2013	42.6	42.1	1.2	39.6	39.4	0.5	37.0	36.2	2.3

<sup>1</sup> Most recent year for which final US data are available.

NOTE: US age-adjusted death rates are from compressed mortality files available at the federal Centers for Disease Control and Prevention's WONDER online database. Unlike the data shown in tables 6-54 and 6-55, all Oregon data are from state mortality files. Consequently, the rates and percentage differences shown here will vary from those in tables 6-54 and 6-55 due to different file closure dates, different population estimate methodologies, and incorporation of physician query results. National comparability ratios have been applied to rates prior to 1999 to control for coding changes resulting from the implementation of ICD-10 when it supplanted ICD-9 in 1999. Because the ratios are based on national data, discontinuities may occur when Oregon physicians reported causes of death differently than their national counterparts (e.g., Alzheimer's disease vs. Alzheimer's dementia). Some differences between Oregon and US rates (e.g., alcohol-induced deaths) result, at least in part, from the Oregon's query program: When death certificates are incomplete, letters are sent to physicians/certifiers requesting additional information.
