plan.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board has taken a leadership role during the executive director transition. The council board has focused on board recruitment and is working to address geographic, racial and ethnic diversity on the board and within the organization. The council recently updated its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council uses multiple documents to plan and prioritize the work of the council. The council is currently updating its Strategic Plan to inform its next 20 years. The council is actively engaging in multiple planning processes, including the Willamette Oak Partnership, and is working to expand its work with tribal partners.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and is working on new, innovative restoration approaches in urban settings and related to fire. The council leverages its partnerships, including the Upper Willamette Stewardship Network, to help increase its capacity to achieve restoration outcomes in the watershed.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council, with its partners, is using multiple stakeholder engagement methods to engage the local community. The council leverages its partnerships, including the Upper Willamette Stewardship Network, to help increase its capacity to explore and learn how to be more inclusive and increase its engagement with non-traditional partners.

Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board is engaging with and providing support, management, and direction to the council. The council board has prioritized DEI training and awareness, moving the council towards a more inclusive organization.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is actively engaging in multiple planning processes across the watershed and using monitoring data to help inform future restoration actions.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and is focusing on strategic areas within the watershed to do both stakeholder engagement and restoration.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council, with its partners, is using multiple stakeholder engagement methods to engage the local community, including events spread throughout the watershed. The council's engagement with the Mid-Willamette Partnership is helping to expand its capacity to engage and partner in the watershed.

Concerns

The council last reviewed its bylaws in 2021. The council must complete another review before the next council capacity application deadline in 2025 to ensure they meet the eligibility criteria of a review once every 3 years.

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-029

Project Name: Middle Fork Willamette Watershed Council Capacity Application 2023-2025

Applicant: Middle Fork Willamette WC

Application Description

This project seeks to fund a Watershed Council Coordinator for the Middle Fork Willamette Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality - altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board is engaging with and providing support, management, and direction to the council during the recent staff transitions. The council recently updated its policies and procedures.

OWEB staff found the council demonstrates ***effective progress in planning***. The council recently updated its Strategic Plan, is actively engaging with multiple planning processes across the watershed, and is working with a diversity of partners within the Upper Willamette Stewardship Network as well as other local partnerships to plan the work of the council.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and has limited future restoration projects identified at this time. It will be important for the council to use its new strategic plan to identify and prioritize future restoration actions.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council, with its partners, is using multiple stakeholder engagement methods to engage the local community. The council leverages its partnerships, including the Upper Willamette Stewardship Network, to help increase its capacity to engage with the entire watershed community.

Concerns

During recent staffing transitions the council has made progress on existing restoration projects and focused on organizational governance and management. It is important that the council thinks strategically about what comes next related to on-the-ground restoration and continues to pursue projects that align with the new strategic plan.

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-030

Project Name: 2023-2025 North Santiam Watershed Council Capacity Grant

Applicant: North Santiam WC

Application Description

This project seeks to fund a Watershed Council Coordinator for the North Santiam Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board is engaging with and providing support, management, and direction to the council. The council board provided leadership during recent staffing transitions and challenges. The council recently updated its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council purposefully adjusted the priorities of the council to support communities impacted by the fall 2020 fires. It is important for the council to begin to plan for council priorities post-fire recovery.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council has focused its restoration efforts on post-fire recovery in the area impacted by the 2020 fires. The council needs to plan and prioritize future restoration actions as it moves past fire recovery.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council has partnered with the Mid-Willamette Partnership to increase its capacity for outreach and partnership collaboration. The council needs to plan and prioritize future stakeholder engagement actions as it moves past fire recovery.

Concerns

The council has been very focused and engaged with post-fire recovery in the watershed. The council needs to think strategically about what comes next for the council in relation to on-the-ground restoration and stakeholder engagement.

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-031

Project Name: Pudding River Watershed Council Capacity Grant 2023-2025

Applicant: Pudding River WC

Application Description

This project will enable the council to continue partnership support to various state and federal agencies currently relying on the Council for their role in organizing the grassroots in an otherwise difficult to access demographic area. Limiting factors include high stream temperatures due to a lack of riparian vegetation, over-appropriation of stream flow in the summer, numerous fish passage barriers, erosion and sedimentation, invasive plant species, wetland degradation, lack of floodplain connectivity and low public engagement.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board is engaging with and providing support, management, and direction to the council. The council recently updated its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council recently adopted a new strategic plan, after significant stakeholder engagement, and is using the plan to prioritize the work of the council.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and has projects currently in development that are in support of its strategic plan.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council is working with partners in the watershed to expand its engagement opportunities and develop a communication strategy.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria

Applicant: Scappoose Bay WC

Application Description

This project seeks to fund a Watershed Council Coordinator for the Scappoose Bay Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board is engaging with and providing support, management, and direction to the council. The council board has provided leadership and support during recent staffing transitions. The council recently updated its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is using local, state and federal plans and an existing council strategic plan to guide its restoration work.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council has made great progress on existing restoration projects despite council staffing turnover and has projects currently in development that are in support of council priorities.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council has a strong outreach program and regularly hosts community events, including work with its native plant nursery.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142

Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-036

Project Name: South Santiam Watershed Council Capacity 23-25

Applicant: South Santiam WC

Application Description

This project seeks to fund a Watershed Council Coordinator for the South Santiam Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board is engaging with and providing support, management, and direction to the council. The council recently reviewed and updated it policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is using local, state and federal plans and an existing council strategic plan to guide its restoration work.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and has limited future restoration projects identified. It will be important for the council to use its planning documents and partnerships to make progress on future on-the-ground restoration actions.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council has partnered with the Mid-Willamette Partnership to increase its capacity for outreach and partnership collaboration.

Concerns

As a result of staffing transitions the council struggled with meeting reporting requirements at the beginning of the biennium, which impacted the ability of the council to get new grant agreements. The council coordinator has worked with OWEB staff to resolve the reporting issues.

The council has focused on operations during recent staff transitions, the council needs to think strategically about what comes next in relation to on-the-ground restoration and stakeholder engagement.

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board is engaging with and providing support, management, and direction to the council. The council is focusing on DEI principles, recently updated its policies and bylaws, and is working to recruit new board members.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is leading and engaging in both organizational and local planning efforts. The council is using data from recent Rapid Bio-Assessments to update restoration action plans.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and has projects currently in development that are in support of its planning efforts.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council, with its partners, is using multiple stakeholder engagement methods to engage the local community and is planning for future stakeholder engagement actions. The council has adopted an equity action plan to help guide the council's future outreach actions.

Concerns

Applicant: McKenzie Watershed Alliance

Application Description

This project seeks to fund a Watershed Council Coordinator for the McKenzie River Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board is engaging with and providing support, management, and direction to the council. The council board has continued to work to diversify its board membership and recently added new members. The council recently updated its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council continues to be engaged in planning and project implementation through the Pure Water Partnership. The council is using the assessment documents that were generated in response to the Holiday Farm Fire to plan and prioritize its work.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and has projects currently in development that are in support of its planning efforts. The council continues to develop new restoration projects based on assessments from the Holiday Farm Fire.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council is collaborating with the Upper Willamette Stewardship Network and Pure Water Partners to expand its ability to engage with the watershed community. The council continues to engage with the watershed community in a variety of ways.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: None

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-039

Project Name: Greater Yamhill Watershed Council Capacity 2023-2025

Applicant: Greater Yamhill Watershed Council

Application Description

This project seeks to fund a Watershed Council Coordinator for the Greater Yamhill Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***some governance and management***. The council board provided oversight of the council during a period of staff transition and is working to improve governance and management. The council has contracted with a CPA to improve its fiscal management. The council recently updated its policies and bylaws.

OWEB staff found the council demonstrates ***some progress in planning***. The council has identified the need for a new strategic plan to guide its work and is working to secure funding and support to complete the plan early in the next biennium.

OWEB staff found the council demonstrated ***some progress in on-the-ground watershed restoration***. The council has worked with BLM to implement restoration in the watershed.

OWEB staff found the council demonstrates ***some progress in community engagement*** for watershed restoration purposes. The council worked to build connections with private landowners and industrial timber companies.

Concerns

The council struggled with meeting OWEB reporting requirements throughout the biennium. The board recently hired a new coordinator and needs to develop a governance and management structure that provides adequate staff oversight.

The council has not pursued any of its own restoration work and it is not clear what the council's restoration niche is in the watershed.

The council has no clear strategy for stakeholder engagement and completed limited activities during the biennium.

Concluding Analysis

The council did not demonstrate through the application materials and the secondary interview that it meets all the merit criteria. The council has struggled for multiple biennia to demonstrate effective governance and management. The council did demonstrate some progress in all merit criteria, but needs to work on governance and management, identifying a clear restoration and stakeholder engagement niche for the council in the watershed, and being strategic in its future actions.

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Recommendations

Staff Recommendation to the Board: Reduced funding for 1 year. The second year of funding is contingent on the council meeting the conditions described below. Staff will come to the board in July 2024 with a funding recommendation.

Staff Recommended Award: $66,467

Staff Conditions

- All watershed council approved meeting minutes must be posted on the council's website within 30 days of the meeting at which they were approved.
- All council meeting agendas must be posted on the council's website at least 24 hours before the scheduled council meeting.

Progress Report Requirements

Quarterly Progress reports are required to be submitted to the OWEB Project Manager. Reports must address the progress the council is making to meet OWEB's five merit criteria. The council must demonstrate it is making progress in merit criteria by May 2024 or OWEB staff will not recommend a second year of funding to the OWEB Board. The progress reports must include the following information:

Merit Criteria #1: Effective governance and management:

Actions the council is taking to ensure effective governance and management of the council, including: 1) management of the council coordinator, and 2) sound fiscal and project management reporting.

Merit Criteria #2: Progress in planning:

A description of progress the council is making on updating its strategic plan, including how the council is engaging with the community during the strategic plan development process.

Merit Criteria #3: Progress in on-the-ground restoration:

Actions the council is taking to plan and implement on-the-ground restoration including the number of applications submitted.

Merit Criteria #4: Progress in community engagement for watershed restoration purposes:

Actions the council is taking to engage with the watershed community. Including events held and attendance at the events and attendance at board meetings.

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-040

Project Name: Klamath Watershed Partnership Council Capacity 2023-2025

Applicant: Klamath Watershed Partnership

Application Description

The project seeks to fund a Watershed Council Coordinator position and operating expenses for the Klamath Watershed Partnership. Council-identified watershed limiting factors include knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality-altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board is engaging with and providing support, management, and direction to the council. The council board recently added a new member from the Klamath Tribes.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is using the Upper Klamath Basin Watershed Action Plan to guide its work and has been involved in post-fire recovery in the watershed. The council is also involved in other planning efforts, including the Klamath Lake Forest Health Partnership.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council has a clear restoration niche in the watershed and is making progress on existing restoration projects and has projects currently in development that are in support of its planning efforts. The council is involved in restoration work as a result of recent fires.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council is actively working on stakeholder engagement within the basin and has played a significant role in stakeholder engagement in the local SIA work with the SWCD.

Concerns

The council last reviewed its policies and bylaws in early 2022. The council must complete another review before the next council capacity application deadline in 2025 to ensure they meet the eligibility criteria of a review once every 3 years.

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: None

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-041

Project Name: Council Capacity Grant 2023-2025

Applicant: Crooked River WC

Application Description

This project seeks to fund a Watershed Council Coordinator for the Crooked River Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, physical habitat quality - altered quality of physical habitat.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council regularly holds meetings and makes the information available to the general public. The council has a large board that is representative of the watershed.

OWEB staff found the council demonstrates ***effective progress in planning***. The council uses local, state, federal and its own council action plan to plan and prioritize the work of the council.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and has a clear niche in the watershed. The council is using its planning documents to guide future restoration work in the watershed.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council is actively working on stakeholder engagement within the basin and is targeting landowner outreach in specific basins for the purposes of implementing future restoration actions.

Concerns

The council last reviewed its policies and bylaws in early 2022. The council must complete another review before the next council capacity application deadline in 2025 to ensure they meet the eligibility criteria of a review once every 3 years.

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: None

Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-042

Project Name: Gilliam-East John Day Watershed Council Capacity 2023-2025

Applicant: Gilliam SWCD

Application Description

This project seeks to fund a Watershed Council Coordinator for the Gilliam-East John Day Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, physical habitat quality - altered quality of physical habitat, water quality - altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board engages with and provides support, management, and supervision to the council coordinator. The council board has continued to be engaged and to take a leadership role throughout recent coordinator transitions and staffing challenges. The council recently updated its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council has a clear niche in the watershed and works closely with the SWCD and other partners to plan and prioritize the work of the council.

OWEB staff found the council demonstrates ***some progress in on-the-ground watershed restoration***. The council is a key partner is many restoration efforts by assisting in outreach, planning and coordination. The council is not taking an active role in implementation.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council has a clear niche in the watershed and is actively working on stakeholder engagement within the basin and is targeting landowner outreach in relation to RCPP and other programs.

Concerns

The council is not actively engaged in on-the-ground restoration and needs to better define its niche related to restoration work in the watershed.

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria

Application # 224-043

Project Name: Hood River Watershed Group Council Capacity 2023

Applicant: Hood River WS Group

Application Description

This project seeks to fund a Watershed Council Coordinator for the Hood River Watershed Group. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board engages with and provides support, management, and supervision to the council coordinator. The council became a non-profit during the biennium and updated it bylaws and other governing documents in the process.

OWEB staff found the council demonstrates ***effective progress in planning***. The council worked with local partners to complete the Hood River Partnership SAP and is using the document to plan and prioritize its work.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and planning for future projects. The council has a clear restoration niche in the watershed.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council is actively working with a variety of stakeholders in the watershed and has created some new partnerships to expand its presence in the community.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142

Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-044

Project Name: Middle Deschutes Watershed Council Capacity 2023-2025

Applicant: Jefferson SWCD

Application Description

This project seeks to fund a Watershed Council Coordinator for the Middle Deschutes Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality - altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board engages with and provides support, management, and supervision to the council coordinator. The council coordinator and board are working to fill positions on the board, including the tribal representative.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is working to update its Trout Creek Action Plan with National Water Quality Institute funding and will use the updated plan to guide future restoration work.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council's new coordinator is working to complete existing restoration projects and planning for future restoration projects in the Trout Creek and Willow Creek watersheds.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council recruited new members and is holding tours and other community events to engage a broad representation of the watershed.

Concerns

The council last reviewed its policies in 2021. The council must complete another review before the next council capacity application deadline in 2025 to ensure they meet the eligibility criteria of a review once every 3 years.

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-045

Project Name: Council Capacity - Lake County Umbrella Watershed Council 23-25

Applicant: Lake County Umbrella Watershed Council

Application Description

This project seeks to fund a Watershed Council Coordinator for the Lake County Umbrella Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality - altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board consists of many long-serving members who take an active role in leadership and management of the council. The council was recently able to recruit a new board member and updated its bylaws and policies.

OWEB staff found the council demonstrates ***effective progress in planning***. The council does a great job planning and collaborating with partners. The council is involved in many planning efforts, including SIAs, Warner Basin FIP, and forest health.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and has many projects currently in development that support their ongoing planning efforts. The council has done a good job managing both post-fire recovery work as well as its other existing restoration commitments.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council is very active in the community and uses diversity outreach methods to engage the local community.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria

Council-identified watershed limiting factors include habitat access -impaired access to habitat, hydrograph/water quantity - altered hydrology, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council coordinating board is very active and engages both in organizational governance and management as well as outreach to the individual watersheds. The council recently updated its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is working with multiple partners throughout the basin on a variety of planning efforts including on SIAs, East Cascades Oak FIP, and the forest collaborative. The council is currently working to update its action plan.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council has developed a clear niche in the watershed and collaborates with the SWCD to plan and implement restoration projects that align with the council's priorities.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council is actively working on engaging with community members throughout the watershed and offered several in-person outreach events during the last biennium.

Concerns

None

Application Description

This project seeks to fund a Watershed Council Coordinator for the North Fork John Day Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality - altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board engages with and provides support, management, and supervision to the council coordinator. The council has a large and engaged board with tribal representation and is working to fill identified caps. The council recently updated its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is engaged in multiple planning efforts and uses local, state, federal and council plans to plan and prioritize the work of the council.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and planning for future projects linked to current planning and data collection efforts.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council is actively working on engaging local community members throughout the watershed. The council is working with a local veterans group.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: None

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-053

Project Name: Council Capacity 2023-2025

Applicant: Umatilla Basin WS Foundation

Application Description

This project seeks to fund a Watershed Council Coordinator for the Umatilla Basin Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

OWEB staff found the council demonstrates ***some progress in planning***. The council is working with landowners to identify and prioritize barriers for future removal and is planning on reengaging the Umatilla Basin Technical Team.

The council demonstrates ***some progress in on-the ground watershed restoration*****,** the council completed 100% designs for two future restoration projects.

OWEB staff found the council demonstrates ***some progress in community engagement*** for watershed restoration purposes. The council completed two river clean-up events during the biennium.

Concerns

The council continues to struggle with ***effective governance and management.*** Despite many reminders and grant agreement conditions, the council coordinator continues to miss OWEB grant fiscal and project reporting deadlines. The council is struggling to have a quorum at board meetings and is not consistently taking and approving minutes. The council does not have a plan for recruiting new board members or addressing the current organizational challenges.

The council is relying on planning documents completed by local partners, the council would benefit from completing its own strategic plan in the 2023-2025 biennium that could be used to guide the council in its restoration and outreach efforts.

The council completed no restoration projects in the 2021-2023 biennium, and it is not clear what the restoration niche is for the council or how it is identifying and prioritizing its restoration work.

Concluding Analysis

The council has not met all of OWEB's merit criteria. The council does not demonstrate effective governance and management and has not addressed the concerns identified in the 2021-2023 council capacity evaluation. In addition, the council has made limited progress toward on-the ground restoration.

Recommendations

Staff Recommendation to the Board: Reduced funding for 1 year. The second year of funding is contingent on the council meeting the conditions described below. Staff would come to the board in July 2024 with a funding recommendation.
Staff Recommended Award: $66,457

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Staff Conditions

- All watershed council approved meeting minutes must be posted on the council's website within 30 days of the meeting at which they were approved.
- All council meeting agendas must be posted on the council's website at least 24 hours before the scheduled council meeting.
- The OWEB Project Manager must receive, via email, agendas and minutes of all meetings.

Progress Report Requirements

Quarterly Progress reports are required to be submitted to the OWEB Project Manager. Reports must address the progress the council is making to meet OWEB's five merit criteria. The council must demonstrate it is making progress in merit criteria by May 2024 or OWEB staff will not recommend a second year of funding to the OWEB Board. The progress reports must include the following information:

Merit Criteria #1: Effective Governance and Management
Actions the council is taking to ensure effective governance and management of the council, including 1) management of the council coordinator, 2) sound fiscal and project management reporting, 3) copies of all meeting minutes and agendas from the previous quarter.
Merit Criteria #2: Progress in planning:
An update on the status of reconvening the Umatilla Basin Tech Team, including membership, meeting notes, and meeting agendas.
An updated council work plan.
Merit Criteria #3: Progress in on-the-ground restoration:
Actions the council is taking to plan and implement on-the-ground restoration, including number of applications submitted.
Merit Criteria #4: Progress in community engagement for watershed restoration purposes:
Actions the council is taking to engage with the watershed community. Including events held and attendance at the events and attendance at board meetings.

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-055

Project Name: Mid John Day Watershed Council

Applicant: Bridge Creek WC

Application Description

This project seeks to fund a Watershed Council Coordinator for the Mid John Day-Bridge Creek Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board engages with and provides support, management, and supervision to the council and spent significant time on organizational governance and management this biennium. The council recently updated its bylaws and policies and procedures and recruited three new board members.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is engaged in multiple planning efforts throughout the basin and is using partnership plans and its own action plan to plan and prioritize the work of the council.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and planning for future projects linked to current planning and data collection efforts.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council participates in a variety of events throughout the watershed to connect with the community.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-056

Project Name: Owyhee Watershed Council Capacity 23-25

Applicant: Owyhee WC

Application Description

This project seeks to fund a Watershed Council Coordinator for the Owyhee Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board engages with and provides support, management, and supervision to the council. The council recently updated its bylaws and policies and procedures and will be focusing on board recruitment during the next biennium.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is using local, state, federal and its own action plan to guide its work. The council will be working with local partners to develop a rangeland strategy in the next biennium.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and planning for future projects linked to current planning and data collection efforts.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council worked to engage local partners in a variety of ways and develop a new website. In the next biennium the council will tie its engagement to the development of a local rangeland strategy.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142

2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-057

Project Name: Powder Basin Watershed Council Capacity Grant 23-25

Applicant: Powder Basin WC

Application Description

This project seeks to fund a Watershed Council Coordinator for the Powder Basin Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board engages with and provides support, management, and supervision to the council, especially during a period of recent staff transition. The board recently completed a review of its bylaws and policies and procedures.

OWEB staff found the council demonstrates ***effective progress in planning***. The council recently received funding to develop a Powder Basin Action Plan, which will guide the council's future work.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and planning for future projects linked to current planning and data collection efforts. The council partners with local state and federal partners on restoration projects.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council is actively working with the local community and will incorporate stakeholder engagement in the development of the Powder Basin Action Plan.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria

2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-058

Project Name: Luckiamute Watershed Council

Applicant: Luckiamute WC

Application Description

This project seeks to fund a Watershed Council Coordinator for the Luckiamute Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board engages with and provides support, management, and supervision to the council. The council is actively working on board DEI training and continuous on-board recruitment. The board reviewed its bylaws and policies and procedures during the 21-23 biennium.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is engaged in multiple planning efforts and uses local, state, federal and its own action plan and project review committee to plan and prioritize its work.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and planning for future projects linked to current planning and data collection efforts.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council is actively working on engaging local community members throughout the watershed and is working with the River Network to engage with the community around climate change and urban watershed issues. The council has partnered with the Mid-Willamette Partnership to increase its capacity for outreach and partnership collaboration. The council is developing new tribal partnerships through its engagement in the Mid-Willamette Beaver Partnership.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: None

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-059

Project Name: Greater Oregon City Watershed Council Capacity Grant Application 2023-2025

Applicant: Greater Oregon City WC

Application Description

This project seeks to fund a Watershed Council Coordinator for the Greater Oregon City Watershed Council. Council-identified watershed limiting factors include habitat access - Impaired access to habitat; hydrograph/water quantity - altered hydrology; knowledge gaps - lack of information; physical habitat quality - altered quality of physical habitat; water quality - altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board engages with and provides support, management, and supervision to the council. The council recently updated it policies and bylaws and is looking to see how collaboration across organizations can increase its capacity.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is engaged in multiple planning efforts with a focus on Abernethy Creek and is an active participant in the Clackamas Basin FIP.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects as a member of the Clackamas Basin FIP and planning for future projects linked to current planning efforts.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council is actively working on engaging local community members throughout the watershed and is working with a neighboring watershed council on a cooperative outreach grant.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: None

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-060

Project Name: Smith River Watershed Council

Applicant: Smith River WC

Application Description

This project seeks to fund a Watershed Council Coordinator for the Smith River Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council is made-up of many long-serving board members who provide support, management, and supervision to the council. The council recently updated its policies and procedures.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is engaged in multiple planning efforts and has recently updated its strategic plan to guide its future restoration work.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on a diversity of restoration projects and planning for future projects linked to current planning and monitoring efforts.

OWEB staff found the council demonstrates some ***progress in community engagement*** for watershed restoration purposes. The council continued its relationship building with local tribes but engaged in limited outreach during the biennium. The council does have several outreach activities planned for the end of this biennium and early next biennium.

Concerns

The council engaged in limited stakeholder engagement during the last biennium. It is important for the council to engage broadly with the watershed community throughout the next biennium.

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: None

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-061

Project Name: Lower Nehalem Watershed Council

Applicant: Lower Nehalem WC

Application Description

This project will fund a Watershed Council Coordinator for the Lower Nehalem Watershed Council (LNWC). The Council has identified several limiting factors for watershed health including hydrologic alterations, impaired habitat access, water quality degradation, and knowledge gaps. These limiting factors impact a wide variety of fish and wildlife species.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board engages with and provides support, management, and supervision to the council. The council recently updated its policies and bylaws. The council continues to work on board recruitment, with both short-term and long-term strategies.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is engaged in multiple planning efforts with a focus on anchor habitat and recently completed the Strategic Action Plan for Nehalem River coho.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing complex restoration projects and working with local partners to plan and implement future projects.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council is actively working on engaging local community members throughout the watershed and with a variety of engagement methods. The council is also collaborating with other local councils to increase their collective capacity for stakeholder engagement on the North Coast.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: None

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-062

Project Name: Necanicum Watershed Council OWEB Capacity Funding 23-25

Applicant: Necanicum WC

Application Description

The grant will provide operating capacity support for the Necanicum Watershed Council, located in Seaside, Oregon. The Necanicum watershed contains 86 miles of stream habitat for Coho, Chum, fall Chinook, winter steelhead, resident cutthroat trout, brook and Pacific lamprey. Limiting factors include impaired access to habitat, high stream temperatures due to a lack of riparian vegetation, numerous fish passage barriers, erosion and sedimentation, and lack of floodplain connectivity.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board engages with and provides support, management, and supervision to the council. The council recently updated it policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council has recently updated its Strategic Action Plan, which will guide the council's future restoration efforts.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and has begun planning for some future projects linked to the new strategic plan.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council is actively working on engaging local community members throughout the watershed and with a variety of engagement methods. The council significantly increased its online presence during the biennium and is looking to increase its presence in the community next biennium.

Concerns

The council has been very involved in planning and needs to think strategically about what comes next for the council in relation to on-the-ground restoration work.

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: None

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-063

Project Name: South Fork John Day Watershed Council 2023-2025

Applicant: South Fork John Day WC

Application Description

This project seeks to fund a Watershed Council Coordinator for the South Fork John Day Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality - altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board engages with and provides support, management, and supervision to the council. The council recently updated its policies and bylaws and continues to work on recruiting new members and plan for transitions.

OWEB staff found the council demonstrates ***effective progress in planning***. The council is engaged in multiple planning and monitoring efforts throughout the basin and uses local, state, federal and its own action plan to plan and prioritize its work.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects and planning for future projects linked to current planning and data collection efforts.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council is actively working on engaging local community members throughout the watershed.

Concerns

None

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-064

Project Name: Molalla River Watch Council Capacity

Applicant: Molalla River Watch Inc

Application Description

This project seeks to fund a Watershed Council Coordinator for the Molalla River Watch. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board engages with and provides support, management, and supervision to the council. The council recently updated its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council used monitoring data to update its strategic plan and uses local, state, and federal plans to inform its work.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council is making progress on existing restoration projects in collaboration with local partners and is planning for future projects linked to current planning and watershed needs in response to fires.

OWEB staff found the council demonstrates ***effective progress in community engagement*** for watershed restoration purposes. The council has partnered with other local organizations to host events and engage with the watershed community.

Concerns

The council has been in emergency response mode since the Labor Day weekend fires and would benefit from an outreach plan to help prioritize outreach activities in the broader watershed community.

Concluding Analysis

The council demonstrated it meets all of OWEB's merit criteria and should be recommended for the highest level of funding.

Recommendations

Council Capacity Grant Awards

Board Meeting July 25-26, 2023

Oregon
Tina Kotek, Governor

OREGON WATERSHED ENHANCEMENT BOARD

775 Summer Street NE, Suite 360
Salem OR 97301-1290
www.oregon.gov/oweb
(503) 986-0178

Agenda Item H supports OWEB's Strategic Plan priority #3: Community capacity and strategic partnerships achieve healthy watersheds.

MEMORANDUM

TO: Oregon Watershed Enhancement Board

FROM: Courtney Shaff, Monitoring and Reporting Program Manager
Brian Wolcott, Water Acquisition Coordinator

SUBJECT: Agenda Item H – Council Capacity Grant Awards
July 25-26, 2023 Board Meeting

I. Introduction

This staff report provides an overview of the 2023-2025 Council Capacity grant cycle process and outlines staff recommendations for grant awards. Staff recommend funding 56 watershed councils for $9,220,881. Fifty-four are recommended for full funding, two are recommended for reduced funding and one is not recommended for funding. Evaluations may be found in Attachment A.

II. Background

Council Capacity grants are within the Operating Capacity category of the Board's spending plan and help support the operating costs of effective watershed councils. OWEB has provided Council Capacity grants for more than 20 years. Watershed councils are located throughout the state (Attachment B). OWEB does not create or oversee councils; they are locally designated watershed restoration organizations, but OWEB may provide grants to councils in support of those actions described in Measure 76.

Council Capacity grants are awarded biennially and support engagement with local communities around voluntary restoration projects to protect and restore native fish or wildlife habitats and watershed functions to improve water quality or stream flows. The Board adopted administrative rules and guidance for council capacity grants in 2014. These grants are intended to help support the operating capacity of effective watershed councils. The Council Capacity grant process includes an eligibility determination as well as initial and secondary merit reviews.

III. Merit

Merit criteria evaluate watershed councils for performance and progress including how they addresses challenges.

A. Initial Merit Review. OWEB staff completed the initial review of all fifty-seven councils that applied for funding. Staff reviewed application materials and considered their

knowledge of each council's performance history over the last two years, progress towards meeting the merit criteria, and the council's ability to meet reporting and fiscal requirements of OWEB grants when making the initial merit determination. Five watershed councils did not meet all merit criteria and were referred to the secondary review and interview process.

B. Secondary Review and Interview. The secondary review panel consisted of OWEB staff and external reviewers with expertise in watershed council operations. Reviewers considered: 1) application materials and supplemental materials provided by the council; 2) reviewers' knowledge of the council; 3) OWEB staff input; and 4) an interview with council staff and board officers. Application materials for the councils that participated in the secondary review process are available online for review.

C. **Staff Funding Recommendations**

A. Staff funding recommendations are based on the results of the initial and secondary reviews and available funding. The evaluations for councils recommended for full funding are provided via link in Attachment A. Staff recommend full funding for 54 councils that meet all merit criteria, reduced funding with conditions for two councils that met some, but not all the merit criteria, and a do not fund recommendation for one council that demonstrated inadequate progress across all the merit criteria. In addition, staff recommend one council receives continued merger funding on top of the base award as approved in previous biennia.

B. Reduced Funding. Staff recommend two councils, Greater Yamhill and Umatilla Basin, receive reduced funding because they met some but not all of the merit criteria. In addition to reduced funding, staff also recommend both councils be funded only for one year and grant agreements would include specific benchmarks each council needs to meet in order to receive the second year of funding. The evaluation summaries describing the rationale for the staff recommendations and the grant agreement conditions are provided in Attachment A, pages 10-13.

C. Do Not Fund. Staff recommend Do Not Fund for one council, Lower Columbia River WC. The evaluation summaries describing the rationale for the staff recommendations is provided in Attachment A, page 5. Given the significance of the Do Not Fund recommendation for the council, their council capacity application is found in Attachment C. It is important to note that the Do Not Fund recommendation is not permanent, and the council may submit a council capacity grant application in future cycles.

D. **Recommendation**

Staff recommend the board award council capacity grants as described in Attachment D with an award date of July 1, 2023.

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-002

Project Name: LCRWC Council Capacity and Support

Applicant: Columbia SWCD

Application Description

This project seeks to fund a Watershed Council Coordinator for the Lower Columbia River Watershed Council. Council-identified watershed limiting factors include habitat access – impaired access to habitat, hydrograph/water quantity – altered hydrology, knowledge gaps – lack of information, physical habitat quality – altered quality of physical habitat, water quality - altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council to ***demonstrate some progress in planning*** through the recent submittal of a monitoring application for a Rapid Bioassessment in the watershed. Besides the pending application, the council uses no other documents to plan or prioritize the work of the council. If the monitoring application is funded the council would convene a technical advisory team; however, members of the team have not yet been identified or contacted to see if they would be willing to participate.

Concerns

OWEB staff found the council ***does not demonstrate effective governance and management***. The council is currently operating with the fewest number of board members in the history of the organization. The vice chair recently resigned over the decision to submit a monitoring application and there are no candidates for chair or vice chair in the upcoming October council officer election. The council board has not demonstrated effective management of staff and it is not clear how the board participates in management and oversight of the coordinator, in collaboration with the SWCD, who is the employer.

OWEB staff found the council ***does not demonstrate effective progress in on-the-ground watershed restoration***. The council has implemented no restoration projects in the last two years and the two projects it was working on in the last biennium were transferred to the SWCD for implementation. The council has no clear vision for its restoration niche in the watershed.

OWEB staff found the council ***does not demonstrate effective progress in stakeholder engagement for watershed restoration purposes***. The council did not complete any stakeholder engagement activities during the 2021-2023 biennium and has no activities planned for the 2023-2025 biennium. The current board members have created an isolated environment that does not appear to be welcoming to the general public and is not effective at recruiting new engagement or interest in the council's activities.

Concluding Analysis

The watershed council does not demonstrate it is engaging with its local community to plan and develop restoration projects to support local, state, and federal restoration goals. The council membership does not include a diverse range of community interests and does not appear to be open and welcoming to the broader community. The review team did recognize the council

is showing some limited progress toward future planning with the recent submittal of a monitoring application for a rapid bioassessment, but the council did not meet any of the other merit criteria required by OWEB to receive funding.

Recommendations

Staff Recommendation to the Board: Do Not Fund

Staff Recommended Award: $0

Staff Conditions: N/A

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-007

Project Name: TBWC Capacity Grant 2023-25

Applicant: Tillamook Bay WC

Application Description

This project seeks to fund a Watershed Council Coordinator for the Tillamook Bay Watershed Council. Council-identified watershed limiting factors include habitat access – impaired access to habitat, physical habitat quality – altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council has addressed most of the concerns that were raised previously during the council capacity review process. The council was re-recognized by the Tillamook County commissioners, has engaged a new board of directors that is representative of the community, regularly holds meetings, and recently updated its bylaws and policies.

OWEB staff found the council demonstrates ***effective progress in planning***. The council has continued to plan and engage with the community despite having no council capacity funding. The council recognizes the need to engage with the local community and update the strategic plan before restarting the council's restoration program.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council continued to make progress on some restoration projects, led by volunteer board members, despite having no council capacity funding. The council is working with local partners to determine future restoration priorities.

OWEB staff found the council demonstrates ***effective progress in stakeholder engagement*** for watershed restoration purposes. Council board members have worked to rebuild relationships throughout the watershed and demonstrated the council has broad support from the watershed community.

Concerns

None

Concluding Analysis

The council was without funding for two biennia and has demonstrated it has addressed OWEB's previous concerns and is making progress in all of OWEB's merit criteria. The council should be recommended for the highest level of funding.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: None

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-021

Project Name: Elk Creek Watershed Council Support 2023

Applicant: Elk Creek WC

Application Description

Project will provide funding for the Coordinator/Executive Director, and operations of the Elk Creek Watershed Council in the northern part of Douglas County. The Council will work with local landowners and state and federal agencies to plan, develop, and implement on-the-ground projects to benefit fish and wildlife, and water quality in the Elk Creek Watershed, and in the Umpqua basin. Key partners are local landowners, Douglas and Umpqua SWCD, ODFW, Roseburg District BLM, and others.

Review

Strengths

OWEB staff found the council demonstrates ***effective governance and management***. The council board is engaged and supportive of the council and has recently recruited a new board member. The council recently reviewed its policies and bylaws.

OWEB staff found the council demonstrates ***effective progress in planning***. The council recently completed bioassessment surveys, which were used to inform the newly adopted restoration action plan, which will guide future restoration actions.

OWEB staff found the council demonstrates ***effective progress in on-the-ground watershed restoration***. The council focuses its restoration efforts on private lands and is making progress on existing restoration projects.

OWEB staff found the council demonstrates some ***progress in community engagement*** for watershed restoration purposes. The council has struggled to restart its usual stakeholder engagement approaches post-COVID and is reaching out to landowners to discuss restoration opportunities as its primary outreach tool.

Concerns

The council continues to struggle to recruit a board member from the industrial timber industry, which should be an organizational priority during the next biennium.

The council is using limited approaches to outreach and engage the broader watershed community. Broader stakeholder engagement may lead to increased council participation and help with future board recruitment.

Concluding Analysis

The council has demonstrated progress in all merit criteria and is recommended for full funding. However, the council needs to focus on improving both organization governance and management and stakeholder engagement in the 2023-2025 biennium to ensure it continues to demonstrate process in those two merit criteria areas. The council should consider reviewing its approach to board meetings, including location and time, to make the meetings more accessible to all community members and working to engage with a broader aspect of the watershed.

Recommendations

Staff Recommendation to the Board: Full base funding: meets all merit criteria
Staff Recommended Award: $166,142
Staff Conditions: 1) The council must submit a progress report by July 1, 2024 reporting on the following:

- Progress toward engaging an industrial timber industry member on the board, including a description of what outreach efforts were taken and the result of those efforts.

- Progress in current stakeholder engagement activities and the development of new approaches and efforts to make the council meetings more available to the community at large.

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-039

Project Name: Greater Yamhill Watershed Council Capacity 2023-2025

Applicant: Greater Yamhill Watershed Council

Application Description

This project seeks to fund a Watershed Council Coordinator for the Greater Yamhill Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

Strengths

OWEB staff found the council demonstrates ***some governance and management***. The council board provided oversight of the council during a period of staff transition and is working to improve governance and management. The council has contracted with a CPA to improve its fiscal management. The council recently updated its policies and bylaws.

OWEB staff found the council demonstrates ***some progress in planning***. The council has identified the need for a new strategic plan to guide its work and is working to secure funding and support to complete the plan early in the next biennium.

OWEB staff found the council demonstrated ***some progress in on-the-ground watershed restoration***. The council has worked with BLM to implement restoration in the watershed.

OWEB staff found the council demonstrates ***some progress in community engagement*** for watershed restoration purposes. The council worked to build connections with private landowners and industrial timber companies.

Concerns

The council struggled with meeting OWEB reporting requirements throughout the biennium. The board recently hired a new coordinator and needs to develop a governance and management structure that provides adequate staff oversight.

The council has not pursued any of its own restoration work and it is not clear what the council's restoration niche is in the watershed.

The council has no clear strategy for stakeholder engagement and completed limited activities during the biennium.

Concluding Analysis

The council did not demonstrate through the application materials and the secondary interview that it meets all the merit criteria. The council has struggled for multiple biennia to demonstrate effective governance and management. The council did demonstrate some progress in all merit criteria, but needs to work on governance and management, identifying a clear restoration and stakeholder engagement niche for the council in the watershed, and being strategic in its future actions.

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Recommendations

Staff Recommendation to the Board: Reduced funding for 1 year. The second year of funding is contingent on the council meeting the conditions described below. Staff will come to the board in July 2024 with a funding recommendation.

Staff Recommended Award: $66,467

Staff Conditions

- All watershed council approved meeting minutes must be posted on the council's website within 30 days of the meeting at which they were approved.
- All council meeting agendas must be posted on the council's website at least 24 hours before the scheduled council meeting.

Progress Report Requirements

Quarterly Progress reports are required to be submitted to the OWEB Project Manager. Reports must address the progress the council is making to meet OWEB's five merit criteria. The council must demonstrate it is making progress in merit criteria by May 2024 or OWEB staff will not recommend a second year of funding to the OWEB Board. The progress reports must include the following information:

Merit Criteria #1: Effective governance and management:

Actions the council is taking to ensure effective governance and management of the council, including: 1) management of the council coordinator, and 2) sound fiscal and project management reporting.

Merit Criteria #2: Progress in planning:

A description of progress the council is making on updating its strategic plan, including how the council is engaging with the community during the strategic plan development process.

Merit Criteria #3: Progress in on-the-ground restoration:

Actions the council is taking to plan and implement on-the-ground restoration including the number of applications submitted.

Merit Criteria #4: Progress in community engagement for watershed restoration purposes:

Actions the council is taking to engage with the watershed community. Including events held and attendance at the events and attendance at board meetings.

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Application # 224-053

Project Name: Council Capacity 2023-2025

Applicant: Umatilla Basin WS Foundation

Application Description

This project seeks to fund a Watershed Council Coordinator for the Umatilla Basin Watershed Council. Council-identified watershed limiting factors include habitat access - impaired access to habitat, hydrograph/water quantity - altered hydrology, knowledge gaps - lack of information, physical habitat quality - altered quality of physical habitat, water quality -altered physical, chemical, or biological water characteristics.

Review

OWEB staff found the council demonstrates ***some progress in planning***. The council is working with landowners to identify and prioritize barriers for future removal and is planning on reengaging the Umatilla Basin Technical Team.

The council demonstrates ***some progress in on-the ground watershed restoration*****,** the council completed 100% designs for two future restoration projects.

OWEB staff found the council demonstrates ***some progress in community engagement*** for watershed restoration purposes. The council completed two river clean-up events during the biennium.

Concerns

The council continues to struggle with ***effective governance and management.*** Despite many reminders and grant agreement conditions, the council coordinator continues to miss OWEB grant fiscal and project reporting deadlines. The council is struggling to have a quorum at board meetings and is not consistently taking and approving minutes. The council does not have a plan for recruiting new board members or addressing the current organizational challenges.

The council is relying on planning documents completed by local partners, the council would benefit from completing its own strategic plan in the 2023-2025 biennium that could be used to guide the council in its restoration and outreach efforts.

The council completed no restoration projects in the 2021-2023 biennium, and it is not clear what the restoration niche is for the council or how it is identifying and prioritizing its restoration work.

Concluding Analysis

The council has not met all of OWEB's merit criteria. The council does not demonstrate effective governance and management and has not addressed the concerns identified in the 2021-2023 council capacity evaluation. In addition, the council has made limited progress toward on-the ground restoration.

Recommendations

Staff Recommendation to the Board: Reduced funding for 1 year. The second year of funding is contingent on the council meeting the conditions described below. Staff would come to the board in July 2024 with a funding recommendation.
Staff Recommended Award: $66,457

Oregon Watershed Enhancement Board
2023-2025 Council Capacity Grant
Evaluation for March 15, 2023 Operating Capacity Applications

Staff Conditions

- All watershed council approved meeting minutes must be posted on the council's website within 30 days of the meeting at which they were approved.
- All council meeting agendas must be posted on the council's website at least 24 hours before the scheduled council meeting.
- The OWEB Project Manager must receive, via email, agendas and minutes of all meetings.

Progress Report Requirements

Quarterly Progress reports are required to be submitted to the OWEB Project Manager. Reports must address the progress the council is making to meet OWEB's five merit criteria. The council must demonstrate it is making progress in merit criteria by May 2024 or OWEB staff will not recommend a second year of funding to the OWEB Board. The progress reports must include the following information:

Merit Criteria #1: Effective Governance and Management
Actions the council is taking to ensure effective governance and management of the council, including 1) management of the council coordinator, 2) sound fiscal and project management reporting, 3) copies of all meeting minutes and agendas from the previous quarter.
Merit Criteria #2: Progress in planning:
An update on the status of reconvening the Umatilla Basin Tech Team, including membership, meeting notes, and meeting agendas.
An updated council work plan.
Merit Criteria #3: Progress in on-the-ground restoration:
Actions the council is taking to plan and implement on-the-ground restoration, including number of applications submitted.
Merit Criteria #4: Progress in community engagement for watershed restoration purposes:
Actions the council is taking to engage with the watershed community. Including events held and attendance at the events and attendance at board meetings.

Total Project Amount: $133,938

Administrative Information

Abstract

Provide an abstract statement for the project. Include the following information: 1) Identify the project location; 2) Briefly state the project need; 3) Describe the proposed work; 4) Identify project partners.

LCRWC is located in Columbia and Clatsop Counties, Oregon.
The project need is capacity funding for the council, to continue watershed restoration activities within the basin and to continue stakeholder and local landowner outreach activities.

Capacity funds will dedicate resources to strengthen ongoing organizational efforts to develop new partnerships, recruit new watershed council members and continue internal board development activities. Capacity grant addresses need to expound on ongoing strategic planning efforts and expand current project portfolio. The results of an intended Rapid Biologic Assessment will guide the council going forward. component of the plan includes outreach to broaden community involvement in the watershed council mission to stakeholders and community groups. Capacity grant will also provide resources to develop technical proposals that address data gaps and existing uncertainties about watershed processes and function. Examples of these investigations include anchor habitat identification, flood profiles, rapid bio-assessments, water quality data analysis, and groundwater studies.

Capacity grant will be used to leverage additional funding authorities and expertise to maximize restoration effort needed to manage project complexities. This will contribute to shaping project concepts in collaboration with stakeholders and community groups for future feasibility inquiries and preliminary design.

CSWCD, ODFW, OWEB, Columbia County, and the City of Clatskanie are key project partners.

Location Information

Current Location:

What is the ownership of the project site(s)?

✓ *Public land (any lands owned by the Federal government, the State of Oregon, a city, county, district or municipal or public corporation in Oregon)*

What agency(ies) are involved?

City of Clatskanie, Columbia County, Evenson Logging Company, Oregon State Extension, Clastkanie Public Utilities District, City of Rainier, Oregon Department of Fish and Wildlife, Soil and Water Conservation District, Rainier High School, Clatskanie High School, North Coast Watershed Council, Scappoose Bay Watershed Council, Scappoose Sand and Gravel, Oregon Department of Environmental Quality.

❑ *Tribal lands (any lands owned/managed by a Tribal government)*

✓ *Private (land owned by non-governmental entities)*

Please select one of the following Landowner Contact Certification statements:

❍ I certify that I have informed all participating private landowners involved in the project of the existence of the application, and I have advised all of them that all monitoring information obtained on their property is public record.

● I certify that contact with all participating private landowners was not possible at the time of application for the following reasons: Furthermore, I understand that should this project be awarded, I will be required by the terms of the OWEB grant agreement to secure cooperative landowner agreements with all participating private landowners prior to expending Board funds on a property.

Please List your reasons

Scope of grant proposal is not project specific and does not involve contact with specific landownerships other than through project development and outreach activities described in work plan.

❑*Not applicable to this project*

✓*This grant will take place in more than one county.*

List the counties affected:

Columbia and Clatsop County

Permits

Other than the land-use form, do you need a permit, license or other regulatory approval of any of the proposed project activities?

❍ Yes

● No

Racial and Ethnic Impact Statement

Racial and Ethnic Impact Statement

❍ The proposed grant project policies or programs could have a disproportionate or unique POSITIVE impact on the following minority persons. (indicate all that apply)

❍ The proposed grant project policies or programs could have a disproportionate or unique NEGATIVE impact on the following minority persons. (indicate all that apply)

● The proposed grant project policies or programs WILL HAVE NO disproportionate or unique impact on minority persons.

Insurance Information

If applicable, select all the activities that are part of your project - These require a risk assessment tool unless otherwise noted (check all that apply).

❑*Working with hazardous materials (not including materials used in the normal operation of equipment such as hydraulic fluid)*

❑*Earth moving work around the footprint of a drinking water well*

❑*Removal or alteration of structures that hold back water on land or instream including dams, levees, dikes, tidegates and other water control devices (this does not include temporary diversion dams used solely to divert water for irrigation)*

❑*Applicant's staff or volunteers are working with kids related to this project (DAS Risk assessment tool not required, additional insurance is required)*

❑*Applicant's staff are applying herbicides or pesticides (DAS Risk assessment tool not required, additional insurance is required)*

✓*Insurance not applicable to this project*

Additional Information

❑*This project affects Sage-Grouse.*

Problem Statement

Does the watershed council have a fiscal sponsor?

● Yes
❍ No

For Details If yes, upload your fiscal sponsorship agreement.

Is the council a membership organization?

● Yes
❍ No

Date of last annual membership meeting.
11/12/2019

The council is a group of councils operating collectively.

❍ Yes
● No

Is the applicant a group of councils operating independently?

❍ Yes
● No

For Details Upload the council's most recent bylaws.

Councils are required to review their council's bylaws once every three years, provide the date of the last time the council's governing body reviewed the council's bylaws?

03/20/2023

Councils are required to review their policies and procedures once every three years, provide the date of the last time the council's governing body reviewed the council's policies and procedures?
03/20/2023

For Details Upload the council's most recent policies and procedures.

For Details Upload the council's local government designation

For Details Upload the council's policies and procedures.

Date of the council's 2021-2023 self assessment?
03/31/2021

Date of last council officer elections.
11/12/2019

For Details Upload the minutes from the board meeting documenting the results of the officer election.

Does the council have written position descriptions for council board officers?

● Yes
❍ No

Does the council have written roles and responsibilities for council governing body members?

● Yes
❍ No

How many times did/will the council governing body meet between July 1, 2021-June 30, 2023?

22

How many times will the council governing body meet between July 1,-June 30, of the upcoming biennium for which you are seeking funding?

4

Describe how the council advertises its general council meetings.

Regular postings are made through local newspapers, council website, e-mail lists, and through one on one outreach with council partners when guest speakers are on the agenda.

Do council governing body meetings have agendas, sign-in sheets, and minutes?

● Yes
❍ No

Describe how your board membership includes a diverse range of geographic areas and community interests in the watershed.

Current board membership is at a nadir. The current council consists of:

Four landowners along the Clatskanie River, one of whom is a county commissioner, one who does habitat restoration projects, and two timber land owners...

Three others... the county road dept manager, the city manager of Clatskanie, and the OSU extension Service person for the county.

The council currently has these seven members.

However a new person came to the monthly meeting on March 13th, 2023, a new landowner along Carcus Creek. We hope this continues.

The council passed a motion on March 13th, 2023 to review and revise the policies and procedures at the next monthly meeting scheduled for April 10th, 2023. It is hoped this revision might lead to larger membership.

Describe any board membership and recruitment challenges and actions being taken to address those challenges.

The council has been named by locals as "K.C.'s playhouse".
Locally the council is perceived as having lost its way and become ineffective and a waste of time and money. This presents recruitment challenges.
The council is addressing this challenge by attempting to renew it's direction and get some projects done on the ground.
The council is addressing this challenge by the resignation of the Vice Chairman, Gary Soderstrom.

Are projects of the council, including those identified in the work plan, identified in a council action plan or strategic plan?

● Yes
❍ No

Provide the name and date of the most recent action plan or strategic plan.

Lower Columbia River Watershed Strategic Action Plan (Review Draft) 2012

Is the work of the council specifically designed to benefit salmon or steelhead?

● Yes
❍ No

✓Columbia River - Chum Salmon
✓Lower Columbia River - Coho Salmon
✓Lower Columbia River - Chinook Salmon

Describe how the resulting council capacity grant will benefit salmon or steelhead or their habitat?

The Lower Columbia River watershed contains 36 square miles of watershed area supportive of coho, chinook, steelhead, and chum salmon populations. Watershed landscape is unique in its large expanse of private ownership which includes industrial timberlands, legacy local logging companies, small woodlots, and agricultural interests.

The council's emerging strategic action plan (SAP) is intended to capture demographics shifts in landownership from expanding exurban area and increase in visitors from tourism. SAP will select limiting factors that can be managed at local level. This includes impaired habitat complexity, access to off channel habitats, excessive fine sediment deposition, and seasonal water quality degradation. The coordinator will utilize watershed assessments, stream surveys, spatial datasets, water quality data information, and recovery plans updates to inform a prioritized list of key uncertainties and range of restoration strategies. This will be reflected in action plan drafts for council meeting discussion and engagement with council partners. SAP intends to expand diversity of project types to support broader expression of life history strategies needed for salmon recovery. This includes floodplain reconnection to side channel wetland, estuary rearing areas, and identification of anchor habitats .

Proposed Solution

Community Engagement

Briefly describe the council's stakeholder engagement accomplishments from the 2021-2023 biennium.

This coordinator has not been able to identify any stakeholder engagement accomplishments that occurred during this period.

Briefly describe the council's stakeholder engagement challenges from the 2021-2023 biennium

The stakeholder engagement challenges from this period resulted in the previous coordinator and council chairman resigning, as well as the previous SWCD director..

Briefly describe the council's stakeholder engagement plans for the 2023-2025 biennium.

Three landowners who own property on the banks of the Clatskanie River are Council members. They can provide introductions to other landowners along the Clatskanie River.

The Council is in the process of assembling an OWEB monitoring grant application for a rapid biological assessment which engages Bio Surveys Northwest to perform an outreach function with each property holder along the Clatskanie River and its tributaries in the survey area as part of the Rapid Biological Assessment (RBA).

As part of the RBA every landowner along the Clatskanie River and ten of it's key tributaries will be contacted.

Describe the council's efforts to engage with local tribes present in the council's geography.

The current coordinator has reached out to Lamprey Coordinator - Lori Porter of the Columbia River Inter Tribal Fish Commission and obtained a white paper describing lamprey passage criteria involved in evaluating lamprey passage barriers.

The current Chairman and coordinator attended the Connect+ conference and heard the Chairman of the Chinook Tribe give his keynote address.

Describe the council's efforts to engage with non-traditional partners.

None that I am aware of.

Restoration

Provide a brief summary of the council's 2021-2023 restoration accomplishments.

There are no restoration accomplishments by the council per say during this period. Two project were initiated by the council during this period,
1) A lamprey barrier survey project, and 2) a large wood placement in Carcus Creek.
The project management of both these projects were turned over to CSWCD before the current coordinator was engaged. Initiating the projects was accomplished. Management for finishing the projects was turned over to CSWCD.

Briefly describe the council's restoration challenges from the 2021-2023 biennium

Loss of morale, changed coordinators 3x in 3 years, chairman resigned, SWCD director resigned, COVID.

Three 60% design choices were completed for a channel widening and riparian restoration project on Conyer's Creek. As funding was sought, it became obvious that there was no justification for prioritizing funding for this project within the Clatskanie basin. There was no strategic plan for the basin, no action plan, no current prioritization of what needs to be done across the council's area of responsibility.

Provide a brief summary of the council's restoration plans for 2023-2025.

The coordinator is preparing a monitoring grant application for the OWEB spring funding cycle in hopes of success. Project staff will meet with Ken Fetcho (OWEB) on March 24th, 2023 to coordinate monitoring activities.

This project would fund a Rapid Biological Assessment (RBA) of the Clatskanie River Basin, including 20 of its tributaries, which would include a landowner outreach component.
This project would allow the council to prioritize restoration activities across the basin, and understand where the remaining habitat is fixable and where the remaining species of concern are located.

After over two decades of previous restoration activities, the council can identify what remains to be done in the watershed and how to prioritize the work.

The council has no current strategic plan nor a current work plan. The Rapid Biological Assessment would provide the data to create a sound scientific basis for restoration plans going forward.

Planning

Describe how the council uses planning documents to identify and implement on-the-ground watershed restoration and stakeholder engagement projects.

At this time, the council's planning documents need to be re-created and/or reviewed and revised from a 2012 plan.

The current coordinator is expecting to use the results of the Rapid Biologic Assessment (RBA) to create new planning documents and start planning, prioritizing, and providing a plan to fix the degraded habitat.

Enclosed is a draft action plan plan from 2012 found in the Council's files which has been uploaded. This plan was approved on 3/12/2012 but revisions since then have not been approved. It was under review in 2014 and 2019 during the last funding cycle, at that time submitted as a pending strategic plan/action plan.

It was pointed out at the monthly meeting last by the current chairman, who wasn't chairman at the time, that the lack of a vote recorded in the minutes could mean the current strategic plan was left unchanged by the 2014 and 2019 review cycles. Nevertheless, the plan needs drastic review and likely complete replacement.

Are projects of the council identified in a council action plan or strategic plan?

❍ Yes
● No

Wrap-Up

List the watershed council staff (or contractors), their roles, affiliation (staff or contractor), length of time in position (use the Qualifications space), and contact information.

Role	Name	Affiliation	Qualifications	Email	Phone
Coordinator	Henry Franzoni	Lower Columbia River Watershed Council	10 yrs Data Center Manager of the Fish Passage Center of the Pacific States Marine Fisheries Commission. 10 yrs project lead of the Inter-Tribal Monitoring Project of the Columbia River Inter Tribal Fish Commission. 3yrs Consulting USFWS Col. Riv.	hjfranzoni3@gmail.com	(360) 425-7140

For Details Upload a list, including contact information, for the current board officers.

Policies and Ground Rules

Adopted 9/7/97
Amended 7/11/00
Amended 6/12/12
Amended 9/9/14
Amended 9/13/16

LCRWC Members agree to the following policies and ground rules:

Council Decision-Making

- Robert's Rules of Order, Second Edition, will be used as a guide for conducting business.

- Before a decision is adopted by the council, sufficient time (30 days) will be provided for the members to seek advice from organizations they represent, agencies, or other experts.

- When a decision is reached, council members will advocate to their respective bodies support for the adoption or implementation of the decision.

- The watershed council may select a person to serve as facilitator.

Participation

- The Council will hold regular meetings and follow provisions of the Open Meetings Law. At least 10 minutes will be set aside at each meeting for public comment.
- Business may be conducted by council members present. In the absence of a majority of the council members or their alternates, a simple majority is required for approval of actions with a minimum of four members present.
- Council members will keep their respective agencies, organizations, or interests informed about the work of the council and bring concerns of their groups to the council.
- Council members may designate a representative of their group to serve as an alternate. Designated alternates will be listed on the membership list of the council.
- Each member will brief his/her alternate on all issues, proceedings, and notifications, prior to the alternate's attendance at council meetings.
- The public is invited to all council meetings and, upon request, provide meeting agendas and records of decisions other than personnel discussions and actions.

Organization and Procedures

Robert's Rules of Order shall be followed (see: Decision-Making/Ground Rules)

The Council will elect a chairperson and vice-chairperson to serve as spokespersons, prepare council agendas, call and manage council meetings, enforce ground rules, and perform other tasks as assigned by the council. The council may select other officers and fill vacancies as needed. The periodic election of officers shall take place at the regularly-scheduled meeting in October of odd-numbered years.

The Council may form subcommittees of its own members and task groups that include individuals not on the council to perform certain functions or focus on specific issues. The council will also identify technical advisors who can provide technical data and assistance and call on these experts as needed.

All Council members are eligible to serve as officers or committee members.

There are no term limits for officers.

The Council will hold monthly meetings on the second Tuesday of every month unless otherwise announced.

Council will seek funding for the ongoing operations.

The Columbia SWCD will act as the Council's fiscal agent and follow Generally Accepted Accounting Principles (GAAP).

The Council will not use litigation as a method to implement the Council's mission.

Amendments
A council member may propose an amendment to these Ground Rules at any regularly-scheduled meeting. A vote on the amendment shall take place at the next regularly-scheduled meeting. An affirmative vote by 10 members, or two-thirds of those members present, whichever is greater, will ratify the amendment.

FISCAL SPONSORSHIP and EMPLOYMENT AGREEMENT
Between the Columbia Soil and Water Conservation District And the Lower Columbia River Watershed Council

PARTIES. The parties to this agreement are:

A. Columbia Soil and Water Conservation District, hereafter referred to as "Columbia SWCD."

B. Lower Columbia River Watershed Council hereafter referred to as "LCRWC."

PURPOSE AND RECITALS.

The Columbia SWCD is a political subdivision of the state of Oregon organized and chartered in January of 1947, and considered a municipal corporation, a form of local government under ORS 190.003. It is governed by a host of statutes in Oregon Revised Statutes, chapter 568 and all corresponding Oregon State Laws. The Internal Revenue Service considers SWCDs as instrumentalities of state or municipal government, thus qualifying as tax-exempt under Section 115 of the Internal Revenue Code. The mission of the Columbia Soil & Water Conservation District is to provide educational, technical and financial assistance to our community for the protection, conservation and restoration of natural resources.

A. The LCRWC is an affiliation of stakeholders formed into a Watershed Council under ORS 541.910 to reflect the interests of the Lower Columbia Watershed. It was organized in July, 1997. It is one of three Watershed Councils in Columbia County. The mission of the Lower Columbia River Watershed Council is to improve watershed functionality across the watershed through education, cooperation, stewardship, and restoration/mitigation projects.

B. The parties listed above have entered into this Fiscal and Employment Sponsorship Agreement in order to: 1) formalize their existing relationship, 2) expand their respective capacities, 3) capitalize on their organizational and membership strengths, and 4) extend their missions to all members of the community and stakeholders in the natural resource arena.

AGREEMENT: The parties listed above agree to be legally bound by the following:

COLUMBIA SWCD'S RESPONSIBILITIES. The Columbia SWCD agrees to serve as the employer of staff working on behalf of the LCRWC. Employees, such as the LCRWC Coordinator, work primarily on LCRWC activities. Other employees of the Columbia SWCD may also work on LCRWC activities as part of their assigned tasks. The Columbia SWCD also agrees to act as Fiscal Sponsor for the LCRWC, to receive donations, grants and sign contracts intended to provide financial support to the LCRWC, to treat all funds intended for the LCRWC as restricted funds, and to use such grants and donations to provide funds and staff for the LCRWC so long as the LCRWC is operating in compliance with this agreement. Specifically, the Columbia SWCD agrees to:

A. Employment Management

1. Consider all employees and volunteers of the LCRWC as employees, and/or volunteers of the Columbia SWCD and require that they abide by the Personnel Policies of the Columbia SWCD and the laws governing SWCDs.
2. Provide staff sufficient to conduct the work of the LCRWC, as delineated in the LCRWC Annual Plan of Work, and as LCRWC financial support allows.
3. Provide workers compensation insurance for staff and volunteers of the LCRWC.
4. Pay all employment taxes and file all employment reports for LCRWC staff, per federal and state laws.
5. SWCD procedures and policies will be followed when recruiting and hiring watershed council staff however the hiring committee will consist of two watershed council representatives plus the SWCD District Manager.

B. Work Plan and Budget Development

1. Assist with development of the annual LCRWC Plan of Work (POW), and incorporate LCRWC POW tasks into the Columbia SWCD annual Plan of Work. Assign SWCD responsibilities to assist on LCRWC projects as SWCD staffing and financial capacities allow. All staff activities paid for by LCRWC funds, such as grants and local match, will be included in the LCRWC Plan of Work.
2. Develop an annual budget that accounts for estimated revenues and expenditures for the LCRWC, as part of the overall annual budget for the Columbia SWCD.

C. Fiscal Management

1. Manage money and assets of the LCRWC as a part of the overall money and assets of the Columbia SWCD. As such, the Board of Directors for the Columbia SWCD will approve an annual budget for the expenditures of the LCRWC and manage the funds of the LCRWC in accordance with the Columbia SWCD's Financial Policies and Procedures.
   Assume liability for any debts, obligations or liabilities of the LCRWC created by the actions or inactions of the LCRWC.
2. Clear and accurate records will be maintained by the Columbia SWCD that distinguish between the money and assets earmarked forthe LCRWC and other money and assets owned or controlled by the Columbia SWCD.

3. Contracts
   a. Assist LCRWC by writing contracts or agreements as needed to implement and continue the LCRWC's operation and projects.
   b. Manage the contracts of the LCRWC in accordance with the Columbia SWCD's Contracting Rules.
   c. Consider all contractors of the LCRWC as contractors of the Columbia SWCD.

4. Reporting and Accounting
   a. Provide funders with documentation of LCRWC expenditures in the format prescribed by the funding source.
   b. Provide to the LCRWC regular (monthly) financial reports that detail income received by the Columbia SWCD to support LCRWC staffing and activities and expenditures made by the Columbia SWCD for LCRWC expenses.
   c. Maintain accounting and other financial records for the LCRWC in accordance with generally accepted accounting principles (GAAP).

d. Conduct annual audit by a municipal auditor to meet funding and legal requirements.
e. Facilitate internal controls and authorization protocols to assure a smooth flow of funds and accurate financial tracking as described in the Columbia SWCD's Financial Policies and Procedures.
f. Request, receive, and track funds from funding sources to support LCRWC activities.
g. Account for LCRWC funds used for fiscal and employer services through monthly and yearly Columbia SWCD staff time-tracking and report annually to the LCRWC membership after the conclusion of the Columbia SWCD's fiscal year.
h. Keep all financial and grant records for at least three years or longer, if required by the Columbia SWCD's Records Retention Policy or grant requirements.
i. Provide archiving in accordance with Columbia SWCD's Records Retention Policy or grant requirements.

5. Invoices and Payments
   a. Make timely payments as authorized by the LCRWC Coordinator.
   b. Make timely payments according to the Columbia SWCD's Financial Policies and Procedures.

LCRWC'S RESPONSIBILITIES. Specifically, the LCRWC agrees to:

A. General

1. Establish an Operations Committee to provide guidance and oversight for the LCRWC Coordinator, review proposed LCRWC annual budgets, and communicate to the Board of Directors of the Columbia SWCD.
2. A member of the Operations Committee who is not a staff member of the Columbia SWCD will be designated as a liaison to the Columbia SWCD. This person will be responsible for oversight and review of LCRWC revenues and expenditures reported in the Columbia SWCD's annual financial reports.
3. Task the LCRWC Coordinator with helping to secure funds through donations, contracts, and grants in order to accomplish tasks and projects described in the annual LCRWC POW and support LCRWC operational costs. LCRWC operational costs include but are not limited to fiscal administration of grants, personnel management, rent, phones/internet, website hosting, computers/software, insurance, audits, meeting costs, travel, printing/copying, and postage.
4. The LCRWC president shall designate a special committee of at least two other individuals to participate in the hiring (ranking of applicants, interview, and final selection) and annual performance review of LCRWC staff.
5. Consider LCRWC staff, as employees of the Columbia SWCD, as "public officials" as defined in ORS 244.020(14). As such, employees must comply with the Oregon Government Ethics law regarding conflicts of interest and other matters relating to financial gain.
6. Consider its staff, as employees of the Columbia SWCD, as "public employees" according to ORS 260.432, and require that they not engage in political activity while on the job.
7. Council will abide by any and all liability requirements of the SWCD relating to LCRWC activities.
8. Abide by the following policies and rules of the Columbia SWCD:
   ✓ Personnel Policies

- ✓ Contracting Resolutions and Rules
- ✓ Records Retention Policy
- ✓ Conflict of Interest Policy
- ✓ Note: any future policies adopted by the Columbia SWCD's Board of Directors that pertain to the LCRWC will be provided to the LCRWC for similar adoption.

B. Grants and Local Match

1. Responsible for fulfilling requirements and funding specifications of all grants for LCRWC activities..
2. Provide grant applications made by the LCRWC to the Columbia SWCD for submission to third-party grantor.
3. Secure, document and report required match funds as needed.
4. Provide documentation required by the grantor for funding releases (including, but not limited to, permits, land use forms and landowner agreements).
5. Notify the Columbia SWCD of all requests for grant changes (including budget changes and time extension requests) prior to submission to a grantor.

C. Reporting and Accounting

1. Provide documentation of expenses in the format agreed upon with the Columbia SWCD and funding sources.
2. Document all "in-kind" work (e.g., match of donated materials, services, and volunteer time) as required by the Columbia SWCD and funding sources.
3. Write and submit to Columbia SWCD all all reports not related to fiscal matters to fulfill the requirements of funders

DONATIONS. All donations intended to support the LCRWC that are made by check should be made out to the Columbia SWCD with a notation about its intended purpose. Donations such as equipment may be given directly to the LCRWC and should be accounted for by the LCRWC Coordinator by labeling with permanent marker and entry onto the Columbia SWCD's non-capitol and asset list.

The parties agree that the Columbia SWCD will assist the LCRWC by receiving donations and gifts from individual donors and businesses wishing to support the activities of the LCRWC, and providing the receipts that such donors need to take tax deductions for their donations.

OTHER DUTIES OF THE COLUMBIA SWCD. In addition to the other duties imposed by this agreement, the Columbia SWCD agrees to properly maintain its legal status as a local governmental unit, and as a tax exempt organization under Section 155 of the Internal Revenue Code; to properly prepare and file its own annual reports required by the State and Federal governments; comply with all applicable laws and regulations governing SWCDs; to operate and make decisions properly as a local governmental unit; to keep the required records of its Board meetings and decisions; and to keep adequate financial records and maintain proper oversight and control over its financial activities. The Columbia SWCD shall be responsible for its own employment taxes, insurance, debts, liabilities and other legal obligations. The Columbia SWCD shall notify the LCRWC immediately of any change in its legal status or tax exempt status.

LCRWC'S ENTITY STATUS. The LCRWC is not a legally incorporated separate entity; its programs and activities are considered a project of the Columbia SWCD. However, the LCRWC directs the work of the LCRWC coordinator through the adoption of the LCRWC annual plan of work and through regular reports from the coordinator to the council at each monthly meeting. The LCRWC will notify the Columbia SWCD immediately of any change in its legal status or tax exempt status. The LCRWC agrees to not incorporate or otherwise create a legal entity without written notice to the Columbia SWCD.

All employees, independent contractors and volunteers who perform services or work for the LCRWC are and shall be the employees, independent contractors and volunteers of the Columbia SWCD. The Columbia SWCD shall be responsible for payment of all compensation to LCRWC staff and independent contractors, paying all payroll withholding taxes and payroll taxes for LCRWC employees, filing all required reports to the IRS regarding payroll taxes, and preparing and filing all W-2 forms and 1099 forms reporting the payment of compensation to LCRWC employees and independent contractors.

The Columbia SWCD shall have the sole responsibility to select, employ, supervise, evaluate, discipline and if necessary terminate the employment or services of all employees, independent contractors or volunteers associated with the LCRWC, with the exception of the hiring, supervision and evaluation of the LCRWC Coordinator, which will be done in conjunction with the LCRWC, as described under LCRWC's Responsibilities, section A.2. Discipline and/or termination of the LCRWC Coordinator shall be done by the Columbia SWCD with input from the LCRWC..

Any tangible or intangible property, including intellectual property such as copyrights, obtained or created by the LCRWC shall be the property of the Columbia SWCD. All equipment and supplies purchased with LCRWC funds are the sole property of the Columbia SWCD.

AGREEMENT TO INDEMNIFY. Because the Columbia SWCD is liable for any acts or omissions of the LCRWC, LCRWC funds may be used to defend the Columbia SWCD and its officers, directors, employees and volunteers from any liability, demands or lawsuits for any claim of loss, damage or injury that arises from any of the activities, programs, decisions or omissions of LCRWC or employees, volunteers, members or agents associated with the LCRWC.

TERMINATION OF THIS AGREEMENT. Either party may terminate this agreement at any time, with cause, by delivering a written statement of termination to the other party at least thirty (30) days in advance of the effective date of the termination. This agreement shall automatically terminate if the LCRWC incorporates as a separate legal entity. If this agreement terminates due to the LCRWC's separate incorporation as an organization qualified to receive IRS recognition of its 501(c)(3) status for purposes and activities significantly related to the activities of the LCRWC under this agreement, then the Columbia SWCD shall:

- ✓ Transfer the remaining funds to the LCRWC minus any accrued payment owed to the Columbia SWCD for its services and expenses related to the LCRWC;
- ✓ Transfer ownership of all LCRWC assets, including its name and any intellectual property developed or created by the LCRWC under this agreement, to the LCRWC.

If this agreement is terminated for any reason other than the LCRWC's separate incorporation, then the Columbia SWCD shall retain the funds held in the account for the LCRWC to be used in

accordance with the mission of the LCRWC and in accordance with any restrictions on the use of those funds.

MEDIATION AND ARBITRATION. In the event of a conflict regarding the terms of this agreement, or if the parties cannot agree to terminate this agreement without serious conflict, they will enter into a mediated conflict resolution process with a third-party mediator chosen by both parties. If resolution cannot be achieved through mediation, the parties agree to submit to binding arbitration of their differences before a single arbitrator in accordance with the arbitration rules of the American Arbitration Association. This agreement shall be governed by and construed in accordance with the laws of the State of Oregon, and any decision or award by an arbitrator shall be made in accordance with such laws.

ENTIRE, INTEGRATED AGREEMENT. This agreement, and any attached and properly executed exhibits, contains and constitutes the entire agreement of the parties with respect to the subject matter it addresses, and it supersedes any prior oral or written understandings or communications between the parties.

AMENDMENTS. This agreement may not be amended or modified, except in writing and signed by both parties.

EXECUTION OF THIS AGREEMENT HAS BEEN PROPERLY AUTHORIZED BY BOTH DECISION-MAKING BODIES. Each of the parties to this agreement certify that its own decision-making body (Columbia SWCD Board of Directors and membership of the LCRWC) has formally approved entering into this Fiscal and Employment Sponsorship Agreement, by passage and adoption of a resolution at a properly called Columbia SWCD meeting at which a quorum was present and for which proper minutes were recorded, or by consensus approval of the LCRWC membership at two properly noticed LCRWC membership meetings.

EFFECTIVE DATE AND TERM. This Agreement is effective on the date of its execution by both parties, as shown below. It shall continue in effect until either party terminates the Agreement in accordance with the provisions for termination stated above.

IN WITNESS WHEREOF, the parties have executed this Fiscal and Employment Sponsorship Agreement:

LOWER COLUMBIA RIVER WATERSHED COUNCIL CHARTER and BYLAWS

*Adopted October 14, 1997
*Amended November 13, 2002
*Amended September 9, 2014
*Amended September 13, 2016

Purpose:

The Lower Columbia River Watershed Council was formed to gather and share information, to reduce duplication of activities, and to help address watershed management issues in the Lower Columbia River Watershed and in Columbia County, and to provide a framework for coordination and cooperation among key interests.

Mission:

To foster better stewardship and understanding of the Lower Columbia River Watershed resources in Columbia County, coordinate, cooperate and try to deal with issues in advance of resource degradation, encourage restoration of natural processes and functions where feasible, and help ensure sustainable watershed health, functions, and uses.

The council will work collaboratively with communities and landowners to develop and carry out voluntary watershed protection, restoration, enhancement and community engagement activities.

Vision:

A balanced ecosystem approach that supports a healthy watershed and provides for sustainable natural resources and for an economic base and viable communities.

Relationship to Decision-Making Bodies and Communities of Interest:

The Lower Columbia River Watershed Council is an advisory group to established decision-making bodies and communities of interest in Columbia County. As such, the council gathers information, facilitates stakeholder dialogue, hopefully gains consensus, and makes recommendations concerning the protection, restoration, and enhancement of the quality of the Lower Columbia River Watershed.
The council shall be non-partisan, non-political, and non-regulatory and shall not have the authority to appeal land use or other decisions of elected or appointed public bodies.

The Council will not use litigation as a method to implement the Council's mission.

The stakeholders, agencies, organizations, and public interests represented on the council are not obligated to adopt or carry out the recommendations of the council, but will give due consideration to the recommendations and take actions they consider appropriate.

These stakeholders, agencies, organizations, and interests will report back to the council on any actions taken in response to council recommendations.

The council welcomes and will respond to the requests for advice on actions affecting the watershed that are proposed by local, state, and federal agencies; organizations; and stakeholder and public interests.

Council members will keep their respective agencies, organizations, and interests informed about the work of the council and will bring their concerns to the council.

The Lower Columbia River Watershed Council shall support other watershed councils' efforts to secure funding for watershed projects and activities.

Goals and Objectives:

- Encourage coordinated efforts to increase natural resource education programs
- Improve communication among affected stakeholders, private individuals, interested citizens, business/industry, and representatives of local, state, and federal agencies
- Gather and evaluate environmental information
- Establish a framework for coordination, cooperation, and citizen involvement
- Provide a forum for resolving problems and conflicts related to the Council's mission when all parties to the problem or conflict agree to refer the matter to the council
- Formulate recommendations
- Facilitate enactment of recommendations
- Provide ongoing program evaluation during implementation
- Promote ongoing monitoring of the health of the Lower Columbia River Watershed

Specific Tasks/Responsibilities:

- Establish a public involvement program to ensure an appropriate level of citizen participation in the council's work
- Use available resource information to determine the current condition and uses of the watershed
- Identify critical information gaps
- Gather new critical information
- Identify the desired condition and uses of the watershed
- Identify high value fish and wildlife areas
- Encourage ongoing monitoring of the conditions of the watershed
- Help resolve issues among diverse interests in the watershed
- Seek funding to support program development and implementation, including funding from agencies represented on the council
- Address the needs and concerns of the respective agencies, organizations, and interests represented on the council
- Adopt and implement a work program
- Monitor work program progress and budget

- Identify ongoing education programs in the watershed

Council Members:

The Lower Columbia River Watershed Council shall at all times include representatives from the following interests: Agricultural Community; Business & Industry Community; Education Community; Public Interest Groups; Forestry Community; Sub-Basins and/or Local Watershed Councils; Countywide Organizations; Local Governments; Fishing Interests; and Mining Industry. A majority of the members shall reside in those portions of Columbia County that drain into the Columbia River.

The members shall serve at the pleasure of their respective stakeholder groups, agencies and organizations. Council members may designate an alternate who will participate on the council in their absence.

The council will act to replace members who resign or are unable to continue to serve on the council. The council will strive to maintain continuity and the balance of interests by giving preference to representation from the same agencies and organizations at a similar or higher level position. The council will request the group, agency or organization to nominate a replacement representative. If the group, agency or organization is unable or unwilling to do so, the council will seek representation from other groups, agencies, and organizations of the same community of interest. In this event the council will consult with the County Commissioners to ensure that the replacement agency or organization does represent the same community of interest. In the event the council is unable to find a replacement representative from the same community of interest, the County Commissioners shall be asked to make a replacement appointment to reflect that community of interest.

All Council members are eligible to serve as officers or committee members. There are no term limits.

MATCH FUNDING FORM

Document here the match funding shown on the budget page of your grant application

OWEB accepts all non-OWEB funds as match. An applicant may not use *another OWEB grant* to match an OWEB grant; this includes ODA Weed Board projects because they are funded through OWEB grants. However, an applicant who benefits from a pass-through OWEB agreement with another state agency, by receiving either staff expertise or a grant from that state agency, may use those benefits as match for an OWEB grant. (Example: A grantee may use as match the effort provided by ODFW restoration biologists because OWEB funding for those positions is the result of a pass-through agreement).

At the time of application, match funding for OWEB funds requested does not have to be *secured*, but you must show that at least 25% of match funding has been *sought*. On this form, you do not necessarily need to show authorized signatures ("secured match"), but the more match that is secured, the stronger the application. Identify the type of match (cash or in-kind), the status of the match (secured or pending), and either a dollar amount or a dollar value (based on local market rates) of the in-kind contribution.

If you have questions about whether your proposed match is eligible or not, see Allowable Match document in OGMS http://apps.wrd.state.or.us/apps/oweb/fiscal/nologin.aspx under Technical Assistance application or contact your local OWEB regional program representative (contact information available in the instructions to this application).

BEFORE THE BOARD OF COUNTY COMMISSIONERS

FOR COLUMBIA COUNTY, OREGON

In the Matter of Establishing the Lower Columbia River Watershed Council	)	ORDER NO. 222-97

WHEREAS, the State of Oregon has enacted ORS 541.345 to 541.400 dealing with watershed management and enhancement; and

WHEREAS, the State has created the Governor's Watershed Enhancement Board (GWEB) to initiate a watershed management program that relies on the establishment of voluntary local watershed councils and that provides for the development of local plans that may include, but are not limited to, the assessment of the watershed condition, the creation of a watershed action plan and a strategy for implementing the action plan; and

WHEREAS, local watershed councils shall consist of a majority of local residents, including local officials, shall represent a balance of interested and affected persons within the watershed and assure a high level of citizen involvement in the development and implementation of a watershed action program, and may include representatives of local government, representatives of nongovernment organizations and private citizens, including but not limited to:

(a) Representatives of local and regional boards, commissions, districts and agencies;
(b) Representatives of federally recognized Indian tribes;
(c) Public interest group representatives;
(d) Private landowners;
(e) Industry representatives;
(f) Members of academic, scientific and professional communities; and
(g) Representatives of state and federal agencies; and

WHEREAS, local watershed councils may submit requests to GWEB or other sources for funding or advice and assistance in developing a watershed enhancement project under the program established by

GWEB, however, the local watershed council needs to be sponsored by a local governing body to be eligible for such funding; and

WHEREAS, the proposed Lower Columbia River Watershed Council has drafted a charter with statements of purpose, mission and vision, goals and objectives, tasks and responsibilities; organization and procedures, and has proposed that the membership on the Council be composed of individuals which include, but are not limited to the following interests:

Agriculture Community
Business and Industry Community
Education Community
Public Interest Groups
Forestry Community
Sub-Basins and/or Local Watershed Councils
Countywide Organizations
Local Governments
Fishing Interests
Mining Industry

NOW, THEREFORE, IT HEREBY ORDERED as follows:

1. The Lower Columbia River Watershed Council is established as a local watershed council under ORS 541.345 to 541.400.

2. The Council shall be composed of individuals representing the following interests. The list is intended to be illustrative, and not exhaustive:

Agriculture Community
Business and Industry Community
Education Community
Public Interest Groups
Forestry Community
Sub-Basins and/or Local Watershed Councils
Countywide Organizations
Local Governments
Mining Industry

3. The Council shall have all of the powers provided by ORS 541.345 to 541.400 for watershed councils and in addition shall be

subject to the following:

a. The Council shall be subject to the public records and meetings laws of ORS Chapter 192;

b. The Council may adopt its own charter and bylaws for the conduct of meetings, voting, appointment of officers, and similar matters. However, representatives of state and federal government agencies and research and technical organizations shall only have voting rights if they are responsible for land management; and

c. The Council shall report to the Board of County Commissioners at least once annually as to its activities and proposed future activities, and the status of the Lower Columbia River Watershed.

4. The Council shall endeavor to include representatives from the interests listed above. The members shall serve at the pleasure of their respective agencies and organizations. The Council shall act to replace members who resign or are unable to continue serving on the Council. The Council will strive to maintain continuity and the balance of interests by giving preference to representation from the same agencies and organizations at a similar or higher level position. The Council will request the agency or organization to nominate a replacement representative. If the agency or organization is unable or unwilling to do so, the Council will seek representation from another agency or organization of the same community of interest. In this event the Council will consult with the County Commissioners to ensure that the replacement agency or organization does represent the same community of interest. In the event the Council is unable to find a replacement representative that represents the same community of interest, the County Commissioners will be asked to make a replacement appointment to reflect that community of interest.

5. The Lower Columbia River Watershed Council shall work with other watershed councils and share information pertinent to the County's interests. The Lower Columbia River Watershed Council's jurisdiction over local watersheds which have their own watershed council, e.g., the Scappoose Bay Watershed Council, shall

be limited to providing assistance and coordination to the local watershed council. The Lower Columbia River Watershed Council shall support other watershed council's efforts to secure funding for watershed projects and activities.

6. The Council shall be non-partisan, non-political and non-regulatory and shall not have the authority to appeal land use or other decisions of appointed or elected public bodies.

7. The Board of County Commissioners reserves the authority to withdraw approval of the Council or its charter whenever, in its sole discretion, it deems it to be in the public interest to do so.

DATED this 15th day of October, 1997.

Appendix I

Lower Columbia River Watershed Council
Action Plan

1.0 Introduction

1.1 Purpose

This document is the Action Plan of the Lower Columbia River Watershed Council (LCRWC). The LCRWC is a voluntary, non-regulatory group that unites the diverse interests to improve and preserve watershed health. The Action Plan is based on the Council's goals and mission statement (Charter). The Action Plan takes a watershed-wide approach and strives to integrate existing plans and efforts. This Plan is a working document that will be updated and reevaluated, as information becomes available.

The LCRWC depends on voluntary efforts. The Council is not a regulatory or enforcement agency, nor does the Council adopt plans or rules in a legal sense. The Council makes recommendations to decision-makers, landowners, and managers on ways to protect and enhance the watershed resources of the Lower Columbia. Implementation of the recommendations in the Action Plan will be completely voluntary. The Council provides a framework for communication, collaboration, and cooperation among its member organizations and others.

The LCRWC Action Plan is a resource guide to better understand the nature of the Lower Columbia watershed.

1.2 Background

The Lower Columbia Watershed is located in northwestern Columbia County and northeastern Clatsop County. It is approximately 215,000 acres, which drain into the Lower Columbia River. Its uses are, and historically have been, timber and agriculture. 90.9% of the land is under private ownership. There is a growing rural residential population. The beneficial uses of the watershed include timber, agriculture, recreation, fish and wildlife populations. Beneficial uses are defined by Oregon Water Quality Rules OAR 340.41 for the North Coast Basin as: domestic water supply, industrial water supply, irrigation, livestock watering, anadromous fish passage, salmonid fish rearing, salmonid fish spawning, resident fish and aquatic life, wildlife and hunting, fishing, boating, water contact recreation, and aesthetic quality. The most sensitive of these uses are fish, wildlife, domestic, and recreational use.

1.3 Watershed Council Membership

The Lower Columbia River Watershed Council includes representatives from the following interests:

- Agriculture Community
- Business/Industry Community

- Education Community
- Public Interest Groups
- Forestry Community
- Sub-Basins or Local Watershed Councils
- Countywide Organizations
- Local Governments
- Fishing Community
- Mining Industry

2.0 Development of the Action Plan

Development of the Action Plan began with the adoption of the Charter October 14, 1997. The goals of the Council are:

- Promote sustainable watershed health
- Provide a forum for watershed issues
- Provide education and outreach on watershed issues

To achieve these goals the Council developed preliminary Action Items.

2.1 Action Items to Meet Council Goals and Objectives

The preliminary Action Items identified by the LCRWC (not prioritized):

Action #1: Develop history of watershed

Action #2: Assess watershed conditions

Action #3: Develop and Implement a Water Quality Monitoring Plan, initial focus on 303d listed streams

Action #4: Identify restoration and enhancement sites

Action #5: Implement restoration projects

Action #6: Develop, support and implement a broad-based education/outreach program

Action #7: Develop demonstration projects in priority areas to encourage restoration on Private lands

Action #8: Secure funding for Council support and projects

2.2 Action Item Tasks

Action #1: Develop history of watershed, Watershed Assessment 8/2001, completed

- Personal interviews
- Collect historical data

Action #2: Assess watershed conditions, Watershed Assessment 8/2001, completed
- Secure funding for assessment
- Secure personnel to conduct assessment using OWEB Assessment Manual
- Develop and maintain GIS database for LCRWC

Action #3: Develop and implement WQMP, initial focus on 303d listed streams, Ongoing
- Secure funding for monitoring
- Develop Water Quality Monitoring Plan with Quality Assurance/Quality Control
- Secure equipment for monitoring
- Obtain procedural training
- Identify sites
- Implement monitoring

Action #4: Identify restoration and enhancement sites, Ongoing
- Identify priority restoration issues based on Assessment
- Identify priority sites based on landowner willingness

- Action #5: Implement restoration projects, Ongoing
- Develop implementation strategy based on Action #4
- Develop plans
- Secure funding
- Undertake project and monitor outcome

Action #6: Develop, support and implement a broad-based education/outreach program
- Work with landowners and interest groups on watershed issues
- Work with local schools to enhance stewardship and science education on watershed and natural resource issues
- Conduct workshops on riparian area management
- Submit news articles to local newspapers
- Presentations at local groups
- Maintain a webpage

Action #7: Develop demonstration projects in priority areas to encourage restoration on Private lands
- Work with local groups to identify and recruit landowners
- Assist landowners with implementation
- Monitor effectiveness of demonstration projects
- Provide information on costshare programs

Action #8: Secure funding for Council support and projects

- Identify funding sources
- Match sources to projects
- Submit grants
- Develop partnerships

3.0 Monitoring and Evaluation

The LCRWC is committed to meaningful and successful restoration activities and to promoting sound management practices in the watershed. Monitoring is an important component in determining the success of a restoration project or management practice and whether the desired results are being achieved.

Monitoring requires a long-term commitment of time and resources. The Council will work with project sponsors to develop a monitoring plan for each action item where appropriate.

4.0 Plan Evaluation and Review

This Action Plan will be periodically reviewed.

- Reviewed at completion of the Watershed Assessment
- Reviewed at the request of the Council

Appendix I
Identified Projects

Revised November 9, 2004

- Monitoring of 303d listed streams: *Completed*
- Westport Slough/Clatskanie River Reconnection Project, Completed
- Temperature monitoring of riprap areas, Completed
- Clatskanie River Riparian Planting, Completed
- Beaver Creek Riparian Planting
- Shallow Water Habitat Restoration
- Flume Creek restoration: *Completed*
- Invasive species
    - Purple loosestrife
    - Japanese Knotweed
- Long term monitoring and evaluation, watershed
- Fox Creek, further restoration: *Completed, lg wood*
- Nice Creek, restoration
- Artificial Barrier Assessment; *Habitat Assessment completed*
- Artificial Barrier Removal: Ongoing
- Merrill Creek Culvert, Completed
- Concrete Bridge Removal/Clatskanie River, Completed
- Page Creek Fish Barriers, Completed
- Miller Creek Fish Barrier: *Completed*
- Clatskanie River Culvert Replacements; 5 sites; *2 Completed*
- Kloppman Large Wood; *Completed*
- Louisiana Swamp Wetland Restoration; *Completed*
- Batwater Station Wetland Restoration
- Clatskanie Flood Plain Restoration; 2 sites

Italicized notations added post 11/9/04

These projects will be prioritized as additional information becomes available to the Council.

LCRWC Current Officer's List

Chairman – K.C. Van Natta – kcvn35@gmail.com – 503-313-7298

Secretary – Marilyn Baker – marilynviola@gmail.com – 503-313-7298

Gary Soderstrom officially resigned as Vice Chairman on March 13th, 2023.

Lower Columbia River Watershed Council

Working toward balanced ecosystems that support healthy watersheds and sustainable natural resources
To support an economic base and viable communities

Draft
Meeting minutes
November 9th, 2021
7:00 pm by Zoom

Attendance by Zoom: Ian Bledsoe, Marilyn Van Natta, K.C. Van Natta, Allan Whiting, Margaret Magruder, Harpiar Gandhi, Mike Russell, Pat Welle, Sephe Fox, and Chip Bubl.

All introduced themselves.

Public Comment: None

Pat Welle Presentation: Pat has a long history with restoration projects in the Lower Columbia River landscape. She described the challenges and opportunities that remain to bring some semblance of the biology and the beauty to the Lower Columbia River estuary. She described the positive level of commitment needed to learn and adapt projects for the best outcomes for the fish. Pat is also a fine writer and excellent photographer and showed many slides of her favorite places in the region and some successful projects. Her "Nature's View" web page is https://www.patwelle.com/ . The site is well worth exploring.

Mike Russell moved and Harpiar Gandhi seconded to approve the September, 9, 2021 minutes. Motion carried.

The financial report was in the packet and reviewed by the Board.

The Council Coordinator's report was also in the packet. Allan noted some of the highlights:

- Technical Assistant Grant submitted to OWEB for a flood plain targeted restoration plans. 60-70% of the ownership is interested. However, there are 7 other TAGs in the same pool. There is a lot of concern about why so few Chinook are in the Clatskanie system. These floodplain locations are crucial to their success.

President's message: Nothing to report.

New Board appointments: None

Officer Elections: Margaret Magruder guided the process with the following that agreed to serve:

President:	Ian Bledsoe
Vice President:	K.C. Van Natta

Secretary: Chip Bubl

President Bledsoe asked if there were any further nominations. Hearing none, President Bledsoe closed the nominations and they were all elected to serve another term.

Reports from partner organizations:

Friends of Fox Creek: Having an abridged Zoom meeting on 11/15 at 6:30 to meeting on future governance and plan for next year's Annual Meeting in February.

Scappoose Bay W.C.: No report.

Columbia County: Mike Russell noted that his crews were getting into winter planning and preparation mode. Most road work done for the year.

City of Clatskanie: Harpiar Gandhi discussed the waterline blowout which lost ~200,000 gallons of water and almost led to a road washout. Both the pipe and the road damage has been repaired.

Next meeting: January 11th, 2022 at 7:00pm by Zoom once again

Meeting adjourned by President Bledsoe.

Respectfully submitted by
Chip Bubl
Secretary

LOWER COLUMBIA RIVER WATERSHED COUNCIL CHARTER and BYLAWS

*Adopted October 14, 1997
*Amended November 13, 2002
*Amended September 9, 2014
*Amended September 13, 2016
*Amended March 20, 2023

Purpose:

The Lower Columbia River Watershed Council was formed to gather and share information, to reduce duplication of activities, and to help address watershed management issues in the Lower Columbia River Watershed and in Columbia County, and to provide a framework for coordination and cooperation among key interests.

Mission:

To foster better stewardship and understanding of the Lower Columbia River Watershed resources in Columbia County, coordinate, cooperate and try to deal with issues in advance of resource degradation, encourage restoration of natural processes and functions where feasible, and help ensure sustainable watershed health, functions, and uses.

The council will work collaboratively with communities and landowners to develop and carry out voluntary watershed protection, restoration, enhancement and community engagement activities.

Vision:

A balanced ecosystem approach that supports a healthy watershed and provides for sustainable natural resources and for an economic base and viable communities.

Relationship to Decision-Making Bodies and Communities of Interest:

The Lower Columbia River Watershed Council is an advisory group to established decision-making bodies and communities of interest in Columbia County. As such, the council gathers information, facilitates stakeholder dialogue, hopefully gains consensus, and makes recommendations concerning the protection, restoration, and enhancement of the quality of the Lower Columbia River Watershed.
The council shall be non-partisan, non-political, and non-regulatory and shall not have the authority to appeal land use or other decisions of elected or appointed public bodies.

The Council will not use litigation as a method to implement the Council's mission.

The stakeholders, agencies, organizations, and public interests represented on the council are not obligated to adopt or carry out the recommendations of the council, but will give due consideration to the recommendations and take actions they consider appropriate.

These stakeholders, agencies, organizations, and interests will report back to the council on any actions taken in response to council recommendations.

The council welcomes and will respond to the requests for advice on actions affecting the watershed that are proposed by local, state, and federal agencies; organizations; and stakeholder and public interests.

Council members will keep their respective agencies, organizations, and interests informed about the work of the council and will bring their concerns to the council.

The Lower Columbia River Watershed Council shall support other watershed councils' efforts to secure funding for watershed projects and activities.

Goals and Objectives:

- Encourage coordinated efforts to increase natural resource education programs
- Improve communication among affected stakeholders, private individuals, interested citizens, business/industry, and representatives of local, state, and federal agencies
- Gather and evaluate environmental information
- Establish a framework for coordination, cooperation, and citizen involvement
- Provide a forum for resolving problems and conflicts related to the Council's mission when all parties to the problem or conflict agree to refer the matter to the council
- Formulate recommendations
- Facilitate enactment of recommendations
- Provide ongoing program evaluation during implementation
- Promote ongoing monitoring of the health of the Lower Columbia River Watershed

Specific Tasks/Responsibilities:

- Establish a public involvement program to ensure an appropriate level of citizen participation in the council's work
- Use available resource information to determine the current condition and uses of the watershed
- Identify critical information gaps
- Gather new critical information
- Identify the desired condition and uses of the watershed
- Identify high value fish and wildlife areas
- Encourage ongoing monitoring of the conditions of the watershed
- Help resolve issues among diverse interests in the watershed
- Seek funding to support program development and implementation, including funding from agencies represented on the council
- Address the needs and concerns of the respective agencies, organizations, and interests represented on the council
- Adopt and implement a work program
- Monitor work program progress and budget

- Identify ongoing education programs in the watershed

Council Members:

The Lower Columbia River Watershed Council shall at all times include representatives from the following interests: Agricultural Community; Business & Industry Community; Education Community; Public Interest Groups; Forestry Community; Sub-Basins and/or Local Watershed Councils; Countywide Organizations; Local Governments; Fishing Interests; and Mining Industry. A majority of the members shall reside in those portions of Columbia County that drain into the Columbia River.

The members shall serve at the pleasure of their respective stakeholder groups, agencies and organizations. Council members may designate an alternate who will participate on the council in their absence.

The council will act to replace members who resign or are unable to continue to serve on the council. The council will strive to maintain continuity and the balance of interests by giving preference to representation from the same agencies and organizations at a similar or higher level position. The council will request the group, agency or organization to nominate a replacement representative. If the group, agency or organization is unable or unwilling to do so, the council will seek representation from other groups, agencies, and organizations of the same community of interest. In this event the council will consult with the County Commissioners to ensure that the replacement agency or organization does represent the same community of interest. In the event the council is unable to find a replacement representative from the same community of interest, the County Commissioners shall be asked to make a replacement appointment to reflect that community of interest.

Titles of Officers, How officers are selected, Length of service for officers, Powers of officers, Minimum number/frequency of meetings of governing body

The Council will elect a chairperson and vice-chairperson to serve as spokespersons, prepare council agendas, call and manage council meetings, enforce ground rules, and perform other tasks as assigned by the council. The council may select other officers and fill vacancies as needed. The periodic election of officers shall take place at the regularly-scheduled meeting in October of odd-numbered years.

The Council may form subcommittees of its own members and task groups that include individuals not on the council to perform certain functions or focus on specific issues. The council will also identify technical advisors who can provide technical data and assistance and call on these experts as needed.

All Council members are eligible to serve as officers or committee members. There are no term limits.

Lower Columbia River Watershed Council
Policies and Ground Rules

Adopted 9/7/97
Amended 7/11/00
Amended 6/12/12
Amended 9/9/14
Amended 9/13/16
Amended 3/20/23

LCRWC Members agree to the following policies and ground rules:

Council Decision-Making

- Robert's Rules of Order, Second Edition, will be used as a guide for conducting business.
- Before a decision is adopted by the council, sufficient time (30 days) will be provided for the members to seek advice from organizations they represent, agencies, or other experts.
- When a decision is reached, council members will advocate to their respective bodies support for the adoption or implementation of the decision.
- The watershed council may select a person to serve as facilitator.

Participation

- The Council will hold regular meetings and follow provisions of the Open Meetings Law. At least 10 minutes will be set aside at each meeting for public comment.
- Business may be conducted by council members present. In the absence of a majority of the council members or their alternates, a simple majority is required for approval of actions with a minimum of four members present.
- Council members will keep their respective agencies, organizations, or interests informed about the work of the council and bring concerns of their groups to the council.
- Council members may designate a representative of their group to serve as an alternate. Designated alternates will be listed on the membership list of the council.
- Each member will brief his/her alternate on all issues, proceedings, and notifications, prior to the alternate's attendance at council meetings.
- The public is invited to all council meetings and, upon request, provide meeting agendas and records of decisions other than personnel discussions and actions.

Organization and Procedures

- Robert's Rules of Order shall be followed (see: Decision-Making/Ground Rules)
- The Council will hold monthly meetings on the second Monday of every month unless otherwise announced.
- Council will seek funding for the ongoing operations.
- The Columbia SWCD will act as the Council's fiscal agent and follow Generally Accepted Accounting Principles (GAAP).
- The Council will not use litigation as a method to implement the Council's mission.

Amendments

A council member may propose an amendment to these Ground Rules at any regularly-scheduled meeting. A vote on the amendment shall take place at the next regularly-scheduled meeting. An affirmative vote by 10 members, or two-thirds of those members present, whichever is greater, will ratify the amendment.

OWEB STAFF FUNDING RECOMMENDATION
2023-2025 COUNCIL CAPACITY GRANTS

Staff Recommended Funding Level	Part of Secondary Review	App#	Watershed Council	21-23 Award	23-25 Staff Funding Recommendation
Full Funding		224-001	North Coast WS Assn	$ 131,465	$166,142
Full Funding		224-003	MidCoast WC	$ 131,465	$ 166,142

Capacity Matters:

A 20-Year Review of the Oregon Watershed Enhancement Board's Operating Capacity Investments

Jess Downey
Dr. Emily Jane Davis
Dr. Rich Margerum

July 26th, 2023

Oregon State University
UNIVERSITY OF OREGON

"...investment in districts and councils will increase their ability to purposefully and effectively act and interact within their spheres and influence and
thus effect measurable and meaningful change in the health of watersheds."

OWEB's Strategic Plan, 2018

Research Questions

01 How do organizations use capacity grants?

02 How do these grants leverage partnerships?

03 What builds or reduces organizational capacity?

04 What best practices increase capacity and overcome challenges?

05 How can capacity monitoring and tracking be refined?

06 How can future funding strategies sustain and build operational capacity?

Methods

Project Phases

Online survey
(Apr-May 2022)

Phased case study
(June 2022 - Feb 2023)

Capacity Dimensions

- Internal governance and operational practices
- Resources obtained and leveraged
- Adaptive and resilient governance
- Types of partners engaged
- Partnership types engaged in

Findings

1. Capacity grant uses
2. Top governance challenges
3. Top funding strategies

#1: Capacity Grant Uses

CAPACITY GRANT USES

Districts

- Project development - KEY
- Operational support (e.g., admin staff time, rent, utilities, etc.)
- Staff and board training

Councils

- Project development - KEY
- Initial funds for cash match for restoration projects (e.g., federal)
- Board member recruitment through local boards/committees
- Staff and board training
- Operational support (e.g., admin staff time, rent, utilities, etc.)
- Revising and updating operational policies/procedures

"My **other wildlife areas that don't have an active watershed council, it's a lot harder** to get large projects done. The watershed council and ODFW have all these projects that we're working on, and **it's benefiting the wildlife area and its neighbors, and we are able to combine our budgets to make a larger difference.**"

#2: Top Governance Challenges

1. Lead staff capacity and turnover
2. Board recruitment
3. Strategic planning

TOP GOVERNANCE CHALLENGES

Lead Staff and Board Complement Each Other

Essential Lead Staff Skills

- Leadership/Strategist
- Relationship Building
- Personnel Management
- Fiscal Management
- Grant Writing

Board Leadership Areas

- Diverse Skill set
- Strategic Plan
- Organizational Policies / Procedures
- Fiscal Responsibilities
- Personnel Management of Lead Staff

TOP GOVERNANCE CHALLENGES

Lead Staff Capacity and Turnover

Balanced Board Engagement

- Incorporation of **15-minute educational content and skills training** into board meetings
- **Inviting agency partners and experts to board meetings** to help boards understand regional priorities to make informed decisions
- **Development of strategic plans** to co-establish organizational and watershed priorities
- **Proactive recruitment** of board members
- **Annual retreats for board and lead staff** to discuss accomplishments and priorities

TOP GOVERNANCE CHALLENGES

Lead Staff Capacity and Turnover

Regional Networks

(supported by FIP, P-TA, RCPP)

- **Increased points of connection** between local partners for shared peer learning
- **Increased transparency** of how other organizations operated/managed finances
- **Leveraged group knowledge and experiences** for lead staff mentorship

TOP GOVERNANCE CHALLENGES

Board Recruitment

Lead staff proactively shaped organizations through targeted recruitment:

- Participation in **local boards and committees** and attendance at community events
- Support **strategic plan goals** and strengthen cross-organizational information sharing
- **Districts also recruited non-landowners** to become at-large or associate directors

Strategic Plan Functions Vary

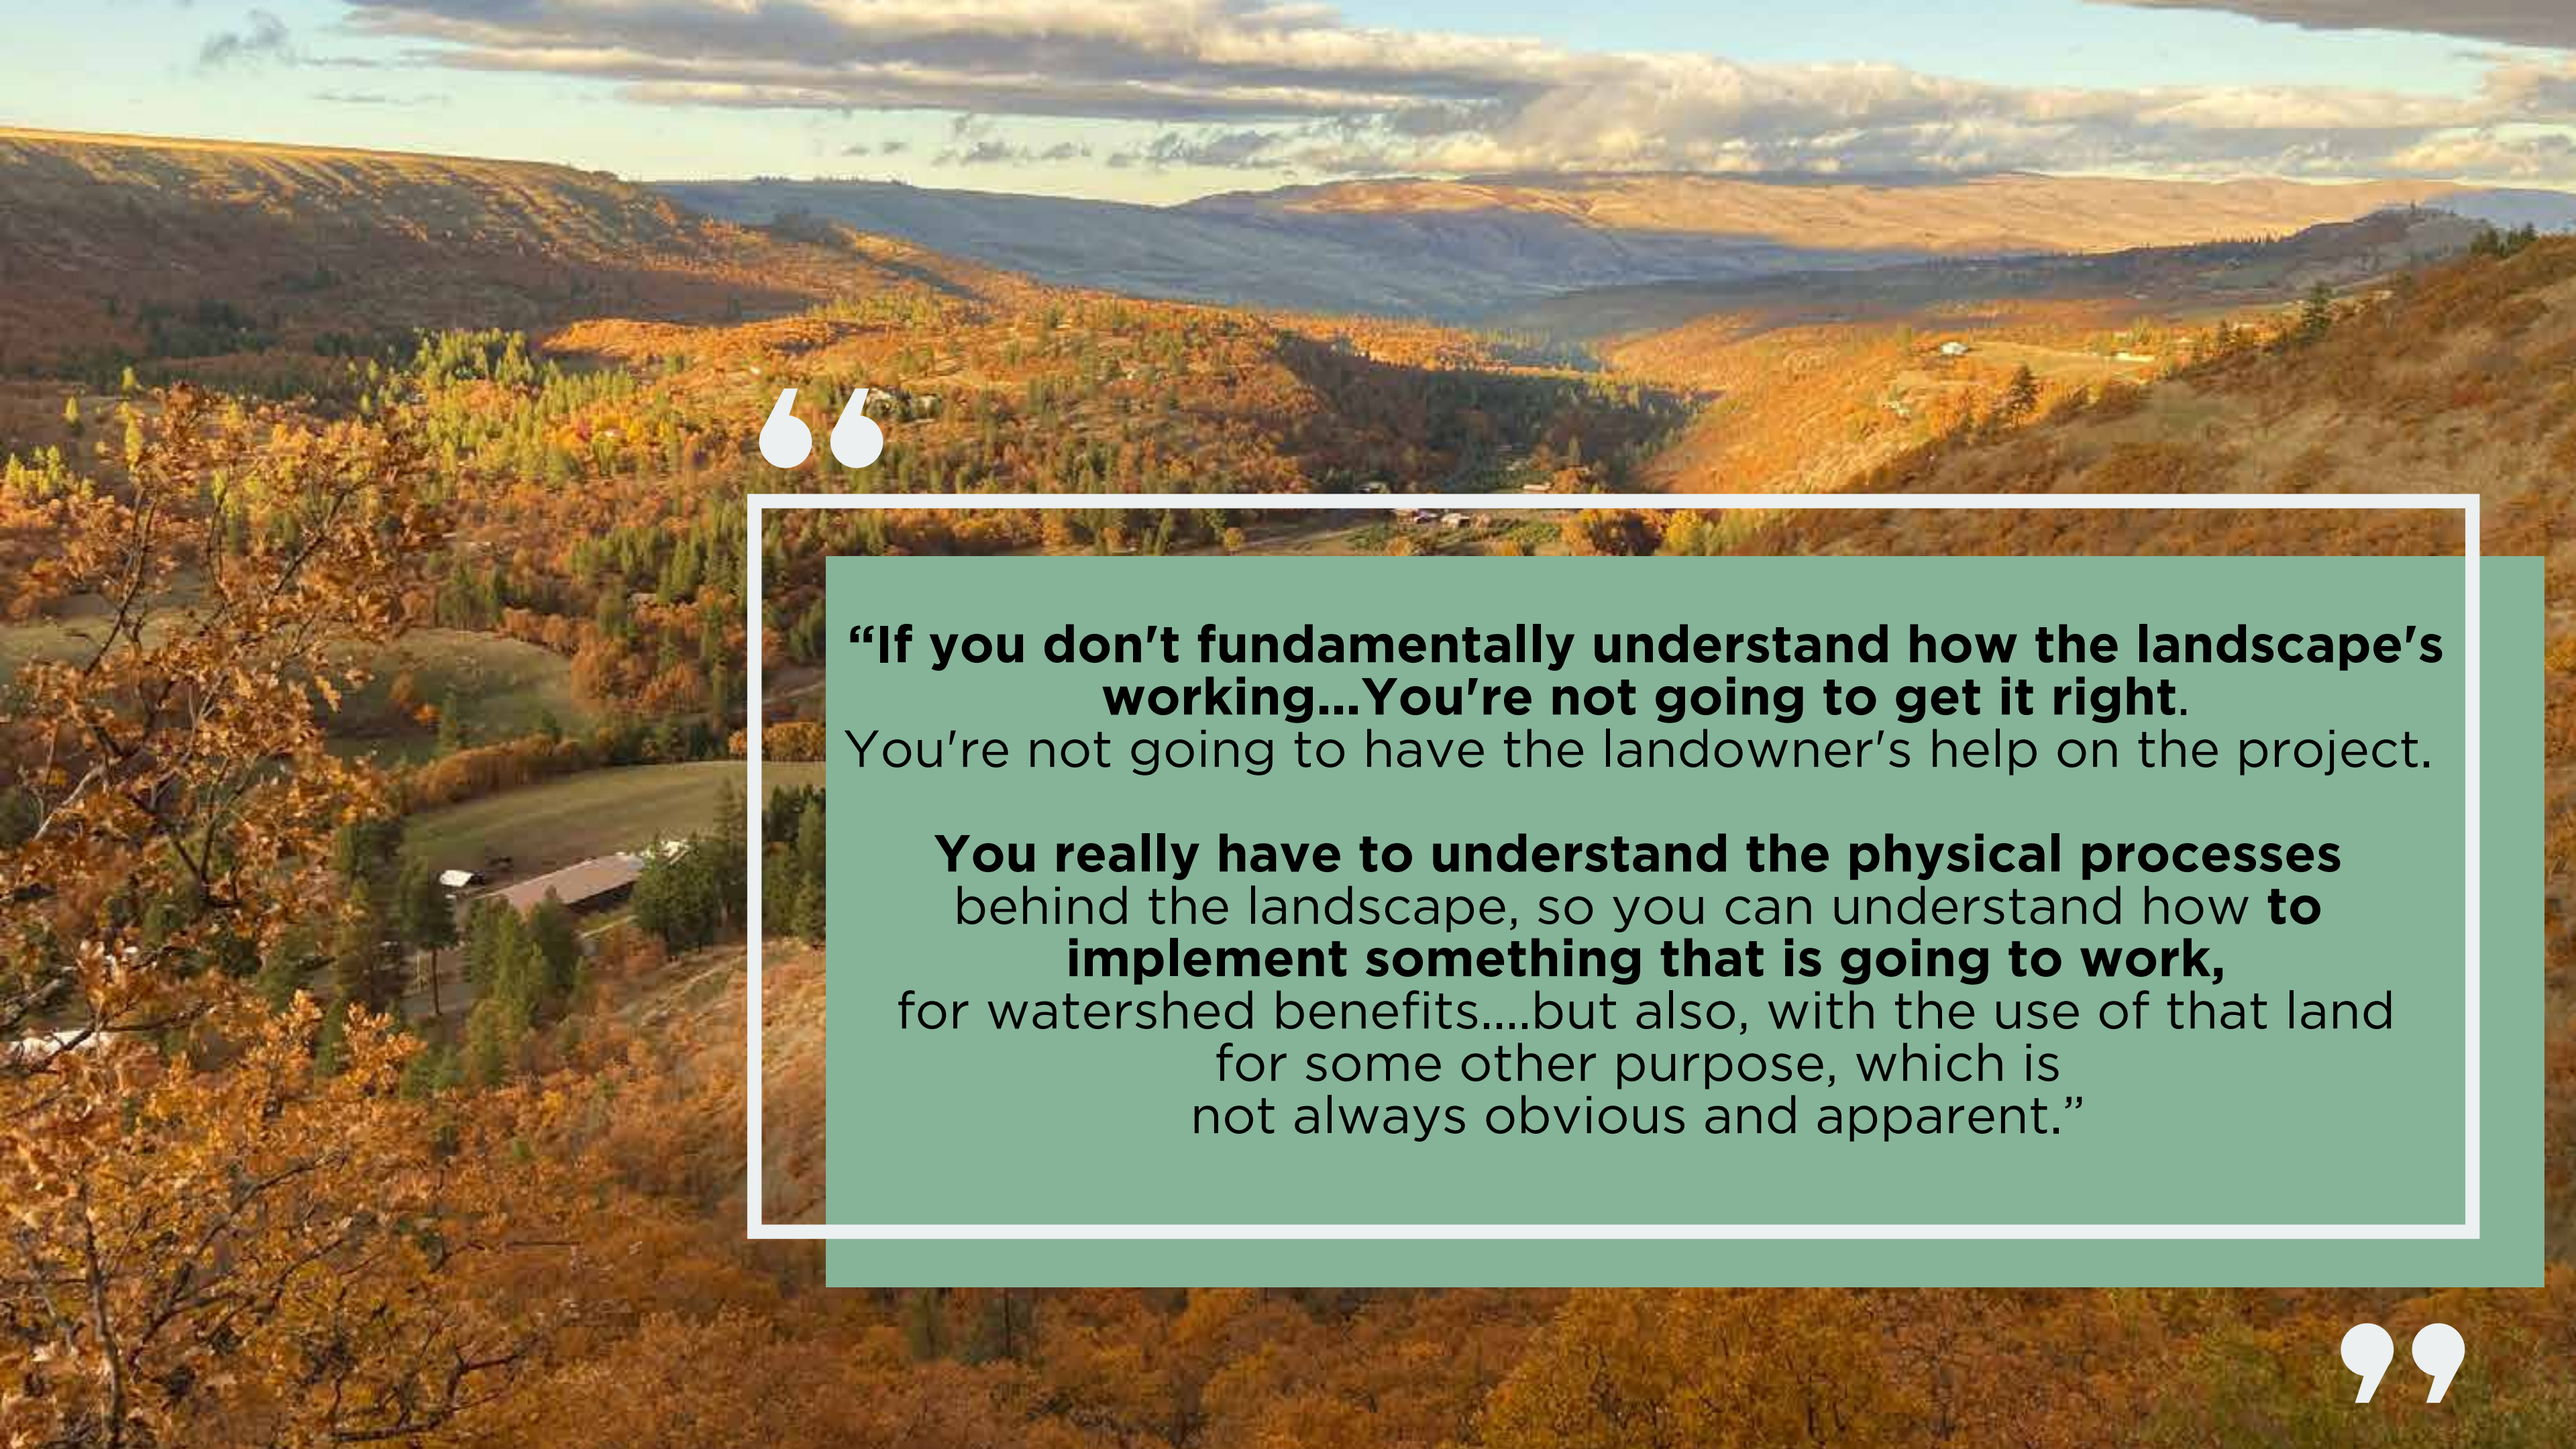
TOP GOVERNANCE CHALLENGES

Detailed

- Incorporated **diverse perspectives and needs**
- Included **relevant technical expertise**
- Identified **geographic project priorities** with clearly measurable objectives
- **Short, medium, and long-term project priorities**
- Identified **potential partnerships and funding**

Broader

- **Organizational history, land uses, limiting factors**
- Developed **balanced board engagement** through joint priority setting
- Streamlined pursuit of **key partnerships and funding**



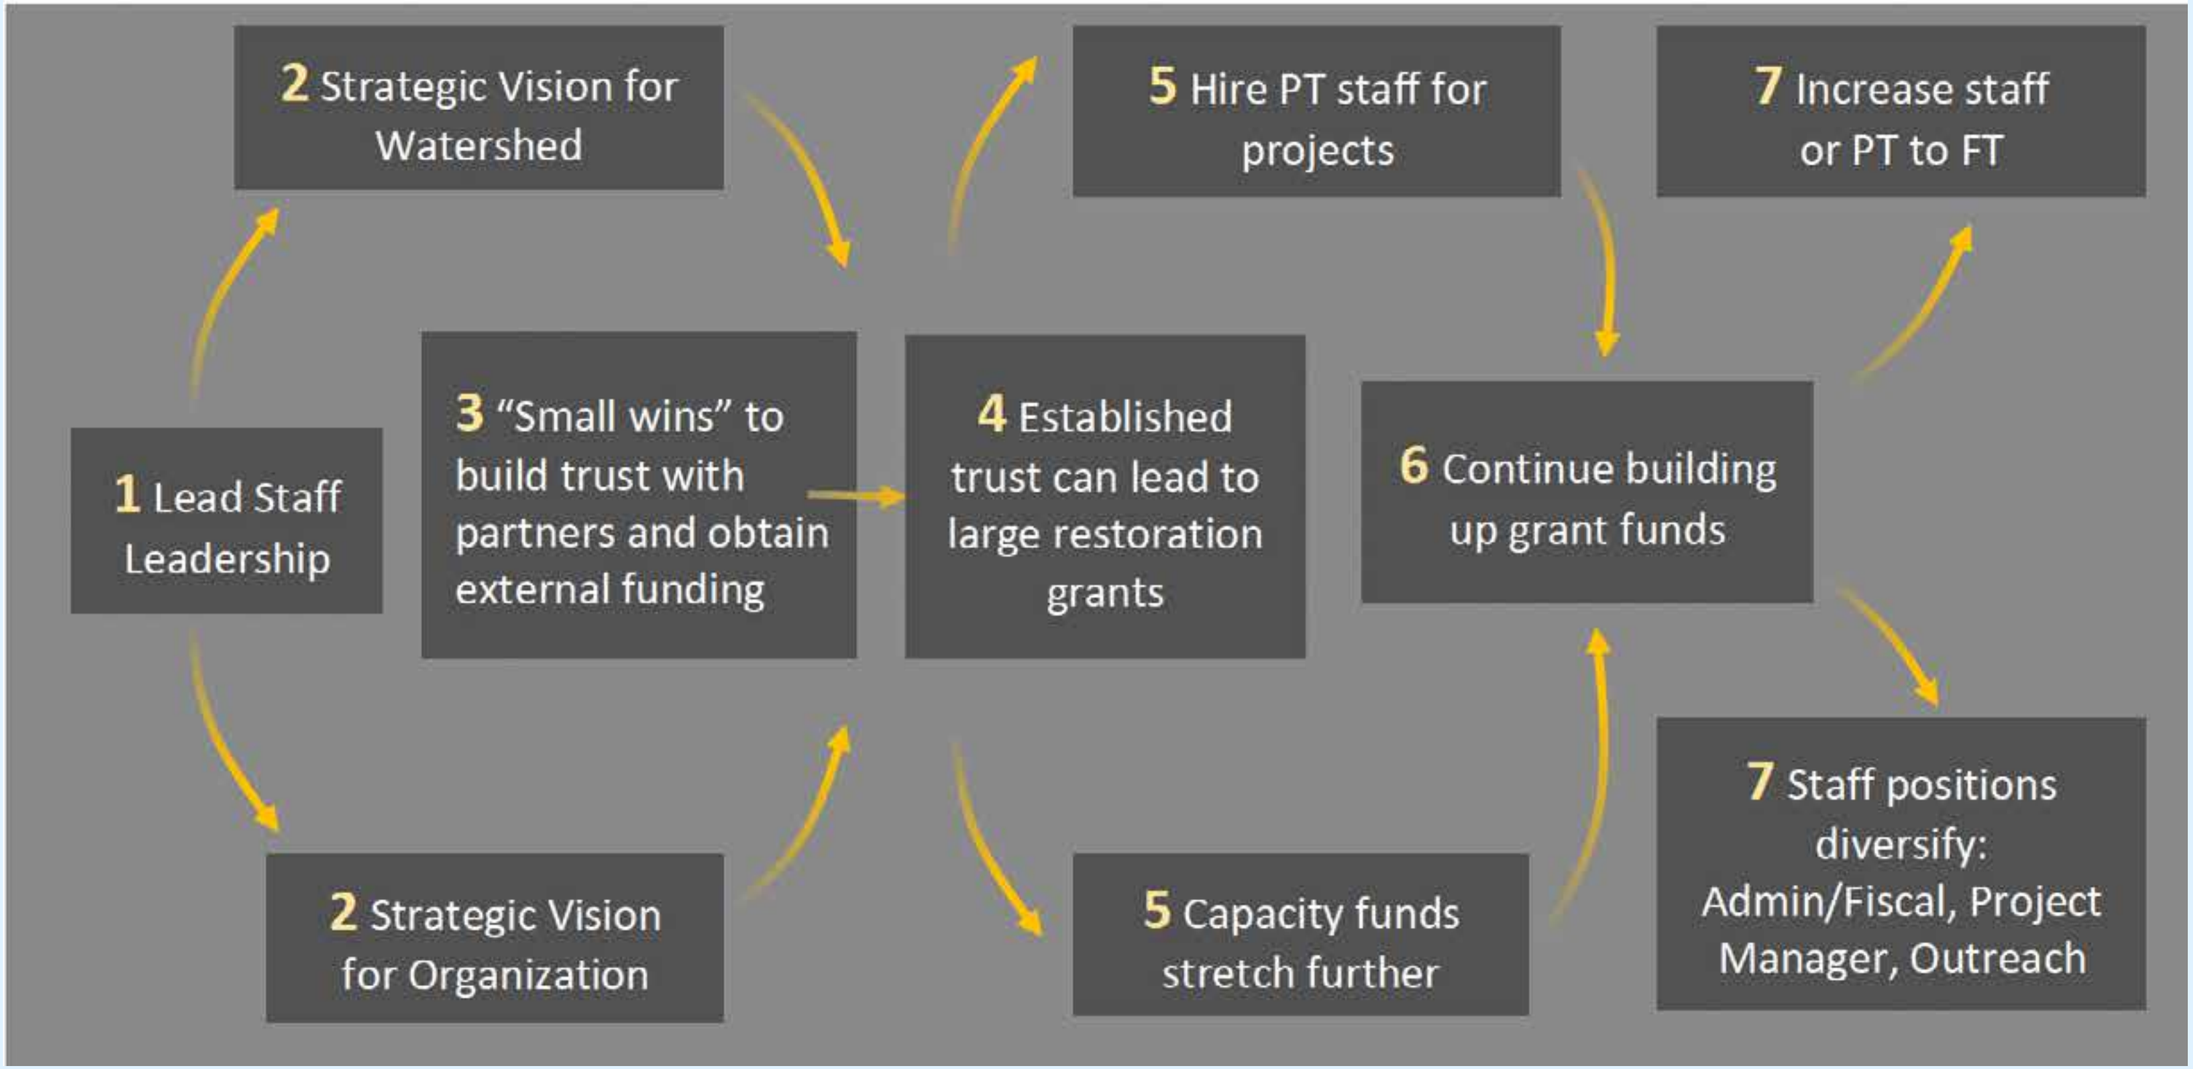
Strategic Plans + Annual Work Plans Work Together

TOP GOVERNANCE CHALLENGES

Supported Organizational Efficiencies

- Created a shared understanding of **manageable project workload**
- Developed **balanced board engagement** through joint priority setting
- Streamlined pursuit of **key partnerships and funding sources**

Organizations that develop strategic plans actively implement them.
The plans don't just sit on the shelf.
They are used as ways to work through complex problem solving.



“**If you don't fundamentally understand how the landscape's working...You're not going to get it right**.
You're not going to have the landowner's help on the project.

You really have to understand the physical processes
behind the landscape, so you can understand how **to implement something that is going to work,**
for watershed benefits....but also, with the use of that land for some other purpose, which is not always obvious and apparent.”

How Do These Work Together?

TOP GOVERNANCE CHALLENGES

BAR
CAT
BEER

#3: Top Funding Strategies

Funding Strategies

- **Assessing staffing capacity**, budgeting more project time into grant applications, accounting for future costs
- **Strategic plans** identified priorities and improved grant proposals
- **Funding opportunities spreadsheet**
- Sought out **long-term funding strategies** via networks
- Fostered **regional networks** using partnership grants

Summary and Implications

Capacity Grants Have:

- Supported completion of on-the-ground restoration projects
- Helped build local partner capacity
- Enabled progress towards state-wide restoration goals
- Positively affected local economies

Lead Staff Capacity and Turnover

Board education to develop organizational management → Balanced board engagement

Regional networks → Leverage group knowledge for lead staff mentorship

Board Recruitment

Connected to strategic plan goals → Community network to cultivate a pool of candidates

Strategic Planning

Understand regional priorities →
- Create manageable workload
- Balanced board engagement
- Streamline pursuit of partners/funders

Roles for Agencies and Service Providers

- **Coordinating** and **improving understanding** of needs
- Requiring greater **specificity in strategic plans**
- Offering **support for strategic planning**
- Providing **board management training**
- Offering toolkits on s**taff benefits and retirement**
- Coordinating with and educating external funders on **significance of longer-term funding**

07/21/2

Capacity matters...

Thank you!

Authors: Jess Downey, Dr. Emily Jane Davis, Dr. Rich Margerum

Author Affiliations

Jess Downey was the Project Lead while working as a faculty research assistant in the Department of Forest Ecosystems and Society at Oregon State University. Jess now works at the Ecosystem Workforce Program (EWP) as a faculty research assistant and as the manager for the Center for Wildfire Smoke Research and Practice, both of which are housed within the University of Oregon's Institute for Resilient Organizations, Communities, and Environments (IROCE).

Dr. Emily Jane Davis is the Interim Extension Fire Program Director, an associate professor, and an extension specialist in the Department of Forest Ecosystems and Society and the Forestry and Natural Resources Extension Program at Oregon State University.

Dr. Rich Margerum is an associate dean and co-director of the College of Design's school of planning, public policy, and management, and a professor at the University of Oregon, as well as a Board member for the Network of Oregon Watershed Councils. Additionally, Dr. Margerum is not funded for his work for NOWC and does not participate in any decision-making about grants or funding affecting councils.

Acknowledgments

We thank the grantee organizations who participated in the survey and interviews for their time. We also wish to particularly thank our Core Project Committee, consisting of key Oregon Watershed Enhancement Board and Oregon Department of Agriculture project support leads (Courtney Shaff, Ken Fetcho, Eric Nusbaum, Marganne Allen, and Karin Stutzman). We also thank the Advisory Group, chaired by OWEB and ODA, which consisted of a selected group of council and district leadership, including Kyle Waggoner (Umatilla SWCD), Rob Hoshaw (Long Tom WC), Amy Stiner (South Fork John Day WC), Herb Winters (Gillam SWCD), Dave Downing (Upper Willamette SWCD), and Kelly Timchak (Lower Rogue WC/Curry Watersheds). Anna Santo and Heidi Huber-Stearns of the Ecosystem Workforce Program at the University of Oregon assisted with initial project concepts and secondary data collection. Lauren Nguyen of the University of Oregon assisted with data collection and management. Eric M. White of the USDA Forest Service Pacific Northwest Research Station assisted with estimation of the economic contribution of operating capacity grants. This project was funded in whole by the Oregon Watershed Enhancement Board.

Marganne Allen, the Agricultural Water Quality Program Manager with ODA, played an essential role in supporting this project with her expertise and experience in water quality management. She passed away in March 2023. We are grateful for the opportunity to have worked with her.

EXECUTIVE SUMMARY

for A 20-Year Review of the Oregon Watershed Enhancement Board's Capacity Investments

Outreach table at City of Cottage Grove Tree Giveaway Arbor Day Celebration. *credit: Coast Fork Willamette WC.*

Executive Summary

Over the past 20 years, the Oregon Watershed Enhancement Board (OWEB) has provided Operating Capacity grants to watershed councils ("councils"), and in close coordination with Oregon Department of Agriculture (ODA), to Soil and Water Conservation Districts ("districts") across the state.

> The underlying theory for this capacity funding assumes "*that investment in districts and councils will increase their ability to purposefully and effectively act and interact within their spheres and influence and thus effect measurable and meaningful change in the health of watersheds*."[1]

[1] Request for Proposals #691-1013-19, p. 5

OWEB's 2018 Strategic Plan further emphasizes the importance of community capacity and strategic partnerships. To evaluate the impact of this funding on councils and districts and help inform future capacity-building investments, OWEB engaged a team from Oregon State University and the University of Oregon to conduct a 20-year programmatic review of Operating Capacity grants provided to councils and districts. A secondary intent of this evaluation is to support best practices for capacity investment funding and identify potential needs for training and guidance for lead council and district staff and boards. We found that many challenges and opportunities were common across councils and districts, and as such, we only point to differences between these when relevant. To better understand factors affecting organizational capacity, we gathered data across five capacity dimensions of (1) internal governance and operational practices, (2) resources obtained and leveraged, (3) adaptive and resilient governance, (4) types of partners engaged, and (5) partnership types engaged in.

From 2011 to 2021, OWEB has provided over $80 million in Operating Capacity grants to councils and districts. With this essential funding, councils and districts have leveraged over $140 million from OWEB's Open Solicitation grants alone to engage in restoration and conservation projects, which supports state agencies in meeting state-wide restoration and conservation goals; and have leveraged multiple other sources of public, private, and philanthropic funds. These initial OWEB funds generated additional economic activity as councils and districts purchased products and services; and as employees of councils, districts, suppliers, and service providers spent their income. The initial investments for councils supported $64.5 million of total economic activity (the original investment plus additional multiplier effect economic activity) and initial investments in districts translated into $64.1 million of economic activity.

Given the influx of federal funding from the 2022 Inflation Reduction Act (P.L.117-18) and the 2021 Bipartisan Infrastructure Law (P.L.117-58), it is particularly important to understand what helps build or reduce organizational capacity at the local level to better position grantees for these resources, since community-based organizations are essential partners in implementing federally funded restoration and conservation work on the ground.

Figure 1. *Summary of Operating Capacity Investments to Councils and Districts from 2011 to 2021.*[2]

Operating Capacity Grants (July 2011-December 2021) **$82,013,681**

Funds Leveraged from OWEB's Open Solicitation Grants (January 2011-December 2021) **$142,730,455**

[2] We chose to calculate OWEB's total operating capacity investments from 2011 to 2021 because in July 2011 OWEB began to provide capacity funds directly to districts, so we could easily track how much funding each district and council has received, over a consistent time period.

Approach

This project applied a mixed-methods and participatory approach including:

- an online survey
- a phased case study process
- capacity programs review with partner and advisory input

Online Survey

From April - May 2022, a survey was administered to all councils and districts that have received Operating Capacity grants from OWEB and ODA. We had an 81% response rate from councils and a 91% response rate from districts. We collected data on number of employees and shared staffing arrangements for the purpose of arranging grantees into similar organizational types (i.e., capacity typology) to frame sampling of case study grantees. We also gathered data on factors affecting organizational capacity including: (1) internal governance and operational practices, (2) resources obtained and leveraged, (3) adaptive and resilient governance, (4) types of partners engaged, and (5) partnership types engaged in.

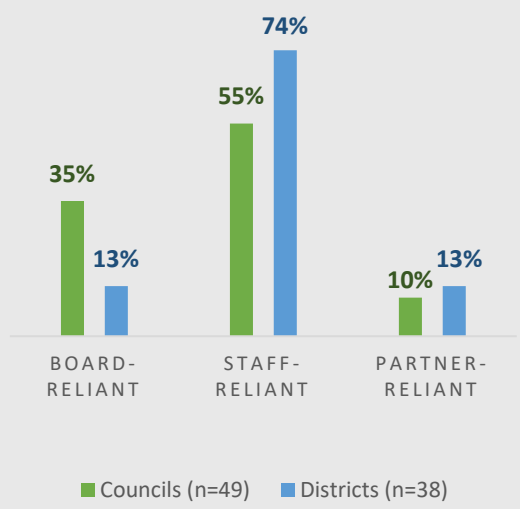
Phased Case Studies

From June 2022 - February 2023, we engaged in a phased case study approach examining a selection of councils and districts with different staffing levels, in rural and urban contexts, and with varying resource classes. To categorize grantees by resource classes, we looked at Oregon Watershed Restoration Inventory (OWRI) and OWEB Grant Management System (OGMS) data from 1997 to 2019, calculated total cash spent and in-kind contributions for each grantee, and used quartile statistical breakpoints to define resource classes. Then, we conducted a 20-year grant document review of 20 selected grantees, to develop in-depth organizational profiles to identify common themes. Using these profiles, we further selected seven case study grantees for in-depth interviews with lead staff, board members, and partner organizations. These strategies helped us create a process that was achievable within our project timeline, while improving the applicability of results.

Capacity Programs Review

We gathered available information about similar capacity-building programs that invest in local organizational capacity (i.e., administrative, financial, technical) in natural resources and conservation management in the United States to identify appliable lessons learned for OWEB's capacity grant context (Refer to Appendix 5).

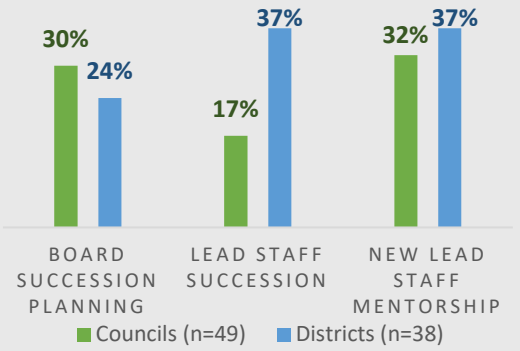
These findings are intended to provide useful knowledge about what fosters and impedes local organizational capacity, and how these factors can lead to upward or downward trajectories for organizational health. They are relevant to lead staff and board members of councils and districts, OWEB and ODA staff, conservation-focused statewide service providers, the OWEB Board, the Soil and Water Conservation Commission (SWCC), and other state agencies and external funders interested in collaborating to ensure that collective investments and capacity resources are coordinated and effective.



Grantee Organizational Models

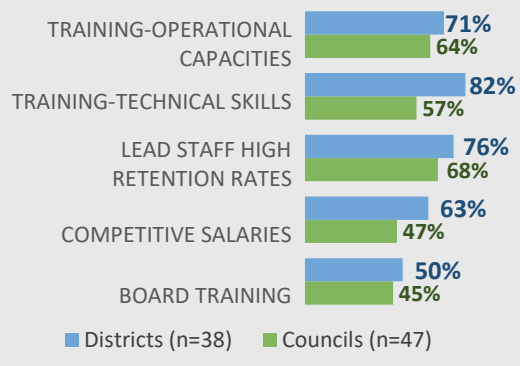
We used Dr. Margerum's "Reliance Model of Collaborative Capacity" to categorize grantees into three broad types based on staffing levels and shared staffing arrangements (journal article in review).

Board-reliant indicates lower staffing levels with a greater reliance on a working board. **Staff-reliant** indicates higher staffing levels where staff fulfill more management capacity and boards are encouraged to take a more strategic role. **Partner-reliant** indicates shared staffing arrangements with another organization, with staff also fulfilling more management roles.



Most grantees were staff-reliant **(Figure 2).** Most districts were staff-reliant, including all districts with a permanent tax rate. This may indicate that tax bases may help districts shift towards greater staffing capacity. However, it is important to acknowledge that while taxes serve as an ongoing base of support, organizational management is just as essential.

Figure 2. Comparing Council and District Typology Results



Overall, most councils and districts responded that they had written personnel and operational policies (>95%) with clear position descriptions for staff (>83%) and board members (>76%) that were well-implemented (> 89%). Additionally, 66% of districts and 70% of councils indicated that their board took initiative in managing the organization. However, regardless of capacity typology, less than half of councils and districts indicated that they had succession planning or mentorship for lead staff, or succession planning for board members **(Figure 3).** Furthermore, only 45% of councils and 50% of districts indicated that they had board member training for financial management, facilitation, or personnel management.

Figure 3. Comparing Council and District Capacity for Board and Lead Staff Transitions

Taxing districts, which were all staff-reliant, were more likely to respond that they had competitive salaries and benefits (90%), access to adequate equipment and technology for virtual meetings (90%), and staff training on key operational capacities (e.g., project management, contracting, and administrative tasks; 80%) compared to non-taxing districts. Regardless of whether a district had a tax base, they still led councils in reported competitive salaries and benefits, staff training on technical skill building and key operational capacities, and lead staff retention rates **(Figure 4).** This may indicate that access to competitive wages and more training may support retention rates.

Figure 4. Comparing Councils and Districts in Training, Staff Salaries, and Retention Rates

Operating Capacity Grant Uses

We found that councils and districts commonly used Operating Capacity grants for project development by building networks to develop joint priorities and obtain funding. This included creating ad-hoc regional groups as a collaborative approach to sharing training, information, and resources. This demonstrates the value of allowing greater flexibility for Operating Capacity funding. Additionally, it is important to recognize that project development can be a multi-year process depending on project complexity and the number of partners involved. This points to an essential function of Operating Capacity grants in providing on-going support for project development through paying staff time to meet with and coordinate with partners until they obtain a grant with these partners to engage in implementation of restoration and conservation projects. Councils also used capacity grants as cash match for restoration and conservation projects, which has helped leverage additional federal grants that require match funding. Councils also described using Council Capacity funds to participate in local boards and committees to identify and cultivate relationships with potential future board members to advance their goals. All councils and districts used the Operating Capacity grants for operational support (e.g., administrative staff), as well as training for staff and boards. This was essential for maintaining their day-to-day operations and governance. Districts indicated an interest in increased flexibility in how they could use their District Capacity funds for staffing and capacity building. Currently, 75% of District Capacity funds are directed towards districts' Scope of Work and Focus Area Action Plan, while 25% are for operations. Council Capacity grants have become more flexible over time, where any expense eligible in other OWEB grants is also eligible in a Council Capacity Grant. Councils have appreciated this flexibility and have found it extremely valuable to use funds based on their self-determined needs.

We learned that Operating Capacity grants have positively impacted communities' local economies, supported the completion of restoration and conservation projects, and helped build capacity among local partners. Investing in local councils and districts around Oregon through the Operating Capacity grants program has enabled progress toward state-wide restoration and conservation goals. Furthermore, many grantees expressed that there is insufficient external capacity-building funding in the face of rising costs and inflation. Without Operating Capacity grants, many councils and districts would not be able to maintain their operations because restoration and conservation work can require months or years of networking, planning, and leveraging projects—which cannot be charged to restoration and conservation project grants. The potential loss of councils and districts would have negative repercussions on conservation efforts throughout the state. State and federal natural resource agencies have also depended on councils and districts for their ability to leverage funding, implement projects, and provide community connections.

Critical Governance Characteristics

Governance refers to how an organization is managed and led, which relates to board and lead staff roles and responsibilities, along with the structures and processes they use for defining priorities and making decisions. Together, these have a large influence on grantees' functioning and trajectory. Across case study grantee organizations, we found three critical characteristics that affected the operating capacity of councils and districts. These were (1) lead staff capacity and retention, (2) board composition and recruitment, and (3) strategic planning.

Key Factors in Effective Governance:

- Lead staff capacity and retention is supported by board engagement and regional networks.
- Targeted board recruitment supports organizational direction.
- Strategic and annual work plans establish and reinforce organizational priorities.

#1: Lead Staff Capacity and Retention: Board Engagement and Formation of Regional Networks Supports Lead Staff

Lead staff have played an important role in grantees' stability and overall trajectory. Crucial lead staff skills include leadership, relationship building, personnel management, fiscal management, grant writing, and conservation knowledge. Factors affecting lead staff capacity and retention include level of board engagement and supportive regional networks.

(1) **Level of board engagement:** Effectively engaged boards provided lead staff with organizational direction for strategic planning, supported lead staff decision-making and development of organizational policies/procedures, contributed guidance on lead staff work plans, and provided fiscal oversight. An effective board was one that is neither too engaged (i.e., micromanaging lead staff), nor too disengaged (i.e., not providing sufficient organizational direction and support for lead staff). Engaged boards were better able to manage lead staff turnover, often supporting operations and interim staff through the transition. Lead staff have used various strategies to improve board engagement and help train them in

their role, since not all board members have a background in organizational management. Some lead staff incorporated 15-minute educational content and skills training into board meetings to help them understand their roles and responsibilities. Other lead staff invited agency personnel or other relevant experts to provide project updates and upcoming funding opportunities to help boards understand regional priorities and inform their decision-making.

(2) **Regional networks:** In rural and urban settings, some grantees established regional networks, using OWEB Focused Investment Partnership (FIP), Partnership Technical Assistance (P-TA), or the Natural Resources Conservation Service's Regional Conservation Partnership Program (NRCS RCPP) grants, which provided additional support for grantees experiencing lead staff transitions. By building on pre-existing relationships, some grantees developed more formalized partnerships with shared by-laws, memorandums of understanding (MOUs), and other governing documents. The intentionality of these partnerships has allowed for increased points of connection between local conservation partners for shared peer learning through regular meetings. Furthermore, the consistency of these meetings and the development of group agreements built trust, which led to some grantees becoming more transparent with each other about how they operated and managed finances. This helped develop a culture that leveraged the diversity of knowledge and expertise of the group for mentorship, rather than relying solely on past lead staff or the board chair.

Challenges: Lead Staff Turnover and Capacity

Turnover of lead staff was challenging for many grantees to overcome and sometimes led to a downward cycle of additional challenges, including issues with recruitment and replacement. Precipitating factors for lead staff loss included: unsustainable workload, lack of joint organizational priority setting between staff and board for strategic plans or annual work plans, and a board that was too engaged (i.e., micromanaging of lead staff) or too disengaged (i.e., not providing sufficient organizational direction or fulfilling essential board functions as described in Table 14). Some lead staff found themselves in a position of managing a challenging workload, while navigating their concerns around pay, health, and retirement benefits, which have been affected by rising costs of living and housing in Oregon. Because of this, some lead staff have left to seek out positions with increased pay and benefits.

Other grantees experienced challenges with organizational stagnation, wherein lead staff lacked the necessary capacity, skills, or training to lead organizations at a particular point in time. In these situations, board members: (1) lacked skills or experience in personnel and organizational management, (2) were disengaged and did not recognize what skills were needed for lead staff positions, and/or (3) faced difficulties of attracting qualified candidates due to the grant-funded nature of lead staff positions, and lack of health and retirement benefits and competitive wages, coupled with the challenges of hiring in rural communities. Rural areas, like the rest of Oregon, have faced rising housing values and increased costs of living in part associated with the COVID-19 pandemic. Some interviewees indicated that effects from organizational stagnation made partners less likely to work with them, which led to missed opportunities for project work and funding. These challenges were particularly acute for board-reliant organizations, while staff and partner-reliant organizations had more opportunity to support advancement of lead staff from within.

#2: Board Recruitment: Targeted Recruitment Helps Grantee Organizations Work Towards Strategic Plan Goals

Boards have held an essential role in organizational direction setting. Essential board member skills included reviewing and updating governing policies and procedures, fiscal oversight and management, and providing guidance and support to lead staff. As part of their operational strategy, some grantees engaged in targeted board recruitment through ongoing, intentional participation in local committees, other boards, or foundations; and by attending local events. This helped access existing community networks to identify potential board members, encourage their broader involvement in projects, and cultivate future candidates. They looked for individuals who could help them move closer to the organization's strategic plan goals and strengthen communication/information sharing across agencies and industries. To pay for lead staff and other project managers' time to participate in these activities, some grantees built their operational budget over time as part of their operational strategy.

In addition, some districts have innovated around the legal requirements for board directors. Typically, to become a zone director, an individual must own or manage at least ten acres of land, while at-large or associate directors do not have these same criteria.[3] Some districts recruited non-landowners or those who own or manage less than ten acres of land to become at-large or associate directors to address issues of diversity or lack of expertise in board composition. After one year in this position, they became eligible to serve as zone director if they were a registered voter who lived within the zone they represented and had a conservation plan approved by the district.

Challenges

Common board recruitment challenges have included issues with identifying and recruiting members with the time and capacity to commit, with organizational/personnel/fiscal management skills, and from a diversity of perspectives. These were difficult to overcome since they have been a product of established OWEB and ODA board requirements or reflective of community contexts. Furthermore, when board positions were posted or spread by word of mouth only, organizations typically had a less diverse board. These challenges were particularly acute in rural areas with a limited pool of potential board members, or key potential board members were already serving in numerous community volunteer roles.

#3: Strategic Planning: Joint Priority Setting Supports an Upward Trajectory

Strategic plans support decision-making between lead staff, boards, and partners. Here, we refer to individual organizations' strategic plans, rather than strategic action plans used to coordinate goals and actions across multiple organizations for a large geographic area as part of an OWEB-FIP, P-TA, NRCS RCPP grant, or others. The planning processes for an individual organization's strategic plan are shaped by regional contexts, vary based on organizational structure, and serve distinct purposes depending on how the organization is managed. Because strategic plans have different functions depending on these factors, it is necessary to account for these nuances. For some organizations, an effective strategic planning process took a more detailed approach. The plan incorporated diverse perspectives and needs and engaged relevant technical expertise to identify geographic project and/or programmatic priorities that could result in tangible benefits or improvements with clearly

[3] Refer to ODA's SWCD Guidebook Chapter 3: Conservation District Directors (updated 12/2022) for more information as well as ORS 568.560(2) and (3) to see the eligibility requirements for a person to become a conservation district director.

measurable objectives. These priorities were sometimes laid out as short, medium, and long-term goals, with identifiable potential partners and funders. These organizations typically had access to more regional funding opportunities. For other organizations, an effective strategic planning process needed a wider scope and to be broader in nature. These plans included organizational history, land uses, and limiting factors, which allowed the organization to be more adaptable to emergent funding opportunities that arose. These organizations typically had fewer regional funding opportunities available. The annual work plans were then derived from these strategic plans to incorporate more detail to guide daily operations and establish geographic project and/or programmatic priorities between lead staff and board. Both approaches supported organizational efficiencies through joint priority setting by lead staff and board, which simultaneously led to a shared understanding of what constituted a manageable project workload based on staffing capacity. This knowledge also streamlined pursuit of key partnerships and funding sources.

However, it is important to recognize that for a strategic plan to gain momentum and foster an upward organizational trajectory, lead staff still needed to be able to move from planning to action by creating "small wins" early on that demonstrated commitment and developed trust that the organization would be reliable and consistent in following through on their plans. This was the case regardless of whether the organization had greater access to funding opportunities or not, though, of course having more funding opportunities in a geographic area was helpful for this.

Challenges

When strategic plans and/or annual work plans lacked specificity in their objectives and measures, the plans did not offer enough organizational direction setting for lead staff to develop projects, seek out partnerships, or identify funding sources. Without joint organizational priority by lead staff and board members, some organizations faced increased lead staff workload, which often led to burn-out from a lack of direction for their strategic and/or annual work plans. In other instances, some organizations faced difficulties with board micromanagement, which led to organizational gridlock and departure of lead staff.

Post-wildfire team efforts. *credit: Upper Willamette Stewardship Network.*

Building Partnership Capacity and Working through Challenges

Partnerships helped organizations to learn from the expertise and experiences of adjacent councils, districts, and other local conservation partners to develop and implement restoration and conservation projects. Over time, some partnerships evolved as they created shared understanding of needs and resources available. These types of partnerships were able to move beyond project-to-project planning and work towards the development of larger-scale restoration and conservation projects. Partnership opportunities and challenges varied in different geographic areas and landownership and land contexts. When neighboring landowners differed in their priorities, it could be challenging to implement a program of work across a landscape. However, councils and districts, as community-based organizations, were positioned to find common goals and work towards landscape-scale restoration and conservation.

Councils and districts built their partnership capacity through participation in city or county committees and other local boards to establish their local reputation and contribute to the community. They also developed strategic plans with key partners to establish priorities for their watersheds through identification of key players (e.g., landowners, city/county officials/boards, public events/outreach) and formation of joint priorities to acquire funds. Additionally, they created diverse models of partnership to meet the needs of those involved through resource- sharing arrangements (e.g., staff positions, staff expertise, equipment) and establishment of group networks.

Challenges

Common partnership challenges that councils and districts faced included partner staff transitions and challenging relationship histories. To address partner staff transitions, lead staff oriented new agency personnel to joint project grants and shared priorities. Some invited agency partners to attend board meetings or one-on-one settings. Challenging partnership histories were typically addressed by lead staff efforts to rebuild the relationship through action, such as funding to work together on a project or monitoring to collect and share information for project development. These approaches supported each other's capacity since each organization had access to complementary skills, knowledge, and community connections necessary for restoration and conservation.

Top Funding Strategies and Challenges

Councils and districts have used various strategies to acquire funding for projects and operating capacity, including from unrestricted and longer-term sources. It is important to keep in mind that these strategies vary by resources available in a given geography. To successfully obtain project funding, top strategies included assessment of staffing and organizational capacity to inform which grants to pursue and when, and development of a strategic plan and funding opportunities spreadsheet.

- To strategically pursue grants, organizations defined what a feasible project workload would look like based on their staffing and project capacity. This structure helped them to implement project work in a timely manner, which built partner trust and attracted additional funding opportunities. Additionally, some described how they learned to build additional capacity into grant applications by budgeting for more project management time and accounting for future costs and expenses (e.g., staff wages and materials), as grants allowed. Strategic plans helped to identify watershed goals and related project priorities, which then helped organizations position themselves for grant opportunities. Some organizations also created a funding opportunities spreadsheet that connected their strategic plan to various funders' priorities. They periodically updated this to keep track of grants, deadlines, and key contacts to maintain awareness of upcoming opportunities. Some also described fostering regional networks using partnership grants (e.g., OWEB-FIP, P-TA, or NRCS RCPP) to formalize partnerships, share information and resources, coordinate projects, and identify partners for project cash match. The designation of a partnership coordinator was particularly useful for identifying landscape-level restoration and conservation funding for multiple organizations.
- To develop unrestricted funding sources, organizations networked in their communities to learn about diverse funding opportunities and build partnerships helped them to find longer-term funding to supplement OWEB's Operating Capacity grants. Examples include: (1) annual federally negotiated indirect cost rate agreements, (2) local government budgets, (3) local community institutions that sponsor non-profits (e.g., local banks, grocers, breweries), and (4) fundraising.

Challenges

Councils and districts faced challenges inherent to with navigating a variable funding landscape and lack of external programmatic capacity funding not tied to specific projects. External funders' priorities change over time, which can lead to loss of reliable funding sources. Additionally, some geographic areas of the state have had greater access to funding opportunities, such as Bonneville Power Administration grants (BPA), district tax bases; species-specific funds for salmon, steelhead, and greater sage-grouse; and other agency regional funding priorities. Further, some rural communities have fewer available local organizations to partner with on projects and/or a lack of local government funding for conservation, and therefore, fewer cash match options for grants. This also ties into difficulties some rural organizations described of finding and retaining qualified staff, which had indirect impacts on their ability to manage and obtain larger restoration and conservation grants. Some have developed and participated in regional partnerships to help mitigate these challenges to the extent possible.

Proposed Recommendations: Agencies and Service Providers

Coordinate Across Agencies and Improve Cross-Agency Understanding of Grantees' Needs

Although several agencies and service providers offer technical assistance and support for grantees (e.g., NOWC, OrCP, OCEAN, and the SWCD Operations Specialist), there is a need to improve awareness of this. As the COIVID-19 pandemic altered what was provided over the past few years, and as more in-person events are happening, it is important to re-introduce and offer additional opportunities for peer networking and information sharing. Additionally, we heard interest from council and district staff in connecting directly with OWEB and ODA staff. Hosting regional in-person forums could be particularly beneficial for organizations in more rural areas, who typically must travel further and face greater travel costs for professional networking opportunities. Lastly, new lead staff may have different needs than those who have been in their positions longer. This emphasizes the ongoing importance of mentorship and peer learning networks to create information exchanges and learn from each other's experiences at all stages.

Potential Strategies

For councils, NOWC could play an enhanced role in supporting regional peer forums, since their board includes regional representatives, and they support regional peer networking groups open to all councils. Additionally, they have created a NOWC Insider Webinar series that covers a variety of topics (e.g., nonprofit board governance, legal issues, financial best practices, partnership opportunities, fundraising strategies, and other relevant topics) with content experts. However, these services are currently limited to councils who are paying NOWC members, because the organization depends on membership dues for funding its part-time coordinator and operations currently. OWEB could also engage with ODA's SWCD Operations Specialist's skills to develop regional round-table trainings for lead staff on management and operations for councils, in addition to those already offered to districts.

Topics for Capacity Building

Content that grantees most wanted to learn more about included OWEB-specific and general grant writing and reporting requirement courses; fiscal management and terminology; guidance on developing unrestricted funding sources to maintain critical operations; best practices or examples of organizational policies, procedures, and bylaws; board management and education; handling personnel management and lead staff transitions; and navigating the management of multiple projects, with a balanced project workload for lead staff. It is important to acknowledge that lead staff may not have a background in project management or organizational management, which are essential functions for this position, and have often needed to learn on-the-job.

Strategic Planning

Requiring greater specificity in strategic plans or annual work plans as part of OWEB Council Capacity Grant Merit Criterion 2, depending on the functions of these plans for the organization, could allow for objectives and measures for how councils are identifying and implementing watershed restoration and conservation while engaging with partners (refer to Proposed Metrics Scorecard in Section VII-C, page 52 for more nuances). It is important to acknowledge that strategic planning processes take time, energy, and resources, which can draw capacity from an organization's other activities and project work. As such, organizations may benefit from additional technical and financial support from OWEB and ODA and other supportive organizations to assist their strategic planning and annual work plan processes to incorporate diverse perspectives and needs and engage relevant technical expertise for identifying priorities. Regional peer learning forums, webinars, and conference sessions may help grantees, particularly lead staff, gain valuable insight into project development, management, and implementation, while making the best use of OWEB's various grants in project design (e.g., technical assistance, stakeholder engagement, monitoring, and restoration).

Board Management

Grantees may benefit from board training guidance, either using existing resources available from ODA, NOWC, and Oregon Conservation Partnership (OrCP), or development of new guidance through these outlets. Considering that lead staff capacity and turnover are common organizational challenges, it is important to continually promote relevant and available board resources for lead staff awareness. Offering these via webinars would allow for increased opportunities to meet the scheduling needs of retired or working board members. Key training areas included strategic plans, organizational policies and procedures, fiscal responsibilities, and personnel management of lead staff.

Staff Benefits and Retirement

A key aspect of lead staff succession planning and staff retention is pay, health and retirement benefits, which are further challenged by the rising costs of living and housing, even prior to the COVID-19 pandemic. It is challenging for councils and districts as smaller grant-funded organizations to afford group health insurance for their staff. It can be challenging to maintain organizational longevity when lead staff leaves to seek out positions with increased pay and benefits. Additionally, based on the survey results, less than half of councils and districts indicated that they had succession planning or mentorship for lead staff, or succession planning for board members. Furthermore, only 47% of councils and 63% of districts indicated that they had competitive salaries and benefits compared to similar types of organizations. Grantees may benefit from a toolkit or an online resource page (including relevant resources from OCEAN, OACD, NOWC and OrCP webinars) for how to

incorporate health and retirement benefits into their organization. Regional peer learning forums, CONNECT and OACD conference sessions, and access to legal experts may be helpful as well.

Coordinating with and Educating External Funders on the Significance of Longer-Term Funding

By reviewing other capacity building programs, we learned that other funders (e.g., the Ford Family Foundation and the Wilburforce Foundation) acknowledge the need to support long-term partnerships through long-term granting, and the importance of collaborating among funders to ensure that collective investments and capacity resources are coordinated and effective. OWEB and ODA have provided ongoing, programmatic support for 20 years to councils and districts' efforts in improving local watershed quality and health. OWEB has developed longer-term funding strategies to help support grantees in partnership capacity and larger landscape-scale restoration (P-TA and FIP grants), while NRCS has developed RCPP grants to support collaboration with other councils and districts for landscape-scale conservation projects with private landowners. External funders often see OWEB and ODA as essential funding partners in getting restoration and conservation work done on the ground through these locally based councils and districts. As such, OWEB can play a role in educating funders on the significance of longer-term grants to work toward landscape-scale restoration and conservation.

CAPACITY MATTERS

REPORT

for A 20-Year Review of the Oregon Watershed Enhancement Board's Capacity Investments

Students survey macro-invertebrates during a Salmon Watch field trip on the North Santiam River. credit: Marion SWCD.

I. Introduction

Since 1997, OWEB has directly invested in the operating capacity of watershed councils (i.e., councils) and soil and water conservation districts (i.e., districts) enabling these entities to collaboratively foster locally based, voluntary restoration to protect or restore native fish or wildlife habitats or restore natural watershed functions to improve water quality or stream flows. This was generated by the Oregon Plan for Salmon and Watersheds (OPSW) which focuses on "restoring our native fish populations and the aquatic systems that support them to productive and sustainable levels that will provide substantial environmental, cultural, and economic benefits."

[1] Under ORS 541.890(15) and 541.910, councils are "designated by a local government group convened by a county governing body, to address the goal of sustaining natural resource and watershed protection, restoration and enhancement within a watershed."[2] Districts are political subdivisions of state government, i.e., municipal corporations, governed by ORS 568. Districts have existed in Oregon for over 75 years, with the first established in 1939 as South Tillamook.

[1] https://www.oregon.gov/oweb/resources/pages/opsw.aspx

[2] OWEB FY 21 - 23 Spending Plan

OWEB's theory of change underpinning the provision of Operating Capacity grants:
If councils and districts receive resources to operate and meet merit criteria, they will be able to better sustain healthy watersheds.

Specifically, capacity investments will "increase [groups'] ability to purposefully and effectively act and interact within their spheres and influence."[3] With that capacity, the councils and districts pursue and achieve their mission and purposes of engaging communities, stimulating economies, mobilizing partners, affecting the systems that interact with watersheds, and ultimately achieving meaningful, measurable, sustainable improvements in the health of Oregon watersheds. OWEB's 2018 Strategic Plan further emphasizes the importance of community capacity and strategic partnerships. Strategy 3.1 recommends completing a qualitative and quantitative evaluation of past council and district capacity investments.[4] In 2020, OWEB initiated this project to evaluate these Operating Capacity grants from the past 20 years and assess what contributes to or impedes capacity, engaging a research team from Oregon State University (OSU) and the University of Oregon (UO). The intent of this evaluation is to identify best practices for capacity investment funding, as councils and districts face evolving changes and challenges in their roles and funding.

Figure 1. *Defining Organizational Capacity.*

Questions

- How have grantees used Operating Capacity grants and what are the outcomes of the Operating Capacity grant program?
- How have grantees used Operating Capacity grants to leverage partnerships?
- What can we learn about what builds or reduces an organization's capacity?
- What guidance and best practices can be developed to help councils and districts increase their capacity and overcome organizational challenges?
- How can we refine approaches for capacity investment monitoring and tracking?
- How can findings inform future funding strategies to sustain and build operating capacity, while also helping to convey to other funders the importance of programmatic capacity?

I.A. History of Operating Capacity Grants

The majority of OWEB's grant funding comes from two sources: Measure 76 Lottery funds and Pacific Coastal Salmon Recovery Funds (PCSRF). For each biennium, OWEB's spending plan is approved by the OWEB Board in the first fiscal year of the biennium. In the second fiscal year of the biennium, the spending is updated based on updated revenues, and additional PCSRF funding awarded from NOAA. OWEB's core grant programs include: (1) Open Solicitation, (2) Focused Investments, (3) Operating Capacity, and (4) Small Grants. In this project, we focused on the Operating Capacity grants provided to councils and districts.

Council Capacity Grants

For over 20 years, OWEB has provided Council Capacity grants to watershed councils. OWEB does not create or oversee councils, but does have statutory discretion to provide Council Capacity grants based on whether councils reflect a balance of watershed interests and display the ability to both protect and improve watershed quality. Councils are also expected to engage a high level of citizen participation in developing and implementing watershed action programs based on ORS 541.910. Council Capacity grants have gone through many iterations over the past 20 years with varying criteria, evaluation metrics, and review processes (**Figure 2**). In 2014, OWEB adopted criteria that emphasized effective governance, evolving strategic plans, and action in watershed restoration and conservation activities with active partner engagement. Refer to Appendix 1 for a detailed description of how OWEB's funding has changed over time.

Figure 2. *OWEB Funding Strategies.*

BLANKET FUNDING — **1997-2003**

Evaluation Criteria: Scope of Work and Accomplishment of Descriptions.

Funding Distribution: Equal distribution across regions.

CATEGORICAL FUNDING — **2003-2005**

Evaluation Criteria: n/a

Funding Distribution: Each category had a pre-designated funding range.

DECISION MATRIX WITH RANKED SCORING — **2005-2007**

Eligibility Criteria: Introduced to provide funding only to councils that have been designated by local government, does not overlap the bounds of another OWEB council grantee, with a council that reflects or seeks to represent a balance of interests.

Evaluation Criteria: Merit based (council organization, past performance on capital and non-capital projects, proposed work plan/watershed complexity) with an intensive review process and applicant ranking system based on level of effectiveness and accomplishments.

Funding Distribution: Quantitative approach using a standard formula that resulted in a graduated point scale. For example: The highest-scoring council received the highest base funding.

MODIFIED DECISION MATRIX WITH RANKED SCORING — **2007-2015**

Eligibility Criteria: Unchanged.

Evaluation Criteria: Merit base simplified (council organization and council effectiveness) with a consensus scoring review process. Following this, OWEB staff applied weighted factors, with council effectiveness /accomplishments weighted more heavily.

Funding Distribution: Unchanged

CATEGORICAL FUNDING — **2015-Present**

Eligibility Criteria: (1) Designated as a watershed council by a local government. (2) Has previously received a Council Capacity grant, and which serves an area that is the same or larger than the geographic area served by a council or group of councils as of 2013 with only 1 applicant per geographic area & includes a minimum population of 500 within its designated boundaries. (3) Adopted action plan by a council-governing body that meets OWEB requirements. (4) 501(c)(3) registered with Oregon, or written fiscal sponsorship agreement with a 501(c)(3), SWCD, city, county, or tribal government. (5) Adopted bylaws/charter & policies/ procedures that include standard best-practice governance provisions. (See Appx. 1 for full description of eligibility criteria in rule.)

Evaluation Criteria: Merit based (effective governance/management, progress in planning, progress in on-the-ground restoration, progress in stakeholder engagement for watershed restoration) with OWEB staff review based on these criteria as well as their institutional knowledge of council, e.g., project performance history. Applications considered independently of other councils, i.e., no ranking process.

Funding Distribution: Full funding if council meets all criteria; reduced funding if council meets some criteria; no funding if council's performance is inadequate.

District Capacity Grants

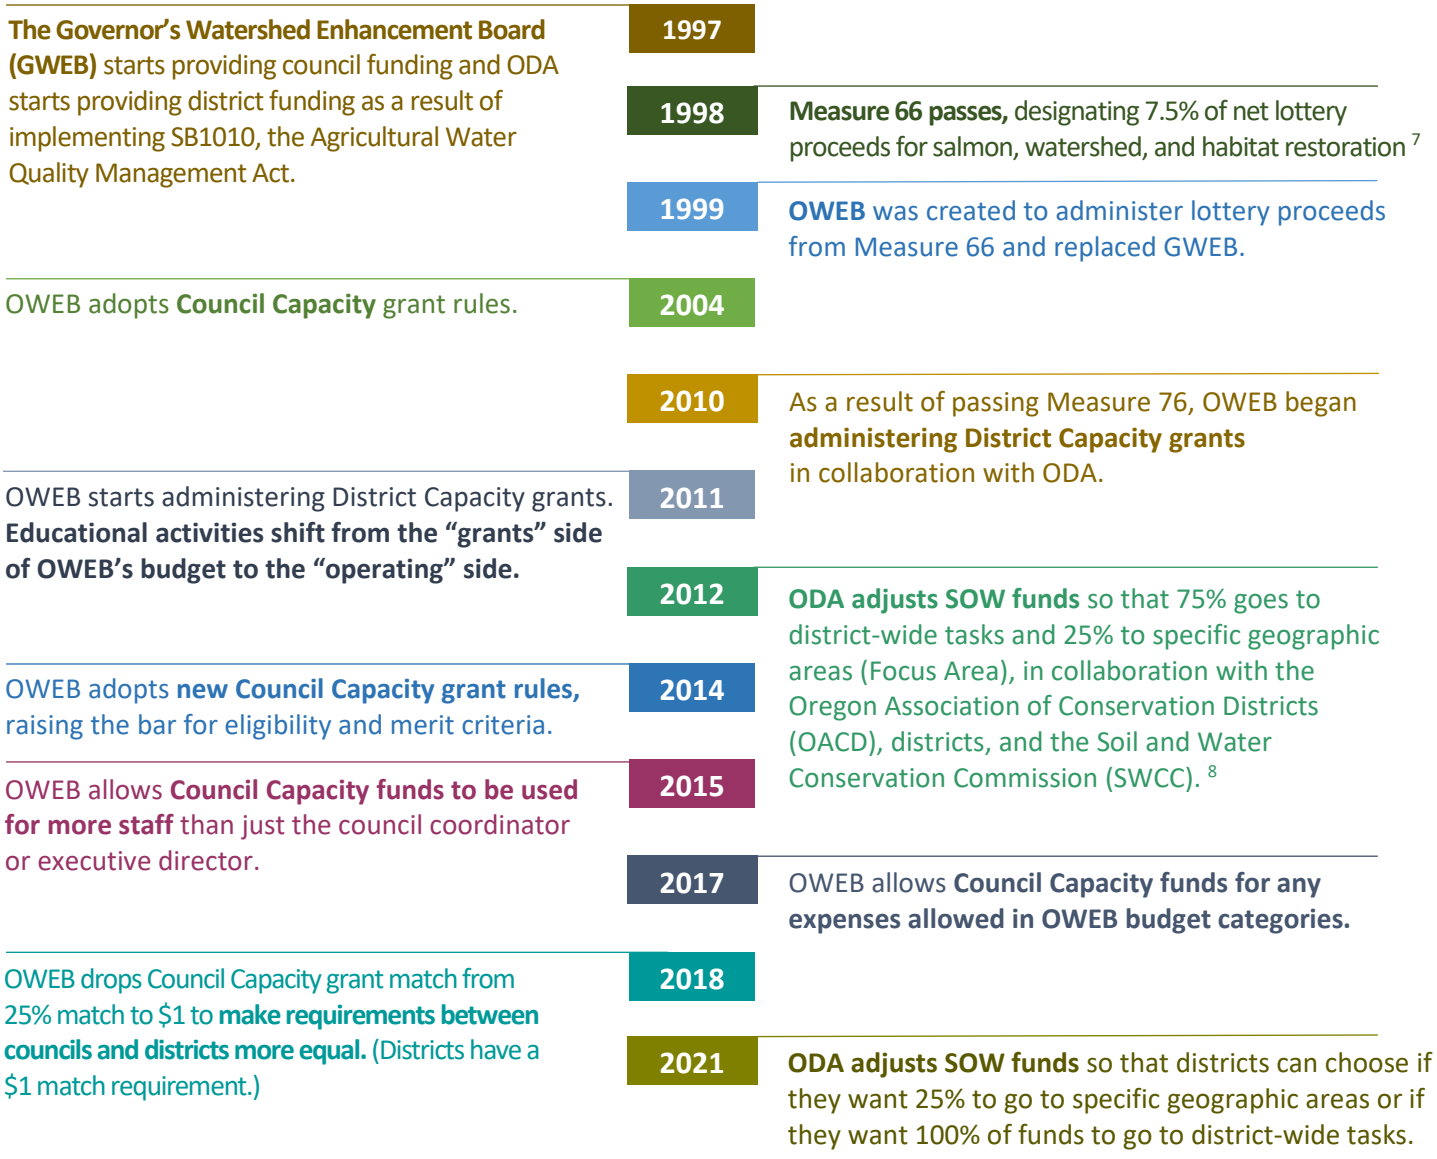
District Capacity grants are provided to all 45 Soil and Water Conservation Districts. The purpose of District Capacity grant funding is to support districts' efforts to work with landowners to conserve natural resources and to help ODA implement the Agricultural Water Quality Management Program. This program was passed by the Oregon Legislature in 1993 to prevent and control water pollution on agricultural lands in support of the federal Clean Water Act. In 2011, after the passage of Measure 76, which precluded OWEB from passing Oregon Lottery funds to other state agencies, OWEB and ODA entered into an interagency agreement for the funding and oversight of District Capacity grants. OWEB administers District Capacity grants. ODA reviews and approves district work plans, assesses progress on these work plans, notifies OWEB if payments should be approved based on work progress, and provides oversight of districts.

District Capacity funds are designated for the (1) Scope of Work (SOW) and (2) District Operations Fund. SOW funds are used to directly support working with partners and landowners for the conservation and protection of natural resources. This includes "technical assistance and community engagement for the restoration and protection of native fish and wildlife, watersheds, and water quality through implementation of Agricultural Water Quality Management Area Plans."[5] District Operations Funds are used for capacity support to help SWCDs comply with ORS, conduct business, and provide assistance to landowners and partners. Unlike Council Capacity grants, there are no criteria or evaluation metrics to designate funding, however ORS 568 outlines criteria to be eligible for funding. This includes (1) current annual and long-range business plans submitted to ODA for comment, (2) annual reports and audits of activities, and (3) an annual meeting of the landowners of the district.

Operating Capacity Funds Distributed and Leveraged from 2011 to 2021

From 2011 to 2021, OWEB has provided over $80 million in Operating Capacity grants to councils and districts. With this essential funding, councils and districts have leveraged over $140 million from OWEB's Open Solicitation grants alone to engage in restoration and conservation projects, which supports state agencies in meeting state-wide restoration and conservation goals.

Figure 3. *Summary of Operating Capacity Investments to Councils and Districts from 2011 to 2021.*



[5] OWEB FY 21 - 23 Spending Plan

Between July 2011 to December 2021, OWEB provided capacity grants of $47.4 million to watershed councils and $47.1 million to SWCDs. These initial OWEB funds generated additional economic activity as councils and districts purchased products and services; and as employees of councils, districts, suppliers, and service providers spent their income. Assuming that 80% of the spending of OWEB funds by councils and councils remained in Oregon and that the economic activity multiplier rate for these organizations is 1.7[6], the initial investments for councils supported $64.5 million of total economic activity (the original investment plus additional multiplier effect economic activity) and initial investments in districts translated into $64.1 million of total economic activity. All values are based on the value of a dollar in 2023.

[8] OWEB FY 21 - 23 Spending Plan

I.C. Context of Capacity Funding Criteria and Service Providers

Given that this evaluation is offering a 20-year review of OWEB's Operating Capacity grants, it is important to be aware of how OWEB has modified its approach to providing Operating Capacity grants and evaluation criteria over the years (For more detail, see Appendix 1). Changes in Operating Capacity grants administration have direct impacts on grantees, and changes in evaluation criteria can affect grant distribution. Additionally, this can inform the development of recommendations for refining OWEB's future investment strategies.

In addition to providing Operating Capacity grants, OWEB and ODA staff assist local councils and districts directly, and contribute to, or partner with various forms of conservation- focused peer learning support through state-wide service providers. These include peer learning networks, affinity groups, conferences, trainings, webinars, and professional networking opportunities. It is important to understand how OWEB, ODA, and service providers contribute to peer learning to help inform and identify useful strategies that councils and districts can benefit from, while being aware of what support is already available (**Figure 5**; for more complete descriptions, see Appendix 2).

II. Project Approach

Our approach was guided by our desire to produce actionable knowledge. We recognized and wanted to draw on the decades of experience and awareness that agency, council, and district staff possess. In developing a strategy for data collection, we considered the challenges and opportunities related to the COVID-19 pandemic, wildfire, drought, and other environmental issues that demand the time of local grantees, OWEB, and ODA. We focused on using existing data as a primary information source to decrease the burden of asking participants to provide information that was already publicly available. For information we could not obtain elsewhere, we carefully developed targeted approaches to new data collection. Importantly, this process aimed to be responsive to, and not extractive of, the local councils and districts who are the intended beneficiaries of this effort.

The Core Project Committee consisted of key OWEB and ODA project support leads (Courtney Shaff, Ken Fetcho, Eric Nusbaum, Marganne Allen, Karin Stutzman). We held meetings every one to two months to obtain input and refine project design, and engaged in ongoing communication as needed. Additionally, Dr. Rich Margerum, who serves as a NOWC board member, led communication with NOWC's Board. Courtney Shaff led communications with Vanessa Green, NOWC's Executive Director, as well as updating the SWCD Commission on this OWEB sponsored project that involves districts. Eric Nusbaum led communications with districts on the project during his annual district trainings.

The Council and District Advisory Group, chaired by OWEB and ODA, consisted of a selected group of council and district leadership, including Kyle Waggoner (Umatilla SWCD), Rob Hoshaw (Long Tom WC), Amy Stiner (South Fork John Day WC), Herb Winters (Gillam SWCD), and Kelly Timchak (Lower Rogue WC/Curry Watersheds). We engaged this group in April 2020 and again in April 2022 to obtain feedback on the study plan to discuss strengths, weaknesses, areas of particular interest for the agency and partners, and timelines. We focused on capacity dimensions and metrics for examination, as well as availability of proposed data sources, and feedback on proposed deliverables. In May 2023, we engaged the Advisory Group again to ground-truth our findings and recommendations, and determine the most effective ways to disseminate and apply what was learned.

II.A. Capacity Dimensions

This study took a multi-step, mixed-methods and participatory approach (**Figure 6**) to examining five dimensions of organizational and partnership capacities through a framework that tailored metrics to the watershed restoration and conservation contexts in which councils and districts work **(Table 1).** Importantly, the evaluation accounted for how grantees need different capacities at different stages of their development, in different social contexts, and for different activities.

Table 1. *Proposed Capacity Dimensions, Indicators, and Metrics.*

Capacity Dimension	Indicator	Evidence of Ability to
	ORGANIZATIONAL CAPACITY	
Internal Governance & Operational Practices	1) # of FTE staff/board members and shared staffing arrangements. 2) Presence/absence of bylaws/charter, governing policies and procedures, adopted action plans. 3) Presence/absence of functional accounting systems. 4) Grantee type (e.g., municipal, nonprofit).	Manage people and resources Have accountability
Resources Obtained & Leveraged	1) Match sources, types, and $ amounts. 2) Categorize grantees' ability to obtain and leverage resources (e.g., cash spent and # of projects completed).	Attract investment and support (crosswalk with partnership capacities)
Adaptive & Resilient Governance	1) Presence/absence/use of transition plans and practices, e.g., handover memos. 2) Documentation of institutional memory	Respond to challenges, changing needs and opportunities
	PARTNERSHIP CAPACITY	
Types of Partners Engaged	1) Extent, depth, and function of relationships with public, private, landowner, research, and other relevant entities.	Work with all necessary types of partners relevant to watershed restoration/ conservation in a given geography
Partnership Types Engaged In	1) Involvement in Focused Investment Partnerships (FIPs), Partnership Technical Assistance (P-TA), NRCS' Regional Conservation Partnership Program (RCPP), cross-boundary partnerships, etc. 2) Participation in a learning network, cooperative partnership, coordinating partnership, collaborative partnership. 3) Tie complexity of partnerships to existing funding opportunities.	Use partnership types suited to issues and needs at hand

II.B. Study Plan Steps

Figure 6. *Study Plan Steps.*

Key Informant Interviews	Interviews took place in 2020. Roles included: OWEB Regional Program Representatives, ODA Regional Water Quality Specialists, ODA's SWCD Operations Specialist, and OWEB's Monitoring and Reporting Program Manager. These interviews informed the organizational and partnership capacity dimensions and potential metrics that informed the study design, the survey questions for councils and districts, and for triangulating data from case study interviews.
Database of Council and District Characteristics	Develop baseline understanding of organizational and partnership characteristics for each included grantee to the extent possible, as well as static attributes, e.g., OWEB region, county, year formed, etc.
Develop Capacity Investments Narrative Characteristics	Document how capacity funding requirements, criteria, and distribution have changed over time, which can help inform future funding strategies to improve operating capacity.
Classify Councils and Districts by Capacity Typology	Guide classification and typology of grantees to support a representative sample of grantee capacity for case study analysis.
Survey Council and District Grantees	Conducted Qualtrics survey to collect information necessary to apply capacity typology to council and district grantees and develop a baseline of quantitative info about barriers and facilitators of capacity building across grantees.
Case Studies (phased approach)	1. Case Study Selection: Crosswalk capacity typology (3c) with OWRI and OGMS data, covering 1997 to 2019, to identify grantees with lower, medium, and higher levels of obtaining and leveraging resources. 2. Initial Document Analysis: Sample 20 grantees that are a representative percentage of councils and districts across capacity typology, resource class, and OWEB region to create an in-depth profile using existing data, e.g. OGMS grant documents over 20 years (including council support, restoration, technical assistance, monitoring, education, outreach, stakeholder engagement), SOW, FAAP, FIPs, P-TA, OWRI, organizational documents available on council and district websites. 3. In-depth Interviews: Select 7 grantees for interviews that are representative of councils and districts across OWEB's six regions in consultation with the Core Project Committee. Interview questions are informed by in-depth organizational profiles from the initial document analysis. Interviewees included: executive directors, district managers, staff, board members, partner organizations.
External Capacity-Building Program Review	Review of other existing capacity-building programs that invest in local organizational capacity for examples and potential lessons learned.

III. Methods

Table 2. *Typology Classifications.*

Board-Reliant Lower staff levels (<3.0 FTE) →	Staff delivers primary capacity with greater reliance on working board.
Staff-Reliant Higher staff levels (>=3.0 FTE) →	Staff fulfills most management capacity roles with board taking on more strategic activities.
Partner-Reliant Varied staffing shared with another organization →	

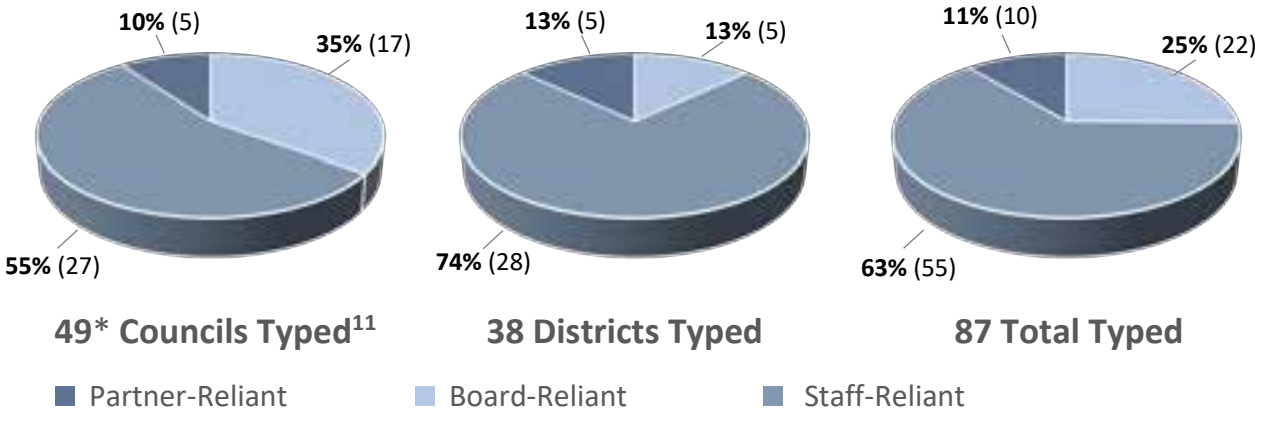
Data were collected through a survey and a phased case study process. The survey took place between April – May 2022 and was sent out to all 58 councils and all 42 districts in Oregon that receive or have received Operating Capacity grants using OSU's Qualtrics online survey platform. We designed the questionnaire to collect data on (1) the number of employees and shared staffing arrangements for the purpose of arranging organizations into similar types using Dr. Margerum's "Reliance Model of Collaborative Capacity**" (Table 1) and (2)** factors affecting organizational capacity. Data analysis occurred in two phases. First, we categorized grantees into the capacity typology by adding the number of staff over the past 12 months, including the executive director, district manager, or coordinator; and if these positions were permanent; contracted; and temporary. We also used the organization's self-description to understand shared staffing arrangements and whether they shared a physical location with another organization. This framed the sampling of grantees for the case studies. Next, we looked at the organizational capacity factors. We used descriptive statistics to examine the percentage of respondents in each response category by: (1) councils and districts, (2) capacity typologies, and (3) taxing and non-taxing districts. Additionally, we calculated the average (mean) response to determine if there was a statistical difference between typologies. Refer to Appendix 3 for more complete descriptions of the methods, as well as for the questionnaire, statistical analysis, and datasets.

Next, we implemented a phased case study approach that took place from June 2022 to February 2023. Refer to Appendix 4 for more complete descriptions, as well as for the interview guides.

- **Case Study Selection:** We cross walked the capacity typology with OWRI and OGMS data from 1997 to 2019 to categorize grantees by resource classes using quartile statistical breakpoints.
- **Initial Document Analysis:** We sampled 20 grantees (i.e., 10 councils and 10 districts) that were representative across capacity typologies, a representative proportion of resource classes, and representative across urban and rural areas. To categorize grantees by resource classes, we gathered OWRI and OGMS data from 1997 to 2019, added up total cash spent and in-kind contributions for each organization, and then used quartile statistical breakpoints to define resource classes. Then, we conducted a 20-year grant document review of 20 case study organizations using OGMS grant documents from 1997 to 2019; as well as SOW and FAAP documents from 2015 to 2019; OWEB FIPs, P-TA, and OWRI data, and other documents accessible on organizations' websites. From this, we created in-depth organizational profiles that summarized the history and trajectory of each organization relative to the capacity dimensions described in **Table 1**.
- **In-depth Case Studies:** We selected seven grantees as case studies that were roughly representative of our selection criteria for the initial document analysis in consultation with the Core Project Committee (See Appendix 4, **Table 14**). Interviewees included: current and past lead staff, as well as project managers, administrative assistants, board and vice chairs, and top partners.
- **Interview Analysis:** We analyzed the interviews to see how Operating Capacity grants were used related to themes from the capacity dimensions. (See Appendix 4, **Table 15**). To validate the findings, we triangulated this data with the key informant interviews and the organizational profiles.

IV. Overall Survey Findings

Respondent Population and Capacity Typology Classification



We had a high response rate from councils and districts (85%). There are more councils than districts; however, proportionately more districts responded to the survey (**Figure 6**). Additionally, ten districts have received local taxes, while 18 have not. Refer to Appendix 3 for the full datasets.

Figure 6. *Survey Response Rates.*

Overall, 87 councils and districts were typed according to the capacity typology (**Figure 7**). Most organizations were staff-reliant, followed by board, and partner types. We expected that partner-reliant organizations would be the least common type given the complexity of sharing staff with another organization, developing joint MOUs, and the degree of commitment that is involved in this kind of partnership. Most districts were classified as staff-reliant and included all districts with a permanent tax rate. In discussion with the Core Project Committee, we discussed that this validated the data based on the working assumption that tax bases help districts shift towards a staff-reliant model. Additionally, it is important to note that because there were a small number of board-reliant districts, as well as partner-reliant types for councils and districts, assessment findings for the level of agreement with statements on factors affecting organizational capacity should be viewed through this lens.

Figure 7. *Council and District Capacity Typology Results.*

[10] Note: Two additional councils were included in the capacity typology as partner-reliant based on how other respondents answered, but did not complete the survey questions, so they were not included in the overall response rate. Furthermore, three councils stated they were not currently receiving OWEB Operating Capacity grants. These include: Tyron Creek WC, Glenn-Gibson WC, and North Clackamas Urban WC. We included their responses to these questions since it still added relevant knowledge for our study purposes.

[11] Note: Two additional councils were included in capacity typology as partner-reliant based on how other respondents answered, which is why this number reflects a higher total than the survey response rate.

Organizational Operations

Overall, most councils and districts responded that they had written personnel and operational policies with clear position descriptions for staff and board members that were well-implemented. Additionally, 66% of districts and 70% of councils indicated that their board took initiative in managing the organization. However, regardless of capacity typology, less than half of councils and districts indicated that they had succession planning or mentorship for lead staff, or succession planning for board members Furthermore, 45% of councils and 50% of districts indicated that they had board member training for financial management, facilitation, or personnel management. These suggest areas for improving organizational capacity building. Taxing districts, which were all categorized as staff-reliant based on the typology methodology, were more likely to have competitive salaries and benefits (90%), have access to adequate equipment and technology for virtual meetings (90%), and staff training on key operational capacities (e.g., project management, contracting, and administrative tasks; 80%) compared to non-taxing districts, which did not include any staff-reliant types. Regardless of whether a district received local taxes or not, they still led councils in competitive salaries and benefits, staff training on technical skill building and key operational capacities, and lead staff retention rates. This may indicate that access to competitive wages and more training may support retention rates.

Working with Other Local Partners

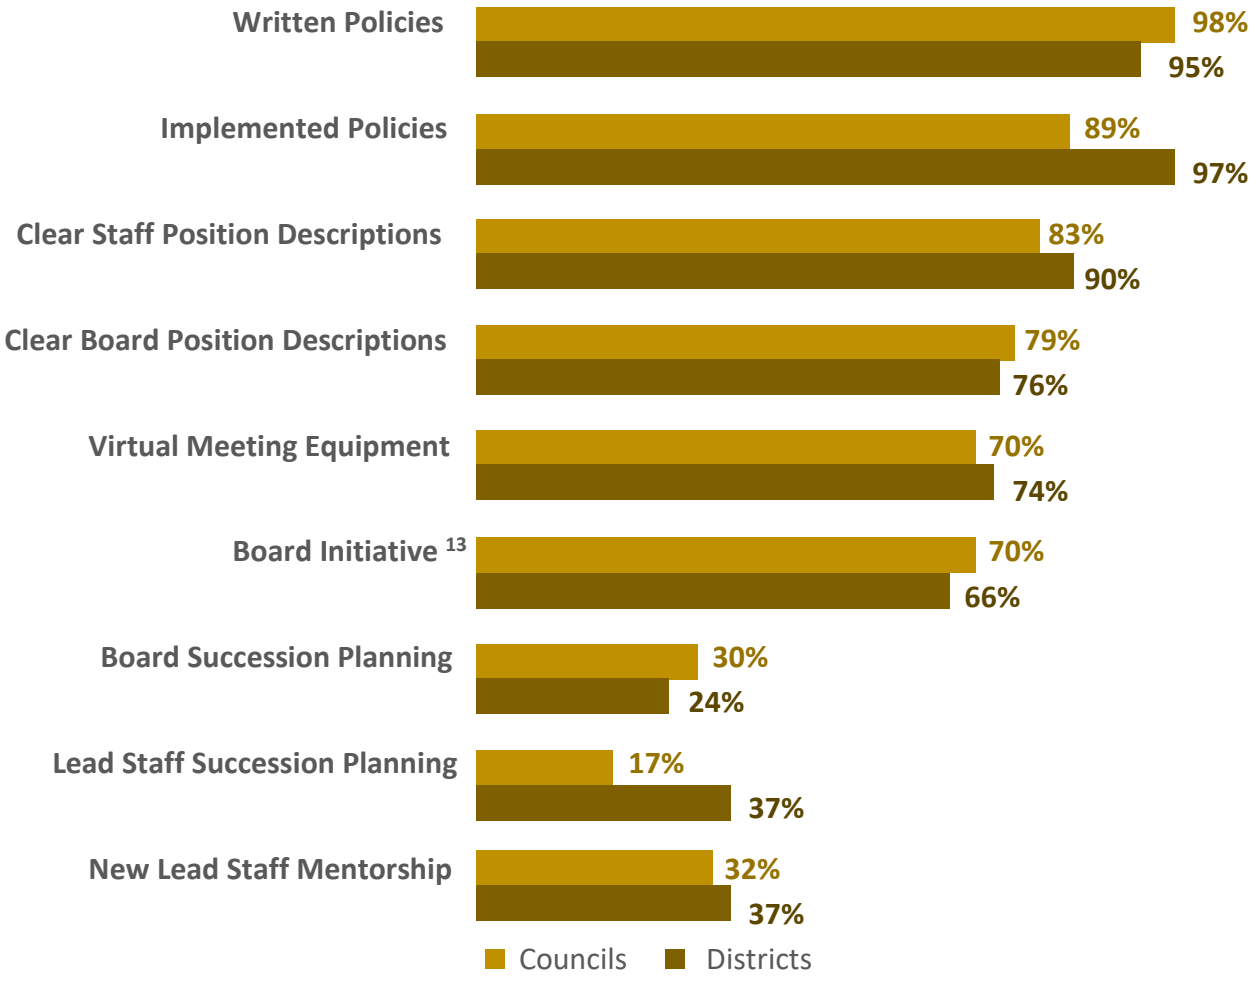
The majority of councils and districts reported working with other councils, districts, and local partners most of the time to accomplish their goals. Staff-reliant districts and councils were more likely to do so, which may be related to their staff capacity to work with partners compared to board- and partner-reliant types.

Leveraging Operating Capacity Grants

Most councils and districts were seeking opportunities to leverage Operating Capacity grants for additional funding for other OWEB grants (e.g., stakeholder engagement, monitoring, technical assistance, restoration) and to build cooperative partnerships with councils, districts, or other local organizations. Districts more commonly reported leveraging District Capacity grants for stakeholder engagement, monitoring, technical assistance, and restoration grants. However, this was likely because of how District Capacity grants have been structured compared to councils. District Capacity funds have a greater emphasis on the implementation of the Agricultural Water Quality Management Program, with 75% of funds designated toward this. Additionally, based on comments by councils and districts in the survey, there may be an opportunity to help organizations develop unrestricted funding sources, which can help maintain critical operations. Some examples to note included the development of an annual federally negotiated indirect cost rate agreement as well as budgeting for more project time in grant applications to build in additional capacity for projects.

IV.A. Detailed Findings

Organizational Operations



We asked organizations to indicate how much they agreed or disagreed with a set of statements focusing on operational policies and procedures. Respondents could choose from “strongly agree” to “strongly disagree” on a 5-point Likert scale.[12] Next, we compare findings for councils and districts as well as across capacity typologies, and compare differences between districts that received local taxes with those that have not.

[12] In the survey, “agree” was broken down into “strongly agree” and “somewhat agree”. For analysis, these categories were simplified into a single category, “agree”.

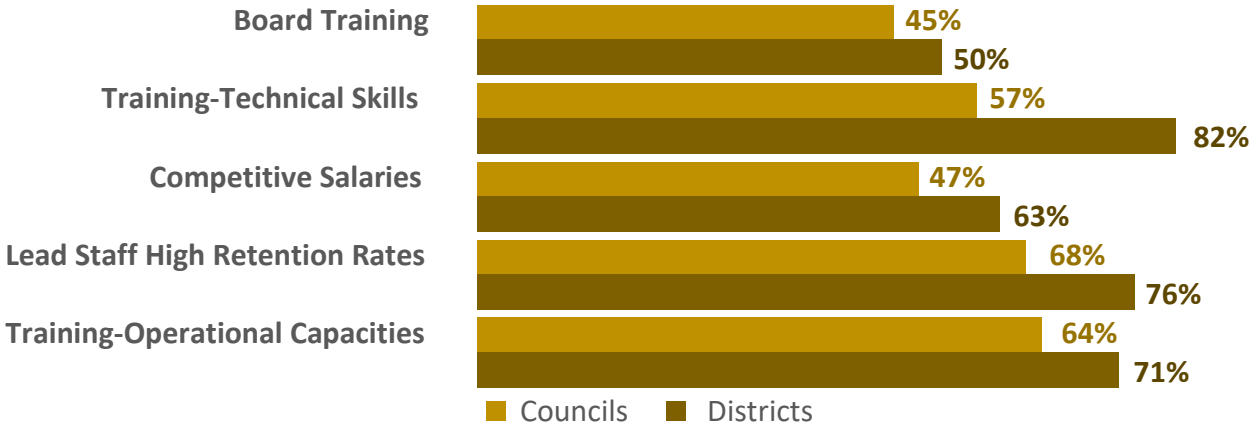
Comparing Council and District Operations

Overall, councils and districts were fairly similar in their use of organizational policies and procedures (**Figure 8**). Most councils and districts reported that they had clear board and staff position descriptions, as well as written and implemented policies for personnel and operations. This is likely because OWEB and ODA require grantees to have these in order to receive Operating Capacity grants. Furthermore, by having written policies, policies are more likely to be implemented. In contrast, most organizations did not have written policies or strategies for succession planning or established mentorship structures. Given that these organizations are typically smaller, this was perhaps not surprising. Although many organizations were classified as staff-reliant, it is important to remember that staff-reliant indicated an organization had at least 3 staff members, which is still a small organization. This could also be in part due to the location of these organizations, which are often in more rural areas and may face challenges with hiring staff. Over half of councils and districts stated that their board was actively engaged in managing the organization, which is defined as "Board Initiative" in **Figure 8** below. This may be because over half the organizations were classified as staff-reliant, which can potentially indicate the degree of involvement of the board. When an organization is staff-reliant, the board can engage in the overall direction setting, while staff can focus on the daily tasks. Additionally, most reported having adequate technology for virtual meetings. This is likely a result of adapting to remote work.

Figure 8. *Councils' and Districts' Organizational Capacities.*

[13] "Board Initiative" was defined as the Board being actively engaged in managing the organization.

Lastly, since councils and districts' legal organizational structure differed, we asked councils whether they had term limits for board members. 49% of councils had board term limits, while 36% did not. One council respondent commented that term limits greatly improved their board management, compared to other organizations they worked with that experienced leadership stagnation.



Comparing Council and District Training, Staff Salaries, and Retention

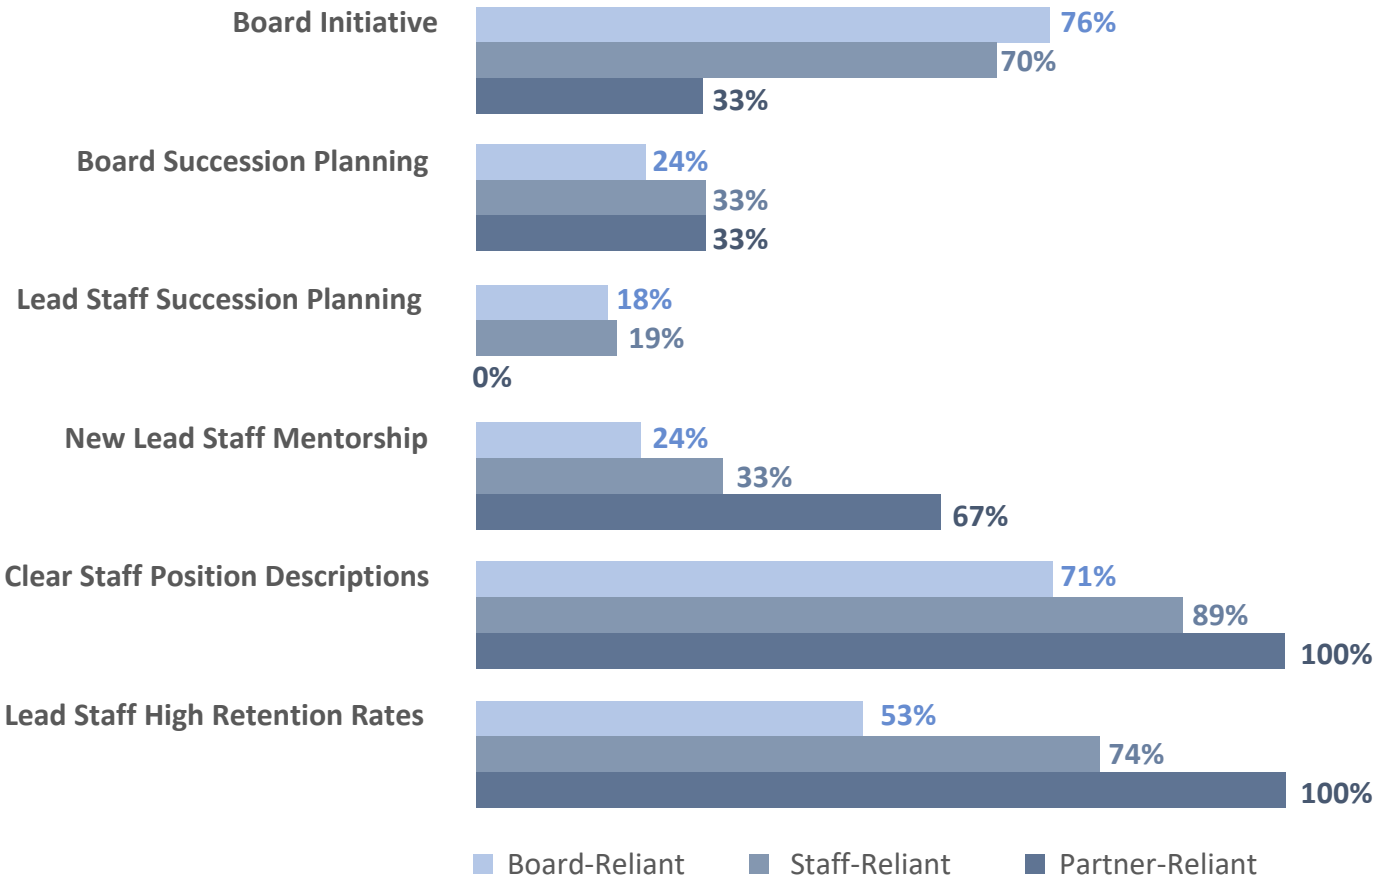
Less than half of councils and districts indicated that their boards received sufficient training for financial management, facilitation, or personnel management (**Figure 9**). District board members have served in elected positions, and typically consist of working landowners who may have insufficient time to participate in trainings. Additionally, they have not been required to participate in the trainings ODA offers to new board members.

Council boards, in contrast, are composed of volunteers. OWEB has required councils to work towards diversification of board members to support organizational management by having members with a varied set of skills, backgrounds, and experiences. However, board recruitment has been challenging in some areas due to a lower number of available and interested participants, which has also made board diversification challenging. Additionally, because board members have served in a volunteer capacity, they have not been required to participate in trainings. Board members may have also lacked the time to engage in trainings, such as agency staff working full-time at another organization or working landowners. Lastly, this may have been because lead staff lacked the time or skills to train board members in these areas.

Less than half of councils indicated that they had competitive staff salaries and benefits compared to similar organizations. This is likely because councils are 501(c)(3) non-profit organizations, and as such, rely on grant funds for much of their services, which can make providing competitive wages challenging. Additionally, with rising housing prices and other costs of living, it can be hard for these smaller organizations to provide competitive wages. More districts than councils had competitive staff salaries and benefits. This was likely influenced by whether or not a district had a tax base. 90% of taxing districts, which included all staff-reliant types based on the typology, responded that they had competitive wages compared to those without a tax base (67%). District staff also more commonly reported receiving training for technical skill building (e.g., GIS) and on key operational capacities (e.g., project management) compared to councils. This could be due to differences in the types of work councils and districts engage in and how their District Capacity funds are structured. District Capacity funds have a greater emphasis on implementing their Agricultural Water Quality Management Program through providing technical assistance with partners and landowners for restoration and conservation projects, with 75% of District Capacity funds directed towards their SOW or FAAP. Additionally, ODA's Regional Water Quality Specialists have provided districts with technical assistance to implement this program. Lastly, districts also had higher retention rates for lead staff than councils, which was likely tied to having more competitive salaries and benefits, and perhaps from receiving more training.

Figure 9. *Comparing Councils and Districts in Training, Staff Salaries, and Retention*

Comparing Operations across Capacity Typologies



Next, we compared organizations across capacity typologies by looking at the percentages for each type as well as determining the statistical significance for each of these statements. Because of the differences between councils' and districts' legal organizational structure, we compared councils to councils and districts to districts. When we calculated the average (mean) response for each of the statements, the averages were different for several variables, but only a handful of the differences were statistically significant due to the small sample size and variation within the samples. In other words, even though the average scores were different, as a group, the respondents cannot be described as statistically different because there was too much variation within the group.

When comparing staff-reliant, board-reliant, and partner-reliant councils, several averages were statistically different (**Figure 10**).

- Board initiative, or "a board that actively engages in helping manage our organization", was lowest among partner-reliant councils and significantly different from board- and staff-reliant.
- There were significant differences among the three groups in relation to whether they had clear staff position descriptions, with partner-reliant councils most likely to agree.
- There were also significant differences with respect to retention rates, with partner-reliant councils being significantly higher than both staff- and board-reliant councils.

Although not significantly different from each other, many respondents noted that they lacked board and staff succession planning and new coordinator mentorship.

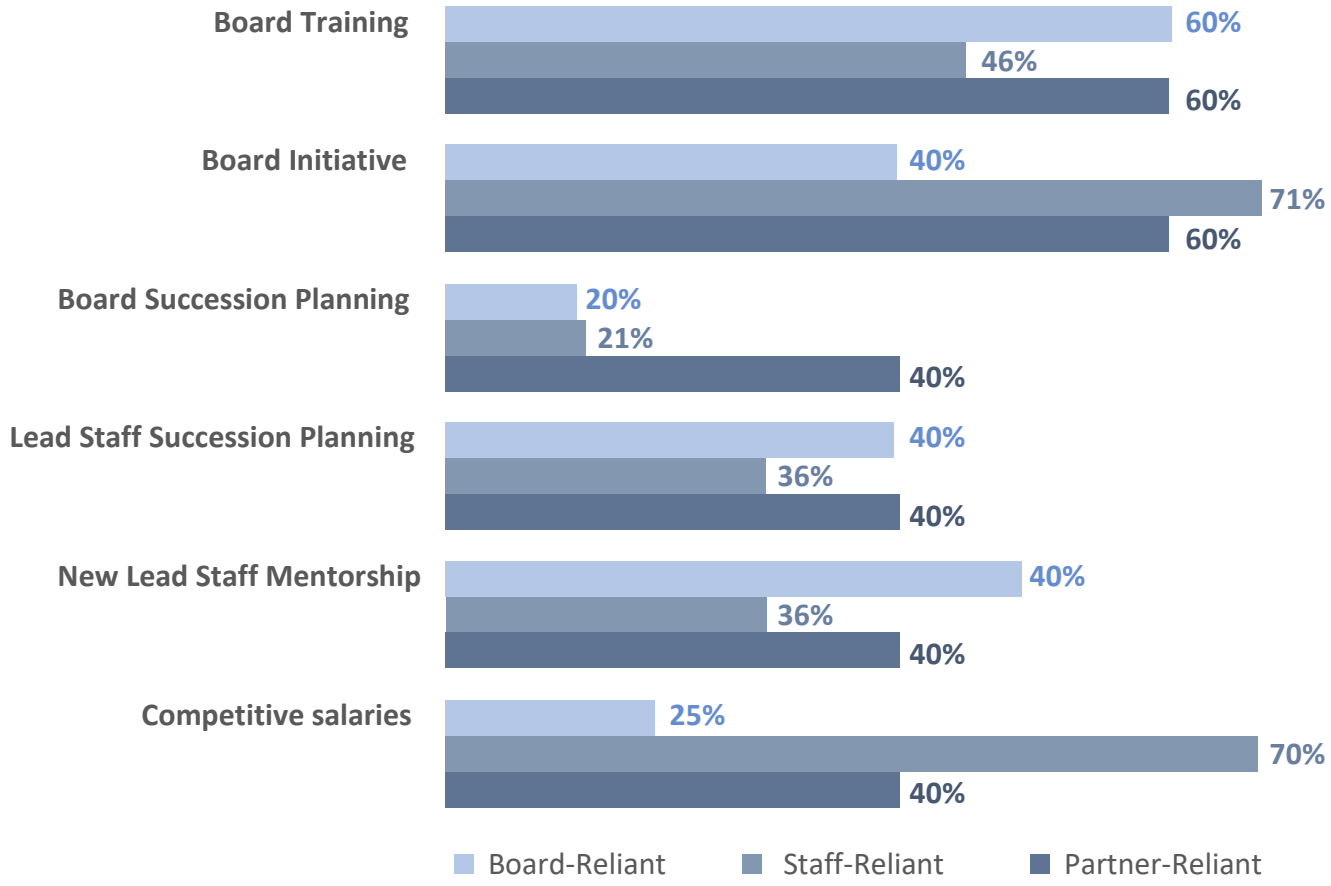


Figure 10. *Differences in Organizational Capacity between Board, Staff, and Partner- Reliant Councils.*

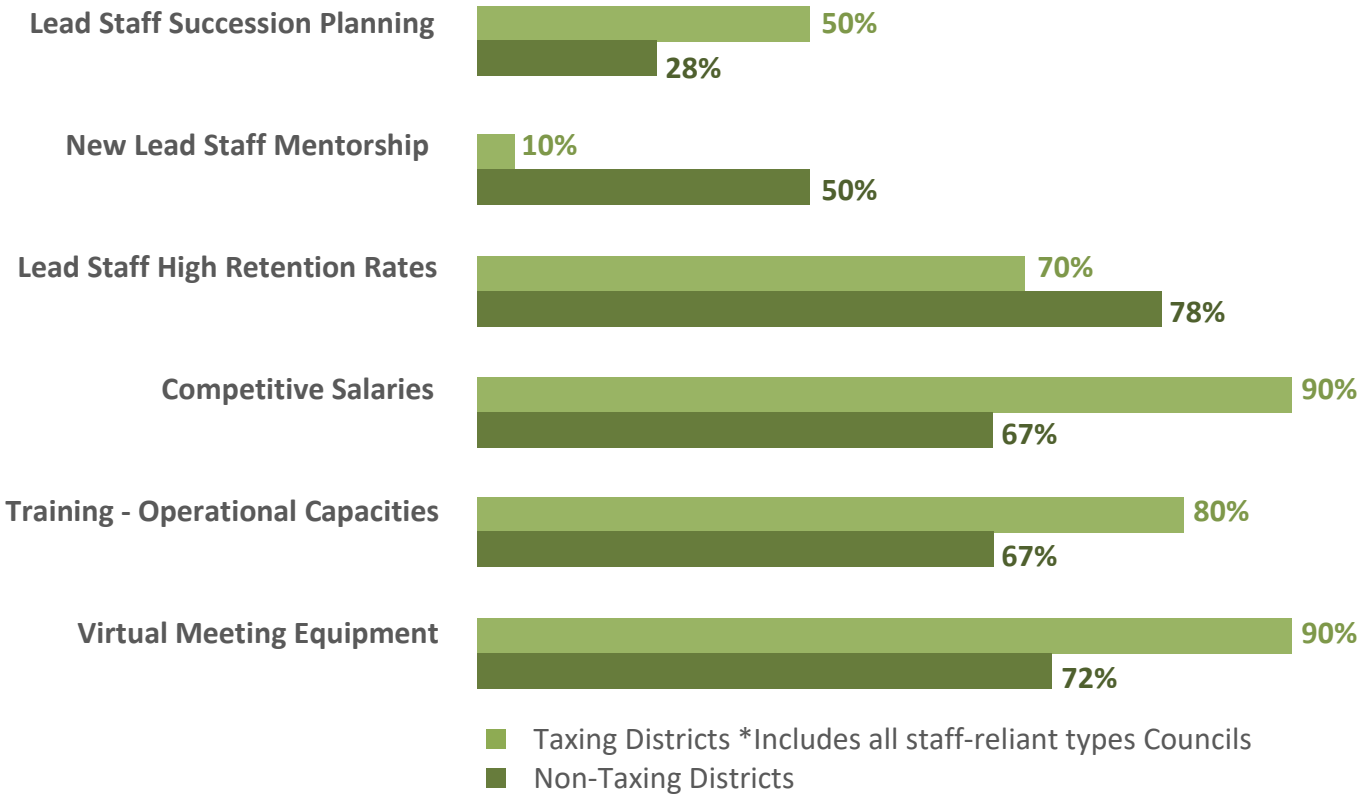
Due to the small sample of some groups and variability for districts, there were fewer statistically significant differences to note from the survey, but several trends were worth highlighting (**Figure 11**).



- Among all district respondents, there was a moderate level of board training and initiative.
- Although not significantly different from each other, many respondents indicated a lack of board and staff succession planning and new district manager mentorship.
- For salary competitiveness, there were significant differences in responses between staff-reliant districts and their board- and partner-reliant counterparts.

Figure 11. *Differences in Organizational Capacity between Board, Staff, and Partner- Reliant Districts.*

Additionally, we analyzed for differences between districts that have a local tax base and those that do not (**Figure 12).** Taxing districts, which were all categorized as staff-reliant based on the typology method, were more likely to have competitive salaries and benefits, have access to adequate equipment and technology for virtual meetings, and staff training on key operational capacities (e.g., project management, contracting, and administrative tasks). These results were not unexpected since having access to unrestricted funds likely provides organizations with opportunities to improve their operations. Interestingly, non-taxing districts, which did not include any staff-reliant types, were slightly more likely to have higher lead staff retention rates. This seemed surprising, given that taxing districts have more competitive salaries and provide more training opportunities on key operational practices. However, other factors may affect this result. For example, 60% of taxing districts, which included all staff-reliant types, responded that board members had clear positions describing their roles and responsibilities, compared to 89% for non-taxing districts. Having clear position descriptions can support understanding of roles, which can have a significant impact on organizational management and relationships between board and staff.

Figure 12. *Differences in Organizational Capacity between Taxing and Non-Taxing Districts.*

Working with Other Local Partners

We asked how often organizations worked with other councils, districts, and/or other local partners. Respondents could choose from "most of the time" to "never" on a 4-point Likert scale. We discuss findings for councils and districts as well as across capacity typologies. When we looked at capacity typologies, we compared councils to councils and districts to districts. We also compared the differences between districts that have received local taxes with those that have not.

Comparing Councils and Districts

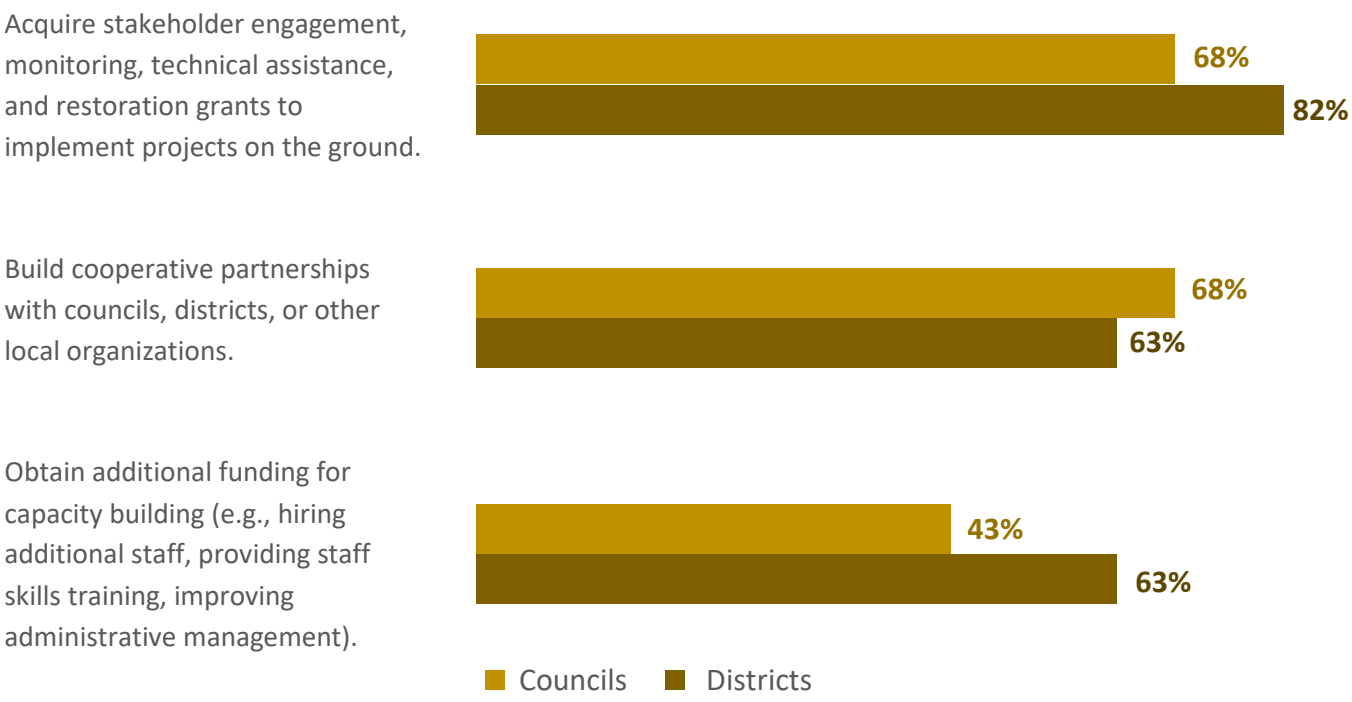
92% of districts and 75% of councils indicated that they worked with councils, districts, and other local partners most of the time. We found that districts shared more resources with other local partners compared to councils. For districts, 58% shared office and other administrative costs with local partners most of the time. Additionally, 74% stated they shared staff expertise with local partners most of the time. This included technical skills, GIS, and outreach to landowners or farmers. By comparison, 68% of councils responded that they seldom or never shared office space and other administrative costs with local partners. Additionally, 45% of councils said they shared staff expertise most of the time and 49% said some of the time. However, it is important to keep in mind that many districts have a history of sharing office space with NRCS, which likely extended to sharing resources with this agency as well, and may have affected these results.

Comparing Capacity Typologies and Taxing Districts v. Non-Taxing Districts

We noted that the only statistically significant finding for districts was that there was less sharing of office space among board-reliant districts compared to staff-reliant districts, which is not surprising given that many board-reliant districts have few staff. The majority of staff-reliant types (96% for districts and 85% for councils) reported that they worked with councils, other districts, or local partners most of the time. For both board- and partner-

reliant districts, 80% indicated the same; while for councils, partner types responded similarly at 67% and board types at 56%. Staff-reliant organizations likely have more capacity to work with partners compared to board- and partner-reliant types. 67% of partner-reliant councils shared staff expertise between councils, districts, and other local partners most of the time, compared to staff- (52%) and board-reliant (31%) council types. All partner-reliant councils (100%) also shared office space and other administrative costs with councils, districts, and other local partners most of the time compared to staff- (19%) and board-reliant (13%) types. This was likely a product of their organizational structure, which may have also influenced how they worked with other partners in a geographic area to have more emphasis on sharing expertise. There were no major distinctions between taxing and non-taxing districts.

Leveraging Operating Capacity Grants



We also asked how often councils and districts looked for opportunities to leverage Operating Capacity grants to sustain and grow organizational capacity, build partnerships, and obtain additional funding. We asked them to rate how often they worked with other local groups. Respondents could choose from "most of the time" to "never" on a 4-point Likert scale. Below, we discuss findings for councils and districts as well as across capacity typologies. When we looked at capacity typologies, we compared councils to councils and districts to districts. We also compared the differences between districts that have received local taxes with those that have not.

Comparing Councils and Districts

Most councils and districts reported seeking opportunities to leverage additional funding (**Figure 13**). More districts than councils obtained additional funding for capacity building to hire additional staff, provide training, and improve administrative management compared to councils. This may be tied to higher retention rates for lead staff and having more competitive salaries. This may create greater stability for an organization through the preservation of institutional knowledge and support an organization in working towards ongoing improvements. Additionally, more districts than councils also used District Capacity grants to acquire grants for stakeholder engagement, monitoring, technical assistance, and restoration for projects compared to councils. This was likely because of how District Capacity grants have been structured compared to those for councils. As described earlier, District Capacity funds have a greater emphasis on the implementation of the Agricultural Water Quality Management Program, with 75% of funds designated for this.

Some additional open-ended comments on the survey provided further insight into what has helped keep organizations healthy and functional to address challenges in sustaining operating capacity. To maintain organizational financial management, most described diversifying funding revenues beyond OWEB and identified a need for unrestricted funds, not tied to project grants, to support critical operations. Some specific examples of funding diversification included: participation in programs (e.g., OWEB's FIP and BPA's Fish & Wildlife), maintaining strong partnerships with other organizations and entities focusing on conservation, (e.g., local counties, councils, districts, and Tribes), and development of an annual federally negotiated indirect cost rate agreement. Lastly, some respondents mentioned learning to budget for more project management time in their grant applications, which built in additional operational capacity for projects.

Figure 13. *Leveraging Operating Capacity Grants.**

* These results included respondents who indicated "most of the time" to each of the statements.

Comparing Capacity Typologies and Taxing Districts v. Non-Taxing Districts

Partner-reliant councils (100%) responded that most of the time they looked for opportunities to leverage Council Capacity grants to acquire stakeholder engagement, monitoring, technical assistance, and restoration grants to implement projects on the ground. Staff-(67%) and board-reliant (63%) councils did not seek these out as much as partner-reliant types, but a majority did. However, staff- (70%) and board-reliant (69%) councils sought out Council Capacity grants to build cooperative partnerships with councils, districts, and other local organizations, in comparison to partner-reliant types (33%). Partner-reliant councils engaged less often in building cooperative relationships and seeking stakeholder engagement—likely due to the built-in collaboration with their district partner. This was statistically significant. There were no major differences between districts based on capacity typology or whether they received local taxes.

V. Case Study Findings

Case studies provide detailed understanding of how organizations operate within their contexts, and what facilitates and impedes capacity. We selected seven case study organizations across Oregon with different staff sizes across typologies, in rural and urban contexts, and with varying levels of resources obtained and leveraged, which increases the applicability of findings for organizations across the state. However, we recognize that councils and districts have a diversity of experiences and contexts within which they function. To address this, we used the survey findings, which had an 85% response rate across all councils and districts that have received Operating Capacity grants, to develop a sense of the typical issues that organizations have faced. We also used the 20 in-depth organizational profiles to identify common themes across the capacity dimensions. Lastly, we included input from the breadth of experiences of the Core Project Committee. Together, these approaches informed our case study design and bolstered the findings to be more generalizable across organizations. We also kept in mind that we needed to create a process that could be reasonably achieved within the project timeline, since examining all organizations in Oregon through an interview process would not be possible. For a list of case study organizations, see Appendix 4.

In the following paragraphs, we review the findings from our analysis of case study organizations.

- Section A considers the impacts and uses of Operating Capacity grants.
- Section B looks at common governance challenges and strategies to address these.
- Section C addresses partnership development, challenges and strategies, and models used.
- Section D focuses on funding strategies and challenges.

V.A. How Were Operating Capacity Grants Used?

All interviewees acknowledged the essential need for the Operating Capacity grant program for councils and districts. Many said that councils and districts across the state would no longer exist if they did not receive Operating Capacity grants. A few indicated they could manage without it, if they had access to other funding sources (e.g., taxing districts, local foundations, local government budgets, endangered species, and BPA funds). However, they said they would function at a much lower level and would not be able to complete most of the restoration and conservation work they were currently doing. Additionally, it is important to recognize that project development can be a multi-year process depending on the complexity of the project and number of partners involved. Because of this, many interviewees pointed to Operating Capacity grants as vital to continue project development, which brought additional funding to the organization. Some interviewees noted the positive impact that Operating Capacity funds had on their community's local economy and how their organization's presence supported other local conservation partners. Additionally, all interviewees pointed to the fundamental need for the Operating Capacity grant program due to changing funding priorities from other agencies, the lack of consistency in external funders' grant deadlines, and a general lack of programmatic capacity funding elsewhere. All highlighted their appreciation for the provision of the Operating Capacity program and how the program's reliability has served as an essential strategy for supporting councils and districts' operations, which has supported state agencies in meeting state-wide restoration and conservation goals.

Councils

Case study councils primarily used their Council Capacity grants as follows (order based on frequency reported):

1. **Project development through relationship/partnership building** through paid staff time to participate in local committees, boards, and foundations; event attendance to build an organizational reputation in the community; and meeting with landowners. Through these avenues, staff have developed joint priorities and project concepts with these partners, and acquired funds. Other than Council Capacity grants, most grants have been tied to project work itself, aside from allowable indirect, and there has been a lack of programmatic capacity grant support.
2. **Initial funds for cash match for restoration and conservation projects** which helped bring in additional project funding. OWEB grants were particularly useful for federal grant match because federal grants cannot be matched with other federal grants. This has also supported use of federal dollars for restoration and conservation work, since federal agencies have often faced challenges in spending all of their allocated dollars on implementation. Councils have also used other OWEB grants for cash match.
3. **Board member recruitment** through paid staff time for participating in local boards and committees, as well as attending community events to develop relationships with potential new board members for current or future board vacancies.
4. **Ad-hoc regional groups as a collaborative approach** to meet the needs of local partners, including training, information sharing, and resource sharing.
5. **Staff and board training** for professional development and networking opportunities through conferences (e.g., CONNECT), technical skills-building courses, and workshops.
6. **Operational support** for rent, utilities, administrative staff time, etc.
7. **Staff time on revising and updating operational policies and procedures, strategic plans, and annual work plans.**

Overall, councils appreciated the current flexibility of the Council Capacity funds and how OWEB's changes over time have made it easier to use the funds in an unrestricted manner. Many appreciated that OWEB removed the match component to obtain the Council Capacity grant and has allowed councils to use the funds as they best deem fit. Any expense eligible in other OWEB grants has been considered an eligible expense for Council Capacity grants. **Many interviewees stated that Council Capacity grants were not able to fund community outreach and education activities due to statute,**[14] but were interested in funding for this. As one interviewee said, "Communications, outreach, and education funding are small pots of funding, so you have to write numerous applications just to get one project funded. Additionally, these types of grants are typically offered annually or bi-annually, so the amount of work adds up quickly."

Additional needs that interviewees expressed included:

- **The ability to use Council Capacity funding for the purchase of vehicles**, which has not been allowed by statute, e.g., ATVs or trucks for site visits, particularly in rural areas.
- **More guidance from OWEB on how to write a successful grant and adhere to reporting requirements.** Some commented that OWEB grants have a steep learning curve, which has been particularly challenging to navigate with lead staff turnover. Some commented on the administrative burden of reporting requirements, but understood the need for state agencies to ensure accountability and effective use of public funds. One interviewee mentioned that it could be helpful to have OWEB new grantee training sessions scheduled periodically throughout the year, instead of once a year. Considering staff transitions and the need for repetition when learning new information, some stated that an OWEB-hosted workshop would be useful.
- **Ways to make funding more equitable for geographic areas that have fewer funding opportunities** (e.g., agency regional funding priorities, lack of endangered or threatened species, fewer available local organizations to partner with on projects, less local foundations). However, they recognized the challenges OWEB has faced in balancing fairness with managing a statewide grant program.
- **A regional forum to learn from other councils or districts.** Suggestions included a show and tell with an OWEB Regional Program Representative that could help organize groups by region. Interestingly, this mimicked what some groups have done already, e.g., the Upper Willamette Stewardship Network or the John Day Basin Partnership. A regional forum could be useful for geographic areas that have faced challenges in working with local partners and developing joint priorities.

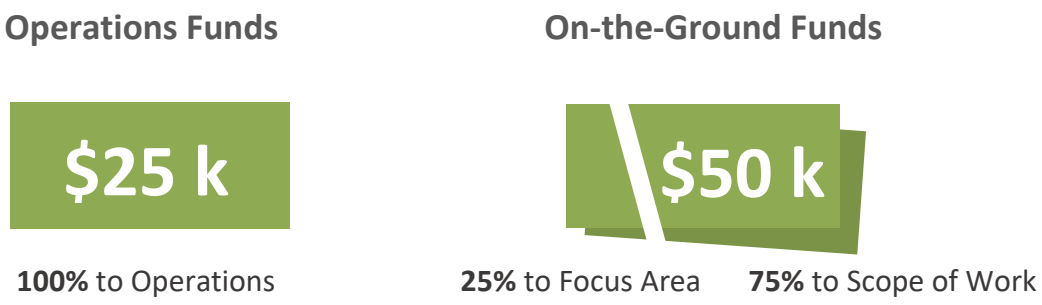
Districts

Case study districts primarily used their District Capacity grants as follows (order based on frequency):

(1) Project development through relationship/partnership building through paid staff time to participate in local committees, boards, and foundations; event attendance to build an organizational reputation in the community; and landowner meetings. Through these avenues, staff have developed joint priorities and project concepts with these partners, and acquired funds. Other than District Capacity grants, most

[14] Refer to Measure 76 and ORS 541.956, which authorize OWEB to make grants available for outreach activities that are necessary for carrying out eligible restoration and acquisition projects that protect or restore native fish or wildlife habitat, or that protect or restore natural watershed or ecosystem functions to improve water quality or stream flows. To qualify as necessary for restoration or acquisition, the project must be tied to a specific geography, address clearly articulated habitat or watershed or ecosystem function goals for that geography, and identify a clear path toward achieving the restoration or acquisition measurable outcomes within a reasonable and specific timeframe. Projects with a primary purpose of education are not eligible.

grants have historically been tied to project work itself, aside from allowable indirect, and there has been a lack of programmatic capacity grant support.



(2) **Operational support** for rent, utilities, administrative staff time, etc.

(3) **Ad-hoc regional groups as a collaborative approach** to meet the needs of local partners, including training, information sharing, and resource sharing.

(4) **Staff and board training** for professional development and networking opportunities through conferences (e.g., CONNECT, OACD), technical skills-building courses, and workshops. Networking has allowed them to see how other districts operate, what structures others have used, and what staff positions they have and the roles/responsibilities associated with them.

Compared to Council Capacity grants, District Capacity funds have been more limited in their use (**Figure 14**). Many interviewees mentioned an **interest in increased flexibility in spending District Capacity funds so that more funding could be spent on staffing and capacity building, rather than for restoration and conservation projects.** As one interviewee said, "If we invested more in staffing, we would get more conservation on the ground. We need to have the capacity to be able to apply for the grants, and right now, that's lacking." Additionally, a district discussed how the tax base funded its own grant program and supported operational costs, while the District Capacity grants paid for grant program administration.

Figure 14. *Breakdown of District Capacity Grants.*

V.B. What Governance Challenges Have Organizations Faced?

Individuals play an important role in maintaining an organization's longevity while engaging in strategic watershed restoration and conservation planning. Councils and districts are typically small organizations facing large-scale issues and needs, and as such, the individuals on the staff and the board need to use their skill sets, backgrounds, and perspectives for the organization to achieve its goals. Through our case studies, we found that the top common governance challenges and opportunities were:

(1) **Lead staff capacity and turnover.** This includes the key role lead staff play and the necessary skills they use to manage the organization, how they support development of an effectively engaged board, and what happens during times of lead staff transition.

(2) **Board recruitment.** This encompasses common challenges in recruitment, as well as essential board member skills. Skills of particular importance included organizational direction setting, reviewing and updating governing policies and procedures, fiscal oversight and management, and providing guidance to lead staff.

(3) **Strategic planning**. This pertains to the significance of the process of creating plans, as well as the level of detail needed to beneficially guide an organization's priority-setting.

How Has Lead Staff Capacity and Turnover Affected Organizations?

Lead staff have played an important role in an organization's stability and overall trajectory. This position has a high learning curve and has required someone who is either competent or quickly able to become competent in multiple skill sets. Lead staff that performed particularly well in this role tended to have years of experience working in a natural resource-focused agency or were strategic in building partnerships and successfully identified how to learn the information they needed. Skills needed for lead staff include leadership, relationship building, personnel management, fiscal management, grant writing, and conservation knowledge (**Table 3**). Additionally, some interviewees described the significance of lead staff's development of board relationships in providing guidance, education, and training to support each in their respective roles, so they could mutually guide the organization's trajectory. This will be discussed in more detail in the section about strategies used by case study organizations. Specific to councils, we noted that as an organization grows, the lead staff role evolves from a Watershed Coordinator to an Executive Director. The change in the skills of this position has also been affected by how OWEB has modified its granting criteria over time to support organizational structure (See Appendix 1).

Table 3. *Key Lead Staff Roles.*

Lead Staff Skills Needed	Components
Leadership/Strategist	• Development of a vision for the organization and the watershed that identifies how partners and funders fit into this. • Effective project management skills and project schedule management. • Incorporation of content training and educational talks by agency experts into board meetings to help board make informed decisions on project and funding priorities. • Engagement in creative problem solving, extended work hours, and driven by concern for land and people.
Relationship Building	• Communication skills with partners and providing updates. • Actively and visibly engaged in the community to discover joint priorities to acquire funds for project development through participation in local committees and boards, event attendance, and meetings with landowners. • Identification of key contacts and development of a community network to obtain multiple perspectives on how to develop and implement projects.
Personnel Management	• Ability to make challenging HR decisions, (e.g., need to lay off staff for fiscal reasons, management and firing of staff for substandard performance, and recognition of need for a different staff skill set as organizational and funding priorities shift). • *This was especially challenging in smaller communities and smaller organizations that have built up relationships among staff and/or board members.*
Fiscal Management	• General knowledge of funding sources, ensuring consistent revenue streams, and development of a plan to diversify funding streams. • *Someone also needed to know financial budgeting, which could be the lead staff or the fiscal manager.*
Grant Writing	• Ability to write a grant proposal that told a story, while integrating the priorities of the organization and potential funder. • Grant cycles from external funders have varied, which created a sense of pressure with constant deadlines.
Conservation Knowledge	• Without a conservation background, it was challenging to lead an organization in strategic planning for the watershed.

Impacts of Lead Staff Turnover

From the case study interviews, we found that the top issue that councils and districts faced with their lead staff was turnover of these positions. It has been challenging for organizations to find their footing when an executive director or district manager has left. Sometimes, this caused an organization to experience a downward cycle from the challenges of finding a qualified and capable candidate, particularly in more remote, rural areas. The most common reason lead staff left stemmed from the large workload for the position, which led to burn-out. Interviewees were often concerned that the highly skilled, multi-talented, motivated individuals would not last in the position for more than a few years, and would use the skills they learned to move on to a job with more stable funding, higher pay, and access to benefits. As one interviewee said, "If you get someone who's a high performer, they're going to leave because they're going to try and leverage something with better opportunities." The rising costs of living and housing in Oregon have further affected these decisions. Interviewees, including lead staff themselves, described how individuals who chose to remain in the position for a longer time, often stayed because they were from the area or had become a part of the community and integrated the job into their lifestyle.

Lead staff turnover was sometimes precipitated by a lack of sufficient board engagement. In these situations, the board was less involved with providing organizational direction through strategic plans and offered less accountability of lead staff's work plans. They were also less engaged in effective fiscal oversight and less aware of how to maintain consistent funding revenue. In these contexts, the board was more focused on project implementation than organizational management. Another reason lead staff left has been tied to board micromanagement, which can lead to organizational gridlock. Board chairs have tended to work more closely with lead staff and have often set the standard for the board's level of engagement with organizational direction-setting, which has impacts on an organization's trajectory. Additionally, lead staff shaped the relationship with the board in establishing expectations, roles, and responsibilities. Micromanagement often stemmed from a lack of priority setting and unclear board roles and responsibilities. Essential board skills and their impacts on case study organizations' capacity are described in more detail in the "Board Recruitment" section.

When lead staff left, it was often a challenge for board members to manage the organization, given the unpaid nature of board positions and the limited time these positions have been able to commit. When an organization had additional staff, they relied on their most experienced staff to fill in as interim. If they lacked additional staff, boards sometimes contacted past lead staff to act as interim or provide essential services (e.g., fiscal management, grant reporting requirements, contractor payments, and managing partner relationships for projects). Staffing transitions were particularly difficult when organizations lacked priority setting. It was challenging to properly maintain budgets, which led to missed contractor payments and project derailment, as well as missed grant reporting deadlines, and a decline in incoming grants, which significantly reduced partner trust.

Because of these struggles, the board was less strategic in hiring replacement lead staff. Although, it is important to keep in mind that many interviewees spoke to inherent hiring challenges from a lack of qualified local applicants and difficulty attracting external applicants because of competitive wages and location. Some organizations that hired from outside the community, and even the state, have dealt with additional issues of people not remaining in these positions for long, even with an actively engaged board. Due to these concerns, some interviewees spoke of difficulty establishing trust with board and staff to effectively support lead staff. It also took time to build trust with partners for project development. These realities have unintentionally raised the bar for lead staff hires to engage in substantial relationship-building and challenging work. When an organization hired lead staff locally, who was new to this level of responsibility and type of work, disengaged boards provided minimal training and guidance, while lead staff tried to get the organization afloat and manage

on-going projects and partner relationships. In both of these situations, lead staff either (1) quickly left, resulting in multiple turnovers, (2) took on the challenge of managing the organization because of personal drive and interest, or (3) remained in the position, but were not able to effectively manage the organization.

Impacts of Organizational Stagnation and Finding Qualified Staff

While many organizations faced challenges with lead staff turnover, others faced difficulties with stagnation, wherein, lead staff lacked the necessary capacity, skills, or training to lead organizations at a particular point in time. From the case study interviews, we learned that board members in these situations: (1) waited too long to fire the individual and were unsure of how to address lead staff personnel issues, (2) were not actively engaged in managing the organization, so they were unable to recognize what lead staff skills were needed, or (3) were concerned they would not find a replacement. Some interviewees indicated challenges with finding qualified candidates were also connected to the grant-funded nature of the positions, salary level, and need for benefits, coupled with challenges of hiring in rural areas, which have also faced rising housing costs and increased costs associated with the COVID-19 pandemic. Some interviewees indicated that effects from organizational stagnation made partners less likely to work with them, which led to missed opportunities for project work and funding.

Specific to districts, a key informant interview discussed how district managers sometimes delayed retirement out of concerns of not finding a qualified replacement after working at the organization for many years. Additionally, case study interviewees for councils and districts stated how there were often limited opportunities for entry-level technicians to become program managers since organizations were typically small. This could lead to a catch-22, wherein there was reduced opportunity for other staff to move up the ladder to take on new responsibilities or needed to wait until someone was ready to retire. This created inherent challenges for some organizations to hire younger staff, who wanted to grow their careers, skills, and income levels. Depending on the level of board engagement, these situations sometimes precipitated a downward cycle when lead staff retired and the board faced difficulties finding a replacement.

What strategies have been used to address these issues?

1. Development of an effectively engaged board.
2. Creation of succession plan.
3. Establishment of regional networks.

Effectively engaged boards were better able to manage lead staff turnover, often supporting operations and interim staff through the transition. Staff had relevant conservation experience and established partner relationships. Board meetings continued to run smoothly, fiscal budget and grant reporting were maintained, projects continued, and contractors received payments. Sometimes board members served on a neighboring council, district, or other local partners' boards, which supported them in finding replacement staff, as well as providing training and support for interim staff. Board members were also connected with the community and partners, who supported their efforts in finding a new lead staff through their community networks. Replacement staff received training and the organization's reputation with partners and funders was maintained.

Approaches used by lead staff to develop an effectively engaged board included:

- Incorporation of 15-minute educational content and skills training into board meetings to help boards understand their roles and responsibilities (e.g., personnel and fiscal management).
- Inclusion of agency partners and experts to board meetings for project updates and upcoming funding opportunities to help boards understand regional priorities to make informed decisions.
- Development of strategic plans to co-establish organizational and watershed priorities.
- Proactive recruitment of board members. (Refer to the "Board Recruitment" section on page 27 for details.)
- Annual retreats for board members and lead staff to discuss accomplishments and priorities.

Some organizations developed a succession plan by training someone within the organization to replace lead staff within the next few years. Typically, this person was the project manager or technician. However, since organizations have typically been small, this has been challenging to implement since a new staff person was needed to fill their role as well. Some interviewees stated that they created an online shared drive of important organizational and project documents for future lead staff to reference. This included a list of daily and annual tasks, a spreadsheet of funding sources, organizational bylaws, policies and procedures, and strategic plans.

In rural and urban settings, some organizations had established regional networks, which provided additional support for lead staff transitions. For example, a group of regional councils and districts formed the Upper Willamette Stewardship Network (UWSN) through the relationships they built over time. UWSN has a "Core Team" consisting of lead staff from each of the organizations, "Project Teams" consisting of other staff positions, and a Network Coordinator that focuses on the partnership's needs. The "Core Team" helps align organizational priorities and leverage grant opportunities, while "Project Teams" focus on various restoration/conservation topics or skills training that are based on the needs of the members involved. The UWSN has bylaws and a MOU, and the varying "Project Teams" have differing degrees of formal guiding documents based on the needs of those in the group. By creating this partnership, interviewees noted that staff transitions have been easier for organizations and, particularly, for new lead staff. This has created an easy landing for connecting with other lead staff to learn from their experiences, increased transparency of how other organizations have operated and managed finances, and supported the development of a community network of relationships with partners and colleagues. This has helped develop a culture that leverages the knowledge and expertise of the group for mentorship, rather than relying solely on past lead staff or the board chair. Furthermore, both the "Core Team" and "Project Teams" meet regularly, which has made space to obtain advice and insight for handling a variety of issues without the conversation being tied to job performance.

Another example of a regional network came from the John Day Basin Partnership (JDBP), which was generated from the relationships developed over time and more recently supported by an OWEB FIP grant. The JDBP has a partnership coordinator who hosts regional quarterly meetings to coordinate projects, bring in agency partners to discuss funding priorities, share completed projects to celebrate successes and learn from each other's experiences, and support skills development. Skills training included a GIS consultant demonstration for how to use an online ArcGIS database for quickly noting prioritized streams to inform project development and coordination. Another example included hands-on training for a rapid survey tool developed by monitoring coordinators to assess beaver habitats. These meetings have supported a network of conservation partners that can assist lead staff transitions through these overlapping points of connection and peer learning.

How does Board Recruitment Affect Organizational Capacity?

Boards have a large impact on organizations' trajectories through the composition of their members, the functions they serve, their level of engagement in organizational direction setting and watershed visioning, and most importantly, the relationships they develop with lead staff (**Table 4**). Through the case study interviews, we learned that common challenges with board guidance typically entailed:

(1) Micromanagement of lead staff, which led to organizational gridlock and departure of lead staff.
(2) Lack of sufficient engagement in establishing organizational priorities and accountability of work plans, which often led to lead staff burn-out.
(3) Board homogeneity, which sometimes led to a lack of sufficient perspectives for brainstorming and making complex land management decisions.

However, it is important to note that some interviewees in rural areas stated that their boards may have appeared "homogeneous" but had key community members with diverse skill sets from holding multiple community roles (e.g., rancher and business owner) and serving on more than one local board. Additionally, some interviewees discussed issues with boards that were mainly comprised of members with a background primarily as landowners versus members who served as landowners, but had an agency staff background. Landowner-dominant boards sometimes had issues related to a lack of understanding of agency processes or familiarity with strategic planning, although they had community trust. Agency-dominant boards sometimes lacked community trust and were viewed as enforcers based on how they served in past roles and lacked the ability to effectively overcome this perception.

Table 4. *How Boards Affected Case Study Organizations' Capacity.*

Board Leadership	How it Contributed to Case Study Organizations' Capacity
Diverse Skill Set	• Lead staff were able to engage with any of the Board members for guidance and brainstorm with their expertise and knowledge. • When there were too many people with the same knowledge and skills, there was less feedback since individuals tended to think and view problems similarly, which can cause an organization to become stuck. • Note: In more rural and remote areas, board members noted they have a diverse skill set in terms of holding multiple roles in a given community, e.g., rancher and business owner.
Strategic Plan	• Provided organizational guidance and direction, which limited micromanagement. • When a strategic plan or annual work plan lacked specificity, some boards micro-managed staff since organizational priorities were unclear.
Organizational Policies and Procedures	• Regular updates to these created accountability, supported communication, and helped boards avoid getting stuck in the day-to-day operations. • Helped organizations to remain compliant with updates in legal requirements.
Fiscal Responsibilities	• Provision of fiscal oversight, e.g., knowledge of fiscal terms, ability to read a financial report and budget, and recognition of red flags. • Identification of differences between types of funders (e.g., federal agencies, private foundations, OWEB, ODA) to understand how each distributed funds since this affected how organizations managed their operations, projects, and ability to balance budgets. • Needed training/guidance on this.
Personnel Management of Lead Staff	• Accountability of lead staff in performing duties and guidance on work plan and strategic plan. • Supported lead staff decision-making without micromanaging, (i.e., Board not overly involved in the details of running the organization). • Needed training/guidance on this.

Furthermore, we learned that the biggest challenges organizations faced with boards were tied to recruitment challenges. Interviewees discussed how these were difficult to overcome since they have been a product of board requirements established by OWEB and ODA or reflected community perspectives. Common recruitment challenges councils and districts faced are described below.

Diversity - Since board positions have been unpaid, interviewees often spoke to challenges with recruiting younger participants, as well as Black, Indigenous, and People of Color (BIPOC) residents, due to time and financial constraints. Specific to districts, they faced additional challenges based on requirements of land ownership for election eligibility, which often meant that only typically older, white men were qualified candidates.

Grant Management - Many interviewees described difficulties of finding board members that understood fiscal management principles. Although agency staff were more likely to have experience with managing budgets and projects, they lacked experience with grant management and navigating fluctuations in funding. Landowners who had experiences with business principles and ownership also lacked experience with grants and nonprofit management.

Varying Commitment - Interviewees indicated that retirees tended to remain on the board longer because they had more time, but were sometimes less engaged based on the voluntary nature of board positions. In contrast, landowners with a background as agency staff were paid, in a sense, by their agency for their time on the board, which some interviewees felt made them more dedicated, even if they had less time to engage. Landowners were typically involved if they were large landowners and/or had completed numerous restoration and conservation projects with the organization.

Challenges in Smaller Communities - Interviewees from rural communities often discussed that they had a smaller pool of potential members to draw from, who were often unable to take on additional commitments. For districts, it is not uncommon to have the bare minimum number of board positions filled to have quorum. Some interviewees described difficulties when one to two members were unable to attend a meeting, it prevented the district from conducting business and making decisions due to a lack of quorum.

Community Trust in Organization - Some spoke about issues of communities not wanting state agencies to regulate lands and practices, as well as negative past experiences with agency representatives. Interviewees sometimes discussed challenges related to lack of community awareness of conservation issues.

Level of Responsibility - Some interviewees mentioned that being a board member carried too many responsibilities and risks as an unpaid, volunteer position. Risks included: legal implications and ethics violations, mandatory reporting for abuse, and fiscal liability.

District Specific - Some interviewees described challenges with absentee landowners, in Eastern Oregon, who were frequent project partners, but have not been eligible to run for board positions, since their primary residence was outside of the community.

How have councils and districts navigated board recruitment challenges?

We learned that board diversity was important not only for skills and experiences, but also because of how this influenced organizational management. When board positions were posted or spread by word of mouth alone, organizations typically had a less diverse board. Some interviewees described how they **proactively shaped their organizations through targeted recruitment.** These are broken down by councils and districts.

Council recruitment strategies included:

Completed a needs assessment. Councils used board demographic and skills surveys to ensure a diversity of knowledges and experiences to address organizational and land use needs. Interviewees commonly mentioned looking for candidates with nonprofit management and financial knowledge, familiarity with restoration/conservation projects, and technical skills from a variety of work experiences (e.g., lawyer, environmental, livestock, and agriculture). Additionally, they recognized agency staff's familiarity with government processes, partnerships, and funding sources; while landowners had more familiarity with ranching and farming practices.

Targeted recruitment to find board members who could help them meet goals in their strategic plans and strengthen communication and information sharing across different sectors. For example, an interviewee described how they pursued a transportation department representative for their council so they could conduct a road mile inventory using the department's GIS data. This aided project and funding development, which also supported the local county. Another interviewee shared how they sought an industry representative to gain property access for projects and obtain private industry monies to leverage larger, federal grants.

Attended and hosted community events with agency partners to form a community network with the intention to identify potential board members and encourage their involvement in projects to cultivate a pool of potential candidates. Interviewees indicated that by consistently showing up and demonstrating that they were able to help troubleshoot problems and find funding to implement projects, they were able to build a positive organizational reputation and educate the public on their role. This encouraged community members to join the board because of the help they received.

District recruitment strategies included:

Recruited non-landowners or those who own or manage less than 10 acres of land to become at-large or associate directors with the intention to become zone directors. To address issues of diversity or lack of expertise in the board, some districts have engaged individuals who do not meet the zone director eligibility criteria to become at-large or associate directors, since these positions do not have the same legal requirements. It is important to note that the associate director position has no vote when the board makes an official decision, but can augment the knowledge of board members. After 1-year, these positions were eligible to become a zone director if they were also a registered voter who lived within the zone they represented, and had a conservation plan approved by the district.[15]

Encouraged frequent project partners to apply to become board members as long as they meet the election eligibility criteria for directorship. Interviewees stated that landowners were often interested in giving back and supporting the economic vitality of the community.

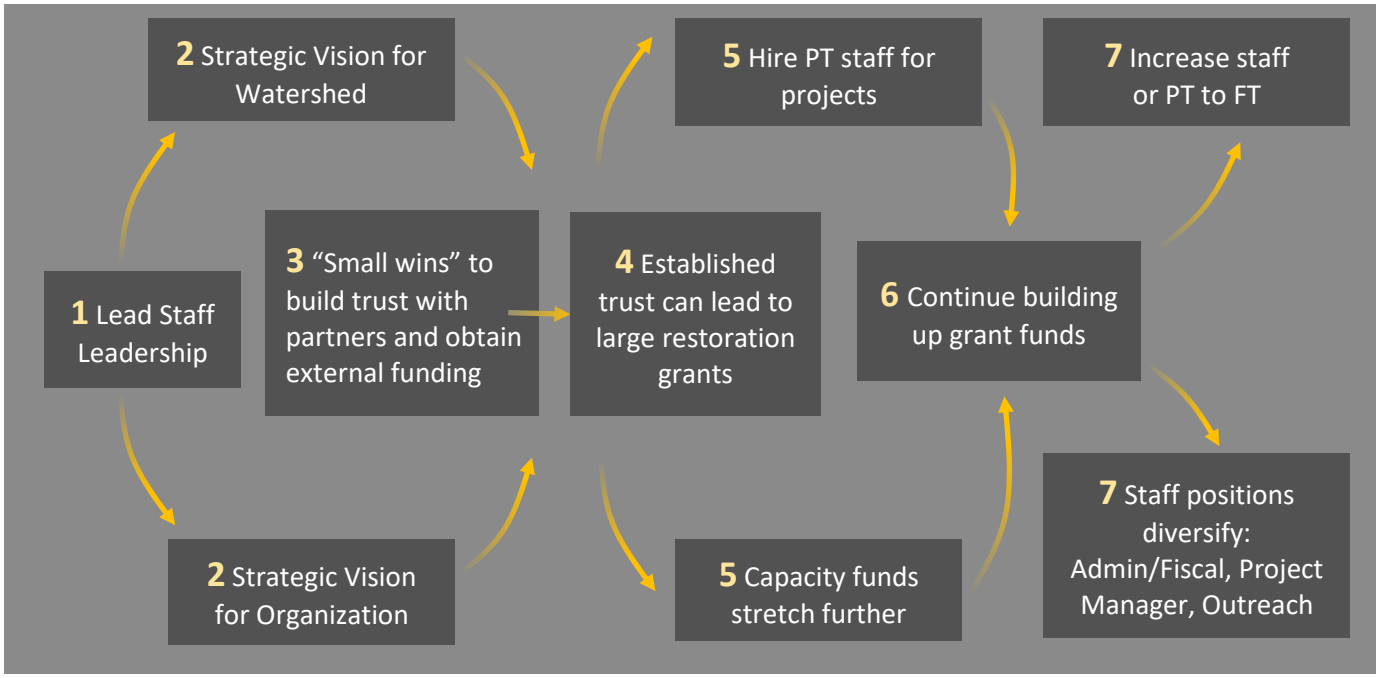
How Have Strategic Plans Affected Organizational Capacity?

From the case study interviews, we learned that strategic planning processes varied based on the organization's structure, management style, and the regional contexts within which they worked. Because of these realities, strategic plans served different functions. Some organizations engaged in a more detailed approach, while others needed a broader plan. In this section, strategic plans refer to an individual organization's strategic plan, rather than strategic action plans used to coordinate landscape-scale restoration and conservation across multiple organizations as part of an OWEB-FIP, P-TA, NRCS RCPP grant, or others.

[15] ORS 568.560(2) and (3) describe the full eligibility requirements to become a conservation district director.

- **Detailed strategic plans** included a variety of perspectives and needs, and incorporated relevant technical expertise, to identify geographic project and/or programmatic priorities that could result in tangible benefits or improvements with clearly measurable objectives, and designation of short, medium, and long-term priorities. Lastly, they identified potential partnerships and funding sources. *These organizations typically had more available regional funding opportunities.*
- **Broader strategic plans** focused on organizational history, land uses, and limiting factors (e.g., biological, physical, or chemical conditions that limit a species viability in a habitat). The strategic plan then functioned as a litmus test to see if emergent funding opportunities were aligned with the goals and needs described in the strategic plan. This allowed them to be better positioned for those funding sources. To guide day-to-day work, lead staff developed a detailed annual work plan from the strategic plan to help establish geographic project and/or programmatic priorities between staff and the board, along with potential partners and funders. *These organizations often had more limited regional funding opportunities.*

Strategic plans and annual work plans, together, supported organizational efficiencies and established expectations between board and lead staff through joint priority setting. By creating specific objectives and measures to reach the vision of their plans, lead staff and boards:



- Identified short, medium, and long-term project priorities to better sequence project timing.
- Developed a shared understanding of what amount and type of project work was manageable based on staffing capacity, which helped establish reasonable workload expectations.
- Developed a shared understanding of organizational priorities, which enabled lead staff and boards to function effectively in their respective roles.
- Guided lead staff's annual work plans and day-to-day tasks.
- Streamlined pursuit of key partnerships and funding sources for projects.
- Designed stronger grant proposals.

Over time, this created an upward organizational trajectory by supporting their ability to obtain larger grants by attracting partnerships and external funding sources (**Figure 15**). The successful execution of a plan was led by lead staff who were able to "carry the vision," engage in relationship building, and create opportunities for "small wins" early on that demonstrated commitment, which built trust with partners. Furthermore, achieving "small wins" cemented partners' faith that the organization could reliably accomplish the work, so partners were willing to put in more time and energy. This was the case regardless of whether the organization had greater access to funding opportunities or not, though, of course having more funding opportunities in a geographic area was helpful.

As more funding became available, some interviewees described how they were able to hire additional staff to work on projects and stretch the capacity grants further. Lead staff continued to build up the organization's grant application portfolio and diversified funding streams to keep funding coming in the door to increase existing staff's FTE from part-time to full-time or hire additional project staff. Over time, this allowed them to diversify key organizational staffing positions in-house as well (e.g., project manager, fiscal manager/ administrator, outreach coordinator). This allowed lead staff to delegate some of their responsibilities and expanded the organizations' capacity to gain partnerships, obtain grants, and develop projects. In watersheds with varied land uses, some interviewees also mentioned how they diversified the types of restoration and conservation projects they pursued to engage additional partners and develop more funding opportunities. Some interviewees were able to tie smaller restoration and conservation projects into landscape-scale projects, leveraging the partnerships they built, by pursuing OWEB FIP, P-TA, and NRCS RCPP grants.

> As one interviewee said, *"If you don't fundamentally understand how the landscape's working, in terms of watershed processes, land use, and the owner's objectives, you're not going to get it right and you're not going to have them helping you on the project. You really have to understand the physical processes behind the landscape, so you can understand how to implement something that is going to work, both for watershed benefits, whether it's fish, water quality, whatever it may be, but also, with the use of that land for some other purpose, which is not always obvious and apparent."*

Figure 15. *Organizational Upward Trajectory.*

What Happened Without a Detailed Strategic Plan?

Strategic plans and/or annual work plans that lacked specificity in their objectives and measures did not typically provide enough direction for lead staff to develop projects, seek out partnerships, or find funding sources. Without this, organizations struggled to develop projects efficiently and effectively and faced more challenges in pursuing partners and funding. When organizations lacked a shared understanding of priorities, this sometimes led to an imbalanced level of board engagement, with either micromanagement of lead and other staff in their daily tasks or limited input from the board with too much workload and direction setting falling on lead staff.

How Have Organizations Created Strategic Plans?

From the case study interviews, we learned that organizations that pursued multiple methods for identifying potential projects were able to develop more informed strategic plans that guided the board in making decisions on project and grant priorities. Lead staff and board members were also better able to identify whether new grant opportunities or project proposals from agency partners, landowners, and other local partners were relevant to pursue based on established priorities.

Organizations used the following information sources in developing strategic plans:

- **Conducted surveys to identify community needs and interests** to ascertain geographic areas of focus, limiting factors, and related project activities. Some interviewees described how they obtained an OWEB stakeholder engagement grant to survey private landowners on their restoration and conservation project interests and needs to establish priorities.
- **Participated in regional information-sharing groups** to remain aware of agency funding priorities and coordinate projects with agency staff and other local partners.
- **Maintained a database of potential projects** that included project priorities, potential funding sources, and landowner, agency, or county staff contact information. Some interviewees stated that they used this to quantify potentially available project work to inform board decisions.

V.C. How Have Organizations Engaged in Partnerships?

Through our case studies, we looked at how organizations typically developed partnerships, how they navigated common challenges in partnership building, and the variety of partnership models organizations engaged in through partnership-focused grants (e.g., OWEB FIP, P-TA, or NRCS RCPP) and other forms of involvement. Partnerships support organizations in leveraging experience, knowledge, and expertise with adjacent councils, districts, and other local conservation partners to plan and implement projects for restoration and conservation actions. Furthermore, partnerships can develop over time as those involved can begin to identify a common understanding of the needs of the landscape, the community, and the available resources and partners to move beyond project to project and towards development of larger-scale restoration and conservation projects. Opportunities and challenges for partnerships vary in different geographical areas and contexts. Depending on the landowners in their watershed, councils and districts need to work across boundaries of federal, state, and local government, as well as private industry (e.g., timber) and private landowners (e.g., ranching, farming). When neighboring landowners differ in their priorities, it can be challenging to implement a program of work across a landscape. However, councils and districts are in a prime position to work towards landscape-scale restoration and conservation through building relationships with the community and agency partners. Geographic areas with a fewer number of landowners may face less complexities in implementing work across a landscape, though the greatest factor still depends on the ability of the organization's lead staff or board to build partnerships.

Organizations Typically Developed Partnerships Through:

(1) Participation in city or county committees and other local boards to build a reputation in the community, while serving as a community member. This helped bring capacity to local governments, particularly smaller ones. Some organizations' programs were included in local city budgets, which helped them develop a general fund. *(Note: It took time to build a general operations budget for staff to be paid for their engagement and participation in committees.)*

(2) Development of strategic action plans with key partners. Effective organizations developed priorities for the watershed through identification of key players (e.g., main landowners, city/county officials, boards, public events/outreach) to establish joint priorities to acquire funds.

(3) Referrals from agency partners connected landowners or non-profits to councils or districts as a better avenue for project work. Councils and districts assisted landowners and other conservation partners in establishing a plan and finding funds. Additionally, councils and districts invited agency partners to board meetings to share updates on funding and project priorities.

(4) **Development of a community outreach program.** This included hosting regular community events in public spaces to engage landowners, e.g., breweries. When the event was consistent, it built reliability and improved access for community engagement. Some organizations purchased office space downtown to increase community visibility.
(5) **Sustained ties with past workplaces.** Some partnerships emerged from staff movement between organizations, who maintained connections with past agencies, as well as other councils, districts, and local partners.

Overall, organizations that consistently obtained OWEB large restoration grants or other grants, while also implementing project work in a timely manner, established themselves as reliable and capable. Partners were more willing to provide them with funding for riskier, more complex projects. As one interviewee said, "I think we make a pretty good partnership because if they can find grants, even if I have to match one to one, we can get a lot more done that way. If I just paid for it all, I'd only be able to pay for half of that. It's still done eventually, hopefully, but only at half the rate. They've been awesome, and I hope they never leave. My other wildlife areas that don't really have an active watershed council, it's a lot harder to get large projects done. The watershed council and ODFW have all these projects on the table that we're working on, and it's benefiting the wildlife area and its neighbors, and we are able to combine our budgets to make a larger difference, which is huge."

What are Common Challenges in Partnership Building?

Through our case studies, we found that common challenges organizations faced in partnership building included: (1) staff turnover at partner organizations and (2) historical challenges. In this section, we also look at how organizations navigated these challenges.

Staff Turnover at Partner Organizations

When state and federal agency partners have experienced managerial turnover or when key contacts have left, it has been challenging for councils and districts to maintain these relationships and funding sources. Continuation of partnerships depended on the priorities of new management, i.e., what kinds of restoration and conservation work they wanted to focus on and how they interpreted implementing agency work. Some interviewees discussed how some agency partners wanted to shift from monitoring to implementation, which required the council or district's staff to learn new skills or potentially hire someone with these skills. This was sometimes challenging for organizations in rural areas, which often spoke to difficulties of finding qualified staff. Additionally, some agency staff were less focused on partnership building, which hampered relationships with councils and districts. However, sometimes changes in partners' management had positive impacts if they were more partner-focused, or when the agency itself shifted its priorities to promote partnerships. Lastly, lead staff turnover in adjacent councils and districts who were key partners and experts in a particular restoration or conservation activity affected other councils' and districts' capacity.

> As one interviewee pointed out, *"We recognize that our partners' capacity has a lot to do with our capacity…A lot of our partner organizations are losing institutional knowledge, as there's been a lot of staffing changes. So, one of the things we're working on at the district is a conservation planning regional training course…We plan to include videos that talk about conservation planning specifics as well as connecting attendees with partner organizations that can talk about their programs. It would be something that we could make available to folks at the Watershed Council, neighboring SWCDs, or other partner organizations when they get new staff members."*

Protective Factors

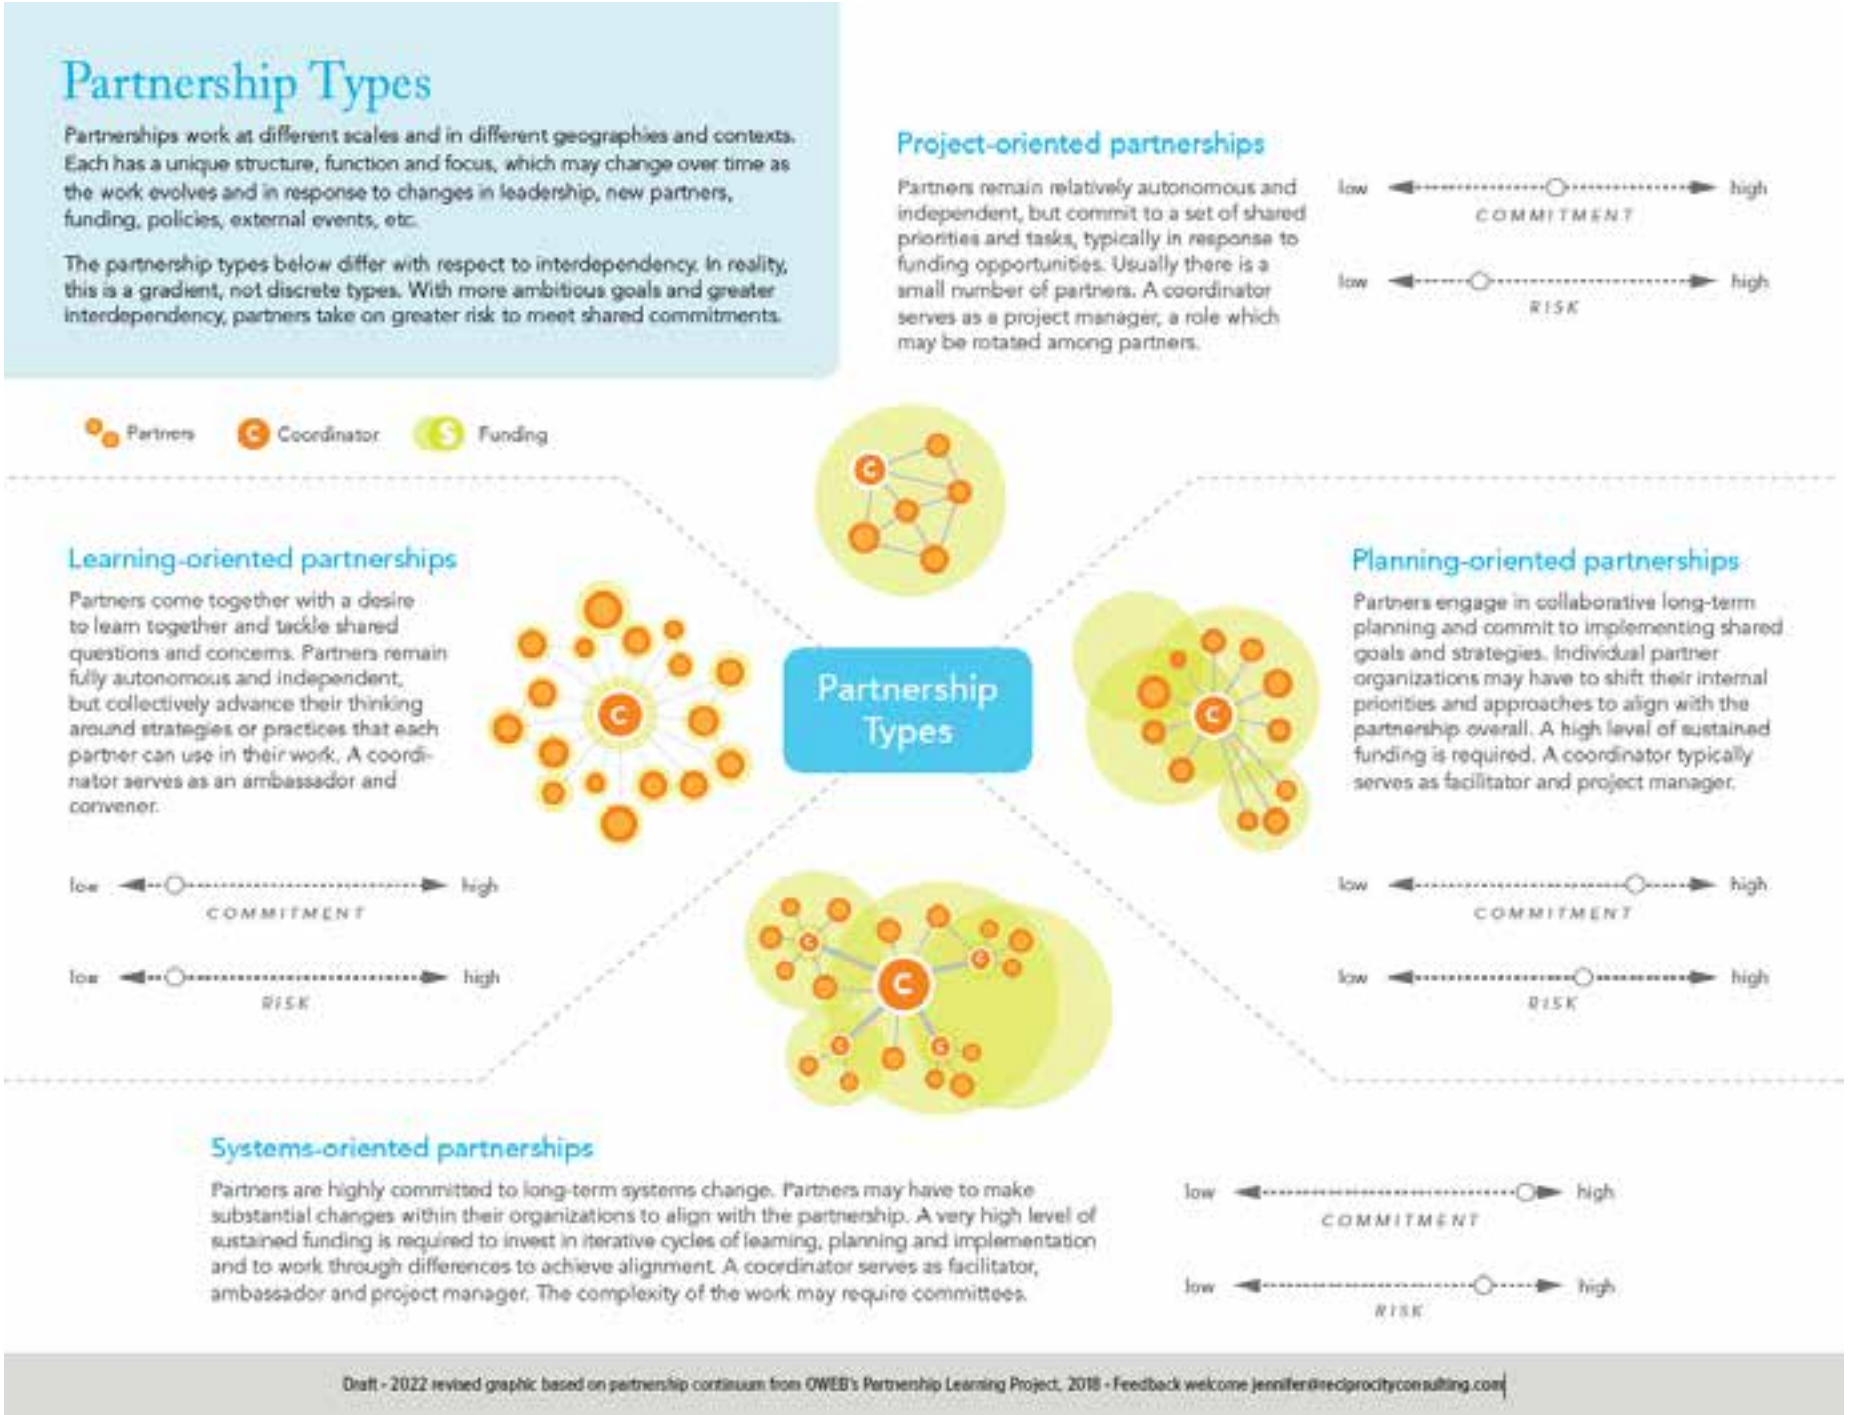
Some interviewees spoke to the importance of maintaining connections with partners during times of staffing transitions. Council, district, or agency partners began a relationship with the new personnel by onboarding them on joint project grants, priorities, and the program of work. This included inviting agency partners to attend board meetings or meeting with them individually. One interviewee discussed how an effective strategy for introducing agency partners to councils and districts happened when agencies used their extra funding from staffing vacancies to double-fill the position for the last month. Lastly, some councils and districts participated in group information-sharing networks to stay connected to regional priorities, and project and grant opportunities. This helped them be aware of and adapt to upcoming changes.

Historical Challenges and Opportunities

Some interviewees spoke about challenges they faced in building partnerships with consecutive lead staff turnover or a history of troubled partnerships in an area.

Consecutive Lead Staff Turnover

Some interviewees mentioned how turnover of lead staff or other key staff (e.g., project manager) resulted in a decline in organizational management, particularly when a board was disengaged. Current staff stepped into the role as interim to maintain fiscal management, grant reporting, and project work. However, because of a lack of managerial direction and priority setting, reporting deadlines and contractor payments were missed, projects were derailed and partners were lost. Sometimes, however, changing staff at a council or district allowed for partnership repair by consistently following through on projects, and also established new organizational connections from their past workplaces. These staff also brought new knowledge of available funding resources and strategies for obtaining them, which allowed for organizational expansion over time.



History of Troubled Partnerships

Some councils and districts have faced challenges around an ongoing history of troubled partnerships. This was sometimes challenging for new lead staff to handle; however, sometimes they brought a fresh perspective and rebuilt trust. Some lead staff interviewees engaged in partnership problem-solving by acquiring funding to work on a joint project or through obtaining a monitoring grant to gather and share information that both organizations needed to develop projects. Furthermore, some partner interviewees discussed how they offered joint project funding to organizations that had a troubled history to work together since each had access to valuable skills, knowledge, and community connections necessary to complete the restoration and conservation activities. Through this funding, change of staff, and the necessity to work together, organizations worked towards development of a new narrative. In other instances, organizations brought in outside facilitators to bridge relationships between landowners, agency partners, councils, and districts. Interviewees indicated that these facilitators served as a stepping stone to improving relationships and signified a basic agreement to work together, but a crucial factor was having a key leader who was able to make it work for everyone. Additionally, they described the need for incremental small victories to carry the momentum forward. Interestingly, some interviewees spoke about creating an external group of partners led by a community leader, who had a vision for the watershed, helped reset dynamics in an area, outside of the confines of organizations.

Partnership Models

Diverse models of partnership emerge depending on the relationships built and the needs identified by those involved, and as such, a variety of partnership structures may be best suited for different times and in varied contexts. The Partnership Learning Project referred to the "Continuum of Partnership Types" to identify what OWEB FIP partnerships "needed to be resilient and maintain a high level of performance and impact".[16] Over time, this model has evolved based on continued conversations with groups to broaden the understanding of partnerships as an evolving process that is neither discrete nor linear and to reflect the level of interdependency and degree of collaboration (See **Figure 16** below). These include learning-oriented partnerships, project-oriented partnerships, planning-oriented partnerships, and systems-oriented partnerships. Learning-oriented partnerships focus on brainstorming ways to improve strategies and practices, but have minimal formal connection or shared work. In project-oriented partnerships, responsibilities are shared for individual projects. In planning-oriented partnerships, partners are engaged in matching their strategies and actions to meet mutual needs for the partnership overall. In systems-oriented partnerships, partners are committed to working together in supportive and integral roles to accomplish a long-term shared vision.

Figure 16. *Partnership Types Model.*

Our case study interviews showed three primary ways that organizations sought partnerships:

1. **For networks:** Creation of group networks and larger scale network entities.
2. **For shared planning:** Development of cross-partner plans such as strategic plans or integrated weed management plans.
3. **For resource sharing:** Development of resource sharing arrangements.

Leveraging Networks

Some interviewees described the importance of leveraging experience, knowledge, and expertise with adjacent councils, districts, and other local partners. Some geographic areas have established regional partnerships using OWEB FIP or P-TA grants to develop governance documents (e.g., MOU and bylaws) to define roles, responsibilities, and commitments to build cross-organizational support for landscape-level restoration and conservation. For example, the Upper Willamette Stewardship Network (UWSN), a regional cooperative planning group, has built in planning efficiencies and reduced administrative burden on participating councils and districts, while providing beneficial outcomes for an individual staff member, individual organizations, and the Network as a whole. One of the councils served as the "organizational home" for the Network's Working Lands program since they had working lands expertise with a dedicated staff member. Other organizations in the Network contracted with them to provide services in their geographic area. This built in job security for the individual, and thereby, the council's funding for the position, while simultaneously contributing to other organizations' capacity for projects. Additionally, this reduced duplication of efforts; created regional consistency in program language, development, and implementation; and established a regional point of contact, which supported communication and planning with partners. Furthermore, this staff member became an expert in navigating NRCS, which increased the council's ability to obtain grants and benefited everyone in the Network to leverage additional funding. Together, this reduced the administrative burden of the involved organizations.

Shared Planning

Some interviewees participated in regional information-sharing groups, which supported streamlining of projects through identification of partners for cost-match and coordination of efforts to work towards landscape-scale restoration and conservation. Examples included council and district-led regional coordination meetings with agency partners through OWEB FIP grants, funder-led regional coordination meetings, and an annual workgroup led by a local NRCS office to provide updates on upcoming funding opportunities. Furthermore, some interviewees were involved in NRCS' RCPP program to work collaboratively with other local districts or councils on landscape-scale projects with private landowners. Additionally, one interviewee mentioned development of a cross-county regional weed management plan, which enabled the district to work on weed projects with ODA since they lacked a local weed management area.

Resource Sharing

Some interviewees engaged in resource sharing arrangements such as:

- **Split costs for drones or other equipment** that were too costly for a single organization to purchase, but could be shared between each other.
- **Shared staff expertise to provide skills training for other organizations** by contracting them for a project to engage in on-the-job learning.
- **Shared a grant writer**, whose position was housed in one organization, but was contracted out with other nearby organizations.
- **Developed a lending library of educational materials** that were available for partners to borrow, covering topics such as landowner materials, soil health, and more.

V.D. What Funding Strategies Have Organizations Used?

This section builds on the previous section by highlighting how organizations strategically identify, obtain, and leverage available funding resources to work with partners while maintaining awareness of their own capacity. From the case study organizations we interviewed, we learned about how organizations diversified funders; how they relied on community, board, and network relationships to find additional funding; and how they navigated a variable funding landscape, while maintaining relationships with partners.

Strategic Pursuit of Grants

Lead staff described the need to assess their organizational and staffing capacity to identify what amount of grant work they can reasonably manage at a given time, the importance of strategic plan development to guide grant processes, and the creation of funding spreadsheets to track potential opportunities.

Assessment of Staffing and Organizational Capacity

Interviewees discussed the need to strategize which grants to apply for since grant writing required significant staff time, which could not be charged to another grant. Interviewees also voiced a need to not apply for more grants than they were able to manage at once, even when a grant was directly relevant to their priorities. Some mentioned learning to budget for more project management time in their grant applications, which helped build additional capacity for projects. Specific to new federal grants, some described the importance of working with partners to determine if grants were significantly aligned with their priorities and worth the "risk" of staff time to pursue these. Interviewees also described fatigue and challenges with funders only wanting to fund innovative, "new and shiny" projects. Some interviewees perceived their watershed as less competitive for funders' grant priorities and that they had less innovative or interesting projects that were still essential for their geography.

Development of Strategic Plans and Funding Opportunities Spreadsheet

Some interviewees described how strategic plans directed their pursuit of grants through identification of watershed goals and related project priorities, objectives, and measurable outcomes. By engaging in a strategic planning process, staff and boards were better positioned to recognize relevant grant opportunities and write more informed, detailed grants that were more likely to obtain funding. Alongside strategic planning, some interviewees developed a funding opportunities spreadsheet that they periodically updated to keep track of grants, deadlines, key contacts, and connections between funders' priorities and their strategic plans. Some indicated the need to develop a grant timeline to see when a funder was likely to solicit funds. These spreadsheets were created by researching opportunities online, attending webinars to learn about grants, or "cold-calling" funders to develop relationships. Lead staff interviewees indicated that it became easier to identify relevant grants over time as they built up an understanding of watershed needs through strategic plan development.

Additionally, one interviewee described how they created a simple watershed map with an overlay of funding sources (e.g., OWEB FIP, ODA Strategic Implementation Area, or NRCS RCPP) to identify needs addressed by those grants. Another interviewee discussed how they developed a regional OWEB grants database to see trends in match percentage, types of projects being awarded, and how many of each type. This informed them on what grants to apply for by learning what projects were more likely to be funded. This was particularly useful since some projects may have only required a 15% match, but some applicants have secured a much higher match, which may reduce the organization's likelihood of attaining the grant. Additionally, some interviewees spoke with funders to determine why their grant was unsuccessful (e.g., quality of grant writing or if the project was not a current priority). They saved these as "drafts" for future grants.

Diversifying Funders for Short- and Long-Term Funding Needs

Some interviewees described how they developed a funding plan to address short- and long-term needs. Short-term funding necessities included items like staff payroll, rent, and contractor payments. Long-term funding focused on the development of additional revenue streams to diversify funding sources outside of OWEB. These interviewees mentioned how strategic planning sessions with the board and lead staff were the most useful time

to discuss this. Some board and partner interviewees indicated that prior lead staff or board members lacked the skills or ability to manage this level of complexity in grant and project management, which made it challenging to obtain OWEB funding for projects. To address this, some board members shared that during times of lead staff transitions, they focused on hiring someone who was able to guide the organization in this direction. Interviewees also highlighted the importance of being networked in the community to learn about diverse funding opportunities. Examples included: federal and state agencies, private foundations, and local community institutions that sponsored non-profits (e.g., banks, grocery stores, or breweries), as well as annual fundraising events with local partners and fostering of city/county government relations for inclusion of their programs in local government budgets. Furthermore, interviewees discussed how funding from local community institutions, local government budgets, and fundraising events served as unrestricted funds to support operational costs and supplemented the Operating Capacity grants. Additionally, some organizations have maintained an annual federally negotiated indirect cost rate agreement to support critical operation costs. However, it is important to recognize that some geographic areas will likely always face challenges with diversifying funding outside of OWEB based on fewer available resources. This is described in more detail in the section, "Navigating a Variable Funding Landscape."

Relying on Community, Board, and Network Relationships

Community Focus

Some interviewees described the importance of developing landowner connections that emphasized conservation problem identification and being solution-oriented by developing plans and obtaining funding. This was especially useful in navigating community distrust of agencies, who were perceived as "enforcers" and "regulators." Some shared how this approach encouraged previously disinterested landowners to discuss issues in managing their property.

Board Connections

Specific to councils, lead staff members have often been essential for identifying potential funding sources and maintaining relationships with partners. However, some interviewees described how board connections have played a role by attending fundraising and other key events, attaching personal notes to known recipients for end-of-year fundraising letters, and reaching out to personal contacts to attain additional funding. Additionally, some board members were aware of funding sources from federal and state agencies based on their work experiences.

Network Relationships

Some interviewees mentioned participation in quarterly or annual regional information-sharing groups, led by agencies, tribes, councils, and districts, helped them learn about funding opportunities, coordinate projects, and identify partners for project cost-match. Some noted that OWEB P-TA and FIP grants helped support funding for a partnership coordinator, who helped identify larger funding opportunities for multiple organizations (e.g., JDBP and UWSN).

Maintaining Relationships with Funding Partners

Case study interviewees discussed the importance of maintaining relationships with federal, state, and local government funding partners, as well as the need to continually build relationships with new funders. Partnership building was achieved by gaining a reputation for consistently obtaining grants, reliably meeting project deadlines, communicating as changes occurred, and implementing quality work on the ground. Lead staff interviewees discussed how this led to new opportunities. They indicated that federal agencies often have

trouble getting funding on the ground, so they have sometimes asked partners to develop and apply for federal grants. Additionally, federal and state agency partners sometimes developed a pre-written OWEB grant application for lead staff to revise and submit since state and federal entities have historically been ineligible to apply for OWEB grants. Some interviewees also described the importance of establishing trust with local partners. One interviewee shared how they called their local partners when they needed project work for their staff, e.g., maintenance of past riparian or weed management projects, as well as simply asking if there was any relevant work that needed to be completed. This proactive approach helped lead staff to identify short-term funding opportunities that supported the staff member, the organization, and the partner. Additionally, interviewees spoke about the need to continue building relationships with new funders, since external funding sources have typically been tied to projects and have not been meant to serve as ongoing, programmatic support. As one interviewee said, "You're always building relationships, maintaining relationships, and ending relationships with funders." Because of this reality, they pointed to the essential need for district and Council Capacity grants to maintain a base of support.

Navigating a Variable Funding Landscape

Interviewees described challenges around changes in external funders' priorities as well as access to funding opportunities. Some discussed how they lost funding sources that were once reliable for up to 10 years after external funders shifted their focus from one particular geographic area or type of restoration/conservation work to another. Additionally, when state and federal agencies have received an increase in dollars earmarked for restoration and conservation activities, they have often depended on councils and districts as community-based partners who can expand agency capacity to develop and implement projects. As smaller organizations, it can be difficult for them to adapt to these needs and benefit from these resources. Councils and districts, particularly lead staff, have always needed to manage this consistent ebb and flow. Additionally, it is important to note that some geographic areas have had greater access to funding opportunities (e.g., taxing districts; BPA; and species-specific funds for salmon, steelhead, sage-grouse, and other agency regional funding priorities). Interviewees in some rural communities have also had fewer available local organizations to partner with on projects, little to no local foundations, and a lack of local government funding for conservation. Furthermore, they often described the difficulties of finding or retaining qualified staff, which affected their ability to manage and obtain larger grants. Some interviewees indicated that a lack of funding sources encouraged them to work with local partners more, while others spoke to the challenges of perceiving each other as competition for funding. This seemed to vary based on how an organization viewed the role of partnerships.

Lastly, taxing districts sometimes developed their own program of partner support funding to act as a "mini-foundation," which established an additional funding source for local partners or private landowners. Interviewees discussed how their taxing district-funded programs were more accessible than federal and other large funders. They described how it was easier for landowners to obtain funding and reporting requirements were less complex. This increased landowner interest in project development. Furthermore, local, non-profit partners who received these grants obtained year-round support for staff, rather than seasonal, which they viewed as providing regional uplift. Interviewees also indicated that strategic direction and leadership from the lead staff and board were necessary to effectively use these resources.

VI. Discussion
